PROPANTHELINE BROMIDE

Propanthelini bromidum

$C_{23}H_{30}BrNO_3$ M_r 448.4
[50-34-0]

DEFINITION

N-Methyl-*N*,*N*-bis(1-methylethyl)-2-[(9*H*-xanthen-9-ylcarbonyl)oxy]ethanaminium bromide.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish-white, slightly hygroscopic powder.

Solubility: very soluble in water, in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 60 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with *methanol R*.

Spectral range: 230-350 nm.

Absorption maxima: at 246 nm and 282 nm.

Specific absorbance at the absorption maxima:

– at 246 nm: 115 to 125;

– at 282 nm: 57 to 63.

B. Dissolve 0.2 g in 15 ml of *water R* and add 1 ml of *strong sodium hydroxide solution R*. Boil for 2 min and cool slightly. Add 7.5 ml of *dilute hydrochloric acid R* and filter. Wash the residue with *water R* and recrystallise from *ethanol (50 per cent V/V) R*. Dry at 100-105 °C for 1 h. Dissolve about 10 mg of the residue in 5 ml of *sulphuric acid R*. The solution has an intense yellow colour and shows an intense yellowish-green fluorescence when examined in ultraviolet light at 365 nm.

C. Dissolve 50 mg in 0.1 ml of *water R* in a 25 ml flask and add 1 ml of a saturated solution of *potassium permanganate R*. Attach a fractionating column and a condenser, with the end of the delivery tube immersed in 1 ml of *water R* in a test-tube placed in a bath of iced water. Distil fairly vigorously and continue heating for 1 min after a dry residue has been obtained in the flask. Prepare a blank by introducing into an identical test-tube a volume of *water R* equal to that of the distillate. Place the tubes in a bath of iced water. To each tube, add 0.5 ml of a 20 per cent *V/V* solution of *morpholine R* and 0.5 ml of a freshly prepared 50 g/l solution of *sodium nitroprusside R*. Mix and allow to stand at 0 °C for 5 min, and then at room temperature for 3 min. No blue colour develops in either tube. Add 1 g of *ammonium*

Monographs P

sulphate R, mix and allow to stand for 15 min. A stable, intense pink colour develops in the test solution. A brownish-yellow colour develops in the blank.

D. It gives reaction (a) of bromides (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*).

Dissolve 0.6 g in *water R* and dilute to 20 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Solvent mixture: *acetonitrile R, water R* (40:60 *V/V*).

Test solution (a). Dissolve 6 mg of the substance to be examined in the solvent mixture and dilute to 50 ml with the solvent mixture.

Test solution (b). Dissolve 6 mg of the substance to be examined in 30 ml of the solvent mixture. Add 5 ml of reference solution (b) and dilute to 50 ml with the solvent mixture.

Test solution (c). Dissolve 6 mg of *xanthydrol R1* and 6 mg of the substance to be examined in the solvent mixture, then dilute to 50 ml with the solvent mixture.

Reference solution (a). Dissolve 6 mg of *xanthydrol R1* in the solvent mixture and dilute to 50 ml with the solvent mixture.

Reference solution (b). Dilute 5 ml of reference solution (a) to 50 ml with the solvent mixture.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mixture of equal volumes of *acetonitrile R* and of a solution containing 28 g/l of *sodium perchlorate R* and 11 g/l of *phosphoric acid R*, adjusted to pH 3.8 with *strong sodium hydroxide solution R* and then with *0.1 M sodium hydroxide*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 206 nm.

Injection: 20 µl of test solutions (a), (b), (c) and reference solution (a).

Run time: twice the retention time of propantheline.

System suitability: test solution (c):

– in the chromatogram obtained with test solution (a), there is no peak corresponding to the principal peak in the chromatogram obtained with reference solution (a);
– *resolution*: minimum 8.0 between the peaks due to propantheline and xanthydrol.

Limits: test solution (b):

– *any impurity*: for each impurity, not more than the area of the peak due to xanthydrol (1.0 per cent), and not more than one such peak has an area greater than or equal to 0.5 times the area of the peak due to xanthydrol (0.5 per cent);
– *disregard limit*: disregard any peak with a retention time relative to propantheline of less than 0.2 (bromide); disregard the peak due to xanthydrol.

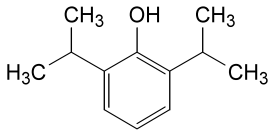
Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 50 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* corresponds to 44.84 mg of $C_{23}H_{30}BrNO_3$.



STORAGE

In an airtight container.

01/2008:1558

PROPOFOL

Propofolum

$C_{12}H_{18}O$ M_r 178.3
[2078-54-8]

DEFINITION

2,6-Bis(1-methylethyl)phenol.

Content: 98.0 per cent to 102.0 per cent.

This monograph applies to propofol prepared using distillation for purification.

CHARACTERS

Appearance: colourless or very light yellow, clear liquid.

Solubility: very slightly soluble in water, miscible with hexane and with methanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *propofol CRS*.

TESTS

Refractive index (*2.2.6*): 1.5125 to 1.5145.

Related substances. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 1.00 g of the substance to be examined in *hexane R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 0.240 g of the substance to be examined in *hexane R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 5 µl of the substance to be examined and 15 µl of *propofol impurity J CRS* in *hexane R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 0.1 ml of *propofol for peak identification CRS* (containing impurities E and G) to 1.0 ml with *hexane R*.

Reference solution (c). Dilute 1.0 ml of test solution (a) to 100.0 ml with *hexane R*. Dilute 1.0 ml of this solution to 10.0 ml with *hexane R*.

Reference solution (d). Dissolve 0.240 g of *propofol CRS* in *hexane R* and dilute to 100.0 ml with the same solvent.

Column:

– *size*: *l* = 0.20 m, Ø = 4.6 mm;

– *stationary phase*: *silica gel for chromatography R* (5 µm).

Mobile phase: *anhydrous ethanol R, acetonitrile R, hexane R* (1.0:7.5:990 *V/V/V*).

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 275 nm.

Injection: 10 µl of test solution (a) and reference solutions (a), (b) and (c).

Run time: 7 times the retention time of propofol.

Identification of impurities: use the chromatogram obtained with reference solution (b) to identify the peaks due to impurities G and E.

Relative retention with reference to propofol (retention time = about 3 min): impurity G = about 0.5; impurity I = about 0.6; impurity B = about 0.7; impurity N = about 2.3; impurity D = about 2.5; impurity P = about 2.9; impurity A = about 3.0; impurity C = about 3.4; impurity E = about 4.0; impurity F = about 5.8; impurity H = about 6.4.

System suitability: reference solution (a):

– *resolution*: minimum 4.0 between the peaks due to impurity J and propofol.

Limits:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity E = 0.25; impurity G = 5.0;

– *impurity G*: not more than twice the area of the peak due to propofol in the chromatogram obtained with reference solution (c) (0.2 per cent);

– *impurity E*: not more than 0.1 times the area of the peak due to propofol in the chromatogram obtained with reference solution (c) (0.01 per cent);

– *unspecified impurities*: for each impurity, not more than 0.5 times the area of the peak due to propofol in the chromatogram obtained with reference solution (c) (0.05 per cent);

– *total*: not more than 3 times the area of the peak due to propofol in the chromatogram obtained with reference solution (c) (0.3 per cent);

– *disregard limit*: 0.3 times the area of the peak due to propofol in the chromatogram obtained with reference solution (c) (0.03 per cent), except for impurity E.

Impurities J, K, L and O. Gas chromatography (*2.2.28*).

Test solution. Dissolve 40.0 mg of the substance to be examined in *methylene chloride R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *methylene chloride R*. Dilute 1.0 ml of this solution to 10.0 ml with *methylene chloride R*.

Reference solution (b). Dissolve 5 µl of *propofol impurity J CRS* (corresponding to 5 mg) in *methylene chloride R* and dilute to 100 ml with the same solvent. Dilute 1.0 ml of this solution to 25 ml with *methylene chloride R*.

Reference solution (c). Dissolve 4 mg of *propofol CRS* in reference solution (b) and dilute to 1 ml with the same solution.

Column:

– *material*: fused silica;

– *size*: *l* = 30 m, Ø = 0.32 mm;

– *stationary phase*: *polymethylphenylsiloxane R* (film thickness 0.5 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.7 ml/min.

Split ratio: 1:5.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 3	80
	3 - 25	80 → 210
	25 - 40	210
Injection port		100
Detector		270

Detection: flame ionisation.

Injection: 1 µl of the test solution and reference solutions (a) and (c).

Relative retention with reference to propofol (retention time = about 17 min): impurity K = about 0.76; impurity L = about 0.81; impurity J = about 1.01; impurity O = about 1.03.

System suitability: reference solution (c):

– *peak-to-valley ratio*: minimum 3.0, where H_p = height above the baseline of the peak due to impurity J, and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to propofol.

Limits:

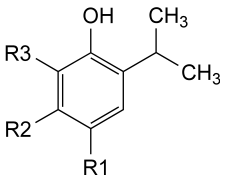
– *impurities J, K, L, O*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution (b) and reference solution (d).

Calculate the percentage content of $C_{12}H_{18}O$ using the declared content of *propofol CRS*.



STORAGE

Protected from light under an inert gas.

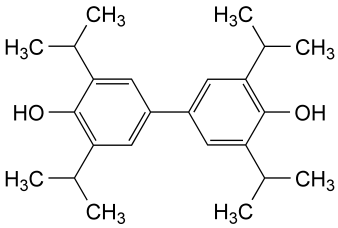
IMPURITIES

Specified impurities: E, G, J, K, L, O.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034).* It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, D, F, H, I, N, P.*

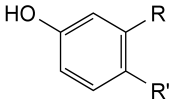
A. R1 = $CH(CH_3)_2$, R2 = R3 = H: 2,4-bis(1-methylethyl)phenol,

B. R1 = R2 = H, R3 = $C(CH_3)=CH_2$: 2-(1-methylethenyl)-6-(1-methylethyl)phenol,



C. R1 = R2 = R3 = H: 2-(1-methylethyl)phenol,

D. R1 = R3 = H, R2 = $CH(CH_3)_2$: 2,5-bis(1-methylethyl)phenol,



N. R1 = CO_2H, R2 = H, R3 = $CH(CH_3)_2$: 4-hydroxy-3,5-bis(1-methylethyl)benzoic acid,

PROPRANOLOL HYDROCHLORIDE

Propranololi hydrochloridum

$C_{16}H_{22}ClNO_2$ M_r 295.8
[318-98-9]

DEFINITION

(2*RS*)-1-[(1-Methylethyl)amino]-3-(naphthalen-1-yloxy)-propan-2-ol hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: soluble in water and in ethanol (96 per cent).

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 163 °C to 166 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *propranolol hydrochloride CRS.*

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in 1 ml of *methanol R.*

Reference solution. Dissolve 10 mg of *propranolol hydrochloride CRS* in 1 ml of *methanol R.*

Plate: *TLC silica gel G plate R.*

Mobile phase: *concentrated ammonia R1, methanol R* (1:99 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: at 100-105 °C.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C until the colour of the spots reaches maximum intensity (10-15 min).

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

Dissolve 2.0 g in *methanol R* and dilute to 20 ml with the same solvent.

Acidity or alkalinity. Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. Add 0.2 ml of *methyl red solution R* and 0.2 ml of *0.01 M hydrochloric acid*; the solution is red. Add 0.4 ml of *0.01 M sodium hydroxide*; the solution is yellow.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *propranolol hydrochloride for performance test CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m; Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 1.6 g of *sodium laurilsulfate R* and 0.31 g of *tetrabutylammonium dihydrogen phosphate R* in a mixture of 1 ml of *sulphuric acid R*, 450 ml of *water R* and 550 ml of *acetonitrile R*; adjust to pH 3.3 using *dilute sodium hydroxide solution R*.

Flow rate: 1.8 ml/min.

Detection: spectrophotometer at 292 nm.

Equilibration: for at least 30 min.

Injection: 20 µl.

Run time: 7 times the retention time of propranolol.

Identification of impurities: use the chromatogram supplied with *propranolol hydrochloride for performance test CRS* to identify the peak due to impurity A.

System suitability: reference solution (a):

– baseline separation is obtained between the peaks due to impurity A and propranolol.

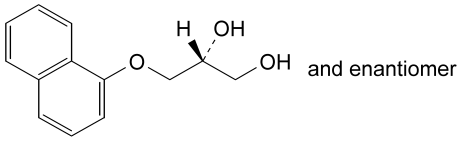
Limits:

– *any impurity*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

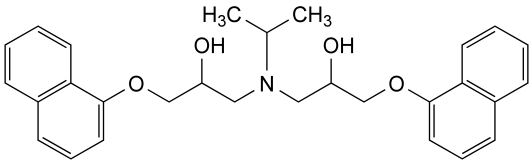
Dissolve 1.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with test B. Prepare the reference solution using lead standard solution (1 ppm Pb) prepared by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *methanol R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.



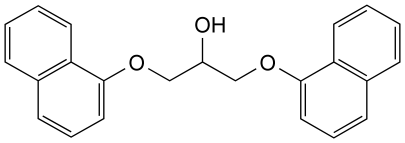
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.250 g in 25 ml of *ethanol (96 per cent) R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

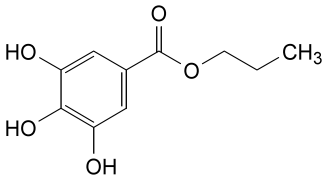
1 ml of *0.1 M sodium hydroxide* is equivalent to 29.58 mg of $C_{16}H_{22}ClNO_2$.



IMPURITIES

A. (2*RS*)-3-(naphthalen-1-yloxy)propane-1,2-diol (diol derivative),

B. 1,1′-[(1-methylethyl)imino]bis[3-(naphthalen-1-yloxy)propan-2-ol] (tertiary amine derivative),



C. 1,3-bis(naphthalen-1-yloxy)propan-2-ol (bis-ether derivative).

corrected 6.0

PROPYL GALLATE

Propylis gallas

$C_{10}H_{12}O_5$ M_r 212.2
[121-79-9]

DEFINITION

Propyl gallate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of propyl 3,4,5-trihydroxybenzoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very slightly soluble in water, freely soluble in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 148 °C to 151 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *propyl gallate CRS*.

C. Examine the chromatograms obtained in the test for gallic acid. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 10 mg in 10 ml of *water R* by heating to about 70 °C. Cool and add 1 ml of *bismuth subnitrate solution R*. A bright yellow precipitate is formed.

TESTS

Appearance of solution. Dissolve 1.0 g in *ethanol (96 per cent) R* and dilute to 20 ml with the same solvent. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

Gallic acid. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 20 ml with *acetone R*.

Reference solution (a). Dissolve 10 mg of *propyl gallate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *gallic acid R* in *acetone R* and dilute to 20 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *acetone R*.

Reference solution (c). Dilute 0.5 ml of test solution (b) to 5 ml with reference solution (b).

Apply separately to the plate 5 µl of each solution. Develop over a path of 8 cm using a mixture of 10 volumes of *anhydrous formic acid R*, 40 volumes of *ethyl formate R* and 50 volumes of *toluene R*. Allow the plate to dry in air for 10 min and spray with a mixture of 1 volume of *ferric chloride solution R1* and 9 volumes of *ethanol (96 per cent) R*. Any spot due to gallic acid in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows 2 clearly separated principal spots.

Total chlorine. Mix 0.5 g with 2 g of *calcium carbonate R1*. Dry and ignite at 700 ± 50 °C. Take up the residue with 20 ml of *dilute nitric acid R* and dilute to 30 ml with *water R*. 15 ml of the solution, without further addition of *dilute nitric acid R*, complies with the limit test for chlorides (*2.4.4*) (200 ppm).

Chlorides (*2.4.4*). To 1.65 g add 50 ml of *water R*. Shake for 5 min. Filter. 15 ml of the filtrate complies with the limit test for chlorides (100 ppm).

Zinc. Not more than 25.0 ppm of Zn, determined by atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. To 2.5 ml of the solution obtained in the test for heavy metals, add 2.5 ml of *water R*.

Reference solutions. Prepare the reference solutions using *zinc standard solution (10 ppm Zn) R*, diluted as necessary with *water R*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as the source of radiation and an air-acetylene flame.

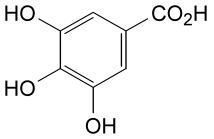
Heavy metals (*2.4.8*). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in *methanol R* and dilute to 250.0 ml with the same solvent. Dilute 5.0 ml of the solution to 200.0 ml with *methanol R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 275 nm.



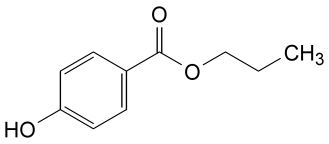
Calculate the content of $C_{10}H_{12}O_5$ taking the specific absorbance to be 503.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A.



A. 3,4,5-trihydroxybenzoic acid (gallic acid).

01/2008:0431
corrected 6.0

PROPYL PARAHYDROXYBENZOATE

Propylis parahydroxybenzoas

$C_{10}H_{12}O_3$ M_r 180.2
[94-13-3]

DEFINITION

Propyl 4-hydroxybenzoate.

Content: 98.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very slightly soluble in water, freely soluble in alcohol and in methanol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 96 °C to 99 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *propyl parahydroxybenzoate CRS*.

C. Examine the chromatograms obtained in the test for related substances.
Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (b).

D. To about 10 mg in a test-tube add 1 ml of *sodium carbonate solution R*, boil for 30 s and cool (solution A). To a further 10 mg in a similar test-tube add 1 ml of *sodium carbonate solution R*; the substance partly dissolves (solution B). Add at the same time to solution A and solution B 5 ml of *aminopyrazolone solution R* and 1 ml of *potassium ferricyanide solution R* and mix. Solution B is yellow to orange-brown. Solution A is orange to red, the colour being clearly more intense than any similar colour which may be obtained with solution B.

TESTS

Solution S. Dissolve 1.0 g in *alcohol R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Acidity. To 2 ml of solution S add 3 ml of *alcohol R*, 5 ml of *carbon dioxide-free water R* and 0.1 ml of *bromocresol green solution R*. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 0.10 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dilute 0.5 ml of test solution (a) to 100 ml with *acetone R*.

Reference solution (b). Dissolve 10 mg of *propyl parahydroxybenzoate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of *ethyl parahydroxybenzoate CRS* in 1 ml of test solution (a) and dilute to 10 ml with *acetone R*.

Plate: suitable octadecylsilyl silica gel with a fluorescent indicator having an optimal intensity at 254 nm as the coating substance.

Mobile phase: *glacial acetic acid R, water R, methanol R* (1:30:70 *V/V/V*).

Application: 2 µl.

Development: over a path of 15 cm.

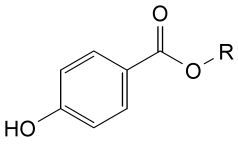
Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (c) shows 2 clearly separated principal spots.

Limits:

– *any impurity*: any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).



Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

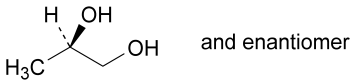
To 1.000 g add 20.0 ml of *1 M sodium hydroxide*. Heat at about 70 °C for 1 h. Cool rapidly in an ice bath. Prepare a blank in the same manner. Carry out the titration on the solutions at room temperature. Titrate the excess sodium hydroxide with *0.5 M sulphuric acid*, continuing the titration until the second point of inflexion and determining the end-point potentiometrically (*2.2.20*).

1 ml of *1 M sodium hydroxide* is equivalent to 180.2 mg of $C_{10}H_{12}O_3$.

IMPURITIES

A. R = H: 4-hydroxybenzoic acid,

B. R = CH_3: methyl 4-hydroxybenzoate,



C. R = CH_2-CH_3: ethyl 4-hydroxybenzoate,

D. R = CH_2-CH_2-CH_2-CH_3: butyl 4-hydroxybenzoate.

01/2008:0430

PROPYLENE GLYCOL

Propylenglycolum

$C_3H_8O_2$ M_r 76.1
[57-55-6]

DEFINITION

Propylene glycol is (*RS*)-propane-1,2-diol.

CHARACTERS

A viscous, clear, colourless, hygroscopic liquid, miscible with water and with ethanol (96 per cent).

IDENTIFICATION

A. It complies with the test for relative density (see Tests).

B. It complies with the test for refractive index (see Tests).

C. Boiling point (*2.2.12*): 184 °C to 189 °C.

D. To 0.5 ml add 5 ml of *pyridine R* and 2 g of finely ground *nitrobenzoyl chloride R*. Boil for 1 min and pour into 15 ml of cold *water R* with shaking. Filter, wash the precipitate with 20 ml of a saturated solution of *sodium hydrogen carbonate R* and then with *water R* and dry. Dissolve in boiling *ethanol (80 per cent V/V) R* and filter the hot solution. On cooling, crystals are formed which, after drying at 100-105 °C, melt (*2.2.14*) at 121 °C to 128 °C.

TESTS

Appearance. It is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Relative density (*2.2.5*): 1.035 to 1.040.

Refractive index (*2.2.6*): 1.431 to 1.433.

Acidity. To 10 ml add 40 ml of *water R* and 0.1 ml of *bromothymol blue solution R1*. The solution is greenish-yellow. Not more than 0.05 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to blue.

Oxidising substances. To 10 ml add 5 ml of *water R*, 2 ml of *potassium iodide solution R* and 2 ml of *dilute sulphuric acid R* and allow to stand in a ground-glass-stoppered flask protected from light for 15 min. Titrate with *0.05 M sodium thiosulphate*, using 1 ml of *starch solution R* as indicator. Not more than 0.2 ml of *0.05 M sodium thiosulphate* is required.

Reducing substances. To 1 ml add 1 ml of *dilute ammonia R1* and heat in a water-bath at 60 °C for 5 min. The solution is not yellow. Immediately add 0.15 ml of *0.1 M silver nitrate* and allow to stand for 5 min. The solution does not change its appearance.

Heavy metals (*2.4.8*). Mix 4 ml with 16 ml of *water R*. 12 ml of the solution complies with limit test A for heavy metals (5 ppm *m/V*). Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*). Not more than 0.2 per cent, determined on 5.00 g by the semi-micro determination of water.

Sulphated ash (*2.4.14*). Heat 50 g until it burns and ignite. Allow to cool. Moisten the residue with *sulphuric acid R* and ignite; repeat the operations. The residue weighs not more than 5 mg (0.01 per cent).

STORAGE

Store in an airtight container.

01/2008:2122

PROPYLENE GLYCOL DICAPRYLOCAPRATE

Propylenglycoli dicaprylocapras

DEFINITION

Propylene glycol diesters of saturated fatty acids, mainly caprylic (octanoic) acid and capric (decanoic) acid, of vegetable origin.

CHARACTERS

Appearance: almost colourless to light yellow, oily liquid.

Solubility: practically insoluble in water, soluble in fatty oils and in light petroleum, slightly soluble in anhydrous ethanol.

IDENTIFICATION

A. Refractive index (*2.2.6*): 1.439 to 1.442.

B. Relative density (*2.2.5*): 0.910 to 0.930.

C. Viscosity (*2.2.9*): 9 mPa·s to 12 mPa·s.

D. It complies with the test for composition of fatty acids (see Tests).

TESTS

Appearance. The substance to be examined is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Acid value (*2.5.1*): maximum 0.2.

Hydroxyl value (*2.5.3, Method A*): maximum 10.

Iodine value (*2.5.4*): maximum 1.0.

Peroxide value (*2.5.5, Method A*): maximum 1.0.

Saponification value (*2.5.6*): 320 to 340.

Unsaponifiable matter (*2.5.7*): maximum 0.3 per cent, determined on 5.0 g.

Alkaline impurities. Dissolve 2.00 g of the substance to be examined in a mixture of 1.5 ml of *ethanol (96 per cent) R* and 3.0 ml of *ether R*. Add 0.05 ml of *bromophenol blue solution R*. Not more than 0.15 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to yellow.

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*). Prepare reference solution (a) as indicated in Table 2.4.22.-2.

Column:

– *material*: fused silica,
– *size*: *l* = 30 m, Ø = 0.32 mm,
– *stationary phase*: *macrogol 20 000 R* (film thickness 0.5 µm),

Carrier gas: *helium for chromatography R*.

Flow rate: 1.3 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	70
	1 - 35	70 → 240
	35 - 50	240
Injection port		250
Detector		250

Detection: flame ionisation.

Composition of the fatty acid fraction of the substance to be examined:

– *caproic acid*: maximum 2.0 per cent,
– *caprylic acid*: 50.0 per cent to 80.0 per cent,
– *capric acid*: 20.0 per cent to 50.0 per cent,
– *lauric acid*: maximum 3.0 per cent,
– *myristic acid*: maximum 1.0 per cent.

Water (*2.5.12*): maximum 0.1 per cent, determined on 5.00 g.

Total ash (*2.4.16*): maximum 0.1 per cent, determined on 2.0 g.

STORAGE

Protected from light.

01/2008:2087

PROPYLENE GLYCOL DILAURATE

Propylenglycoli dilauras

DEFINITION

Mixture of propylene glycol mono- and diesters of lauric (dodecanoic) acid.

Content: minimum 70.0 per cent of diesters and maximum 30.0 per cent of monoesters.

CHARACTERS

Appearance: clear, oily liquid at 20 °C, colourless or slightly yellow.

Solubility: practically insoluble in water, very soluble in alcohol, in methanol and in methylene chloride.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.1 g of the substance to be examined in *methylene chloride R* and dilute to 2 ml with the same solvent.

Reference solution. Dissolve 0.1 g of *propylene glycol dilaurate CRS* in *methylene chloride R* and dilute to 2 ml with the same solvent.

Plate: *TLC silica gel plate R.*

Mobile phase: *hexane R, ether R* (30:70 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 0.1 g/l solution of *rhodamine 6 G R* in *alcohol R*. Examine in ultraviolet light at 365 nm.

Results: the spots in the chromatogram obtained with the test solution are similar in position to those in the chromatogram obtained with the reference solution.

B. It complies with the test for composition of fatty acids (see Tests).

C. It complies with the assay (content of diesters).

TESTS

Acid value (*2.5.1*): maximum 4.0, determined on 5.00 g.

Iodine value (*2.5.4, Method A*): maximum 1.0.

Saponification value (*2.5.6*): 230 to 250.

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*). Use the mixture of calibrating substances in Table 2.4.22.-2.

Composition of the fatty acid fraction of the substance:

– *caprylic acid*: maximum 0.5 per cent,
– *capric acid*: maximum 2.0 per cent,
– *lauric acid*: minimum 95.0 per cent,
– *myristic acid*: maximum 3.0 per cent,
– *palmitic acid*: maximum 1.0 per cent.

Free propylene glycol: maximum 2.0 per cent, determined as prescribed under Assay.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g.

Total ash (*2.4.16*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Size-exclusion chromatography (*2.2.30*).

Stock solution. Introduce 0.100 g of *propylene glycol R* into a flask and dilute to 25.0 ml with *tetrahydrofuran R.*

Test solution. In a 15 ml flask, weigh 0.200 g (*m*). Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

Reference solutions. Into four 15 ml flasks, introduce respectively 0.25 ml, 0.5 ml, 1.0 ml and 2.5 ml of stock solution and add 5.0 ml of *tetrahydrofuran R.* Weigh each flask and calculate the concentration of propylene glycol in milligrams per gram for each reference solution.

Column:

– *size*: *l* = 0.6 m, Ø = 7 mm,
– *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm) with a pore size of 10 nm.

Mobile phase: *tetrahydrofuran R.*

Flow rate: 1 ml/min.

Detection: differential refractometer.

Injection: 40 µl.

Relative retention with reference to propylene glycol: diesters = about 0.85; monoesters = about 0.90.

Calculations:

– *free propylene glycol*: from the calibration curve obtained with the reference solutions, determine the concentration (*C*) in milligrams per gram in the test solution and calculate the percentage content in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

– *monoesters*: calculate the percentage content of monoesters using the following expression:

$$\frac{A}{A+B} \times (100 - D)$$

A = area of the peak due to the monoesters,

B = area of the peak due to the diesters,

D = percentage content of free propylene glycol + percentage content of free fatty acids.

Calculate the percentage content of free fatty acids using the expression:

$$\frac{I_A \times 200}{561.1}$$

I_A = acid value.

– *diesters*: calculate the percentage content of diesters using the following expression:

$$\frac{B}{A+B} \times (100 - D)$$

STORAGE

Protected from moisture.

01/2008:1915

PROPYLENE GLYCOL MONOLAURATE

Propylenglycoli monolauras

DEFINITION

Mixture of propylene glycol mono- and diesters of lauric (dodecanoic) acid.

Content:

– propylene glycol monolaurate (type I): 45.0 per cent to 70.0 per cent of monoesters and 30.0 per cent to 55.0 per cent of diesters,
– propylene glycol monolaurate (type II): minimum 90.0 per cent of monoesters and maximum 10.0 per cent of diesters.

CHARACTERS

Appearance: clear, oily liquid at 20 °C, colourless or slightly yellow.

Solubility: practically insoluble in water, very soluble in alcohol, in methanol and in methylene chloride.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.1 g of the substance to be examined in *methylene chloride R* and dilute to 2 ml with the same solvent.

Reference solution. Dissolve 0.1 g of *propylene glycol monolaurate CRS* in *methylene chloride R* and dilute to 2 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *hexane R, ether R* (30:70 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 0.1 g/l solution of *rhodamine 6 G R* in *alcohol R*. Examine in ultraviolet light at 365 nm.

Results: the spots in the chromatogram obtained with the test solution are similar in position to those in the chromatogram obtained with the reference solution.

B. It complies with the test for composition of fatty acids (see Tests).

C. It complies with the assay (content of monoesters).

TESTS

Acid value (*2.5.1*): maximum 4.0, determined on 5.00 g.

Iodine value (*2.5.4, Method A*): maximum 1.0.

Saponification value (*2.5.6*): 210 to 245 for propylene glycol monolaurate (type I) and 200 to 230 for propylene glycol monolaurate (type II).

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*). Use the mixture of calibrating substances in Table 2.4.22.-2.

Composition of the fatty acid fraction of the substance:

– *caprylic acid*: maximum 0.5 per cent,
– *capric acid*: maximum 2.0 per cent,
– *lauric acid*: minimum 95.0 per cent,
– *myristic acid*: maximum 3.0 per cent,
– *palmitic acid*: maximum 1.0 per cent.

Free propylene glycol: maximum 5.0 per cent for propylene glycol monolaurate (type I) and maximum 1.0 per cent for propylene glycol monolaurate (type II), determined as prescribed under Assay.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g.

Total ash (*2.4.16*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Size-exclusion chromatography (*2.2.30*).

Stock solution. Introduce 0.100 g of *propylene glycol R* into a vial and dilute to 25.0 ml with *tetrahydrofuran R*.

Test solution. In a 15 ml flask, weigh 0.200 g (*m*). Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

Reference solutions. Into four 15 ml flasks, introduce respectively 0.25 ml, 0.5 ml, 1.0 ml and 2.5 ml of stock solution and add 5.0 ml of *tetrahydrofuran R*. In a fifth 15 ml flask, introduce 5.0 ml of stock solution. Weigh each flask and calculate the concentration of propylene glycol in milligrams per gram for each reference solution.

Column:

– *size*: *l* = 0.6 m, Ø = 7 mm,
– *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm) with a pore size of 10 nm.

Mobile phase: *tetrahydrofuran R*.

Flow rate: 1 ml/min.

Detection: differential refractometer.

Injection: 40 µl.

Relative retention with reference to propylene glycol: diesters = about 0.85; monoesters = about 0.90.

Calculations:

– *free propylene glycol*: from the calibration curve obtained with the reference solutions, determine the concentration (*C*) in milligrams per gram in the test solution and calculate the percentage content in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

– *monoesters*: calculate the percentage content of monoesters using the following expression:

$$\frac{A}{A+B} \times (100 - D)$$

A = area of the peak due to the monoesters,

B = area of the peak due to the diesters,

D = percentage content of free propylene glycol + percentage content of free fatty acids.

Calculate the percentage content of free fatty acids using the expression:

$$\frac{I_A \times 200}{561.1}$$

I_A = acid value.

– *diesters*: calculate the percentage content of diesters using the following expression:

$$\frac{B}{A+B} \times (100 - D)$$

STORAGE

Protected from moisture.

LABELLING

The label states the type of propylene glycol monolaurate (type I or type II).

01/2008:1469

PROPYLENE GLYCOL MONOPALMITOSTEARATE

Propylenglycoli monopalmitostearas

DEFINITION

Mixture of propylene glycol mono- and diesters and of stearic (octadecanoic) and palmitic (hexadecanoic) acids, produced by the condensation of propylene glycol and stearic acid 50 of vegetable or animal origin (see *Stearic acid (1474)*).

Content: minimum of 50.0 per cent of monoesters.

CHARACTERS

Appearance: white or almost white, waxy solid.

Solubility: practically insoluble in water, soluble in acetone and in hot alcohol.

IDENTIFICATION

A. It complies with the test for melting point (see Tests).

B. It complies for the test for composition of fatty acids (see Tests).

C. It complies with the assay (monoesters content).

TESTS

Melting point (*2.2.15*): 33 °C to 40 °C.

Acid value (*2.5.1*): maximum 4.0, determined on 10.0 g.

Iodine value (*2.5.4*): maximum 3.0.

Saponification value (*2.5.6*): 170 to 185, determined on 2.0 g.

Composition of fatty acids (*2.4.22, Method A*). The fatty acid fraction has the following composition:

– *stearic acid*: 40.0 per cent to 60.0 per cent,

– *sum of contents of palmitic acid and stearic acid*: minimum 90.0 per cent.

Free propylene glycol: maximum 5.0 per cent, determined as prescribed under Assay.

Total ash (*2.4.16*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Size-exclusion chromatography (*2.2.30*).

Test solution. In a 15 ml flask, weigh about 0.2 g (*m*), to the nearest 0.1 mg. Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Heat gently, if necessary. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

Reference solutions. In four 15 ml flasks, weigh, to the nearest 0.1 mg, about 2.5 mg, 5.0 mg, 10.0 mg and 20.0 mg of *propylene glycol R*. Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Weigh the flasks again and calculate the concentration of propylene glycol in milligrams per gram for each reference solution.

Column:

– *size*: *l* = 0.6 m, Ø = 7 mm,

– *stationary phase*: *styrene-divinylbenzene copolymer R* (particle diameter 5 µm, pore size 10 nm).

Mobile phase: *tetrahydrofuran R*.

Flow rate: 1 ml/min.

Detection: differential refractometer.

Injection: 40 µl.

Relative retention with reference to propylene glycol: diesters = about 0.78, monoesters = about 0.84.

Limits:

– *free propylene glycol*: from the calibration curve obtained with the reference solutions, determine the concentration (*C*) in milligrams per gram in the test solution and calculate the percentage content in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

– *monoesters*: calculate the percentage content of monoesters using the following expression:

$$\frac{A}{A+B} \times (100 - D)$$

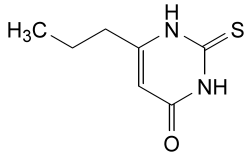
A = area of the peak due to the monoesters,

B = area of the peak due to the diesters,

D = percentage content of free propylene glycol + percentage content of free fatty acids which is determined using the following expression:

$$\frac{I_A \times 270}{561.1}$$

I_A = acid value.



STORAGE

Protected from light.

01/2008:0525
corrected 6.0

PROPYLTHIOURACIL

Propylthiouracilum

$C_7H_{10}N_2OS$ M_r 170.2
[51-52-5]

DEFINITION

Propylthiouracil contains not less than 98.0 per cent and not more than the equivalent of 100.5 per cent of 2,3-dihydro-6-propyl-2-thioxopyrimidin-4(1*H*)-one, calculated with reference to the dried substance.

CHARACTERS

White or almost white, crystalline powder or crystals, very slightly soluble in water, sparingly soluble in alcohol. It dissolves in solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 217 °C to 221 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *propylthiouracil CRS*. Examine as discs prepared using 1 mg of substance and 0.3 g of *potassium bromide R*.

C. Examine the chromatograms obtained in the test for impurity A and related substances in ultraviolet light at 254 nm before exposure of the plate to iodine vapour. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To about 20 mg add 8 ml of *bromine water R* and shake for a few minutes. Boil until the mixture is decolourised, allow to cool and filter. To the filtrate add 2 ml of *barium*

chloride solution R1. A white precipitate is formed whose colour does not become violet on the addition of 5 ml of *dilute sodium hydroxide solution R*.

TESTS

Impurity A and related substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel GF_{254} plate R*.

Test solution (a). Dissolve 0.1 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 10 mg of *propylthiouracil CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 50 mg of *thiourea R* in *methanol R* and dilute to 100 ml with the same solvent. Dilute 1 ml of this solution to 100 ml with *methanol R*.

Reference solution (c). Dilute 1 ml of test solution (a) to 100 ml with *methanol R*.

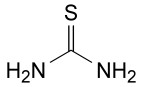
Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 0.1 volumes of *glacial acetic acid R*, 6 volumes of *2-propanol R* and 50 volumes of *chloroform R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. Expose the plate to iodine vapour for 10 min. In the chromatogram obtained with test solution (a), any spot corresponding to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.05 per cent) and any spot apart from the principal spot and any spot corresponding to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (c) (1.0 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test F for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



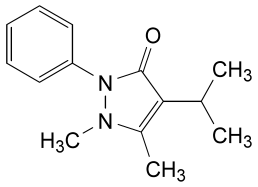
To 0.300 g add 30 ml of *water R* and 30.0 ml of *0.1 M sodium hydroxide*. Boil and shake until dissolution is complete. Add 50 ml of *0.1 M silver nitrate* while stirring, boil gently for 5 min and cool. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*). The volume of *0.1 M sodium hydroxide* used is equal to the sum of the volume added initially and the volume used in the final titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 8.511 mg of $C_7H_{10}N_2OS$.

STORAGE

Store protected from light.

IMPURITIES



A. thiourea.

01/2008:0636

PROPYPHENAZONE

Propyphenazonum

$C_{14}H_{18}N_2O$ M_r 230.3
[479-92-5]

DEFINITION

Propyphenazone contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1,5-dimethyl-4-(1-methylethyl)-2-phenyl-1,2-dihydro-3*H*-pyrazol-3-one, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, slightly soluble in water, freely soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 102 °C to 106 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *propyphenazone CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To 1 ml of solution S (see Tests) add 0.1 ml of *ferric chloride solution R1*. A brownish-red colour appears which becomes yellow on addition of 1 ml of *dilute hydrochloric acid R*.

TESTS

Solution S. Dissolve 2 g in a mixture of equal volumes of *alcohol R* and *carbon dioxide-free water R* and dilute to 50 ml with the same mixture of solvents.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Add 0.2 ml of *0.01 M sodium hydroxide*; the solution becomes pink. Add 0.4 ml of *0.01 M hydrochloric acid*; the solution becomes colourless. Add 0.2 ml of *methyl red solution R*. The solution becomes orange or red.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel HF_{254} R* as the coating substance.

Test solution (a). Dissolve 0.40 g of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 5 ml with *methanol R*.

Reference solution (a). Dissolve 80 mg of *propyphenazone CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 100 ml with *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *butanol R*, 45 volumes of *cyclohexane R* and 45 volumes of *ethyl acetate R*. Dry the plate in a current of hot air for 15 min and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). Spray with a mixture of equal volumes of *potassium ferricyanide solution R* and *ferric chloride solution R1*. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

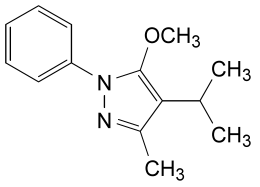
Heavy metals (*2.4.8*). 1.0 g complies with limit test C (10 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 4 h.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 0.5 g.

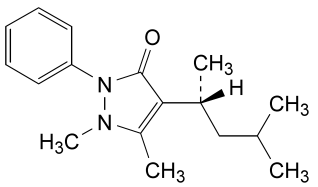
ASSAY

Dissolve 0.2000 g in 10 ml of *anhydrous acetic acid R* and add 75 ml of *ethylene chloride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



1 ml of *0.1 M perchloric acid* is equivalent to 23.03 mg of $C_{14}H_{18}N_2O$.

STORAGE



Store protected from light.

IMPURITIES

A. phenazone,

B. 5-methoxy-3-methyl-4-(1-methylethyl)-1-phenyl-1*H*-pyrazole,

and enantiomer

C. 4-[(1*RS*)-1,3-dimethylbutyl]-1,5-dimethyl-2-phenyl-1,2-dihydro-3*H*-pyrazol-3-one.

corrected 6.0

PROTAMINE HYDROCHLORIDE

Protamini hydrochloridum

DEFINITION

Protamine hydrochloride consists of the hydrochlorides of basic peptides extracted from the sperm or roe of fish, usually species of *Salmonidae* and *Clupeidae*. It binds with heparin in solution, inhibiting its anticoagulant activity; in the conditions of the assay this binding gives rise to a precipitate. Calculated with reference to the dried substance, 1 mg of protamine hydrochloride precipitates not less than 100 IU of heparin.

PRODUCTION

Protamine hydrochloride is prepared in conditions designed to minimise the risk of microbial contamination.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test:

Abnormal toxicity (*2.6.9*). Inject into each mouse 0.5 mg dissolved in 0.5 ml of *water for injections R*.

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: soluble in water, practically insoluble in alcohol.

IDENTIFICATION

A. Specific optical rotation (*2.2.7*): – 40 to – 60 (dried substance).

Dissolve 1.000 g in *0.1 M hydrochloric acid* and dilute to 100.0 ml with the same solvent.

B. In the conditions of the assay, protamine hydrochloride forms a precipitate.

C. To 0.5 ml of solution S (see Tests) add 4.5 ml of *water R*, 1.0 ml of a 100 g/l solution of *sodium hydroxide R* and 1.0 ml of a 0.2 g/l solution of *α-naphthol R* and mix. Cool the mixture to 5 °C. Add 0.5 ml of *sodium hypobromite solution R*. An intense red colour is produced.

D. Heat 2 ml of solution S in a water-bath at 60 °C and add 0.1 ml of *mercuric sulphate solution R*. Mix. No precipitate is formed. Cool the mixture in iced water. A precipitate is formed.

E. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 0.50 g in *water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution BY_6 or Y_6 (*2.2.2, Method II*).

To 2.5 ml of solution S add 7.5 ml of *water R*.

Absorbance (*2.2.25*): maximum 0.1 between wavelengths of 260 nm to 280 nm.

Dilute 2.5 ml of solution S to 5.0 ml with *water R*.

Chloride: 12.3 per cent to 19.0 per cent (dried substance).

Dissolve 0.400 g in 50 ml of *water R*. Add 5 ml of *dilute nitric acid R*, 25.0 ml of *0.1 M silver nitrate* and 2 ml of *dibutyl phthalate R* and shake. Titrate with *0.1 M ammonium thiocyanate* using 2 ml of *ferric ammonium sulphate solution R2* as indicator; shake vigorously when approaching the end-point.

Monographs P

1 ml of *0.1 M silver nitrate* is equivalent to 3.545 mg of chloride (Cl).

Sulphates: maximum 4.0 per cent (dried substance).

Dissolve 0.500 g in 200 ml of *distilled water R*, add 5.0 ml of *dilute hydrochloric acid R* and heat to boiling. Add dropwise 10 ml of a hot 100 g/l solution of *barium chloride R* while stirring with a glass rod, cover the beaker with a watch glass and allow to stand on a water-bath for 2 h to obtain a coarse granular precipitate. Add 0.1 ml of a 100 g/l solution of *barium chloride R* to the clear supernatant liquid. If a turbidity develops, repeat the precipitation procedure. Transfer the precipitate quantitatively to a previously ignited and tared porcelain crucible and wash with hot *distilled water R* until the addition of *silver nitrate solution R1* to the washings produces no opalescence. Ignite the precipitate at 600 ± 50 °C for 1 h. Allow to cool in a desiccator and weigh.

1 mg of residue is equivalent to 0.412 mg of sulphate (SO_4).

Barium: maximum 10.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 1.0 g of the substance to be examined in *distilled water R*, add 1 ml of a 250 g/l solution of *caesium chloride R* and 0.2 ml of *hydrochloric acid R* and dilute to 20.0 ml with *distilled water R*.

Reference solution. To 1.0 ml of *barium standard solution (50 ppm Ba) R* add 5 ml of a 250 g/l solution of *caesium chloride R* and 1 ml of *hydrochloric acid R* and dilute to 100.0 ml with *distilled water R*.

Source: hollow-cathode lamp.

Wavelength: 553.3 nm.

Flame: air-acetylene-nitrous oxide flame of suitable composition.

Iron (*2.4.9*): maximum 10 ppm.

Dissolve 1.0 g with heating in *water R* and dilute to 10 ml with the same solvent.

Mercury: maximum 10 ppm.

Introduce 2.0 g of the substance to be examined into a ground-glass-stoppered 250 ml conical flask and add 20 ml of a mixture of equal volumes of *nitric acid R* and *sulphuric acid R*. Boil under a reflux condenser for 1 h, cool and cautiously dilute with *water R*. Boil until nitrous fumes are no longer seen. Cool the solution, cautiously dilute to 200.0 ml with *water R*, mix and filter. Transfer 50.0 ml of the filtrate to a separating funnel. Shake with successive small portions of *chloroform R* until the chloroform layer remains colourless. Discard the chloroform layers. To the aqueous layer add 25 ml of *dilute sulphuric acid R*, 115 ml of *water R* and 10 ml of a 200 g/l solution of *hydroxylamine hydrochloride R*. Titrate with *dithizone solution R2*; after each addition, shake the mixture 20 times and towards the end of the titration allow to separate and discard the chloroform layer. Titrate until a bluish-green colour is obtained. Calculate the content of mercury using the equivalent in micrograms of mercury per millilitre of titrant determined in the standardisation of the *dithizone solution R2*.

Nitrogen: 23.0 per cent to 27.0 per cent (dried substance).

Carry out the determination of nitrogen by sulphuric acid digestion (*2.5.9*), using 10.0 mg and heating for 3-4 h.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

Bacterial endotoxins (*2.6.14*): less than 7.0 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Test solution (a). Dissolve 15.0 mg of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Test solution (b). Dilute 2.0 ml of test solution (a) to 3.0 ml with *water R*.

Test solution (c). Dilute 1.0 ml of test solution (a) to 3.0 ml with *water R*.

Use as titrant a 1 in 6 dilution of *heparin sodium BRP* in *water R* (for example, 1.7 ml diluted to 10.0 ml with *water R*). Titrate each test solution in duplicate as follows: introduce an accurately measured volume of the solution to be titrated, for example, 1.5 ml, into the cell of a suitable colorimeter, set the apparatus for measurement at a suitable wavelength (none is critical) in the visible range, add the titrant in small volumes until there is a sharp increase in the absorbance and note the volume of titrant added.

Carry out 3 independent assays. For each individual titration, calculate the number of International Units of heparin in the volume of titrant added at the end-point per milligram of the substance to be examined. Calculate the potency of the substance as the average of the 18 values. Test the linearity of the response by the usual statistical methods. Calculate the 3 standard deviations for the results obtained with each of the 3 test solutions. Calculate the three standard deviations for the results obtained with each of the 3 independent assays. The assay is not valid unless each of the 6 standard deviations is less than 5 per cent of the average result.

STORAGE

In an airtight, tamper-proof container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

PROTAMINE SULPHATE

Protamini sulfas

[9009-65-8]

DEFINITION

Protamine sulphate consists of the sulphates of basic peptides extracted from the sperm or roe of fish, usually species of *Salmonidae* and *Clupeidae*. It binds with heparin in solution, inhibiting its anticoagulant activity; in the conditions of the assay this binding gives rise to a precipitate. Calculated with reference to the dried substance, 1 mg of protamine sulphate precipitates not less than 100 IU of heparin.

PRODUCTION

Protamine sulphate is prepared in conditions designed to minimise the risk of microbial contamination.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test:

Abnormal toxicity (*2.6.9*). Inject into each mouse 0.5 mg dissolved in 0.5 ml of *water for injections R*.

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: sparingly soluble in water, practically insoluble in alcohol.

IDENTIFICATION

A. Specific optical rotation (*2.2.7*): – 65 to – 85 (dried substance).

Dissolve 1.000 g in *0.1 M hydrochloric acid* and dilute to 100.0 ml with the same solvent.

B. In the conditions of the assay, protamine sulphate forms a precipitate.

C. To 0.5 ml of solution S (see Tests) add 4.5 ml of *water R*, 1.0 ml of a 100 g/l solution of *sodium hydroxide R* and 1.0 ml of a 0.2 g/l solution of *α-naphthol R* and mix. Cool the mixture to 5 °C. Add 0.5 ml of *sodium hypobromite solution R*. An intense red colour is produced.

D. Heat 2 ml of solution S in a water-bath at 60 °C and add 0.1 ml of *mercuric sulphate solution R*. Mix. No precipitate is formed. Cool the mixture in iced water. A precipitate is formed.

E. It gives reaction (a) of sulphates (*2.3.1*).

TESTS

Solution S. Dissolve 0.20 g in *water R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution BY_6 or Y_6 (*2.2.2, Method II*).

To 2.5 ml of solution S add 7.5 ml of *water R*.

Absorbance (*2.2.25*): maximum 0.1 between wavelengths of 260 nm to 280 nm.

Dilute 2.5 ml of solution S to 5.0 ml with *water R*.

Sulphate: 16 per cent to 24 per cent (dried substance).

Dissolve 0.150 g in 15 ml of *distilled water R* in a beaker. Add 5 ml of *dilute hydrochloric acid R*. Heat to boiling and slowly add to the boiling solution 10 ml of a 100 g/l solution of *barium chloride R*. Cover the beaker and heat on a water-bath for 1 h. Filter. Wash the precipitate several times with small quantities of hot *water R*. Dry and ignite the residue at 600 ± 50 °C to constant mass.

1.0 g of residue is equivalent to 0.4117 g of sulphate (SO_4).

Iron (*2.4.9*): maximum 10 ppm.

Dissolve 1.0 g with heating in *water R* and dilute to 10 ml with the same solvent.

Mercury: maximum 10 ppm.

Introduce 2.0 g of the substance to be examined into a 250 ml ground-glass-stoppered conical flask and add 20 ml of a mixture of equal volumes of *nitric acid R* and *sulphuric acid R*. Boil under a reflux condenser for 1 h, cool and cautiously dilute with *water R*. Boil until nitrous fumes are no longer seen. Cool the solution, cautiously dilute to 200.0 ml with *water R*, mix and filter. Transfer 50.0 ml of the filtrate to a separating funnel. Shake with successive small portions of *chloroform R* until the chloroform layer remains colourless. Discard the chloroform layers. To the aqueous layer add 25 ml of *dilute sulphuric acid R*, 115 ml of *water R* and 10 ml of a 200 g/l solution of *hydroxylamine hydrochloride R*. Titrate with *dithizone solution R2*; after each addition, shake the mixture 20 times and towards the end of the titration allow to separate and discard the chloroform layer. Titrate until a bluish-green colour is obtained. Calculate the content of mercury using the equivalent in micrograms of mercury per millilitre of titrant, determined in the standardisation of the *dithizone solution R2*.

Nitrogen: 21.0 per cent to 26.0 per cent (dried substance).

Carry out the determination of nitrogen by sulphuric acid digestion (*2.5.9*), using 10.0 mg and heating for 3-4 h.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

Bacterial endotoxins (*2.6.14*): less than 7.0 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Test solution (a). Dissolve 15.0 mg of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Test solution (b). Dilute 2.0 ml of test solution (a) to 3.0 ml with *water R*.

Test solution (c). Dilute 1.0 ml of test solution (a) to 3.0 ml with *water R*.

Use as titrant a 1 to 6 dilution of *heparin sodium BRP* in *water R* (for example, 1.7 ml diluted to 10.0 ml with *water R*). Titrate each test solution in duplicate as follows: introduce an accurately measured volume of the solution to be titrated, for example 1.5 ml, into the cell of a suitable colorimeter and set the apparatus for measurement at a suitable wavelength (none is critical) in the visible range. Add the titrant in small volumes until there is a sharp increase in the absorbance and note the volume of titrant added.

Carry out 3 independent assays. PROTIRELIN

Protirelinum

$C_{16}H_{22}N_6O_4$ M_r 362.4

[24305-27-9]

DEFINITION

5-Oxo-L-prolyl-L-histidyl-L-prolinamide.

Synthetic tripeptide with the same sequence of amino acids as the natural hypothalamic neurohormone, which stimulates the release and synthesis of thyrotropin.

Content: 97.0 per cent to 102.0 per cent (anhydrous and acetic acid-free substance).

CHARACTERS

Appearance: white or yellowish-white powder, hygroscopic.

Solubility: very soluble in water, freely soluble in methanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *protirelin CRS*.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with the reference solution.

TESTS

Appearance of solution. A 10 g/l solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_5 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*): – 62 to – 70 (anhydrous and acetic acid-free substance).

Dissolve 10 mg in 1.0 ml of *water R*.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 5.0 mg of the substance to be examined in mobile phase A and dilute to 5.0 ml with mobile phase A.

Reference solution (a). Dissolve the contents of a vial of *D-His-protirelin CRS* in an appropriate volume of mobile phase A to obtain a concentration of 1 mg/ml. Mix equal volumes of this solution and the test solution.

Reference solution (b). Dilute 0.2 ml of the test solution to 10.0 ml with mobile phase A.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm,
– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 12 nm.

Mobile phase:

– *mobile phase A*: a mixture of 100 ml of *acetonitrile for chromatography R*, 1900 ml of *water R* and 2.0 g of *sodium octanesulphonate R*, containing 2.5 ml/l of *tetraethylammonium hydroxide solution R*; adjust to pH 3.5 with *phosphoric acid R*,
– *mobile phase B*: a mixture of 300 ml of *acetonitrile for chromatography R*, 1700 ml of *water R* and 2.0 g of *sodium octanesulphonate R*, containing 2.5 ml/l of *tetraethylammonium hydroxide solution R*; adjust to pH 3.5 with *phosphoric acid R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 30	74 → 41	26 → 59
30 - 35	41 → 74	59 → 26
35 - 50	74	26

Flow rate: 1 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 µl.

Relative retention with reference to protirelin (retention time = about 18 min): impurity C = about 0.2; impurity D = about 0.68; impurity A = about 0.91; impurity B = about 0.95; impurity E = about 1.08.

System suitability: reference solution (a):

– *resolution*: minimum 2.5 between the peaks due to impurity A and protirelin,
– *symmetry factor*: 0.9 to 1.2 for the peak due to protirelin.

Limits:

– *any impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent),
– *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent),
– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Acetic acid (*2.5.34*): maximum 2.0 per cent.

Test solution. Dissolve 40.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of solvents.

Water (*2.5.12*): maximum 7.0 per cent, determined on 0.200 g.

Bacterial endotoxins (*2.6.14*): less than 0.7 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

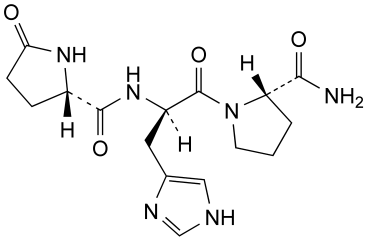
ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Reference solution. Dissolve the contents of a vial of *protirelin CRS* in an appropriate volume of mobile phase A to obtain a concentration of 1.0 mg/ml.

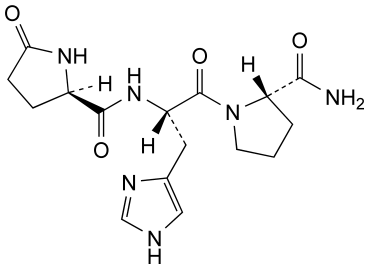
Calculate the content of protirelin ($C_{16}H_{22}N_6O_4$) using the peak areas of the chromatograms obtained with the test solution and the reference solution and the declared content of $C_{16}H_{22}N_6O_4$ in *protirelin CRS*.

STORAGE



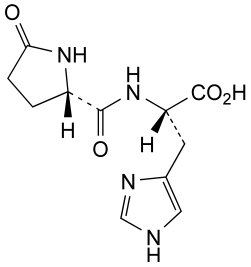
In an airtight container, protected from light at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

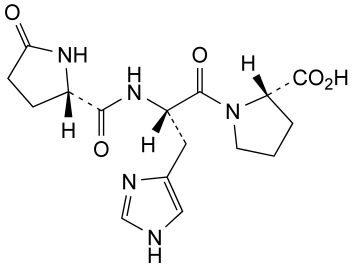


The label states the mass of peptide in the container.

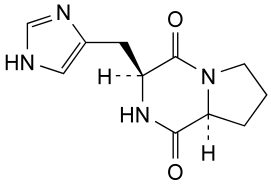
IMPURITIES



Specified impurities: A, B, C, D, E.



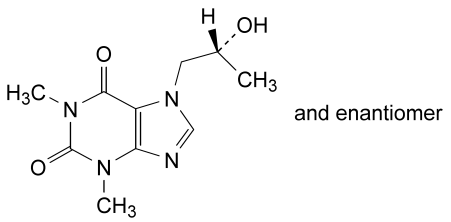
A. 5-oxo-L-prolyl-D-histidyl-L-prolinamide,



B. 5-oxo-D-prolyl-L-histidyl-L-prolinamide,

C. 5-oxo-L-prolyl-L-histidine,

D. 5-oxo-L-prolyl-L-histidyl-L-proline,



E. (3*S*,8a*S*)-3-(1*H*-imidazol-4-ylmethyl)hexahydropyrrolo[1,2-*a*]pyrazine-1,4-dione (cyclo(-L-histidyl-L-prolyl-)).

corrected 6.0

PROXYPHYLLINE

Proxyphyllinum

$C_{10}H_{14}N_4O_3$ M_r 238.2
[603-00-9]

DEFINITION

Proxyphylline contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 7-[(2*RS*)-2-hydroxypropyl]-1,3-dimethyl-3,7-dihydro-1*H*-purine-2,6-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very soluble in water, soluble in alcohol.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 134 °C to 136 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *proxyphylline CRS*. Examine the substances as discs prepared using 0.5 mg to 1 mg of the substance to be examined in 0.3 g of *potassium bromide R*.

C. Dissolve 1 g in 5 ml of *acetic anhydride R* and boil under a reflux condenser for 15 min. Allow to cool and add 100 ml of a mixture of 20 volumes of *ether R* and 80 volumes of *light petroleum R*. Cool in iced water for at least 20 min, shaking from time to time. Filter, wash the precipitate with a mixture of 20 volumes of *ether R* and 80 volumes of *light petroleum R*, recrystallise from *alcohol R* and dry *in vacuo*. The crystals melt (*2.2.14*) at 87 °C to 92 °C.

D. It gives the reaction of xanthines (*2.3.1*).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.25 ml of *bromothymol blue solution R1*. The solution is yellow or green. Not more than 0.4 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* HF_{254} *R* as the coating substance.

Test solution. Dissolve 0.3 g of the substance to be examined in a mixture of 20 volumes of *water R* and 30 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents. Prepare immediately before use.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *methanol R*.

Reference solution (b). Dilute 0.2 ml of the test solution to 100 ml with *methanol R*.

Reference solution (c). Dissolve 10 mg of *theophylline R* in *methanol R*, add 0.3 ml of the test solution and dilute to 10 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 10 volumes of *ethanol R* and 90 volumes of *chloroform R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (*2.4.4*). Dilute 2.5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (400 ppm).

Heavy metals (*2.4.8*). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

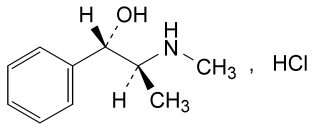
Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.200 g in 3.0 ml of *anhydrous formic acid R* and add 50.0 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid* determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 23.82 mg of $C_{10}H_{14}N_4O_3$.



STORAGE

Store protected from light.

corrected 6.0

PSEUDOEPHEDRINE HYDROCHLORIDE

Pseudoephedrini hydrochloridum

$C_{10}H_{16}ClNO$ M_r 201.7
[345-78-8]

DEFINITION

(1*S*,2*S*)-2-(Methylamino)-1-phenylpropan-1-ol hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: freely soluble in water and in ethanol (96 per cent), sparingly soluble in methylene chloride.

mp: about 184 °C.

IDENTIFICATION

First identification: A, B, D.

Second identification: A, C, D.

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *pseudoephedrine hydrochloride CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *pseudoephedrine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *ephedrine hydrochloride CRS* in reference solution (a) and dilute to 5 ml with reference solution (a).

Plate: *TLC silica gel plate R*.

Mobile phase: *methylene chloride R, concentrated ammonia R, 2-propanol R* (5:15:80 *V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *ninhydrin solution R* and heat at 110 °C for 5 min.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Solution S (see Tests) gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 1.25 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. Dilute 2 ml of solution S to 10 ml with *carbon dioxide-free water R*. Add 0.1 ml of *methyl red solution R* and 0.1 ml of *0.01 M sodium hydroxide*; the solution is yellow. Add 0.2 ml of *0.01 M hydrochloric acid*; the solution is red.

Specific optical rotation (*2.2.7*): + 61.0 to + 62.5 (dried substance), determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 20.0 mg of *ephedrine hydrochloride CRS* (impurity A) in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (c). Dissolve 10 mg of *ephedrine hydrochloride CRS* (impurity A) in 5 ml of the test solution and dilute to 100 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *phenylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 6 volumes of *methanol R* and 94 volumes of an 11.6 g/l solution of *ammonium acetate R* adjusted to pH 4.0 with *glacial acetic acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 257 nm.

Injection: 20 µl.

Run time: 1.5 times the retention time of pseudoephedrine.

System suitability: reference solution (c):

– *resolution*: minimum 2.0 between the peaks due to impurity A and pseudoephedrine; if necessary, reduce the content of methanol in the mobile phase.

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent);

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

Monographs P

– *sum of impurities other than A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent);
– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.170 g in 30 ml of *ethanol (96 per cent) R*. Add 5.0 ml of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 20.17 mg of $C_{10}H_{16}ClNO$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: *A*.

A. ephedrine.

corrected 6.0

PSYLLIUM SEED

Psyllii semen

DEFINITION

Ripe, whole, dry seeds of *Plantago afra* L. (*Plantago psyllium* L.) or *Plantago indica* L. (*Plantago arenaria* Waldstein and Kitaibel).

CHARACTERS

Sweet taste.

IDENTIFICATION

P. afra seeds are light brown to very dark brown but never black, smooth and shiny having an elliptical oblong shape. They are 2-3 mm long and 0.8-1.0 mm wide, one end being wider than the other. Towards the middle of the dorsal surface there is a fairly marked transverse constriction of light colour. On the ventral surface, there is a linear lighter-coloured groove in the middle of which is a clear spot corresponding to the hilum and bounded by swollen edges.

P. indica seeds are almost identical to the seeds of *P. afra*, but a little less shiny; they are 2-3 mm long and have a maximum diameter of 1.5 mm.

TESTS

Swelling index (*2.8.4*): minimum 10.

Foreign matter (*2.8.2*): maximum 1.0 per cent, determined on 10.0 g of the drug, including greenish unripe seeds. Psyllium seed does not contain seeds having a dark central spot on the groove (*Plantago lanceolata* L. and *P. major* L.) or seeds with brownish-grey or pinkish outer coats (*P. ovata* Forssk. and *P. sempervirens* Crantz).

Loss on drying (*2.2.32*): maximum 14.0 per cent, determined on 1.000 g of drug by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 4.0 per cent.

STORAGE

Store protected from moisture.

corrected 6.0

PURPLE CONEFLOWER HERB

Echinaceae purpureae herba

DEFINITION

Dried, whole or cut flowering aerial parts of *Echinacea purpurea* (L.) Moench.

Content: minimum 0.1 per cent for the sum of caftaric acid ($C_{13}H_{12}O_9$; M_r 312.2) and cichoric acid ($C_{22}H_{18}O_{12}$; M_r 474.3) (dried drug).

IDENTIFICATION

First identification: A, B, C.

Second identification: A, B, D.

A. The herbaceous perennial plant is 60-150 cm, rarely up to 180 cm high. The stem is green to red, upright and slightly branched. The leaves are alternate, ovate to ovate-lanceolate, irregularly serrate, rugose on both surfaces, dark green with prominent light green veins; the lamina is thick and shiny. The involucral bracts of the large capitulum are arranged in 2 or 3 rows. The solid receptacle is slightly convex. Each of the outer violet ligulate florets (4-6 cm) and of the inner violet-pink tubular florets is attached to a reddish acute and coriaceous bract, which overtops the tubular florets. The calyx is reduced to a very short crown, one of the sepals is up to 1 mm long.

B. Reduce to a powder (355) (*2.9.12*). The powder is green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: whitish-green groups of fibres, 150-200 µm in length, 10-15 µm in diameter, sometimes with black deposits; fragments of leaves in surface view showing anomocytic or anisocytic stomata (*2.8.3*) (about 35-40 µm in length); uniseriate covering trichomes or fragments thereof consisting mainly of 3 or 4 thick-walled cells of which the apical cell is markedly longer than the others; fragments of leaves with rosette-like arranged epidermal cells around the base of the covering trichomes; uniseriate glandular trichomes composed of very thin-walled cells; pitted parenchymatous cells from the pith of the stem as well as pitted elongated cells from the mesocarp of the achenes; fragments of parenchyma from the seeds with oil droplets; fragments of the epidermis of ligulate florets composed of red to violet papillous cells; spheroidal pollen grains, 30-40 µm in diameter, with a spiny exine.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methanol R* and sonicate for 5 min. Centrifuge and use the supernatant solution.

Reference solution. Dissolve 0.5 mg of *caffeic acid R* and 0.5 mg of *chlorogenic acid R* in 5.0 ml of *methanol R*.

Plate: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase: *anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (3:3:9:15 *V/V/V/V*).

Application: 25 µl [or 5 µl] of the test solution and 10 µl [or 2 µl] of the reference solution, as bands.

Development: over a path of 15 cm [or 5 cm].

Drying: in a stream of cold air for about 10 min, then at 100 °C for 2 min.

Detection: spray the still-warm plate with a 5 g/l solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*; after 30 min, examine in ultraviolet light at 365 nm.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint blue fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	An intense red fluorescent zone
Caffeic acid: a strong blue fluorescent zone	A blue fluorescent zone
———	———
	A blue fluorescent zone
Chlorogenic acid: a strong blue fluorescent zone	
	A faint yellow-orange fluorescent zone
———	———
Reference solution	**Test solution**

D. Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution is due to cichoric acid and a smaller peak is due to caftaric acid. Peaks due to caffeic acid and chlorogenic acid are minor or may be absent.

TESTS

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 12.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. In a 100 ml volumetric flask place 0.500 g of the powdered drug (355) (*2.9.12*) and add 80 ml of *ethanol (70 per cent V/V) R*. Sonicate for 15 min and dilute to 100.0 ml with *ethanol (70 per cent V/V) R*. Mix the suspension and allow to stand for a few minutes to allow visible solids to settle.

Reference solution. Dissolve 10.0 mg of *chlorogenic acid CRS* and 10.0 mg of *caffeic acid R* in *ethanol (70 per cent V/V) R*, sonicate for 15 min and dilute to 10.0 ml with the same solvent. Dilute 4.0 ml of this solution to 100.0 ml with *ethanol (70 per cent V/V) R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 35 °C.

Mobile phase:

– *mobile phase A*: *phosphoric acid R, water R* (1:999 *V/V*);

– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0	90	10
0 - 13	90 → 78	10 → 22
13 - 14	78 → 60	22 → 40
14 - 20	60	40

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 330 nm.

Injection: 10 µl.

Relative retention with reference to chlorogenic acid (retention time = about 7 min): caftaric acid = about 0.8; caffeic acid = about 1.5; cynarin = about 1.6; echinacoside = about 1.7; cichoric acid = about 2.3.

System suitability: reference solution:

– *resolution*: minimum 5 between the peaks due to caffeic acid and chlorogenic acid.

Locate the peaks due to caffeic acid and chlorogenic acid using the chromatogram obtained with the reference solution. Locate the peaks due to caftaric acid and cichoric acid using the chromatogram in Figure 1823.-1.

Calculate the percentage content of caftaric acid using the following expression:

$$\frac{A_1 \times C_2 \times 100 \times 0.881}{A_2 \times C_1}$$

Calculate the percentage content of cichoric acid using the following expression:

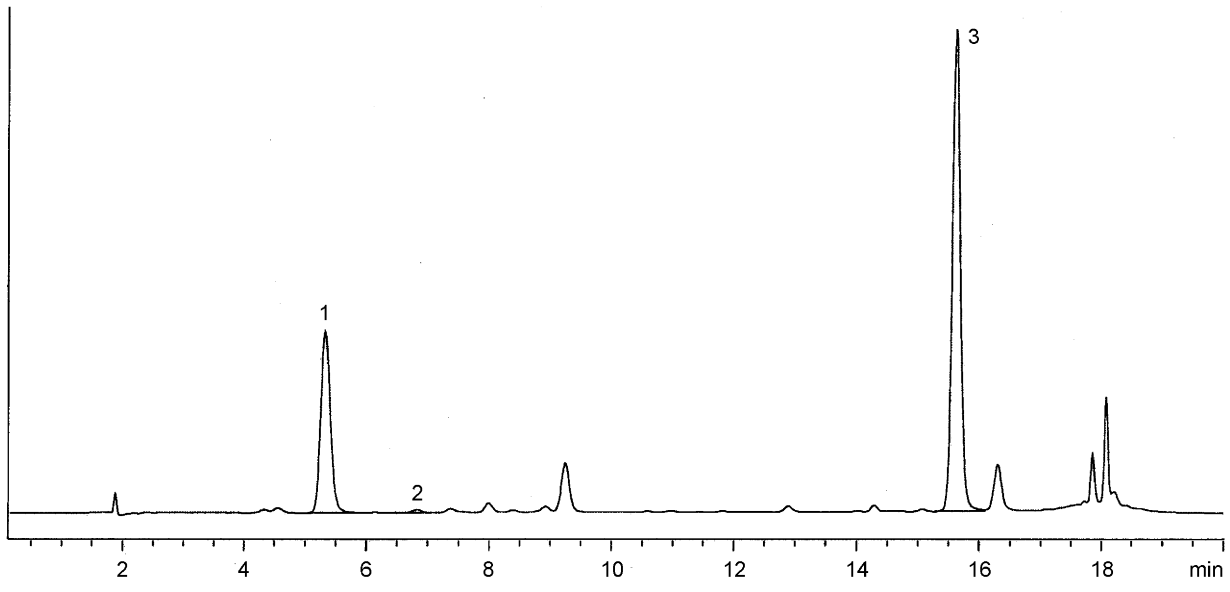
$$\frac{A_3 \times C_2 \times 100 \times 0.695}{A_2 \times C_1}$$

A_1 = area of the peak due to caftaric acid in the chromatogram obtained with the test solution;

A_2 = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;

A_3 = area of the peak due to cichoric acid in the chromatogram obtained with the test solution;

C_1 = concentration of the test solution, in milligrams per millilitre;



C_2 = concentration of chlorogenic acid in the reference solution, in milligrams per millilitre;

0.695 = peak correlation factor based upon the liquid chromatography response observed;

0.881 = peak correlation factor between caftaric acid and chlorogenic acid.

STORAGE

Uncomminuted.

1. caftaric acid 2. chlorogenic acid 3. cichoric acid

Figure 1823.-1. – *Chromatogram for the assay of caftaric acid and cichoric acid in purple coneflower herb*

01/2008:1824
corrected 6.0

PURPLE CONEFLOWER ROOT

Echinaceae purpureae radix

DEFINITION

Dried, whole or cut underground parts of *Echinacea purpurea* (L.) Moench.

Content: minimum 0.5 per cent for the sum of caftaric acid ($C_{13}H_{12}O_9$; M_r 312.2) and cichoric acid ($C_{22}H_{18}O_{12}$; M_r 474.3) (dried drug).

IDENTIFICATION

First identification: A, B, C, E.

Second identification: A, B, D, E.

A. The rhizome is up to 15 cm long, branched, reddish-brown to dark brown on the surface and carries many stem bases; the inside is fibrous and white. The numerous roots are spirally twisted, light to dark brown and show a fine cross structuring on the surface.

B. Reduce to a powder (355) (*2.9.12*). The powder is light yellow to pinkish-beige. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous light-brown spindle-shaped fibres that are joined together in long bundles without black deposits; rare sclereids from the rhizomes and roots, usually occuring singly, those from the rhizomes being isodiametric, about 60 µm in diameter, with black deposits, those from the roots being 50-120 µm in length with no black deposits; secretory cavities up to 180 µm in diameter with yellow oil droplets; squarish to rectangular cells of the outer layers, some with reddish walls; bordered-pitted vessels from the rhizome, 30-40 µm in diameter.

C. Examine the chromatogram obtained in the test for other *Echinacea* species and *Parthenium integrifolium*.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, faint greenish fluorescent zones may be present just below the zone situated in the middle of the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a strong blue fluorescent zone	A strong blue fluorescent zone
Cynarin: a strong greenish fluorescent zone	A blue fluorescent zone
Echinacoside: a strong greenish fluorescent zone

D. Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution is due to cichoric acid and a smaller peak is due to caftaric acid. Peaks due to caffeic acid and chlorogenic acid are minor or may be absent.

E. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methylene chloride R* and sonicate for 5 min. Centrifuge and use the supernatant solution.

Reference solution. Dissolve 1 mg of *β-sitosterol R* and a volume of *N-isobutyldodecatetraenamide solution R* corresponding to 1 mg of *N-isobutyldodecatetraenamide R* in 5.0 ml of *methanol R*.

Plate: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase: *anhydrous formic acid R, cyclohexane R, ethyl acetate R, toluene R* (0.9:3:6:24 *V/V/V/V*).

Application: 25 µl [or 5 µl], as bands.

Development: over a path of about 15 cm [or 5 cm].

Drying: in a stream of cold air for about 10 min.

Detection: dip the plate into *anisaldehyde solution R* for 1 s and heat at 100-105 °C for 3 min; examine in daylight.

Monographs P

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

PYGEUM AFRICANUM BARK

Pruni africanae cortex

DEFINITION

Whole or cut, dried bark of the stems and branches of *Prunus africana* (Hook f.) Kalkm. (syn. *Pygeum africanum* Hook f.).

IDENTIFICATION

A. The dark brown to reddish-brown bark occurs in curved, hard, irregular pieces. The outer surface has a wrinkled dark reddish-brown cork with areas of adhering lichen. The reddish-brown to dark brown inner surface bears longitudinal striations. It may also occur in rolled fragments with a fibrous fracture.

B. Reduce to a powder (355) (*2.9.12*). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powdered drug shows thick-walled sclereids, solitary or in groups; calcium oxalate cluster crystals of different size; numerous lignified fibres, thick-walled and with narrow lumen, some of them solitary and most in groups with forked ends; fragments of pigmented polygonal cells of reddish-brown colour; fragments of cork. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*, the powder shows some isolated small starch grains that stain bluish-black against *iodine solution R1*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Extract 15.0 g of powdered drug (250) (*2.9.12*) with *methylene chloride R* for 30 min in a continuous extraction apparatus (Soxhlet type). Filter. Evaporate the solvent to dryness under reduced pressure. Dissolve the residue in 1 ml of *methylene chloride R*.

Reference solution. Dissolve 20 mg of *β-sitosterol R* and 20 mg of *ursolic acid R* in 10 ml of a mixture of equal volumes of *methanol R* and *methylene chloride R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *methanol R, methylene chloride R* (10:90 *V/V*).

Application: 10 µl, as 1 cm bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *vanillin reagent R*. Heat the plate at 100-105 °C for 10 min and allow to cool; examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A violet zone Several weak violet, blue or grey zones

PYRANTEL EMBONATE

Pyranteli embonas

$C_{34}H_{30}N_2O_6S$ M_r 594.7
[22204-24-6]

DEFINITION

1-Methyl-2-[(*E*)-2-(thiophen-2-yl)ethenyl]-1,4,5,6-tetrahydropyrimidine hydrogen 4,4′-methylenebis(3-hydroxynaphthalene-2-carboxylate).

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: pale yellow or yellow powder.

Solubility: pratically insoluble in water, soluble in dimethyl sulphoxide, pratically insoluble in methanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *pyrantel embonate CRS*.

TESTS

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use and strictly protect from light at all stages.*

Solvent mixture. Mix 5 volumes of *glacial acetic R* with 5 volumes of *water R* and add 2 volumes of *diethylamine R* with cooling.

Test solution. Dissolve 80 mg in 7 ml of the solvent mixture and dilute to 100.0 ml with *acetonitrile R*.

Reference solution (a). Dissolve 10.0 mg of *pyrantel impurity A CRS* in the solvent mixture, add 2.5 ml of the test solution and dilute to 50.0 ml with the solvent mixture. Dilute 2.0 ml of this solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *silica gel for chromatography R* (5 µm).

Mobile phase: solvent mixture, *acetonitrile for chromatography R* (72:928 *V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 288 nm.

Injection: 20 µl.

Run time: 4 times the retention time of pyrantel.

Relative retention with reference to pyrantel (retention time = about 11 min): embonic acid = about 0.5; impurity A = about 1.3; impurity B = about 1.8 (impurity A also gives rise to an embonate peak).

System suitability: reference solution (a):

- *resolution*: minimum 4.0 between the peaks due to pyrantel and impurity A.

Limits:

- *correction factor*: for the calculation of content, multiply the peak area of impurity B by 0.4,
- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *impurity B*: not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- *any other impurity*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *sum of impurities other than A and B*: not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chlorides (*2.4.4*): maximum 360 ppm.

To 0.46 g add 10 ml of *dilute nitric acid R* and 30 ml of *water R*. Heat on a water-bath for 5 min. Cool, dilute to 50 ml with *water R*, mix well and filter. 15 ml complies with the limit test for chlorides.

Sulphates (*2.4.13*): maximum 0.1 per cent.

To 0.50 g add 2.5 ml of *dilute nitric acid R* and dilute to 50 ml with *distilled water R*. Heat on a water-bath for 5 min, shake for 2 min, cool and filter. 15 ml complies with the limit test for sulphates.

Iron (*2.4.9*): maximum 75 ppm.

Ignite 0.66 g at 800 ± 50 °C for 2 h. Dissolve the residue in 2.5 ml of *dilute hydrochloric acid R* with gentle heating for 10 min. Cool and dilute to 50 ml with *water R*. 10 ml complies with the limit test for iron.

Heavy metals (*2.4.8*): maximum 20 ppm.

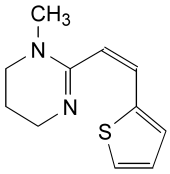
1.0 g complies with limit test D. Prepare the reference solution using 2.0 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

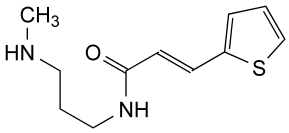
ASSAY

To 0.450 g add 10 ml of *acetic anhydride R* and 50 ml *glacial acetic acid R*, heat at 50 °C and stir for 10 min. Allow to cool (a clear solution is not obtained). Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.



1 ml of *0.1 M perchloric acid* is equivalent to 59.47 mg of $C_{34}H_{30}N_2O_6S$.

STORAGE

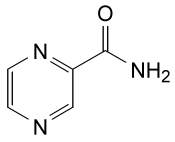


Protected from light.

IMPURITIES

Specified impurities: A, B.

A. 1-methyl-2-[(*Z*)-2-(thiophen-2-yl)ethenyl]-1,4,5,6-tetrahydropyrimidine,



B. (*E*)-*N*-[3-(methylamino)propyl]-3-(thiophen-2-yl)prop-2-enamide.

PYRAZINAMIDE

Pyrazinamidum

$C_5H_5N_3O$ M_r 123.1
[98-96-4]

DEFINITION

Pyrazinamide contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of pyrazine-2-carboxamide, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, sparingly soluble in water, slightly soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Melting point (*2.2.14*): 188 °C to 191 °C.

B. Dissolve 50.0 mg in *water R* and dilute to 100.0 ml with the same solvent (solution (a)). Dilute 1.0 ml of solution (a) to 10.0 ml with *water R*. Examined between 290 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 310 nm. Dilute 2.0 ml of solution (a) to 100.0 ml with *water R*. Examined between 230 nm and 290 nm, the solution shows an absorption maximum at 268 nm. The specific absorbance at the maximum is 640 to 680.

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *pyrazinamide CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *alcohol R*, evaporate to dryness and record new spectra using the residues.

D. Dissolve 0.1 g in 5 ml of *water R*. Add 1 ml of *ferrous sulphate solution R2*. The solution becomes orange. Add 1 ml of *dilute sodium hydroxide solution R*. The solution becomes dark blue.

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 25 ml of solution S add 0.05 ml of *phenolphthalein solution R1* and 0.2 ml of *0.01 M sodium hydroxide*. The solution is red. Add 1.0 ml of *0.01 M hydrochloric acid*. The solution is colourless. Add 0.15 ml of *methyl red solution R*. The solution is red.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

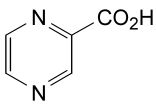
Reference solution (a). Dilute 1 ml of the test solution to 50 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*. Dilute 1 ml of the solution to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (b). Dissolve 10 mg of *nicotinic acid CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*, add 1 ml of the test solution and dilute to 10 ml with the same mixture of solvents.

Apply separately to the plate 20 µl of each solution. Develop over a path of 10 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air and examine immediately in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

Heavy metals (*2.4.8*). 1.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*). Not more than 0.5 per cent, determined on 2.00 g by the semi-micro determination of water.



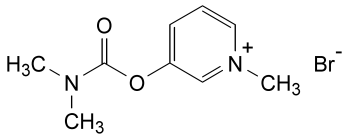
Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 50 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 12.31 mg of $C_5H_5N_3O$.

IMPURITIES



A. pyrazine-2-carboxylic acid.

01/2008:1255
corrected 6.0

PYRIDOSTIGMINE BROMIDE

Pyridostigmini bromidum

$C_9H_{13}BrN_2O_2$ M_r 261.1
[101-26-8]

DEFINITION

3-(Dimethylcarbamoyloxy)-1-methylpyridinium bromide.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline, deliquescent powder.

Solubility: very soluble in water and in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *pyridostigmine bromide CRS*.

B. It gives reaction (a) of bromides (*2.3.1*).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 40 ml of solution S add a few drops of *methyl red solution R*. To 20 ml of this solution add 0.2 ml of *0.02 M sodium hydroxide*. The solution is yellow. To the other 20 ml add 0.2 ml of *0.02 M hydrochloric acid*. The solution is red.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50 mg of the substance to be examined in the mobile phase at about 40 °C. Allow to cool and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 4 mg of *pyridostigmine impurity A CRS* and 4 mg of *pyridostigmine bromide CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 10.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 20.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;

– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (5-10 µm).

Mobile phase: mix 30 volumes of *acetonitrile R* and 70 volumes of a 4.33 g/l solution of *sodium dodecyl sulphate R* previously adjusted to pH 2.0 with *phosphoric acid R*.

Flow rate: 1.1 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl.

Run time: twice the retention time of pyridostigmine.

System suitability: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to pyridostigmine and impurity A.

Limits:

– *impurities A, B*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent), at most one such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and at most one further peak has an area greater than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

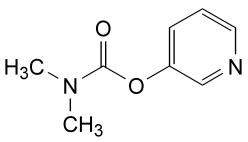
1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

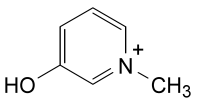
ASSAY

Dissolve 0.230 g in 10 ml of *anhydrous acetic acid R*. Add 40 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



1 ml of *0.1 M perchloric acid* is equivalent to 26.11 mg of $C_9H_{13}BrN_2O_2$.

STORAGE

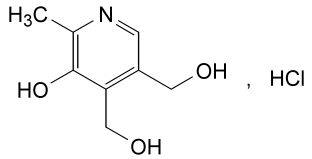


In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container, protected from light.

IMPURITIES

Specified impurities: *A, B.*

A. pyridin-3-yl dimethylcarbamate,



B. 3-hydroxy-1-methylpyridinium.

PYRIDOXINE HYDROCHLORIDE

Pyridoxini hydrochloridum

$C_8H_{12}ClNO_3$ M_r 205.6
[58-56-0]

DEFINITION

Pyridoxine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (5-hydroxy-6-methylpyridine-3,4-diyl)dimethanol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, slightly soluble in alcohol.

It melts at about 205 °C, with decomposition.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Dilute 1.0 ml of solution S (see Tests) to 50.0 ml with *0.1 M hydrochloric acid* (solution A). Dilute 1.0 ml of solution A to 100.0 ml with *0.1 M hydrochloric acid*. Examined between 250 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 288 nm to 296 nm. The specific absorbance at the maximum is 425 to 445. Dilute 1.0 ml of solution A to 100.0 ml with a mixture of equal volumes of *0.025 M potassium dihydrogen phosphate solution* and *0.025 M disodium hydrogen phosphate solution* (*2.2.3*). Examined between 220 nm and 350 nm, the solution shows 2 absorption maxima, at 248 nm to 256 nm and at 320 nm to 327 nm. The specific absorbances at the maxima are 175 to 195 and 345 to 365, respectively.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *pyridoxine hydrochloride CRS*.

C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Solution S gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

pH (*2.2.3*). The pH of solution S is 2.4 to 3.0.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel G plate R*.

Test solution (a). Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *water R*.

Reference solution (a). Dissolve 0.10 g of *pyridoxine hydrochloride CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 2.5 ml of test solution (a) to 100 ml with *water R*. Dilute 1 ml of this solution to 10 ml with *water R*.

Apply to the plate 2 µl of each solution. Develop in an unsaturated tank over a path of 15 cm using a mixture of 9 volumes of *concentrated ammonia R*, 13 volumes of *methylene chloride R*, 13 volumes of *tetrahydrofuran R* and 65 volumes of *acetone R*. Allow the plate to dry in air and spray with a 50 g/l solution of *sodium carbonate R* in a mixture of 30 volumes of *alcohol R* and 70 volumes of *water R*. Dry the plate in a current of air, spray with a 1 g/l solution of *dichloroquinonechlorimide R* in *alcohol R* and examine the chromatograms immediately. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent). Disregard any spots remaining on the starting line.

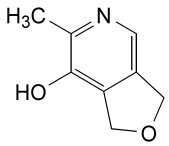
Heavy metals (*2.4.8*). 12 ml of solution S complies with limit test A (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

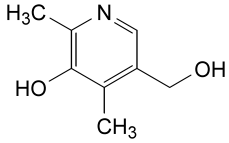
ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.



Dissolve 0.150 g in 5 ml of *anhydrous formic acid R*. Add 50 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 20.56 mg of $C_8H_{12}ClNO_3$.

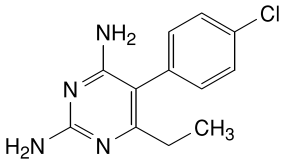


STORAGE

Store protected from light.

IMPURITIES

A. 6-methyl-1,3-dihydrofuro[3,4-*c*]pyridin-7-ol,



B. 5-(hydroxymethyl)-2,4-dimethylpyridin-3-ol.

01/2008:0288
corrected 6.0

PYRIMETHAMINE

Pyrimethaminum

$C_{12}H_{13}ClN_4$ M_r 248.7
[58-14-0]

DEFINITION

Pyrimethamine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 5-(4-chlorophenyl)-6-ethylpyrimidine-2,4-diamine, calculated with reference to the dried substance.

CHARACTERS

An almost white, crystalline powder or colourless crystals, practically insoluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Melting point (*2.2.14*): 239 °C to 243 °C.

B. Dissolve 0.14 g in *ethanol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with *0.1 M hydrochloric acid*. Dilute 10.0 ml of this solution to 100.0 ml with *0.1 M hydrochloric acid*. Examined between 250 nm and 300 nm (*2.2.25*), the solution shows an absorption maximum at 272 nm and an absorption minimum at 261 nm. The specific absorbance at the maximum is 310 to 330.

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *pyrimethamine CRS*.

D. Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Shake 1.0 g with 50 ml of *distilled water R* for 2 min and filter.

Appearance of solution. *Prepare the solution immediately before use.*

Dissolve 0.25 g in a mixture of 1 volume of *methanol R* and 3 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of *phenolphthalein solution R1*. The solution is colourless. Not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink. Add 0.4 ml of *0.01 M hydrochloric acid* and 0.05 ml of *methyl red solution R*. The solution is red or orange.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance. *Prepare the solutions immediately before use.*

Test solution (a). Dissolve 0.25 g of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R* and dilute to 25 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R*.

Reference solution (a). Dissolve 0.1 g of *pyrimethamine CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (b). Dilute 2.5 ml of test solution (a) to 100 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R*. Dilute 1 ml of the solution to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R*.

Apply to the plate 20 µl of each solution. Develop over a path of 10 cm using a mixture of 4 volumes of *chloroform R*, 8 volumes of *propanol R*, 12 volumes of *glacial acetic acid R* and 76 volumes of *toluene R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent).

Sulphates (*2.4.13*). 15 ml of solution S complies with the limit test for sulphates (80 ppm). Prepare the standard using a mixture of 2.5 ml of *sulphate standard solution (10 ppm* SO_4*) R* and 12.5 ml of *distilled water R*.

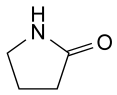
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 0.50 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 25 ml of *anhydrous acetic acid R*, heating gently. Cool. Titrate with *0.1 M perchloric acid* determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 24.87 mg of $C_{12}H_{13}ClN_4$.



STORAGE

Store protected from light.

01/2008:2180

PYRROLIDONE

Pyrrolidonum

C_4H_7NO M_r 85.1
[616-45-5]

DEFINITION

Pyrrolidin-2-one.

CHARACTERS

Appearance: clear, colourless or slightly greyish liquid, or white or almost white crystals, or colourless crystal needles.

Solubility: miscible with water, with ethanol (96 per cent) and with most common organic solvents.

mp: about 25 °C; the molten substance remains liquid at temperatures below the melting point.

bp: about 245 °C.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *pyrrolidone CRS.*

B. Relative density (*2.2.5*): 1.112 to 1.115.

C. Refractive index (*2.2.6*): 1.487 to 1.490.

TESTS

Use the molten substance for all tests.

Appearance. The substance to be examined is clear (*2.2.1*) and not more intensely coloured than intensity 7 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

Alkalinity. To 100 ml of *water R* add 1.0 ml of *bromothymol blue solution R1* and adjust to a green colour with *0.02 M potassium hydroxide* or *0.02 M hydrochloric acid*. To 50 ml of this solution add 20 ml of the substance to be examined and titrate with *0.02 M hydrochloric acid* to the initial colour. Not more than 8.0 ml of *0.02 M hydrochloric acid* is required.

Related substances. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. The substance to be examined.

Reference solution (a). Dissolve 1 ml of the substance to be examined and 1 ml of *N-methylpyrrolidone R* (impurity C) in *methylene chloride R* and dilute to 20 ml with the same solvent.

Reference solution (b). Dissolve 1.1 g of the substance to be examined in *methylene chloride R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 20.0 ml with *methylene chloride R*.

Column:

- *material*: fused silica;
- *size*: *l* = 30 m, Ø = 0.32 mm;
- *stationary phase*: *poly(dimethyl)siloxane R* (film thickness 5 µm).

Carrier gas: *nitrogen for chromatography R.*

Flow rate: 1.3 ml/min.

Split ratio: 1:80.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 18.75	100 → 250
	18.75 - 30	250
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 0.1 µl.

Relative retention with reference to pyrrolidone (retention time = about 13 min): impurity B = about 0.73; impurity A = about 0.76; impurity C = about 0.97.

System suitability: reference solution (a):

- *resolution*: minimum 2.0 between the peaks due to pyrrolidone and impurity C.

Limits:

- *impurities A, B, C*: for each impurity, maximum 0.1 per cent;
- *unspecified impurities*: for each impurity, maximum 0.10 per cent;
- *total*: maximum 0.3 per cent;
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

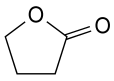
Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 4.0 g in *water R* and dilute to 20.0 ml with the same solvent. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Water (*2.5.32*): maximum 0.1 per cent, determined on 1.00 g.

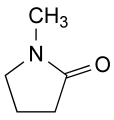
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

STORAGE



Protected from light.

IMPURITIES



Specified impurities: A, B, C.

A. butane-1,4-diol,

B. dihydrofuran-2(3*H*)-one (γ-butyrolactone),

C. 1-methylpyrrolidin-2-one (*N*-methylpyrrolidone).

QUINIDINE SULPHATE

Chinidini sulfas

$C_{40}H_{50}N_4O_8S,2H_2O$ M_r 783

[6591-63-5]

DEFINITION

Content: 99.0 per cent to 101.0 per cent of alkaloid monosulphates, expressed as bis[(*S*)-[(2*R*,4*S*,5*R*)-5-ethenyl-1-azabicyclo[2.2.2]oct-2-yl](6-methoxyquinolin-4-yl)methanol] sulphate (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or silky, colourless needles.

Solubility: slightly soluble in water, soluble in boiling water and in ethanol (96 per cent), practically insoluble in acetone.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.10 g of *quinidine sulphate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R*.

Mobile phase: *diethylamine R, ether R, toluene R* (10:24:40 *V/V/V*).

Application: 5 µl.

Development: twice over a path of 15 cm; dry in a current of air for 15 min between the 2 developments.

Drying: at 105 °C for 30 min and allow to cool.

Detection: spray with *iodoplatinate reagent R*.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Dissolve about 5 mg in 5 ml of *water R*. Add 0.2 ml of *bromine water R* and 1 ml of *dilute ammonia R2*. A green colour develops.

C. Dissolve 0.1 g in 3 ml of *dilute sulphuric acid R* and dilute to 100 ml with *water R*. When examined in ultraviolet light at 366 nm, an intense blue fluorescence appears which disappears almost completely on addition of 1 ml of *hydrochloric acid R*.

D. Dissolve about 50 mg in 5 ml of hot *water R*, cool, add 1 ml of *silver nitrate solution R1* and stir with a glass rod. After a few minutes, a white precipitate is formed that dissolves on the addition of *dilute nitric acid R*.

E. It gives reaction (a) of sulphates (*2.3.1*).

F. pH (see Tests).

TESTS

Solution S. Dissolve 0.500 g in *0.1 M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution GY_6 (*2.2.2, Method II*).

pH (*2.2.3*): 6.0 to 6.8.

Dissolve 0.10 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Specific optical rotation (*2.2.7*): + 275 to + 290 (dried substance), determined on solution S.

Other cinchona alkaloids. Liquid chromatography (*2.2.29*): use the normalisation procedure.

Test solution. Dissolve 20 mg of the substance to be examined in 5 ml of the mobile phase, with gentle heating if necessary, and dilute to 10 ml with the mobile phase.

Reference solution (a). Dissolve 20 mg of *quinine sulphate CRS* (impurity A) in 5 ml of the mobile phase, with gentle heating if necessary, and dilute to 10 ml with the mobile phase.

Reference solution (b). Dissolve 20 mg of *quinidine sulphate CRS* in 5 ml of the mobile phase, with gentle heating if necessary, and dilute to 10 ml with the mobile phase.

Reference solution (c). To 1 ml of reference solution (a) add 1 ml of reference solution (b).

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (e). Dissolve 10 mg of *thiourea R* in the mobile phase and dilute to 10 ml with the mobile phase.

Column:

– *size*: *l* = 0.15-0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5-10 µm).

Mobile phase: dissolve 6.8 g of *potassium dihydrogen phosphate R* and 3.0 g of *hexylamine R* in 700 ml of *water R*, adjust to pH 2.8 with *dilute phosphoric acid R*, add 60 ml of *acetonitrile R* and dilute to 1000 ml with *water R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 250 nm for reference solution (e) and at 316 nm for the other solutions.

Injection: 10 µl.

Run time: 2.5 times the retention time of quinidine.

Identification of peaks: use the chromatogram obtained with reference solution (a) to identify the peaks due to impurity A and dihydroquinine; use the chromatogram obtained with reference solution (b) to identify the peaks due to quinidine and impurity C; the chromatogram obtained with reference solution (c) shows 4 peaks due to quinidine, impurity A, impurity C and dihydroquinine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solutions (a) and (b).

Relative retention with reference to impurity A: dihydroquinine = about 1.4.

Relative retention with reference to quinidine: impurity C = about 1.5.

System suitability:

– *resolution*: minimum 3.0 between the peaks due to impurity A and quinidine and minimum 2.0 between the peaks due to impurities C and A in the chromatogram obtained with reference solution (c);

– *signal-to-noise ratio*: minimum 4 for the principal peak in the chromatogram obtained with reference solution (d);
– *mass distribution ratio*: 3.5 to 4.5 for the peak due to quinidine in the chromatogram obtained with reference solution (b), $t_{R'}$ being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e); if necessary, adjust the concentration of acetonitrile in the mobile phase.

Limits:
– *impurity C*: maximum 15 per cent;
– *any impurity eluted before quinidine*: for each impurity, maximum 5 per cent;
– *any other impurity*: for each impurity, maximum 2.5 per cent;
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (d) (0.2 per cent).

Boron: maximum 5 ppm. *Avoid where possible the use of glassware.*

Test solution. Dissolve 1.00 g in a mixture of 0.5 ml of *hydrochloric acid R* and 4.0 ml of *water R*.

Reference solution. Dissolve 0.572 g of *boric acid R* in *water R* and dilute to 1000.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with *water R*. To 1.0 ml of this solution add 3.0 ml of *water R* and 0.5 ml of *hydrochloric acid R*.

Blank solution. Add 0.5 ml of *hydrochloric acid R* to 4.0 ml of *water R*.

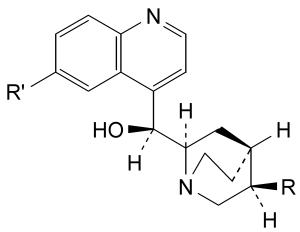
Add 3.0 ml of a 100 g/l solution of *2-ethylhexane-1,3-diol R* in *methylene chloride R* to the test solution, to the reference solution and to the blank solution, then shake for 1 min. Allow to stand for 6 min. To 1.0 ml of the lower layer, add 2.0 ml of a 3.75 g/l solution of *curcumin R* in *anhydrous acetic acid R* and 0.3 ml of *sulphuric acid R*. Mix and after 20 min add 25.0 ml of *ethanol (96 per cent) R*. Mix. The blank solution is yellow. Any red colour in the test solution is not more intense than that in the reference solution.

Loss on drying (*2.2.32*): 3.0 per cent to 5.0 per cent, determined on 1.000 g by drying in an oven at 130 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 20 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, using 0.15 ml of *naphtholbenzein solution R* as indicator.



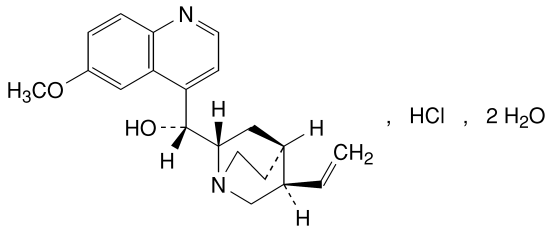
1 ml of *0.1 M perchloric acid* is equivalent to 24.90 mg of $C_{40}H_{50}N_4O_8S$.

STORAGE

Protected from light.

IMPURITIES

A. quinine,



B. R = $CH{=}CH_2$, R′ = H: (*S*)-[(2*R*,4*S*,5*R*)-5-ethenyl-1-azabicyclo[2.2.2]oct-2-yl](quinolin-4-yl)methanol (cinchonine),

C. R = C_2H_5, R′ = OCH_3: (*S*)-[(2*R*,4*S*,5*R*)-5-ethyl-1-azabicyclo[2.2.2]oct-2-yl](6-methoxyquinolin-4-yl)methanol (dihydroquinidine).

corrected 6.0

QUININE HYDROCHLORIDE

Chinini hydrochloridum

, HCl , 2 H_2O

$C_{20}H_{25}ClN_2O_2,2H_2O$ M_r 396.9
[6119-47-7]

DEFINITION

Content: 99.0 per cent to 101.0 per cent of alkaloid monohydrochlorides, expressed as (*R*)-[(2*S*,4*S*,5*R*)-5-ethenyl-1-azabicyclo[2.2.2]oct-2-yl](6-methoxyquinolin-4-yl)methanol hydrochloride (dried substance).

CHARACTERS

Appearance: white or almost white or colourless, fine, silky needles, often in clusters.

Solubility: soluble in water, freely soluble in ethanol (96 per cent).

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.10 g of *quinine sulphate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: *diethylamine R, ether R, toluene R* (10:24:40 *V/V/V*).

Application: 5 µl.

Development: twice over a path of 15 cm; dry in a current of air for 15 min between the 2 developments.

Drying: at 105 °C for 30 min and allow to cool.

Detection: spray with *iodoplatinate reagent R.*

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Dissolve about 10 mg in *water R* and dilute to 10 ml with the same solvent. To 5 ml of this solution add 0.2 ml of *bromine water R* and 1 ml of *dilute ammonia R2.* A green colour develops.

C. Dissolve 0.1 g in 3 ml of *dilute sulphuric acid R* and dilute to 100 ml with *water R*. When examined in ultraviolet light at 366 nm, an intense blue fluorescence appears which disappears almost completely on the addition of 1 ml of *hydrochloric acid R*.

D. It gives the reactions of chlorides (*2.3.1*).

E. pH (see Tests).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

pH (*2.2.3*): 6.0 to 6.8.

Dilute 10 ml of solution S to 20 ml with *carbon dioxide-free water R*.

Specific optical rotation (*2.2.7*): – 245 to – 258 (dried substance).

Dissolve 0.500 g in *0.1 M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Other cinchona alkaloids. Liquid chromatography (*2.2.29*): use the normalisation procedure.

Test solution. Dissolve 20 mg of the substance to be examined in 5 ml of the mobile phase, with gentle heating if necessary, and dilute to 10 ml with the mobile phase.

Reference solution (a). Dissolve 20 mg of *quinine sulphate CRS* in 5 ml of the mobile phase, with gentle heating if necessary, and dilute to 10 ml with the mobile phase.

Reference solution (b). Dissolve 20 mg of *quinidine sulphate CRS* (impurity A) in 5 ml of the mobile phase, with gentle heating if necessary, and dilute to 10 ml with the mobile phase.

Reference solution (c). To 1 ml of reference solution (a) add 1 ml of reference solution (b).

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (e). Dissolve 10 mg of *thiourea R* in the mobile phase and dilute to 10 ml with the mobile phase.

Column:

– *size*: *l* = 0.15-0.25 m, Ø = 4.6 mm;
– *stationary phase = octadecylsilyl silica gel for chromatography R* (5-10 µm).

Mobile phase: dissolve 6.8 g of *potassium dihydrogen phosphate R* and 3.0 g of *hexylamine R* in 700 ml of *water R*, adjust to pH 2.8 with *dilute phosphoric acid R*, add 60 ml of *acetonitrile R* and dilute to 1000 ml with *water R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 250 nm for reference solution (e) and at 316 nm for the other solutions.

Injection: 10 µl.

Run time: 2.5 times the retention time of quinine.

Identification of peaks: use the chromatogram obtained with reference solution (a) to identify the peaks due to quinine and impurity C; use the chromatogram obtained with reference solution (b) to identify the peaks due to impurity A and dihydroquinidine; the chromatogram obtained with reference solution (c) shows 4 peaks due to impurity A, quinine, dihydroquinidine and impurity C, which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solutions (a) and (b).

Relative retention with reference to quinine: impurity C = about 1.4.

Relative retention with reference to impurity A: dihydroquinidine = about 1.5.

System suitability:

– *resolution*: minimum 3.0 between the peaks due to quinine and impurity A and minimum 2.0 between the peaks due to dihydroquinidine and quinine in the chromatogram obtained with reference solution (c);
– *signal-to-noise ratio*: minimum 4 for the principal peak in the chromatogram obtained with reference solution (d);
– *mass distribution ratio*: 3.5 to 4.5 for the peak due to impurity A in the chromatogram obtained with reference solution (b), $t_{R'}$ being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e); if necessary, adjust the concentration of acetonitrile in the mobile phase.

Limits:

– *impurity C*: maximum 10 per cent;
– *any impurity eluted before quinine*: for each impurity, maximum 5 per cent;
– *any other impurity*: for each impurity, maximum 2.5 per cent;
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (d) (0.2 per cent).

Sulphates (*2.4.13*): maximum 500 ppm, determined on solution S.

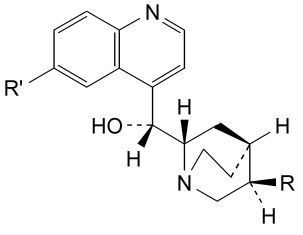
Barium. To 15 ml of solution S add 1 ml of *dilute sulphuric acid R*. Allow to stand for 15 min. Any opalescence in the solution is not more intense than that in a mixture of 15 ml of solution S and 1 ml of *distilled water R*.

Loss on drying (*2.2.32*): 6.0 per cent to 10.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *ethanol (96 per cent) R* and add 5.0 ml of *0.01 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*). Read the volume added between the 2 inflexion points.



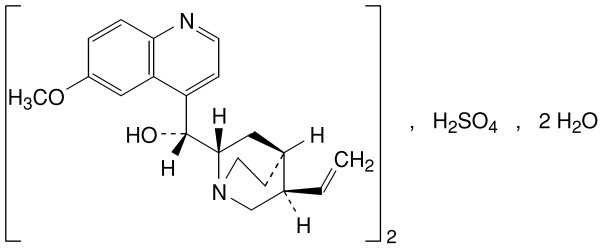
1 ml of *0.1 M sodium hydroxide* is equivalent to 36.09 mg of $C_{20}H_{25}ClN_2O_2$

STORAGE

Protected from light.

IMPURITIES

A. quinidine,



B. R = CH=CH$_2$, R′ = H: (*R*)-[(2*S*,4*S*,5*R*)-5-ethenyl-1-azabicyclo[2.2.2]oct-2-yl](quinolin-4-yl)methanol (cinchonidine),

C. R = C_2H_5, R′ = OCH_3: (*R*)-[(2*S*,4*S*,5*R*)-5-ethyl-1-azabicyclo[2.2.2]oct-2-yl](6-methoxyquinolin-4-yl)methanol (dihydroquinine).

QUININE SULPHATE

Chinini sulfas

$C_{40}H_{50}N_4O_8S,2H_2O$ M_r 783
[6119-70-6]

DEFINITION

Content: 99.0 per cent to 101.0 per cent of alkaloid monosulphates, expressed as bis[(*R*)-[(2*S*,4*S*,5*R*)-5-ethenyl-1-azabicyclo[2.2.2]oct-2-yl](6-methoxyquinolin-4-yl)methanol] sulphate (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or fine, colourless needles.

Solubility: slightly soluble in water, sparingly soluble in boiling water and in ethanol (96 per cent).

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.10 g of *quinine sulphate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: *diethylamine R, ether R, toluene R* (10:24:40 *V/V/V*).

Application: 5 µl.

Development: twice over a path of 15 cm; dry in a current of air for 15 min between the 2 developments.

Drying: at 105 °C for 30 min and allow to cool.

Detection: spray with *iodoplatinate reagent R.*

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Dissolve about 5 mg in 5 ml of *water R*. Add 0.2 ml of *bromine water R* and 1 ml of *dilute ammonia R2.* A green colour develops.

C. Dissolve 0.1 g in 3 ml of *dilute sulphuric acid R* and dilute to 100 ml with *water R*. When examined in ultraviolet light at 366 nm, an intense blue fluorescence appears which disappears almost completely on the addition of 1 ml of *hydrochloric acid R*.

D. Dissolve about 45 mg in 5 ml of *dilute hydrochloric acid R*. The solution gives reaction (a) of sulphates (*2.3.1*).

E. pH (see Tests).

TESTS

Solution S. Dissolve 0.500 g in *0.1 M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution GY_6 (*2.2.2, Method II*).

pH (*2.2.3*): 5.7 to 6.6 for a 10 g/l suspension in *water R*.

Specific optical rotation (*2.2.7*): – 237 to – 245 (dried substance), determined on solution S.

Other cinchona alkaloids. Liquid chromatography (*2.2.29*): use the normalisation procedure.

Test solution. Dissolve 20 mg of the substance to be examined in 5 ml of the mobile phase, with gentle heating if necessary, and dilute to 10 ml with the mobile phase.

Reference solution (a). Dissolve 20 mg of *quinine sulphate CRS* in 5 ml of the mobile phase, with gentle heating if necessary, and dilute to 10 ml with the mobile phase.

Reference solution (b). Dissolve 20 mg of *quinidine sulphate CRS* (impurity A) in 5 ml of the mobile phase, with gentle heating if necessary, and dilute to 10 ml with the mobile phase.

Reference solution (c). To 1 ml of reference solution (a) add 1 ml of reference solution (b).

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (e). Dissolve 10 mg of *thiourea R* in the mobile phase and dilute to 10 ml with the mobile phase.

Column:

– *size*: *l* = 0.15-0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5-10 µm).

Mobile phase: dissolve 6.8 g of *potassium dihydrogen phosphate R* and 3.0 g of *hexylamine R* in 700 ml of *water R*, adjust to pH 2.8 with *dilute phosphoric acid R*, add 60 ml of *acetonitrile R* and dilute to 1000 ml with *water R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 250 nm for reference solution (e) and at 316 nm for the other solutions.

Injection: 10 µl.

Run time: 2.5 times the retention time of quinine.

Identification of peaks: use the chromatogram obtained with reference solution (a) to identify the peaks due to quinine and impurity C; use the chromatogram obtained with reference solution (b) to identify the peaks due to impurity A and dihydroquinidine; the chromatogram obtained with reference solution (c) shows 4 peaks due to impurity A, quinine, dihydroquinidine and impurity C which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solutions (a) and (b).

Relative retention with reference to quinine: impurity C = about 1.4.

Relative retention with reference to impurity A: dihydroquinidine = about 1.5.

System suitability:

– *resolution*: minimum 3.0 between the peaks due to quinine and impurity A and minimum 2.0 between the peaks due to dihydroquinidine and quinine in the chromatogram obtained with reference solution (c);

RAMIPRIL

Ramiprilum

$C_{23}H_{32}N_2O_5$ M_r 416.5
[87333-19-5]

DEFINITION

(2*S*,3a*S*,6a*S*)-1-[(*S*)-2-[[(*S*)-1-(Ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]octahydrocyclopenta[*b*]pyrrole-2-carboxylic acid.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: sparingly soluble in water, freely soluble in methanol.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *ramipril CRS*.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 0.1 g in *methanol R* and dilute to 10 ml with the same solvent.

Specific optical rotation (*2.2.7*): + 32.0 to + 38.0 (dried substance).

Dissolve 0.250 g in a mixture of 14 volumes of *hydrochloric acid R1* and 86 volumes of *methanol R* and dilute to 25.0 ml with the same mixture of solvents.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in mobile phase A and dilute to 20.0 ml with mobile phase A.

Reference solution (a). Dissolve 5 mg of *ramipril impurity A CRS*, 5 mg of *ramipril impurity B CRS*, 5 mg of *ramipril impurity C CRS* and 5 mg of *ramipril impurity D CRS* in 5 ml of the test solution, and dilute to 10 ml with mobile phase B.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with mobile phase B. Dilute 5.0 ml of this solution to 50.0 ml with mobile phase B.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with mobile phase B.

Column:
- *size*: *l* = 0.25 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 65 °C.

Mobile phase:
- *mobile phase A*: dissolve 2.0 g of *sodium perchlorate R* in a mixture of 0.5 ml of *triethylamine R* and 800 ml of *water R*; adjust to pH 3.6 with *phosphoric acid R* and add 200 ml of *acetonitrile R*;
- *mobile phase B*: dissolve 2.0 g of *sodium perchlorate R* in a mixture of 0.5 ml of *triethylamine R* and 300 ml of *water R*; adjust to pH 2.6 with *phosphoric acid R* and add 700 ml of *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 6	90	10
6 - 7	90 → 75	10 → 25
7 - 20	75 → 65	25 → 35
20 - 30	65 → 25	35 → 75
30 - 40	25	75
40 - 45	25 → 90	75 → 10
45 - 55	90	10

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 210 nm.

Equilibration: with the mobile phase at the initial composition for at least 35 min; if a suitable baseline cannot be obtained, use another grade of triethylamine.

Injection: 10 µl.

Retention time: impurity A = about 14 min; ramipril = about 18 min; impurity B = about 22 min; impurity G = about 24 min; impurity C = about 26 min; impurity D = about 28 min.

System suitability:
- *resolution*: minimum 3.0 between the peaks due to impurity A and ramipril in the chromatogram obtained with reference solution (a);
- *signal-to-noise ratio*: minimum 3 for the principal peak in the chromatogram obtained with reference solution (c);
- *symmetry factor*: 0.8 to 2.0 for the peak due to ramipril in the chromatogram obtained with the test solution.

Limits:
- *correction factor*: for the calculation of content, multiply the peak area of impurity C by 2.4;
- *impurities A, B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *unspecified impurities*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent);
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Palladium: maximum 20.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 0.200 g in a mixture of 0.3 volumes of *nitric acid R* and 99.7 volumes of *water R*, and dilute to 100.0 ml with the same mixture of solvents.

Reference solutions. Use solutions containing 0.02 µg, 0.03 µg and 0.05 µg of palladium per millilitre, freshly prepared by dilution of *palladium standard solution (0.5 ppm Pd) R* with a mixture of 0.3 volumes of *nitric acid R* and 99.7 volumes of *water R*.

Modifier solution. Dissolve 0.150 g of *magnesium nitrate R* in a mixture of 0.3 volumes of *nitric acid R* and 99.7 volumes of *water R*, and dilute to 100.0 ml with the same mixture of solvents.

Injection: 20 µl of the test solution and the reference solution, and 10 µl of the modifier solution.

Source: palladium hollow-cathode lamp using a transmission band preferably of 1 nm and a graphite tube.

Wavelength: 247.6 nm.

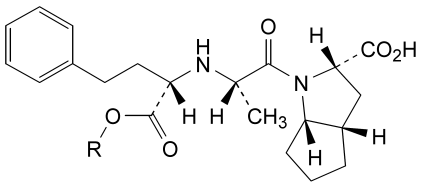
Loss on drying (*2.2.32*): maximum 0.2 per cent, determined on 1.000 g by drying in an oven under high vacuum at 60 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 25 ml of *methanol R* and add 25 ml of *water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

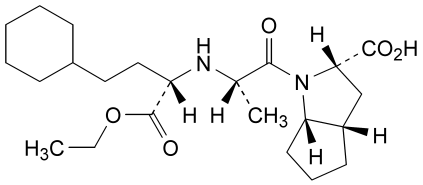
1 ml of *0.1 M sodium hydroxide* is equivalent to 41.65 mg of $C_{23}H_{32}N_2O_5$.



STORAGE

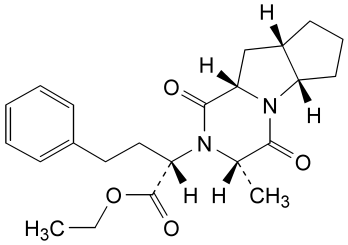
Protected from light.

IMPURITIES



Specified impurities: *A, B, C, D.*

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E, F, G, H, I, J, K, L, M, N.*



A. R = CH_3: (2*S*,3a*S*,6a*S*)-1-[(*S*)-2-[[(*S*)-1-(methoxycarbonyl)-3-phenylpropyl]amino]propanoyl]octahydrocyclopenta-[*b*]pyrrole-2-carboxylic acid (ramipril methyl ester),

01/2008:0946

RANITIDINE HYDROCHLORIDE

Ranitidini hydrochloridum

$C_{13}H_{23}ClN_4O_3S$ M_r 350.9
[66357-59-3]

DEFINITION

N-[2-[[[5-[(Dimethylamino)methyl]furan-2-yl]methyl]sulphanyl]ethyl]-*N*′-methyl-2-nitroethene-1,1-diamine hydrochloride.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or pale yellow, crystalline powder.

Solubility: freely soluble in water, sparingly soluble or slightly soluble in anhydrous ethanol, very slightly soluble in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *ranitidine hydrochloride CRS*.

If the spectra obtained in the solid state show differences, dissolve 10 mg of the substance to be examined and 10 mg of the reference substance separately in 0.5 ml of *methanol R* in an agate mortar. Evaporate to dryness under a stream of *nitrogen R*. Dry the residues under vacuum for 30 min. Add 3 drops of *liquid paraffin R* to the residues and triturate until the mull shows a milky appearance. Compress the mulls between 2 plates transparent to infrared radiation and record new spectra.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

pH (*2.2.3*): 4.5 to 6.0 for solution S.

Related substances. Liquid chromatography (*2.2.29*).

Buffer solution. Dissolve 6.8 g of *potassium dihydrogen phosphate R* in 950 ml of *water R*. Adjust to pH 7.1 with *strong sodium hydroxide solution R* and dilute to 1000 ml with *water R*.

Test solution. Dissolve 13 mg of the substance to be examined in mobile phase A and dilute to 100 ml with mobile phase A.

Reference solution (a). Dissolve 6.5 mg of *ranitidine for system suitability CRS* (containing impurities A, D and H) in mobile phase A and dilute to 50 ml with mobile phase A.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (c). Dissolve the contents of a vial of *ranitidine impurity J CRS* in 1 ml of test solution.

Column:

– *size*: *l* = 0.1 m, Ø = 4.6 mm,

– *stationary phase*: *octadecylsilyl amorphous organosilica polymer R* (3.5 µm),

– *temperature*: 35 °C.

Mobile phase:

– *mobile phase A*: *acetonitrile R*, buffer solution (2:98 *V/V*),

– *mobile phase B*: *acetonitrile R*, buffer solution (22:78 *V/V*),

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 10	100 → 0	0 → 100
10 - 15	0	100
15 - 16	0 → 100	100 → 0
16 - 20	100	0

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 10 µl of the test solution, reference solutions (a), (b) and (c) and mobile phase A as a blank.

Relative retention with reference to ranitidine (retention time = about 6.8 min): impurity H = about 0.1; impurity G = about 0.2; impurity F = about 0.4; impurity B = about 0.5; impurity C = about 0.6; impurity E = about 0.7; impurity D = about 0.8; impurity J = about 0.9; impurity I = about 1.3; impurity A = about 1.7.

System suitability:

– *resolution*: minimum 1.5 between the peaks due to impurity J and ranitidine in the chromatogram obtained with reference solution (c),

– the chromatogram obtained with reference solution (a) is similar to the chromatogram supplied with *ranitidine for system suitability CRS*,

– the chromatogram obtained with the blank solution does not show any peak with the same relative retention as the peak due to impurity A in the chromatogram obtained with reference solution (a).

Limits:

– *correction factor*: for the calculation of content, multiply the peak area of impurity J by 2,

– *impurity A*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

– *impurities B, C, D, E, F, G, H, I, J*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),

– *any other impurity*: for each impurity, not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *sum of impurities other than A*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard any peak due to the blank.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

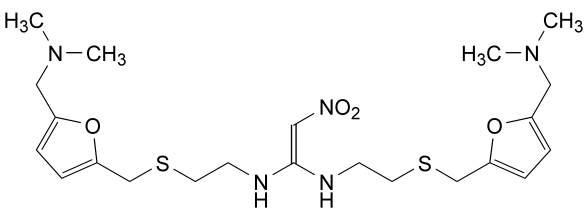
Loss on drying (*2.2.32*): maximum 0.75 per cent, determined on 1.000 g by drying under high vacuum at 60 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

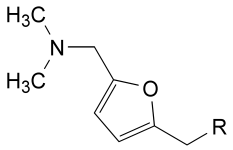
Dissolve 0.280 g in 35 ml of *water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M sodium hydroxide* is equivalent to 35.09 mg of $C_{13}H_{23}ClN_4O_3S$.



STORAGE

In airtight container, protected from light.



IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *K*.

RAPESEED OIL, REFINED

Rapae oleum raffinatum

DEFINITION

Refined rapeseed oil is the fatty oil obtained from the seeds of *Brassica napus* L. and *Brassica campestris* L. by mechanical expression or by extraction. It is then refined. A suitable antioxidant may be added.

CHARACTERS

A clear, light yellow liquid, practically insoluble in water and in alcohol, miscible with light petroleum (bp: 40 °C to 60 °C).

It has a relative density of about 0.917 and a refractive index of about 1.473.

IDENTIFICATION

Carry out the identification of fatty oils by thin-layer chromatography (*2.3.2*). The chromatogram obtained is similar to the typical chromatogram for rapeseed oil.

TESTS

Acid value (*2.5.1*). Not more than 0.5, determined on 10.0 g.

Peroxide value (*2.5.5*). Not more than 10.0.

Unsaponifiable matter (*2.5.7*). Not more than 1.5 per cent, determined on 5.0 g.

Alkaline impurities (*2.4.19*). It complies with the test for alkaline impurities in fatty oils.

Composition of fatty acids (*2.4.22, Method A*). The fatty acid fraction of the oil has the following composition:

- *palmitic acid*: 2.5 per cent to 6.0 per cent,
- *stearic acid*: not more than 3.0 per cent,
- *oleic acid*: 50.0 per cent to 67.0 per cent,
- *linoleic acid*: 16.0 per cent to 30.0 per cent,
- *linolenic acid*: 6.0 per cent to 14.0 per cent,
- *eicosenoic acid*: not more than 5.0 per cent,
- *erucic acid*: not more than 2.0 per cent.

STORAGE

Store in an airtight, well-filled container, protected from light.

LABELLING

The label states whether the oil is obtained by mechanical expression or by extraction.

01/2008:1881
corrected 6.0

RED POPPY PETALS

Papaveris rhoeados flos

DEFINITION

Dried, whole or fragmented petals of *Papaver rhoeas* L.

IDENTIFICATION

A. The petal is dark red or dark violet-brown, very thin, floppy, wrinkled, often crumpled into a ball and velvety to the touch. It is broadly ovate with an entire margin, about 6 cm long and 4-6 cm wide, narrowing at the base where there is a black spot. The vascular bundles radiate from the base and they anastomose in a continuous arc, all at the same short distance from the margin.

B. Reduce to a powder (355) (*2.9.12*). Examine under a microscope using *chloral hydrate solution R*. The powder has an intense reddish-pink colour and shows the following diagnostic characters: fragments of epidermis composed of elongated, sinuous-walled cells with small, rounded, anomocytic stomata (*2.8.3*), numerous vascular bundles with spiral vessels embedded in the parenchyma; occasional fragments of the fibrous layer of the anthers; rounded pollen grains, about 30 µm in diameter, with 3 pores and a finely verrucose exine.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *ethanol (60 per cent V/V) R*. Stir for 15 min. Filter through a filter paper.

Reference solution. Dissolve 1 mg of *quinaldine red R* and 1 mg of *sulphan blue R* in 2 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, water R, butanol R* (10:12:40 *V/V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in daylight.

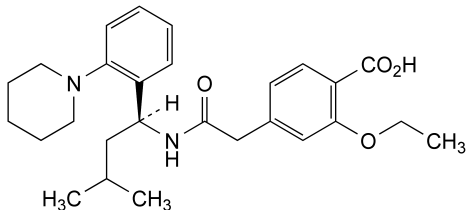
Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other bands may be present in the chromatogram obtained with the test solution.

Top of the plate	
	2 yellow zones
Quinaldine red: an orange-red zone	
———	———
	A violet principal zone
	A violet zone
	A yellow zone
Sulphan blue: a blue zone	
———	———
	A compact group of violet zones
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 2.0 per cent of capsules and maximum 1.0 per cent of other foreign matter.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.



Total ash (*2.4.16*): maximum 11.0 per cent.

Colouring intensity. Place 1.0 g of the powdered drug (355) (*2.9.12*) in a 250 ml flask and add 100 ml of *ethanol (30 per cent V/V) R*. Allow to macerate for 4 h with frequent stirring. Filter and discard the first 10 ml. Transfer 10.0 ml of the filtrate to a 100 ml volumetric flask and add 2 ml of *hydrochloric acid R*. Dilute to 100.0 ml with *ethanol (30 per cent V/V) R*. Allow to stand for 10 min. The absorbance (*2.2.25*) measured at 523 nm using *ethanol (30 per cent V/V) R* as the compensation liquid is not less than 0.6.

corrected 6.0

REPAGLINIDE

Repaglinidum

$C_{27}H_{36}N_2O_4$ M_r 452.6
[135062-02-1]

DEFINITION

2-Ethoxy-4-[2-[[(1*S*)-3-methyl-1-[2-(piperidin-1-yl)phenyl]butyl]amino]-2-oxoethyl]benzoic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in methanol and in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Specific optical rotation (*2.2.7*): + 6.3 to + 7.7.

Dissolve 1.00 g in *methanol R* and dilute to 20.0 ml with the same solvent.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *repaglinide CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *anhydrous ethanol R*, evaporate to dryness and record new spectra using the residues.

TESTS

Enantiomeric purity. Liquid chromatography (*2.2.29*). *Prepare the solutions in amber flasks and vials.*

Test solution. Dissolve 10.0 mg of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *repaglinide impurity E CRS* in *methanol R* and dilute to 50.0 ml with the same of solvent.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 100.0 ml with *methanol R*.

Reference solution (c). Mix 1.0 ml of the test solution and 10 ml of reference solution (a) and dilute to 50.0 ml with *methanol R*.

Column:

– *size*: *l* = 0.1 m, Ø = 4.0 mm,
– *stationary phase*: *silica gel AGP for chiral chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: 1.0 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 4.7 with *dilute sodium hydroxide solution R*;

– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 4	80 → 60	20 → 40
4 - 6	60	40

Equilibration after installation of the column for use: using *water R*, slowly increase the flow rate from 0.2 ml/min to 0.5 ml/min. Maintain the flow rate at 0.5 ml/min for 5 min. The column must be washed for 1 h at a flow rate of 1 ml/min with *water R* and for 1 h with the mobile phase at the initial composition prior to the 1st analysis.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 10 µl of the test solution and reference solutions (b) and (c).

Retention time: repaglinide = about 3.3 min; impurity E = about 5.0 min.

System suitability: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to repaglinide and impurity E.

Limit:

– *impurity E*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 30.0 mg of the substance to be examined in *acetonitrile R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with *acetonitrile R*. Dilute 2.0 ml of this solution to 100.0 ml with *acetonitrile R*.

Reference solution (b). With the aid of an ultrasonic bath, dissolve the contents of 1 vial of *repaglinide for system suitability CRS* in 2.0 ml of *acetonitrile R*.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,

– *stationary phase*: *silica gel for chromatography, alkyl-bonded for use with highly aqueous mobile phases R* (5 µm),

– *temperature*: 45 °C.

Mobile phase:

– *mobile phase A*: 4.0 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 3.2 with *dilute phosphoric acid R*;

– *mobile phase B*: mobile phase A, *acetonitrile R* (300:700 *V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 20	50 → 7	50 → 93
20 - 30	7	93

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 10 µl.

Relative retention with reference to repaglinide (retention time = about 10 min): impurity A = about 0.2; impurity B = about 0.3; impurity C = about 0.4; impurity D = about 1.5.

System suitability: reference solution (b):

– *resolution*: minimum 5.0 between the peaks due to impurity B and impurity C,

– the chromatogram obtained is similar to the chromatogram supplied with *repaglinide for system suitability CRS*.

Limits:

– *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.6; impurity B = 0.7; impurity C = 3.1;

– *impurities A, B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);

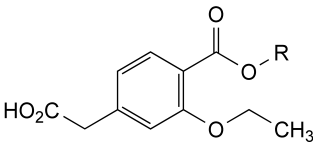
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

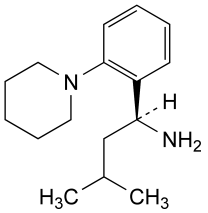
Dissolve 0.320 g in 10 ml *methanol R* and add 60 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



1 ml of *0.1 M perchloric acid* is equivalent to 45.26 mg of $C_{27}H_{36}N_2O_4$.

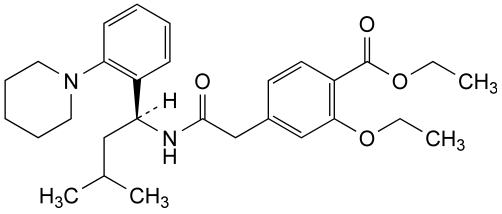
STORAGE

Protected from light.

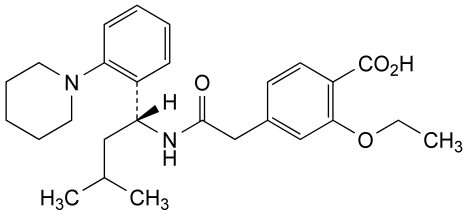


IMPURITIES

Specified impurities: A, B, C, D, E.



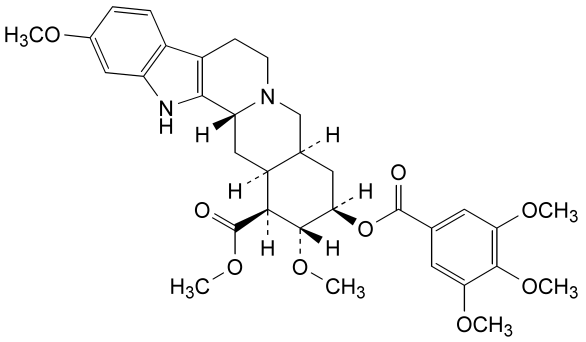
A. R = H: 4-(carboxymethyl)-2-ethoxybenzoic acid,



B. R = C_2H_5: [3-ethoxy-4-(ethoxycarbonyl)phenyl]acetic acid,

C. (1*S*)-3-methyl-1-[2-(piperidin-1-yl)phenyl]butan-1-amine,

D. ethyl 2-ethoxy-4-[2-[[(1*S*)-3-methyl-1-[2-(piperidin-1-yl)phenyl]butyl]amino]-2-oxoethyl]benzoate,



E. 2-ethoxy-4-[2-[[(1*R*)-3-methyl-1-[2-(piperidin-1-yl)phenyl]butyl]amino]-2-oxoethyl]benzoic acid.

01/2008:0528

RESERPINE

Reserpinum

$C_{33}H_{40}N_2O_9$ M_r 609

[50-55-5]

DEFINITION

Methyl 11,17α-dimethoxy-18β-[(3,4,5-trimethoxybenzoyl)oxy]-3β,20α-yohimban-16β-carboxylate.

Content:

– *reserpine*: 98.0 per cent to 102.0 per cent (dried substance),

– *total alkaloids*: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or slightly yellow, small crystals or crystalline powder, darkening slowly on exposure to light.

Solubility: practically insoluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: B.

Second identification: A, C, D, E.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 20.0 mg in *chloroform R* and dilute to 10.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with *ethanol (96 per cent) R*. Examine immediately.

Spectral range: 230-350 nm.

Absorption maximum: at 268 nm.

Specific absorbance at the absorption maximum: 265 to 285.

Over the range 288-295 nm, the curve shows a slight absorption minimum followed by a shoulder or a slight absorption maximum; over this range, the specific absorbance is about 170.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *reserpine CRS*.

C. To about 1 mg add 0.1 ml of a 1 g/l solution of *sodium molybdate R* in *sulphuric acid R*. A yellow colour is produced which becomes blue within 2 min.

D. To about 1 mg add 0.2 ml of a freshly prepared 10 g/l solution of *vanillin R* in *hydrochloric acid R*. A pink colour develops within 2 min.

E. Mix about 0.5 mg with 5 mg of *dimethylaminobenzaldehyde R* and 0.2 ml of *glacial acetic acid R* and add 0.2 ml of *sulphuric acid R*. A green colour is produced. Add 1 ml of *glacial acetic acid R*. The colour becomes red.

TESTS

Specific optical rotation (*2.2.7*): – 116 to – 128 (dried substance).

Dissolve 0.250 g in *chloroform R* and dilute to 25.0 ml with the same solvent. Examine immediately.

Oxidation products. Dissolve 20 mg in *glacial acetic acid R* and dilute to 100.0 ml with the same acid. The absorbance (*2.2.25*) measured immediately at the absorption maximum at 388 nm is not greater than 0.10.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 0.500 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 667 Pa for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 0.5 g.

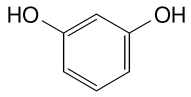
ASSAY

Total alkaloids. Dissolve 0.500 g in a mixture of 6 ml of *acetic anhydride R* and 40 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 60.9 mg of total alkaloids.

Reserpine. *Protect the solutions from light.* Moisten 25.0 mg with 2 ml of *ethanol (96 per cent) R*, add 2 ml of *0.25 M sulphuric acid* and 10 ml of *ethanol (96 per cent) R*, and warm gently to dissolve. Cool and dilute to 100.0 ml with *ethanol (96 per cent) R*. Dilute 5.0 ml of this solution to 50.0 ml with *ethanol (96 per cent) R*. Prepare a reference solution in the same manner using 25.0 mg of *reserpine CRS*. Place 10.0 ml of each solution separately in 2 boiling-tubes, add 2.0 ml of *0.25 M sulphuric acid* and 2.0 ml of a freshly prepared 3 g/l solution of *sodium nitrite R*. Mix and heat in a water-bath at 55 °C for 35 min. Cool, add 1.0 ml of a freshly prepared 50 g/l solution of *sulphamic acid R* and dilute to 25.0 ml with *ethanol (96 per cent) R*. Measure the absorbance (*2.2.25*) of each solution at the absorption maximum at 388 nm, using as the compensation liquid 10.0 ml of the same solution prepared at the same time in the same manner, but omitting the sodium nitrite.

Calculate the content of $C_{33}H_{40}N_2O_9$ from the absorbances measured and the concentrations of the solutions.



STORAGE

Protected from light.

01/2008:0290

RESORCINOL

Resorcinolum

$C_6H_6O_2$ M_r 110.1
[108-46-3]

DEFINITION

Resorcinol contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of benzene-1,3-diol, calculated with reference to the dried substance.

CHARACTERS

A colourless or slightly pinkish-grey, crystalline powder or crystals, turning red on exposure to light and air, very soluble in water and in alcohol.

IDENTIFICATION

A. Melting point (*2.2.14*): 109 °C to 112 °C.

B. Dissolve 0.1 g in 1 ml of *water R*, add 1 ml of *strong sodium hydroxide solution R* and 0.1 ml of *chloroform R*, heat and allow to cool. An intense, deep-red colour develops which becomes pale yellow on the addition of a slight excess of *hydrochloric acid R*.

C. Thoroughly mix about 10 mg with about 10 mg of *potassium hydrogen phthalate R*, both finely powdered. Heat over a naked flame until an orange-yellow colour is obtained. Cool and add 1 ml of *dilute sodium hydroxide solution R* and 10 ml of *water R* and shake to dissolve. The solution shows an intense green fluorescence.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution B_5 or R_5 (*2.2.2, Method II*) and remains so when heated in a water-bath for 5 min.

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of *bromophenol blue solution R2*. Not more than 0.05 ml of *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.5 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dilute 0.1 ml of the test solution to 20 ml with *methanol R*.

Apply separately to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 40 volumes of *ethyl acetate R* and 60 volumes of *hexane R*. Allow the plate to dry in air for 15 min and expose it to iodine vapour. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Pyrocatechol. To 2 ml of solution S add 1 ml of *ammonium molybdate solution R2* and mix. Any yellow colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using 2 ml of a 0.1 g/l solution of *pyrocatechol R*.

Loss on drying (*2.2.32*). Not more than 1.0 per cent, determined on 1.00 g of powdered substance by drying in a desiccator for 4 h.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.500 g in *water R* and dilute to 250.0 ml with the same solvent. To 25.0 ml of the solution in a ground-glass-stoppered flask add 1.0 g of *potassium bromide R*, 50.0 ml of *0.0167 M potassium bromate*, 15 ml of *chloroform R* and 15.0 ml of *hydrochloric acid R1*. Stopper the flask, shake and allow to stand in the dark for 15 min, shaking occasionally. Add 10 ml of a 100 g/l solution of *potassium iodide R*, shake thoroughly, allow to stand for 5 min and titrate with *0.1 M sodium thiosulphate*, using 1 ml of *starch solution R* as indicator.

1 ml of *0.0167 M potassium bromate* is equivalent to 1.835 mg of $C_6H_6O_2$.

STORAGE

Store protected from light.

corrected 6.0

RESTHARROW ROOT

Ononidis radix

DEFINITION

Whole or cut, dried root of *Ononis spinosa* L.

IDENTIFICATION

A. The root is more or less flattened, twisted and branched, deeply wrinkled, brown and grooved longitudinally. The transversely cut surface shows a thin bark and a xylem cylinder with a conspicuously radiate structure. The fracture of the root is short and fibrous.

B. Reduce to a powder (355) (*2.9.12*). The powder is light brown or brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: brown fragments of cork composed of thin-walled polygonal cells; groups of thick-walled narrow fibres, often accompanied by a parenchymatous crystal sheath containing prisms of calcium oxalate; fragments of vessels with numerous small bordered pits; parenchymatous cells with single prisms of calcium oxalate. Examine under a microscope using a mixture of equal volumes of *glycerol R* and *water R*. The powder shows numerous simple, round starch granules, 5-10 µm in diameter.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (180) (*2.9.12*) add 15.0 ml of *methanol R* and boil under a reflux condenser for 30 min. Cool and filter.

Reference solution. Dissolve 10 mg of *resorcinol R* and 50 mg of *vanillin R* in 10 ml of *methanol R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *ethanol (96 per cent) R, methylene chloride R, toluene R* (10:45:45 *V/V/V*).

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm and 365 nm.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones are present in the middle third of the chromatogram obtained with the test solution.

Top of the plate	
Vanillin: a zone visible at 254 nm ————	————
Resorcinol: a zone visible at 254 nm ————	An intense blue fluorescent zone visible at 365 nm ————
Reference solution	**Test solution**

Detection B: spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min. Examine in daylight.

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Vanillin: a greyish-violet zone Resorcinol: a red zone	A violet zone (onocol)
Reference solution	**Test solution**

TESTS

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 8.0 per cent.

Extractable matter: minimum 15.0 per cent.

To 2.00 g of the powdered drug (250) (*2.9.12*) add a mixture of 8 g of *water R* and 12 g of *ethanol (96 per cent) R* and allow to macerate for 2 h, shaking frequently. Filter, evaporate 5 g of the filtrate to dryness on a water-bath and dry in an oven at 100-105 °C for 2 h. The residue weighs a minimum of 75 mg.

01/2008:0289
corrected 6.0

RHATANY ROOT

Ratanhiae radix

DEFINITION

Dried, usually fragmented, underground organs of *Krameria triandra* Ruiz and Pavon, known as Peruvian rhatany.

Content: minimum 5.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

IDENTIFICATION

A. The taproot is dark reddish-brown and has a thick, knotty crown. The secondary roots are the same colour and nearly straight or somewhat tortuous. The bark is rugged or scaly in the older pieces and smooth with sharp, transverse fissures in the younger pieces; it separates readily from the wood. The fracture is fibrous in the bark and splintery in the wood. The smooth, transversely cut surface shows a dark brownish-red bark about one third of the radius in thickness; a dense, pale reddish-brown and finely porous wood is present with numerous fine medullary rays; the central heartwood is often darker.

B. Reduce to a powder (355) (*2.9.12*). The powder is brownish-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: cork cells containing dark brown phlobaphenes; fragments of unlignified phloem fibres, usually 12-30 µm in diameter with moderately thick walls; phloem parenchyma cells in files containing prisms and microcrystals of calcium oxalate; fragments of vessels usually 20-60 µm in diameter with bordered pits; fragments of tracheids up to 20 µm wide with slit-shaped pits. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows rounded starch granules, simple or 2- to 4-compound, an individual granule measuring up to 30 µm in diameter and some granules being found in the cells of the medullary rays and in the parenchyma.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of a mixture of 3 volumes of *water R* and 7 volumes of *ethanol (96 per cent) R*, shake for 10 min and filter. To the filtrate add 10 ml of *light petroleum R* and shake. Separate the light petroleum layer, add 2 g of *anhydrous sodium sulphate R*, shake and filter. Evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of *methanol R*.

Reference solution. Dissolve 5.0 mg of *Sudan red G R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, toluene R* (2:98 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 5 g/l solution of *fast blue B salt R*. Allow to dry in air and spray with *0.1 M ethanolic sodium hydroxide*; examine in daylight.

Results: the chromatogram obtained with the reference solution shows in the lower third a red zone due to Sudan red G. The chromatogram obtained with the test solution shows a violet zone due to rhatany phenol I similar in position to the zone of Sudan red G in the chromatogram obtained with the reference solution, below it the brownish zone due to rhatany phenol II and below this the bluish-grey zone due to rhatany phenol III. Further zones may be present.

TESTS

Foreign matter (*2.8.2*): maximum 2 per cent of foreign matter and maximum 5 per cent of fragments of crown or root exceeding 25 mm in diameter. Root without bark may be present in very small quantities.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C.

Total ash (*2.4.16*): maximum 5.5 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (*2.8.14*). Use 0.750 g of powdered drug (180) (*2.9.12*).

01/2008:1888

RHATANY TINCTURE

Ratanhiae tinctura

DEFINITION

Tincture produced from *Rhatany root (0289)*.

Content: minimum 1.0 per cent *m/m* of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1).

PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

Appearance: reddish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. To 5 ml of the tincture to be examined, add 10 ml of *light petroleum R* and shake. Separate the light petroleum layer, add 2 g of *anhydrous sodium sulphate R*, shake and filter. Evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of *methylene chloride R*.

Reference solution. Dissolve 5 mg of *thymol R* and 10 mg of *dichlorophenolindophenol, sodium salt R* in 10 ml of *alcohol (60 per cent V/V) R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *methylene chloride R*.

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with a 5 g/l solution of *fast blue B salt R*; allow the plate to dry in air and spray with *0.1 M ethanolic sodium hydroxide*; examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
———	———
Thymol: an orange brownish-yellow zone	A violet zone
———	———
	A greenish-grey zone
	A bluish-grey zone
	A yellowish-brown zone
Dichlorophenolindophenol: a greyish-blue zone	A violet zone
Reference solution	**Test solution**

TESTS

Ethanol (*2.9.10*): 63 per cent *V/V* to 67 per cent *V/V*.

Methanol and 2-propanol (*2.9.11*): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

ASSAY

Carry out the determination of tannins in herbal drugs (*2.8.14*) using 2.500 g of the tincture to be examined.

01/2008:0291
corrected 6.0

RHUBARB

Rhei radix

DEFINITION

Rhubarb consists of the whole or cut, dried underground parts of *Rheum palmatum* L. or of *Rheum officinale* Baillon or of hybrids of these two species or of a mixture. The underground parts are often divided; the stem and most of the bark with the rootlets are removed. It contains not less than 2.2 per cent of hydroxyanthracene derivatives, expressed as rhein ($C_{15}H_8O_6$, M_r 284.2), calculated with reference to the dried drug.

CHARACTERS

Characteristic, aromatic odour.

IDENTIFICATION

A. The appearance is variable: disc-shaped pieces up to 10 cm in diameter and 1 cm to 5 cm in thickness; cylindrical pieces; oval or planoconvex pieces. The surface has a pinkish tinge and is usually covered with a layer of brownish-yellow powder. It shows, especially after moistening, a reticulum of darker lines. This structure causes the marbled appearance of the drug. The fracture is granular. The transverse section of the rhizome shows a narrow outer zone of radiating brownish-red lines. These medullary rays are crossed perpendicularly by a dark cambial ring. Inside this zone is a ring of small star-spot formations of anomalous vascular bundles. The root shows a more radiate structure.

B. Reduce to a powder (355) (*2.9.12*). The powder is orange to brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: large calcium oxalate cluster crystals, which may measure more than 100 µm, and their fragments; reticulately thickened non-lignified vessels measuring up to 175 µm. Numerous groups of rounded or polygonal, thin-walled parenchyma cells. Sclereids and fibres are absent. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple, rounded or compound (2 to 4) starch granules with a star-shaped hilum.

C. Examine by thin-layer chromatography (*2.2.27*), using a suitable silica gel as the coating substance.

Test solution. Heat 50 mg of the powdered drug (180) (*2.9.12*) in a water-bath for 15 min with a mixture of 1 ml of *hydrochloric acid R* and 30 ml of *water R*. Allow to cool and shake the liquid with 25 ml of *ether R*. Dry the ether layer over *anhydrous sodium sulphate R* and filter. Evaporate the ether layer to dryness and dissolve the residue in 0.5 ml of *ether R*.

Reference solution. Dissolve 5 mg of *emodin R* in 5 ml of *ether R*.

Apply separately to the plate as bands 20 µl of each solution. Develop over a path of 10 cm using a mixture of 1 volume of *anhydrous formic acid R*, 25 volumes of *ethyl acetate R* and 75 volumes of *light petroleum R*. Allow the plate to dry in air and examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in its central part a zone of orange fluorescence (emodin). The chromatogram obtained with the test solution shows: a zone due to emodin; above the emodin zone, two zones of similar fluorescence (physcione and chrysophanol, in order of

increasing R_F value); below the emodin zone, also two zones of similar fluorescence (rhein and aloe-emodin, in order of decreasing R_F value). Spray with a 100 g/l solution of *potassium hydroxide R* in *methanol R*. All the zones become red to violet.

D. To about 50 mg of the powdered drug (180) (*2.9.12*) add 25 ml of *dilute hydrochloric acid R* and heat the mixture on a water-bath for 15 min. Allow to cool, shake with 20 ml of *ether R* and discard the aqueous layer. Shake the ether layer with 10 ml of *dilute ammonia R1*. The aqueous layer becomes red to violet.

TESTS

Rheum rhaponticum. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution. To 0.2 g of the powdered drug (180) (*2.9.12*) add 2 ml of *methanol R* and boil for 5 min under a reflux condenser. Allow to cool and filter. Use the filtrate as the test solution.

Reference solution. Dissolve 10 mg of *rhaponticin R* in 10 ml of *methanol R*.

Apply separately to the plate, as bands not more than 20 mm by 3 mm, 20 µl of each solution. Develop over a path of 12 cm using a mixture of 20 volumes of *methanol R* and 80 volumes of *methylene chloride R*. Allow the plate to dry in air and spray with *phosphomolybdic acid solution R*. The chromatogram obtained with the test solution does not show a blue zone near the starting-line (rhaponticin) corresponding to the zone in the chromatogram obtained with the reference solution.

Loss on drying (*2.2.32*). Not more than 12.0 per cent, determined on 1.000 g of the powdered drug (180) (*2.9.12*) by drying in an oven at 105 °C.

Total ash (*2.4.16*). Not more than 12.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*). Not more than 2.0 per cent.

ASSAY

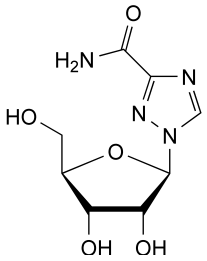
Carry out the assay protected from bright light.

Introduce 0.100 g of the powdered drug (180) (*2.9.12*) into a 100 ml flask. Add 30.0 ml of *water R*, mix and weigh. Heat in a water-bath under a reflux condenser for 15 min. Allow to cool, add 50 mg of *sodium hydrogen carbonate R*, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 10.0 ml of the liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Heat under a reflux condenser on a water-bath for 20 min, add 1 ml of *hydrochloric acid R* and heat for a further 20 min, shaking frequently. Cool, transfer to a separating funnel and shake with three quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the ether extracts and wash with two quantities, each of 15 ml, of *water R*. Filter the ether extracts through a plug of absorbent cotton into a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 10.0 ml carefully to dryness on a water-bath and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (*2.2.25*) at 515 nm, using *methanol R* as the compensation liquid.

Calculate the percentage content of rhein from the expression:

$$\frac{A \times 0.64}{m}$$

i.e. taking the specific absorbance of rhein to be 468, calculated on the basis of the specific absorbance of barbaloin.



A = absorbance at 515 nm,

m = mass of the drug used, in grams.

01/2008:2109
corrected 6.0

RIBAVIRIN

Ribavirinum

$C_8H_{12}N_4O_5$ M_r 244.2
[36791-04-5]

DEFINITION

1-β-D-Ribofuranosyl-1*H*-1,2,4-triazole-3-carboxamide.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, slightly soluble in ethanol (96 per cent), slightly soluble or very slightly soluble in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *ribavirin CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methylene chloride R*, evaporate to dryness and record new spectra using the residues.

TESTS

pH (*2.2.3*): 4.0 to 6.5.

Dissolve 0.200 g in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent.

Specific optical rotation (*2.2.7*): – 33 to – 37 (dried substance).

Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent. Determine the specific optical rotation within 10 min of preparing the solution.

Related substances. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Test solution (b). Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve the contents of a vial of *ribavirin for system suitability CRS* in 2.0 ml of the mobile phase.

Reference solution (c). Dissolve 25.0 mg of *ribavirin CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.10 m, Ø = 7.8 mm,

– *stationary phase*: *strong cation-exchange resin R* (9 µm),

– *temperature*: 40 °C.

Mobile phase: *water R* adjusted to pH 2.5 with *sulphuric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 207 nm.

Injection: 10 µl of test solution (a) and reference solutions (a) and (b).

Run time: 11 times the retention time of ribavirin.

Relative retention with reference to ribavirin (retention time = about 4 min): impurity F = about 1.2.

System suitability: reference solution (b):

– *peak-to-valley ratio*: minimum 1.2, where H_p = height above the baseline of the peak due to impurity F and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to ribavirin.

Limits:

– *impurity F*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 4.0 g in 20 ml of *water R*, with heating if necessary. 12 ml of the solution complies with limit test A. Prepare the reference solution using 10 ml of *lead standard solution (2 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 5 h.

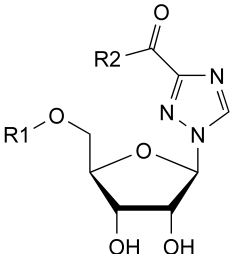
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution (b) and reference solution (c).

Calculate the percentage content of $C_8H_{12}N_4O_5$ using the declared content of *ribavirin CRS*.

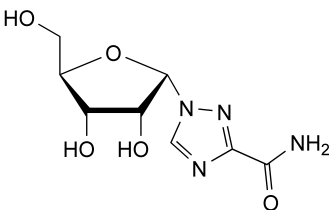


STORAGE

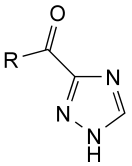
Protected from light.

IMPURITIES

Specified impurities: F.



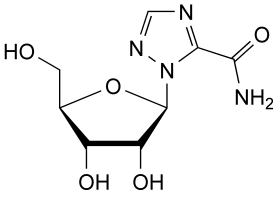
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, D, E, G.*



A. R1 = H, R2 = OH: 1-β-D-ribofuranosyl-1*H*-1,2,4-triazole-3-carboxylic acid,

E. R1 = CO-C_6H_5, R2 = NH_2: 1-(5-*O*-benzoyl-β-D-ribofuranosyl)-1*H*-1,2,4-triazole-3-carboxamide (5′-*O*-benzoylribavirin),

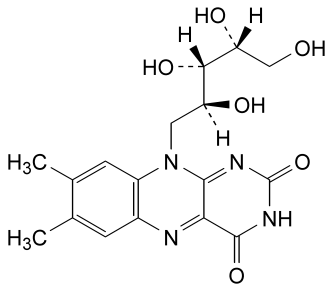
F. R1 = CO-CH_3, R2 = NH_2: 1-(5-*O*-acetyl-β-D-ribofuranosyl)-1*H*-1,2,4-triazole-3-carboxamide (5′-*O*-acetylribavirin),



B. 1-α-D-ribofuranosyl-1*H*-1,2,4-triazole-3-carboxamide (anomer),

C. R = OH: 1*H*-1,2,4-triazole-3-carboxylic acid,

D. R = NH_2: 1*H*-1,2,4-triazole-3-carboxamide,



G. 1-β-D-ribofuranosyl-1*H*-1,2,4-triazole-5-carboxamide (*N*-isomer).

01/2008:0292

RIBOFLAVIN

Riboflavinum

$C_{17}H_{20}N_4O_6$ M_r 376.4
[83-88-5]

DEFINITION

7,8-Dimethyl-10-[(2*S*,3*S*,4*R*)-2,3,4,5-tetrahydroxypentyl]-benzo[*g*]pteridine-2,4(3*H*,10*H*)-dione.
This monograph applies to riboflavin produced by fermentation.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: yellow or orange-yellow, crystalline powder.

Solubility: very slightly soluble in water, practically insoluble in ethanol (96 per cent).

Solutions deteriorate on exposure to light, especially in the presence of alkali.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Thin-layer chromatography (*2.2.27*).

Test solution. Suspend 25 mg of the substance to be examined in 10 ml of *water R*, shake for 5 min and filter the suspension to remove the undissolved material.

Reference solution. Suspend 25 mg of *riboflavin CRS* in 10 ml of *water R*, shake for 5 min and filter the suspension to remove the undissolved material.

Plate: *TLC silica gel plate R* (2-10 µm).

Mobile phase: *water R*.

Application: as follows, drying in a current of cold air after each individual application:

– *1st application*: 2 µl of *methylene chloride R* then 2 µl of the test solution;
– *2nd application*: 2 µl of *methylene chloride R* then 2 µl of the reference solution.

Development: over a path of 6 cm.

Drying: in a current of cold air.

Detection: examine in ultraviolet light at 365 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. Dissolve about 1 mg in 100 ml of *water R*. The solution has, by transmitted light, a pale greenish-yellow colour, and, by reflected light, an intense yellowish-green fluorescence which disappears on the addition of mineral acids or alkalis.

TESTS

Specific optical rotation (*2.2.7*): – 115 to – 135 (dried substance).

Dissolve 50.0 mg in *0.05 M sodium hydroxide* free from carbonate and dilute to 10.0 ml with the same alkaline solution. Measure the optical rotation within 30 min of dissolution.

Absorbance (*2.2.25*).

Test solution. Dilute the final solution prepared for the assay with an equal volume of *water R*.

Absorption maxima: at 223 nm, 267 nm, 373 nm and 444 nm.

Absorbance ratios:

– A_{373}/A_{267} = 0.31 to 0.33;
– A_{444}/A_{267} = 0.36 to 0.39.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use and protect from light.*

Solution A: 13.6 g/l solution of *sodium acetate R*.

Test solution. With the aid of ultrasound, dissolve 0.120 g of the substance to be examined in 10 ml of *0.1 M sodium hydroxide* and dilute to 100 ml with solution A.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with solution A. Dilute 1.0 ml of this solution to 100.0 ml with solution A.

Reference solution (b). With the aid of ultrasound, dissolve the contents of a vial of *riboflavin for peak identification CRS* (containing impurities C and D) in 1.0 ml of a mixture of 1 volume of mobile phase B and 9 volumes of mobile phase A.

Reference solution (c). In order to prepare *in situ* impurities A and B, dissolve 10 mg of the substance to be examined in 1 ml of *0.5 M sodium hydroxide*. Expose to daylight for 1.5 h. Add 0.5 ml of *acetic acid R* and dilute to 100 ml with *water R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: *phosphoric acid R, water R* (1:1000 *V/V*);
– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	90	10
5 - 20	90 → 80	10 → 20
20 - 25	80	20
25 - 35	80 → 50	20 → 50
35 - 45	50	50

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 267 nm.

Injection: 10 µl.

Identification of impurities: use the chromatogram supplied with *riboflavin for peak identification CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities C and D.

Relative retention with reference to riboflavin (retention time = about 16 min): impurity C = about 0.2; impurity D = about 0.5; impurity A = about 1.4; impurity B = about 1.9.

Monographs Q-S

System suitability:

- *resolution*: minimum 5 between the peaks due to impurities A and B in the chromatogram obtained with reference solution (c);
- the chromatogram obtained with reference solution (b) is similar to the chromatogram supplied with *riboflavin for peak identification CRS*.

Limits:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.7; impurity B = 1.4; impurity C = 2.3; impurity D = 1.4;
- *impurity A*: not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.025 per cent);
- *impurities B, C, D*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *disregard limit for peaks other than those due to impurity A*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

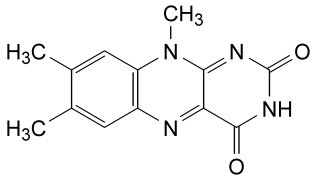
Loss on drying (*2.2.32*): maximum 1.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on the residue obtained in the test for loss on drying.

ASSAY

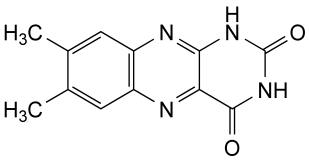
Carry out the assay protected from light.

In a brown-glass 500 ml volumetric flask, suspend 65.0 mg in 5 ml of *water R* ensuring that it is completely wetted and dissolve in 5 ml of *dilute sodium hydroxide solution R*. As soon as dissolution is complete, add 100 ml of *water R* and 2.5 ml of *glacial acetic acid R* and dilute to 500.0 ml with *water R*. Place 20.0 ml of this solution in a 200 ml brown-glass volumetric flask, add 3.5 ml of a 14 g/l solution of *sodium acetate R* and dilute to 200.0 ml with *water R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 444 nm.



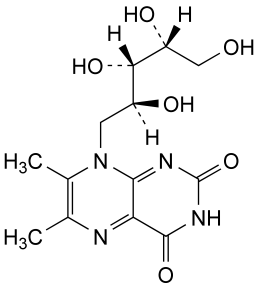
Calculate the content of $C_{17}H_{20}N_4O_6$ taking the specific absorbance to be 328.

STORAGE

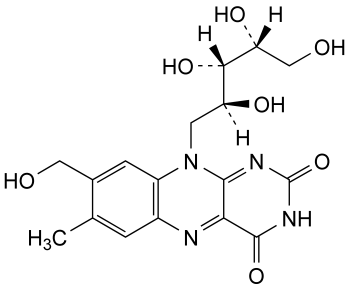


In an airtight container, protected from light.

IMPURITIES



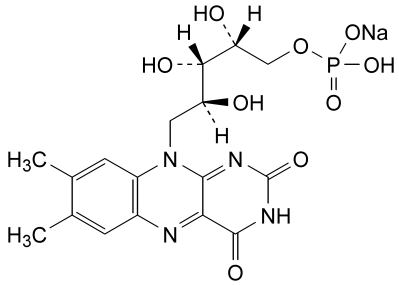
Specified impurities: *A, B, C, D.*



A. 7,8,10-trimethylbenzo[*g*]pteridine-2,4(3*H*,10*H*)-dione (lumiflavine),

B. 7,8-dimethylbenzo[*g*]pteridine-2,4(1*H*,3*H*)-dione,

C. 6,7-dimethyl-8-[(2*S*,3*S*,4*R*)-2,3,4,5-tetrahydroxypentyl]-pteridine-2,4(3*H*,8*H*)-dione,



D. 8-(hydroxymethyl)-7-methyl-10-[(2*S*,3*S*,4*R*)-2,3,4,5-tetrahydroxypentyl]benzo[*g*]pteridine-2,4(3*H*,10*H*)-dione.

RIBOFLAVIN SODIUM PHOSPHATE

Riboflavini natrii phosphas

$C_{17}H_{20}N_4NaO_9P$ M_r 478.3
[130-40-5]

DEFINITION

Mixture containing riboflavin 5′-(sodium hydrogen phosphate) as the main component and other riboflavin sodium monophosphates.

Content: 73.0 per cent to 79.0 per cent of riboflavin ($C_{17}H_{20}N_4O_6$; M_r 376.4) (dried substance).

It contains a variable amount of water.

CHARACTERS

Appearance: yellow or orange-yellow, crystalline, hygroscopic powder.

Solubility: soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50.0 mg in *phosphate buffer solution pH 7.0 R* and dilute to 100.0 ml with the same buffer solution. Dilute 2.0 ml of this solution to 100.0 ml with *phosphate buffer solution pH 7.0 R*.

Spectral range: 230-350 nm.

Absorption maximum: at 266 nm.

Specific absorbance at the absorption maximum: 580 to 640.

B. Examine the chromatograms obtained in the test for related substances.

Results: the principal peak in the chromatogram obtained with the test solution is similar in position and approximate size to the principal peak in the chromatogram obtained with reference solution (b).

C. Dissolve about 10 mg in *dilute sodium hydroxide solution R* and dilute to 100 ml with the same solution. Expose 1 ml of this solution to ultraviolet light at 254 nm for 5 min, add sufficient *acetic acid R* to make the solution acidic to *blue litmus paper R* and shake with 2 ml of *methylene chloride R*. The lower layer shows yellow fluorescence.

D. To 0.5 g add 10 ml of *nitric acid R* and evaporate the mixture to dryness on a water-bath. Ignite the residue until it becomes white, dissolve the residue in 5 ml of *water R* and filter. The filtrate gives reaction (a) of sodium and reaction (b) of phosphates (*2.3.1*).

TESTS

pH (*2.2.3*): 5.0 to 6.5.

Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Specific optical rotation (*2.2.7*): + 38.0 to + 43.0 (dried substance).

Dissolve 0.300 g in 18.2 ml of *hydrochloric acid R1* and dilute to 25.0 ml with *water R*.

Impurity E. To about 35 mg add 10 ml of *methylene chloride R*, shake for 5 min and filter. The filtrate is not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Related substances. Liquid chromatography (*2.2.29*). *Carry out the test protected from actinic light.*

Test solution. Dissolve 0.100 g of the substance to be examined in 50 ml of *water R* and dilute to 100.0 ml with the mobile phase. Dilute 8.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 60 mg of *riboflavin CRS* (impurity D) in 1 ml of *hydrochloric acid R* and dilute to 250.0 ml with *water R*. Dilute 4.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 0.100 g of *riboflavin sodium phosphate CRS* in 50 ml of *water R* and dilute to 100.0 ml with the mobile phase. Dilute 8.0 ml of this solution to 50.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *methanol R*, 7.35 g/l solution of *potassium dihydrogen phosphate R* (150:850 *V/V*).

Flow rate: 2 ml/min.

Detection: spectrophotometer at 266 nm.

Injection: 100 µl.

Run time: until the peak due to riboflavin can be clearly evaluated.

Relative retention with reference to riboflavin 5′-monophosphate (retention time = about 20 min): impurity A = about 0.2; impurity B = about 0.3; impurity C = about 0.5; riboflavin 3′-monophosphate = about 0.7; riboflavin 4′-monophosphate = about 0.9; impurity D = about 2.

System suitability: reference solution (b):

– *resolution*: minimum 1.5 between the peaks due to riboflavin 4′-monophosphate and riboflavin 5′-monophosphate.

Calculate the percentage content of free riboflavin (impurity D) and of riboflavin in the form of the diphosphates of riboflavin (impurities A, B, C) from the areas of the peaks in the chromatogram obtained with the test solution and the amount of free riboflavin in reference solution (a).

Limits:

– *impurity D*: maximum 6.0 per cent (dried substance);
– *sum of impurities A, B and C*: maximum 6.0 per cent (dried substance).

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

Inorganic phosphate: maximum 1.5 per cent.

Dissolve 0.10 g in *water R* and dilute to 100 ml with the same solvent. To 5 ml of this solution, add 10 ml of *water R*, 5 ml of *buffered copper sulphate solution pH 4.0 R*, 2 ml of a 30 g/l solution of *ammonium molybdate R*, 1 ml of a freshly prepared solution containing 20 g/l of *4-methylaminophenol sulphate R* and 50 g/l of *sodium metabisulphite R*, and 1 ml of a 3 per cent *V/V* solution of *perchloric acid R*. Dilute to 25.0 ml with *water R* and measure, within 15 min of its preparation, the absorbance (*2.2.25*) of the solution at 800 nm, using as the compensation liquid a solution prepared in the same manner but without the substance to be examined. The absorbance is not greater than that of a solution prepared as follows: to 15 ml of *phosphate standard solution (5 ppm PO_4) R*, add 5 ml of *buffered copper sulphate solution pH 4.0 R*, 2 ml of a 30 g/l solution of *ammonium molybdate R*, 1 ml of a freshly prepared solution containing 20 g/l of *4-methylaminophenol sulphate R* and 50 g/l of *sodium metabisulphite R*, and 1 ml of a 3 per cent *V/V* solution of *perchloric acid R*; dilute to 25.0 ml with *water R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

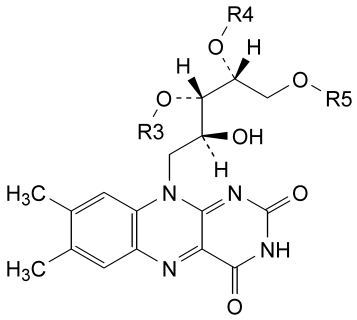
To 2.0 g in a silica crucible add 2 ml of *nitric acid R*, dropwise, followed by 0.25 ml of *sulphuric acid R*. Heat cautiously until white fumes are evolved and ignite. Extract the cooled residue with 2 quantities, each of 2 ml, of *hydrochloric acid R* and evaporate the extracts to dryness. Dissolve the residue in 2 ml of *dilute acetic acid R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using 10 ml of *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 8.0 per cent, determined on 1.000 g by drying in an oven at 105 °C at a pressure not exceeding 0.7 kPa for 5 h.

ASSAY

Carry out the assay protected from light.

Dissolve 0.100 g in 150 ml of *water R*, add 2 ml of *glacial acetic acid R* and dilute to 1000.0 ml with *water R*. To 10.0 ml of this solution add 3.5 ml of a 14 g/l solution of *sodium acetate R* and dilute to 50.0 ml with *water R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 444 nm.



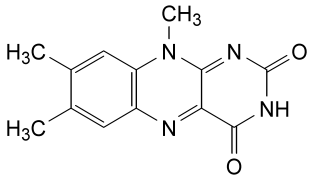
Calculate the content of $C_{17}H_{20}N_4O_6$ taking the specific absorbance to be 328.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: *A, B, C, D, E.*



A. R3 = R4 = PO_3H_2, R5 = H: riboflavin 3′,4′-diphosphate,

B. R3 = R5 = PO_3H_2, R4 = H: riboflavin 3′,5′-diphosphate,

C. R3 = H, R4 = R5 = PO_3H_2: riboflavin 4′,5′-diphosphate,

D. R3 = R4 = R5 = H: riboflavin,

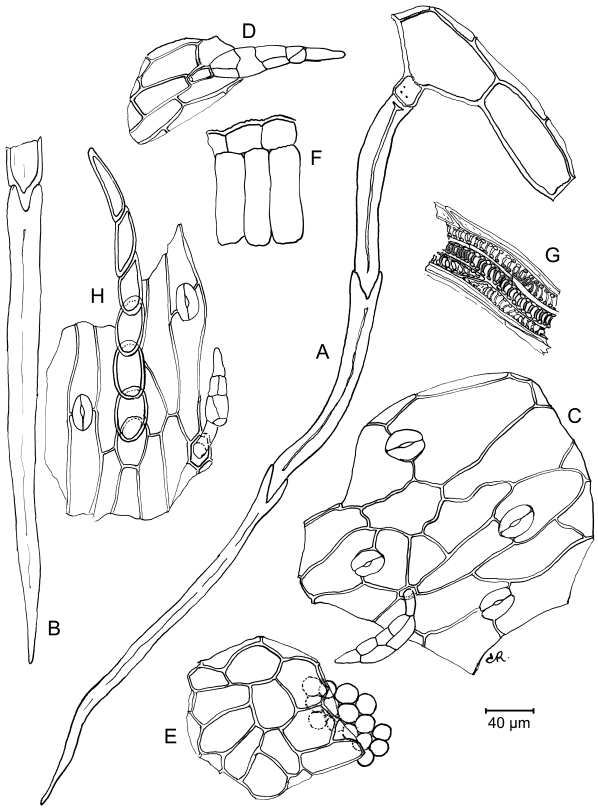
E. 7,8,10-trimethylbenzo[*g*]pteridine-2,4(3*H*,10*H*)-dione (lumiflavin).

01/2008:1884

RIBWORT PLANTAIN

Plantaginis lanceolatae folium

DEFINITION



Whole or fragmented, dried leaf and scape of *Plantago lanceolata* L. *s.l.*

Content: minimum 1.5 per cent of total *ortho*-dihydroxycinnamic acid derivatives expressed as acteoside ($C_{29}H_{36}O_{15}$; M_r 624.6) (dried drug).

IDENTIFICATION

A. The leaf is up to 30 cm long and 4 cm wide, yellowish-green to brownish-green, with a prominent, whitish-green, almost parallel venation on the abaxial surface. It consists of a lanceolate lamina narrowing at the base into a channelled petiole. The margin is indistinctly dentate and often undulate. It has 3, 5 or 7 primary veins, nearly equal in length and running almost parallel. Hairs may be almost absent, sparsely scattered or sometimes abundant, especially on the lower surface and over the veins. The scape is brownish-green, longer than the leaves, 3-4 mm in diameter and is deeply grooved longitudinally, with 5-7 conspicuous ribs. The surface is usually covered with fine hairs.

B. Reduce to a powder (355) (*2.9.12*). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of epidermis, composed of cells with irregularly sinuous anticlinal walls, the fragments from the scape with thickened outer walls and a coarsely ridged cuticle; stomata mostly of the diacytic type (*2.8.3*) and sometimes anomocytic; the multicellular, uniseriate, conical covering trichomes are highly characteristic, with a basal cell larger than the other epidermal cells followed by a short cell supporting 2 or more elongated cells with the lumen narrow and variable, occluded at intervals corresponding to slight swellings in the trichome and giving a jointed appearance; the terminal cell has an acute apex and a filiform lumen; the glandular trichomes have a unicellular cylindrical stalk and a multicellular, elongated, conical head consisting of several rows of small cells and a single terminal cell; dense groups of lignified fibro-vascular tissue with narrow, spirally and annularly thickened vessels and slender, moderately thickened fibres.

A. Covering trichome of the leaf (usually only fragments observed)
B. Fragment of covering trichome of the leaf
C. Lower epidermis of lamina with glandular trichome
D. Glandular trichome
E. Upper epidermis of lamina with palisade parenchyma, in surface view
F. Upper epidermis and palisade parenchyma, in section view
G. Vessels
H. Epidermis from the scape

Figure 1884.-1. — *Illustration of powdered herbal drug of ribwort plantain (see Identification B)*

C. Examine the chromatograms obtained in the test for *Digitalis lanata* leaves.

Results A: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatograms obtained with the test solution.

Top of the plate	
———	———
Acteoside: a yellow zone	A yellow zone (acteoside)
———	———
Aucubin: a blue zone	A blue zone (aucubin)
Reference solution	**Test solution**

TESTS

***Digitalis lanata* leaves.** Thin layer chromatography (*2.2.27*).

Solvent mixture: *water R, methanol R* (30:70 *V/V*).

Test solution. Use a freshly prepared solution. To 1 g of the powdered drug (355) (*2.9.12*) in a 25 ml flask, add 10 ml of the solvent mixture and shake for 30 min. Filter, rinse the flask and filter with 2 quantities, each of 5 ml, of the solvent mixture. Dilute to 25 ml with the solvent mixture.

Reference solution. Dissolve 1 mg of *acteoside R* and 1 mg of *aucubin R* in 1 ml of the solvent mixture.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *acetic acid R, anhydrous formic acid R, water R, ethyl acetate R* (11:11:27:100 *V/V/V/V*).

Application: 10 µl as bands.

Development: over a path of 8 cm; heat immediately after development at about 120 °C for 5-10 min.

Detection A: examine in daylight.

Detection B: examine in ultraviolet light at 365 nm.

Results B: the chromatogram obtained with the test solution shows no bright blue fluorescent zone just below the reddish-brown fluorescent zone corresponding to aucubin in the chromatogram obtained with the reference solution.

Foreign matter (*2.8.2*): maximum 5 per cent of leaves of different colour and maximum 2 per cent of other foreign matter.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 14.0 per cent.

ASSAY

Stock solution. In a flask, place 1.000 g of the powdered drug (355) (*2.9.12*) and add 90 ml of *ethanol (50 per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter into a 100 ml volumetric flask. Rinse the flask and the filter with 10 ml of *ethanol (50 per cent V/V) R*. Combine the filtrate and the rinsings and dilute to 100.0 ml with *ethanol (50 per cent V/V) R*.

Test solution. To a 10 ml volumetric flask add, mixing after each addition, 1.0 ml of the stock solution, 2 ml of *0.5 M hydrochloric acid*, 2 ml of a solution prepared by dissolving 10 g of *sodium nitrite R* and 10 g of *sodium molybdate R* in 100 ml of *water R*, and 2 ml of *dilute sodium hydroxide solution R*. Dilute to 10.0 ml with *water R*.

Immediately measure the absorbance (*2.2.25*) of the test solution at 525 nm using as compensation liquid a solution prepared as follows: to a 10 ml volumetric flask add 1.0 ml of the stock solution, 2 ml of *0.5 M hydrochloric acid* and 2 ml of *dilute sodium hydroxide solution R*, and dilute to 10.0 ml with *water R*.

Calculate the percentage content of total *ortho*-dihydroxycinnamic acid derivatives, expressed as acteoside, using the following expression:

$$\frac{A \times 1000}{185 \times m}$$

i.e. taking the specific absorbance to be 185 for acteoside at 525 nm.

A = absorbance of the test solution at 525 nm;

m = mass of the substance to be examined, in grams.

01/2008:0349

RICE STARCH

Oryzae amylum

DEFINITION

Rice starch is obtained from the caryopsis of *Oryza sativa* L.

CHARACTERS

Appearance: very fine, white or almost white powder, which creaks when pressed between the fingers.

Solubility: practically insoluble in cold water and in ethanol (96 per cent).

Rice starch does not contain starch grains of any other origin. It may contain traces of, if any, fragments of the endosperm tissue of the fruit.

IDENTIFICATION

A. Examined under a microscope using a mixture of equal volumes of *glycerol R* and *water R*, it presents polyhedral, simple grains 1-10 µm, mostly 4-6 µm, in size. These simple grains often gather in ellipsoidal, compound grains 50-100 µm in diameter. The grains have a poorly visible central hilum and there are no concentric striations. Between orthogonally orientated polarising plates or prisms, the starch grains show a distinct black cross intersecting at the hilum.

B. Suspend 1 g in 50 ml of *water R*, boil for 1 min and cool. A thin, cloudy mucilage is formed.

C. To 1 ml of the mucilage obtained in identification test B add 0.05 ml of *iodine solution R1*. An orange-red to dark blue colour is produced, which disappears on heating.

TESTS

pH (*2.2.3*): 5.0 to 8.0.

Shake 5.0 g with 25.0 ml of *carbon dioxide-free water R* for 60 s. Allow to stand for 15 min.

Iron (*2.4.9*): maximum 10 ppm for the filtrate.

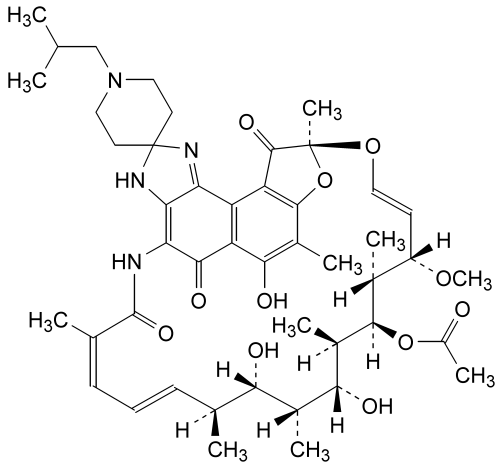
Shake 1.5 g with 15 ml of *dilute hydrochloric acid R*. Filter.

Foreign matter. Examine under a microscope using a mixture of equal volumes of *glycerol R* and *water R*. Not more than traces of matter other than starch granules are present. No starch grains of any other origin are present.

Loss on drying (*2.2.32*): maximum 15.0 per cent, determined on 1.00 g by drying in an oven at 130 °C for 90 min.

Sulphated ash (*2.4.14*): maximum 0.6 per cent, determined on 1.0 g.

Oxidising substances (*2.5.30*): maximum 0.002 per cent, calculated as H_2O_2.



Sulphur dioxide (*2.5.29*): maximum 50 ppm.

Microbial contamination. Total viable count (*2.6.12*) not more than 10^3 bacteria and 10^2 fungi per gram, determined by plate-count. It complies with the test for *Escherichia coli* (*2.6.13*).

01/2008:1657
corrected 6.0

RIFABUTIN

Rifabutinum

$C_{46}H_{62}N_4O_{11}$ M_r 847
[72559-06-9]

DEFINITION

(9*S*,12*E*,14*S*,15*R*,16*S*,17*R*,18*R*,19*R*,20*S*,21*S*,22*E*,24*Z*)-6,18,20-trihydroxy-14-methoxy-7,9,15,17,19,21,25-heptamethyl-1′-(2-methylpropyl)-5,10,26-trioxo-3,5,9,10-tetrahydrospiro[9,4-(epoxypentadeca[1,11,13]trienimino)-2*H*-furo[2′,3′:7,8]naphtho[1,2-*d*]imidazole-2,4′-piperidine]-16-yl acetate.

Semi-synthetic product derived from a fermentation product.

Content: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: reddish-violet amorphous powder.

Solubility: slightly soluble in water, soluble in methanol, slightly soluble in alcohol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *rifabutin CRS*.

B. Examine the chromatograms obtained in the test for related substances.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Impurity A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.100 g of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 10 mg of *rifabutin impurity A CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. Dilute 3 ml of the solution to 100 ml with a mixture of equal volumes of *methanol R* and *methylene chloride R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *acetone R, light petroleum R* (23:77 *V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: expose the plate to iodine vapour for about 5 min, then spray with *potassium iodide and starch solution R* and allow to stand for 5 min.

Limit:

– *impurity A*: any spot corresponding to impurity A is not more intense than the spot in the chromatogram obtained with the reference solution (0.3 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *rifabutin CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve about 10 mg of *rifabutin CRS* in 2 ml of *methanol R*, add 1 ml of *dilute sodium hydroxide solution R* and allow to stand for about 4 min. Add 1 ml of *dilute hydrochloric acid R* and dilute to 50 ml with the mobile phase.

Column:

– *size*: *l* = 0.110 m, Ø = 4.6 mm,

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix equal volumes of *acetonitrile R* and a 13.6 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 6.5 with *dilute sodium hydroxide solution R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

Run time: 2.5 times the retention time of rifabutin.

Relative retention with reference to rifabutin (retention time = about 9 min): impurity E = about 0.5; impurity B = about 0.6; impurity D = about 0.9; impurity C = about 1.3.

System suitability: reference solution (c):

– *resolution*: minimum 2.0 between the second peak of the 3 peaks due to degradation products and the peak due to rifabutin.

Limits:

– *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent); not more than 1 such peak has

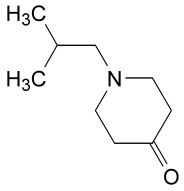
an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),

– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

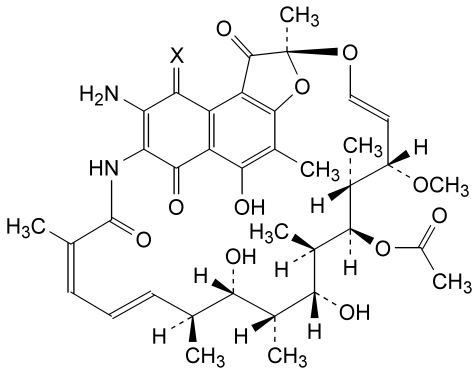
Water (*2.5.12*): maximum 2.5 per cent, determined on 0.200 g.

Sulphated ash (*2.4.14*): maximum 0.3 per cent, determined on 1.0 g.



ASSAY

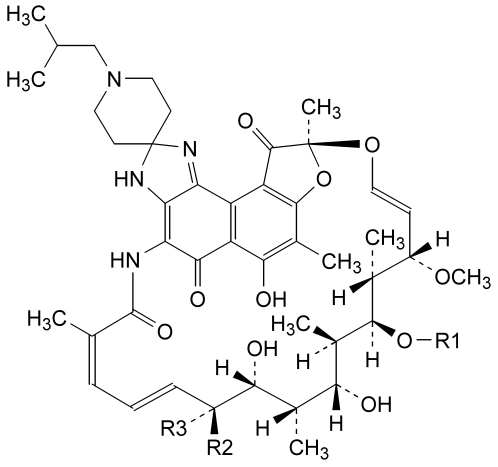
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.



Injection: test solution and reference solution (a).

Calculate the percentage content of ribabutin.

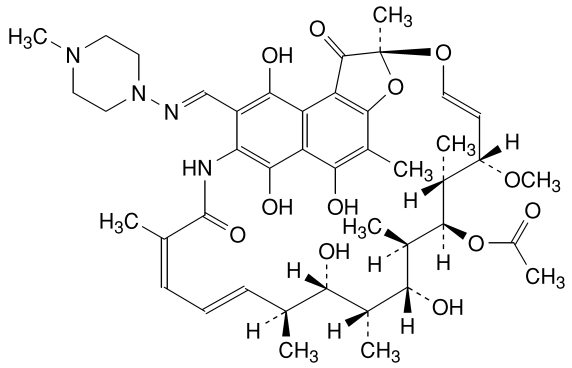
IMPURITIES



A. 1-(2-methylpropyl)piperidin-4-one,

B. X = O: 3-aminorifamycin S,

D. X = NH: 3-amino-4-imidorifamycin S,



C. R1 = CO-CH_3, R2 + R3 = CH_2: 21,31-didehydrorifabutin,

E. R1 = R3 = H, R2 = CH_3: 16-deacetylrifabutin.

01/2008:0052

RIFAMPICIN

Rifampicinum

$C_{43}H_{58}N_4O_{12}$ M_r 823

[13292-46-1]

DEFINITION

(2*S*,12*Z*,14*E*,16*S*,17*S*,18*R*,19*R*,20*R*,21*S*,22*R*,23*S*,24*E*)-5,6,9,17,19-Pentahydroxy-23-methoxy-2,4,12,16,18,20,22-heptamethyl-8-[[(4-methylpiperazin-1-yl)imino]methyl]-1,11-dioxo-1,2-dihydro-2,7-(epoxypentadeca[1,11,13]-trienimino)naphto[2,1-*b*]furan-21-yl acetate.

Semisynthetic antibiotic obtained from rifamycin SV.

Content: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: reddish-brown or brownish-red, crystalline powder.

Solubility: slightly soluble in water, soluble in methanol, slightly soluble in acetone and in ethanol (96 per cent).

IDENTIFICATION

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50 mg in 50 ml of *methanol R*. Dilute 1 ml of this solution to 50 ml with *phosphate buffer solution pH 7.4 R*.

Spectral range: 220-500 nm.

Absorption maxima: at 237 nm, 254 nm, 334 nm and 475 nm.

Absorbance ratio: A_{334}/A_{475} = about 1.75.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: mulls in *liquid paraffin R*.

Comparison: *rifampicin CRS*.

C. Suspend about 25 mg in 25 ml of *water R*, shake for 5 min and filter. To 5 ml of the filtrate add 1 ml of a 100 g/l solution of *ammonium persulphate R* in *phosphate buffer solution pH 7.4 R* and shake for a few minutes. The colour changes from orange-yellow to violet-red and no precipitate is formed.

TESTS

pH (*2.2.3*): 4.5 to 6.5 for a 10 g/l suspension in *carbon dioxide-free water R*.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the test solution and the reference solution immediately before use.*

Solvent mixture. To 10 volumes of a 210.1 g/l solution of *citric acid R* add 23 volumes of a 136.1 g/l solution of *potassium dihydrogen phosphate R*, 77 volumes of a

174.2 g/l solution of *dipotassium hydrogen phosphate R*, 250 volumes of *acetonitrile R* and 640 volumes of *water R*.

Test solution. Dissolve 20.0 mg of the substance to be examined in *acetonitrile R* and dilute to 10.0 ml with the same solvent. Dilute 5.0 ml of this solution to 50.0 ml with the solvent mixure.

Reference solution. Dissolve 20.0 mg of *rifampicin quinone CRS* (impurity A) in *acetonitrile R* and dilute to 100.0 ml with the same solvent. To 1.0 ml of this solution add 1.0 ml of the test solution and dilute to 100.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.12 m, Ø = 4.6 mm;
– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 35 volumes of *acetonitrile R* and 65 volumes of a solution containing 0.1 per cent *V/V* of *phosphoric acid R*, 1.9 g/l of *sodium perchlorate R*, 5.9 g/l of *citric acid R* and 20.9 g/l of *potassium dihydrogen phosphate R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

Run time: twice the retention time of rifampicin.

System suitability: reference solution:

– *resolution*: minimum 4.0 between the peaks due to rifampicin and impurity A; if necessary, adjust the concentration of acetonitrile in the mobile phase.

Limits:

– *impurity A*: not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (1.5 per cent);
– *any other impurity*: for each impurity, not more than the area of the peak due to rifampicin in the chromatogram obtained with the reference solution (1.0 per cent);
– *sum of impurities other than A*: not more than 3.5 times the area of the peak due to rifampicin in the chromatogram obtained with the reference solution (3.5 per cent);
– *disregard limit*: 0.05 times the area of the peak due to rifampicin in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

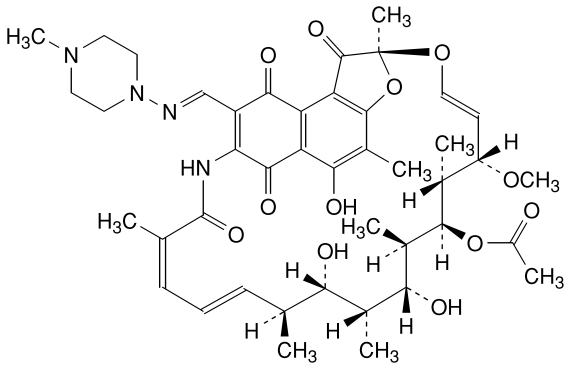
Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying at 80 °C at a pressure not exceeding 0.67 kPa for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 2.0 g.

ASSAY

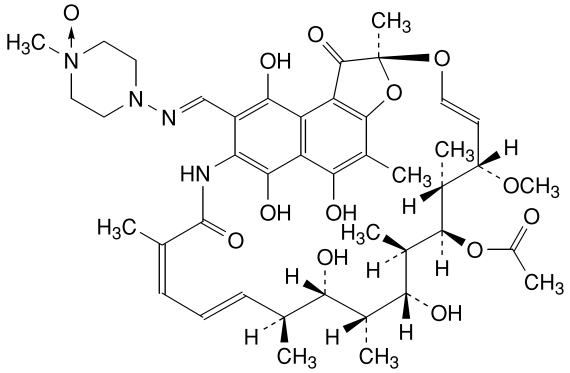
Dissolve 0.100 g in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *phosphate buffer solution pH 7.4 R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 475 nm, using *phosphate buffer solution pH 7.4 R* as the compensation liquid.

Calculate the content of $C_{43}H_{58}N_4O_{12}$, taking the specific absorbance to be 187.



STORAGE

Under nitrogen in an airtight container, protected from light, at a temperature not exceeding 25 °C.

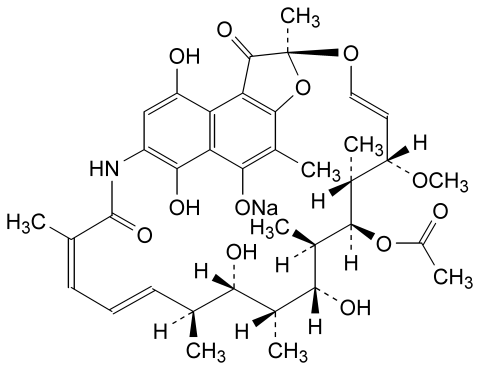


IMPURITIES

Specified impurities: *A*.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B*.

A. rifampicin quinone,



B. rifampicin *N*-oxide.

01/2008:0432

RIFAMYCIN SODIUM

Rifamycinum natricum

$C_{37}H_{46}NNaO_{12}$ M_r 720

[14897-39-3]

DEFINITION

Sodium (2*S*,12*Z*,14*E*,16*S*,17*S*,18*R*,19*R*,20*R*,21*S*,22*R*,23*S*,24*E*)-21-(acetyloxy)-6,9,17,19-tetrahydroxy-23-methoxy-2,4,12,16,18,20,22-heptamethyl-1,11-dioxo-1,2-dihydro-2,7-(epoxypentadeca[1,11,13]trienimino)naphtho[2,1-*b*]furan-5-olate.

Monosodium salt of rifamycin SV, obtained by chemical transformation of rifamycin B, which is produced during the growth of certain strains of *Amycolatopsis mediterranei*. Rifamycin SV may also be obtained directly from certain *A. mediterranei* mutants.

Potency: minimum 900 IU/mg (anhydrous substance).

PRODUCTION

It is produced by methods of manufacture designed to minimise or eliminate substances lowering blood pressure.

The manufacturing process is validated to demonstrate that the product, if tested, would comply with the following test.

Abnormal toxicity (*2.6.9*). Inject into each mouse 4 mg dissolved in 0.5 ml of *water for injections R*.

CHARACTERS

Appearance: fine or slightly granular, red powder.

Solubility: soluble in water, freely soluble in anhydrous ethanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Preparation: discs of *potassium bromide R*.
Comparison: *rifamycin sodium CRS*.

B. It gives reaction (a) of sodium (*2.3.1*).

TESTS

pH (*2.2.3*): 6.5 to 8.0.

Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Absorbance (*2.2.25*). Dissolve 20.0 mg in 5 ml of *methanol R* and dilute to 100.0 ml with freshly prepared *phosphate buffer solution pH 7.0 R1* to which 1 g/l of *ascorbic acid R* has been added immediately before use. Dilute 5.0 ml of this solution to 50.0 ml with the same phosphate buffer solution containing ascorbic acid. Allow to stand for 30 min. The solution shows an absorption maximum at 445 nm. The specific absorbance at this absorption maximum is 190 to 210 (anhydrous substance).

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Solvent mixture. Mix 50 volumes of a 3.9 g/l solution of *sodium dihydrogen phosphate R*, adjusted to pH 3.0 with *phosphoric acid R*, and 50 volumes of *acetonitrile R*.

Test solution. Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 10.0 mg of *rifamycin B CRS* (impurity A) and 40.0 mg of *rifamycin S CRS* (impurity B) in the solvent mixture and dilute to 200.0 ml with the solvent mixture. Dilute 5.0 ml of this solution to 50.0 ml with the solvent mixture.

Reference solution (b). Dissolve 25 mg of the substance to be examined and 8 mg of *rifamycin S CRS* in the solvent mixture and dilute to 250.0 ml with the solvent mixture.

Column:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:
- *mobile phase A*: mix 10 volumes of *acetonitrile R* and 90 volumes of a 3.9 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 7.5 with *dilute sodium hydroxide solution R*;
- *mobile phase B*: mix 30 volumes of a 3.9 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 7.5 with *dilute sodium hydroxide solution R* and 70 volumes of *acetonitrile R*;
- *temperature*: minimum 20 °C;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 40	80 → 20	20 → 80
40 - 45	20	80
45 - 47	20 → 80	80 → 20
47 - 55	80	20

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

Elution order: impurity A, rifamycin SV, impurity B.

System suitability: reference solution (b):
- *resolution*: minimum 5.0 between the peaks due to rifamycin SV and impurity B.

Limits:
- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2 per cent);
- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *sum of impurities other than A and B*: not more than the area of the peak due to impurity B in the chromatogram obtained with reference solution (a) (2 per cent);
- *disregard limit*: the area of the peak due to impurity B in the chromatogram obtained with reference solution (a) (0.1 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

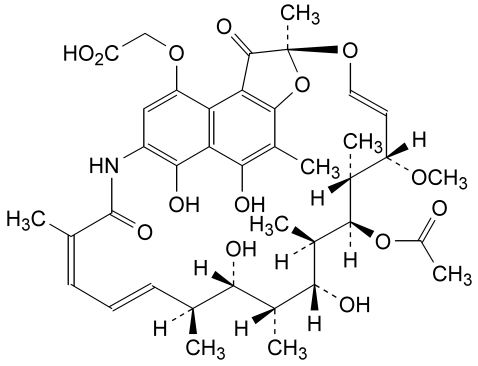
Water (*2.5.12*): 12.0 per cent to 17.0 per cent, determined on 0.200 g.

Bacterial endotoxins (*2.6.14*): less than 0.50 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

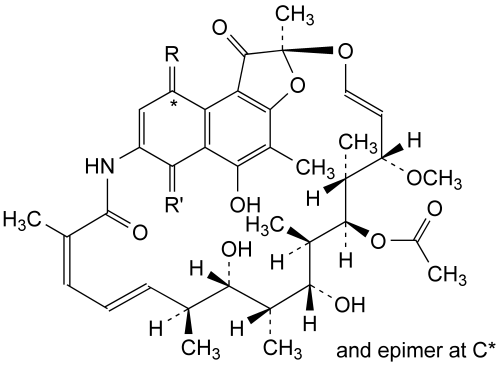
Carry out the microbiological assay of antibiotics (*2.7.2*).

STORAGE



In an airtight container, protected from light at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

IMPURITIES

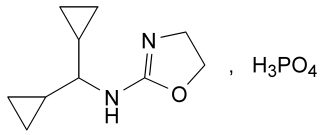


Specified impurities: *A, B.*

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034).* It is therefore not necessary to

identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C.*

A. rifamycin B,



B. R = R′ = O: rifamycin S,

C. -R- = -O-CO-CH_2-O-, R′ = O: rifamycin O.

01/2008:2020

RILMENIDINE DIHYDROGEN PHOSPHATE

Rilmenidini dihydrogenophosphas

$C_{10}H_{19}N_2O_5P$ M_r 278.2
[85409-38-7]

DEFINITION

N-(Dicyclopropylmethyl)-4,5-dihydro-oxazol-2-amine dihydrogen phosphate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, slightly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *Ph. Eur. reference spectrum of rilmenidine dihydrogen phosphate*.

B. Dissolve 10 mg in *water R* and dilute to 1 ml with the same solvent. The solution gives reaction (b) of phosphates (*2.3.1*).

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 60.0 mg of the substance to be examined in *water R* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water R* and dilute 10.0 ml of this solution to 50.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 20.0 ml with *water R*.

Reference solution (c). Dissolve 15.0 mg of *rilmenidine for system suitability CRS* in *water R* and dilute to 5.0 ml with the same solvent.

Column:

– *size*: *l* = 0.15 m, Ø = 3 mm,
– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 10 nm and a carbon loading of 25 per cent,
– *temperature*: 40 °C.

Mobile phase:

– *mobile phase A*: dissolve 3 g of *sodium heptanesulphonate R* in *water R* and dilute to 860 ml with the same solvent; add 130 ml of *methanol R2*, 10 ml of *tetrahydrofuran for chromatography R* and 1.0 ml of *phosphoric acid R*,
– *mobile phase B*: dissolve 3 g of *sodium heptanesulphonate R* in *water R* and dilute to 600 ml with the same solvent; add 350 ml of *acetonitrile for chromatography R*, 50 ml of *tetrahydrofuran for chromatography R* and 1.0 ml of *phosphoric acid R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 14	100 → 0	0 → 100
14 - 15	0 → 100	100 → 0
15 - 30	100	0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 20 µl.

Relative retention with reference to rilmenidine (retention time = about 13 min): impurity A = about 0.6; impurity B = about 0.9; impurity C = about 1.4.

With these conditions the inflexion of the baseline, corresponding to the beginning of the gradient, appears on the recorder after a minimum time *t* of 5 min. If this is not the case (*t* < 5 min) modify the chromatographic sequence by adding an isocratic elution with 100 per cent of mobile phase A for a time corresponding to (5-*t*) min before the linear gradient.

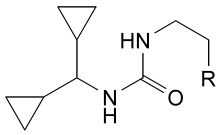
System suitability: reference solution (c):

– *peak-to-valley ratio*: minimum 3, where H_p = height above the baseline of the peak due to impurity B and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to rilmenidine.

Limits:

– *any impurity*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
– *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

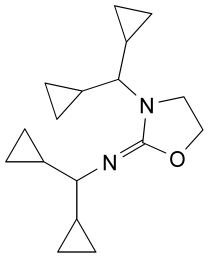
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven *in vacuo* at 50 °C over *diphosphorus pentoxide R* for 2 h.



ASSAY

Dissolve 0.200 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 27.82 mg of $C_{10}H_{19}N_2O_5P$.

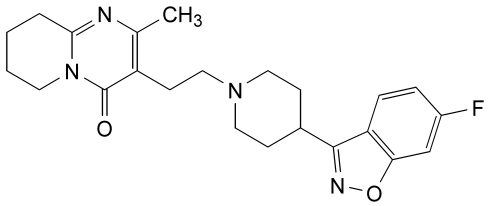


IMPURITIES

Specified impurities: A, B, C.

A. R = OH: 1-(dicyclopropylmethyl)-3-(2-hydroxyethyl)urea,

B. R = Cl: 1-(2-chloroethyl)-3-(dicyclopropylmethyl)urea,



C. *N*,3-bis(dicyclopropylmethyl)oxazolidin-2-imine.

01/2008:1559
corrected 6.0

RISPERIDONE

Risperidonum

$C_{23}H_{27}FN_4O_2$ M_r 410.5
[106266-06-2]

DEFINITION

3-[2-[4-(6-Fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in ethanol (96 per cent). It dissolves in dilute acid solutions.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *risperidone CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 0.1 g in a 7.5 g/l solution of *tartaric acid R* and dilute to 100 ml with the same acid solution.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *risperidone for system suitability CRS* (containing impurities A, B, C, D and E) in *methanol R* and dilute to 1.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 25.0 ml with *methanol R*.

Column:

- *size*: *l* = 0.10 m, Ø = 4.6 mm,
- *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:

- *mobile phase A*: 5 g/l solution of *ammonium acetate R*,
- *mobile phase B*: *methanol R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 2	70	30
2 - 17	70 → 30	30 → 70
17 - 22	30	70
22 - 23	30 → 70	70 → 30
23 - 27	70	30

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 260 nm.

Injection: 10 µl.

Relative retention with reference to risperidone (retention time = about 12 min): impurity A = about 0.69; impurity B = about 0.75; impurity C = about 0.81; impurity D = about 0.94; impurity H = about 0.96; impurity E = about 1.12; impurity F = about 1.32; impurity I = about 1.60.

System suitability: reference solution (a):

- *peak-to-valley ratio*: minimum 1.5, where H_p = height above the baseline of the peak due to impurity D and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to risperidone,
- the chromatogram obtained is similar to the chromatogram supplied with *risperidone for system suitability CRS*.

Limits:

- *impurities A, B, C, D, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- *any other impurity*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

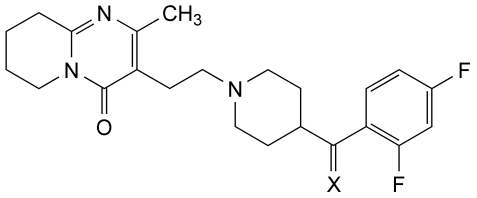
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.160 g in 70 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R* and titrate with *0.1 M perchloric acid*. Determine the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 20.53 mg of $C_{23}H_{27}FN_4O_2$.

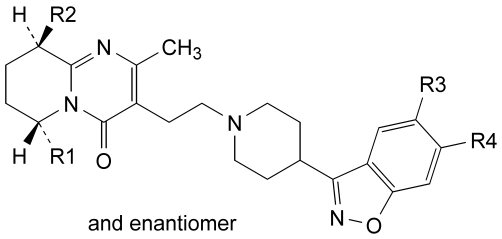


STORAGE

Protected from light.

IMPURITIES

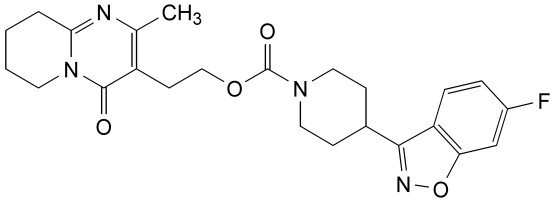
Specified impurities: A, B, C, D, E.



Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F, H, I.*

A. X = N-OH: 3-[2-[4-[(*E*)-(2,4-difluorophenyl)(hydroxyimino)methyl]piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one,

B. X = N-OH: 3-[2-[4-[(*Z*)-(2,4-difluorophenyl)(hydroxyimino)methyl]piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one,



H. X = O: 3-[2-[4-(2,4-difluorobenzoyl)piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one,

RITONAVIR

Ritonavirum

$C_{37}H_{48}N_6O_5S_2$ M_r 721
[155213-67-5]

DEFINITION

Thiazol-5-ylmethyl [(1*S*,2*S*,4*S*)-1-benzyl-2-hydroxy-4-[[(2*S*)-3-methyl-2-[[methyl[[2-(1-methylethyl)thiazol-4-yl]methyl]carbamoyl]amino]butanoyl]amino]-5-phenylpentyl]carbamate.

Content: 97.0 per cent to 102.0 per cent (anhydrous substance).

PRODUCTION

The production method is validated to demonstrate suitable enantiomeric purity of the final product.

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in methanol and in methylene chloride, very slightly soluble in acetonitrile.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *ritonavir CRS*.

If the spectra obtained in the solid state show differences dissolve the substance to be examined and the reference substance separately in *methylene chloride R*, evaporate to dryness and record new spectra using the residues.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Solvent mixture. Mix equal volumes of *acetonitrile R* and a 4.1 g/l solution of *potassium dihydrogen phosphate R*.

Test solution (a). Dissolve 10.0 mg of the substance to be examined in the solvent mixture and dilute to 10.0 ml with the solvent mixture. Sonicate if necessary.

Test solution (b). Dilute 5.0 ml of test solution (a) to 10.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 20.0 ml with the solvent mixture.

Reference solution (a). Dissolve 5.0 mg of *ritonavir for peak identification CRS* (containing impurities E, F, L, O and T) in the solvent mixture and dilute to 5.0 ml with the solvent mixture. Sonicate if necessary.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 10.0 mg of *ritonavir CRS* in the solvent mixture and dilute to 10.0 ml with the solvent mixture. Sonicate if necessary. Dilute 5.0 ml of this solution to 10.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 20.0 ml with the solvent mixture.

Column:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped butylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 60 °C.

Mobile phase:

- *mobile phase A*: mix 5 volumes of *butanol R*, 8 volumes of *tetrahydrofuran R*, 18 volumes of *acetonitrile R* and 69 volumes of a 4.1 g/l solution of *potassium dihydrogen phosphate R* filtered through a 0.45 µm nylon membrane;
- *mobile phase B*: mix 5 volumes of *butanol R*, 8 volumes of *tetrahydrofuran R*, 40 volumes of a 4.1 g/l solution of *potassium dihydrogen phosphate R* filtered through a 0.45 µm nylon membrane and 47 volumes of *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 60	100	0
60 - 120	100 → 0	0 → 100
120 - 120.1	0 → 100	100 → 0
120.1 - 155	100	0

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 50 µl of test solution (a) and reference solutions (a) and (b).

Identification of impurities: use the chromatogram supplied with *ritonavir for peak identification CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities E, F, L, O and T.

Relative retention with reference to ritonavir (retention time = about 34 min): impurity E = about 0.39; impurity F = about 0.40; impurity L = about 0.8; impurity O = about 1.1; impurity T = about 2.6.

System suitability: reference solution (a):

- *peak-to-valley ratio*: minimum 1.2, where H_p = height above the baseline of the peak due to impurity E and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity F.

Limits:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity F = 1.4; impurity L = 1.9; impurity T = 1.4;
- *impurities E, O*: for each impurity, not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *impurity T*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *impurities F, L*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 0.5 per cent, determined on 0.500 g.

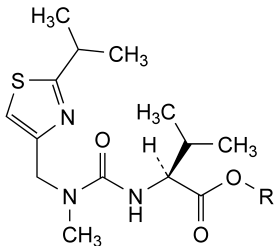
Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution (b) and reference solution (c).

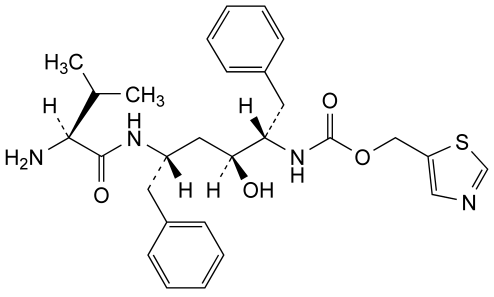
Calculate the percentage content of $C_{37}H_{48}N_6O_5S_2$ from the declared content of *ritonavir CRS*.



STORAGE

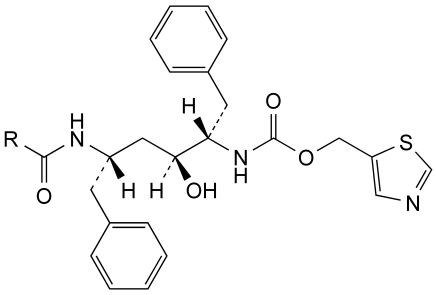
Protected from light.

IMPURITIES



Specified impurities: E, F, L, O, T.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, D, G, H, I, J, K, M, N, P, Q, R, S, U.*



A. R = H: (2*S*)-3-methyl-2-[[methyl[[2-(1-methylethyl)thiazol-4-yl]methyl]carbamoyl]amino]butanoic acid,

ROCURONIUM BROMIDE

Rocuronii bromidum

$C_{32}H_{53}BrN_2O_4$ M_r 610

DEFINITION

1-[17β-(Acetyloxy)-3α-hydroxy-2β-(morpholin-4-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium bromide.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: almost white or pale yellow, slightly hygroscopic powder.

Solubility: freely soluble in water and in anhydrous ethanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of rocuronium bromide.*

B. Solution S (see Tests) gives reaction (a) of bromides (*2.3.1*).

TESTS

Solution S. Dissolve 0.10 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*): + 28.5 to + 32.0 (anhydrous substance).

Dissolve 0.250 g in a 5.15 g/l solution of *hydrochloric acid R* and dilute to 25.0 ml with the same solution.

pH (*2.2.3*): 8.9 to 9.5 for solution S.

Related substances. Liquid chromatography (*2.2.29*).

Solvent mixture: *water R, acetonitrile R1* (10:90 *V/V*).

Test solution. Dissolve 0.100 g of the substance to be examined in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *rocuronium for peak identification CRS* (containing impurities A, B, C, F, G and H) in the solvent mixture and dilute to 5 ml with the solvent mixture.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *silica gel for chromatography R* (5 µm),
– *temperature*: 30 °C.

Mobile phase: mix 100 volumes of a 4.53 g/l solution of *tetramethylammonium hydroxide R* adjusted to pH 7.4 with *phosphoric acid R* and 900 volumes of *acetonitrile R1*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 5 µl of the test solution, reference solutions (a) and (b) and the solvent mixture (blank).

Run time: 2.5 times the retention time of rocuronium.

Relative retention with reference to rocuronium (retention time = about 9 min): impurity A = about 0.20; impurity G = about 0.44; impurity F = about 0.75; impurity B = about 0.80; impurity D = about 0.90; impurity H = about 0.95; impurity C = about 1.20; impurity E = about 1.53.

System suitability: reference solution (b):

– the chromatogram obtained is similar to the chromatogram supplied with *rocuronium for peak identification CRS*.

Limits:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.47; impurity F = 1.26; impurity G = 0.43; impurity H = 0.35;
- *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *impurities B, C*: for each impurity, not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *impurities D, E, F, G, H*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *total*: not more than 15 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent); disregard the peaks due to the blank and to bromide ion eluting just before impurity A.

Chlorides. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in *water R* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dissolve 0.824 g of *sodium chloride R* and 0.644 g of *sodium bromide R* in *water R* and dilute to 1000.0 ml with the same solvent. Dilute 1.0 ml of this solution to 50.0 ml with *water R*.

Reference solution (b). Dissolve 0.824 g of *sodium chloride R* in *water R* and dilute to 1000.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *water R*. Dilute 2.0 ml of this solution to 50.0 ml with *water R*.

Blank solution. Water R.

Precolumn:

- *size*: *l* = 0.05 m, Ø = 4.0 mm,
- *stationary phase*: *anion exchange resin R* (13 µm).

Column:

- *size*: *l* = 0.25 m, Ø = 4.0 mm,
- *stationary phase*: *anion exchange resin R* (13 µm).

Mobile phase: a solution containing 0.063 g/l of *sodium hydrogen carbonate R* and 0.212 g/l of *anhydrous sodium carbonate R*.

Flow rate: 2.0 ml/min.

Detection: conductivity detector set at 100 µS/V and maintained at 30 °C.

Use a self-generating anion suppressor.

Injection: 25 µl.

Retention times: chloride = about 1.7 min; bromide = about 2.8 min.

System suitability: reference solution (a):

- *resolution*: minimum 2.5 between the peaks due to chloride and bromide.

Limit:

- *chlorides*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

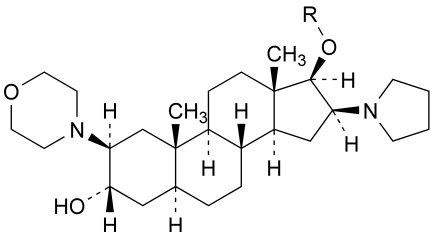
2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 4.0 per cent, determined on 0.400 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

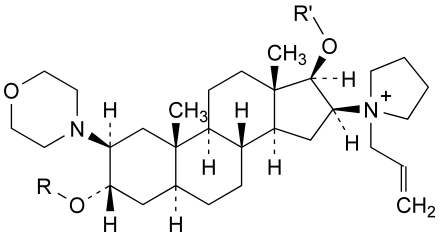
Dissolve 0.400 g in 40 ml of *glacial acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



1 ml of *0.1 M perchloric acid* is equivalent to 60.97 mg of $C_{32}H_{53}BrN_2O_4$.

STORAGE

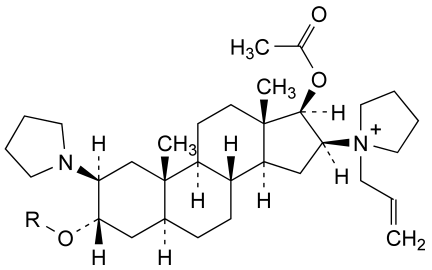
In an airtight container, protected from light.



IMPURITIES

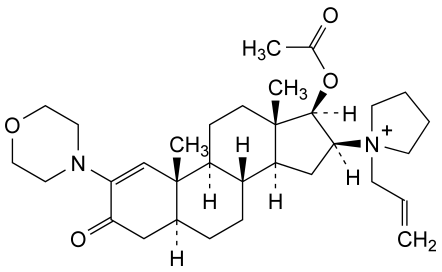
Specified impurities: A, B, C, D, E, F, G, H.

A. R = CO-CH_3: 3α-hydroxy-2β-(morpholin-4-yl)-16β-(pyrrolidin-1-yl)-5α-androstan-17β-yl acetate,



G. R = H: 2β-(morpholin-4-yl)-16β-(pyrrolidin-1-yl)-5α-androstane-3α,17β-diol,

B. R = R′ = CO-CH_3: 1-[3α,17β-bis(acetyloxy)-2β-(morpholin-4-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium,

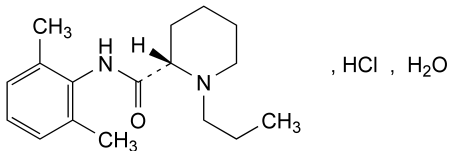


C. R = R′ = H: 1-[3α,17β-dihydroxy-2β-(morpholin-4-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium,

D. R = CO-CH_3, R′ = H: 1-[3α-(acetyloxy)-17β-hydroxy-2β-(morpholin-4-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium,

E. R = H: 1-[17β-(acetyloxy)-3α-hydroxy-2β-(pyrrolidin-1-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium,

F. R = CO-CH_3: 1-[3α,17β-bis(acetyloxy)-2β-(pyrrolidin-1-yl)-5α-androstan-16β-yl]-1-(prop-2-enyl)pyrrolidinium,



H. 1-[17β-(acetyloxy)-2-(morpholin-4-yl)-3-oxo-5α-androst-1-en-16β-yl]-1-(prop-2-enyl)pyrrolidinium.

01/2008:2335

ROPIVACAINE HYDROCHLORIDE MONOHYDRATE

Ropivacaini hydrochloridum monohydricum

$C_{17}H_{27}ClN_2O,H_2O$ M_r 328.9
[132112-35-7]

DEFINITION

(–)-(2*S*)-*N*-(2,6-Dimethylphenyl)-1-propylpiperidine-2-carboxamide hydrochloride monohydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water and in ethanol (96 per cent), slightly soluble in methylene chloride.

IDENTIFICATION

Carry out either tests A, C, D or tests A, B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *ropivacaine hydrochloride monohydrate CRS*.

B. Specific optical rotation (*2.2.7*): – 64.0 to – 74.0 (anhydrous substance).
Mix 2 ml of a 200 g/l solution of *sodium hydroxide R* and 30 ml of *water R* and dilute to 100.0 ml with *ethanol (96 per cent) R* (solution A). Dissolve 0.500 g of the substance to be examined in solution A and dilute to 50.0 ml with solution A.

C. It gives reaction (a) of chlorides (*2.3.1*).

D. Enantiomeric purity (see Tests).

TESTS

Solution S. Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*).

pH (*2.2.3*): 4.5 to 6.0 for solution S.

Absorbance (*2.2.25*): maximum 0.030 at 405 nm and maximum 0.025 at 436 nm, determined on solution S prepared immediately before use, with a path length of 5 cm and using *water R* as the compensation liquid.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 55 mg of the substance to be examined in the mobile phase and dilute to 20 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of the substance to be examined and 5 mg of *bupivacaine hydrochloride CRS* (impurity A) in the mobile phase and dilute to 5 ml with the mobile phase. Dilute 1 ml of this solution to 100 ml with the mobile phase.

Column:
– *size*: *l* = 0.15 m, Ø = 3.9 mm;
– *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (4 μm).

Mobile phase: mix 1.3 ml of a 138 g/l solution of *sodium dihydrogen phosphate R* and 32.5 ml of an 89 g/l solution of *disodium hydrogen phosphate R* and dilute to 1000 ml with *water R*; mix equal volumes of this solution (pH 8.0) and *acetonitrile R*.

Flow rate: 1.0 ml/min.

Injection: 20 μl.

Detection: spectrophotometer at 240 nm.

Run time: 2.5 times the retention time of ropivacaine.

Relative retention with reference to ropivacaine (retention time = about 6 min): impurity A = about 1.6.

System suitability: reference solution (b):
– *resolution*: minimum 6.0 between the peaks due to ropivacaine and impurity A.

Limits:
– *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Impurity H. Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution. Dissolve 13.0 mg of *2,6-dimethylaniline hydrochloride R* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Retention time: impurity H = about 2-3 min.

Limit:
– *impurity H*: not more than the area of the principal peak in the chromatogram obtained with the reference solution (10 ppm).

Enantiomeric purity. Capillary electrophoresis (*2.2.47*): use the normalisation procedure.

Test solution. Dissolve 50 mg of the substance to be examined in *water R* and dilute to 25 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with *water R*.

Reference solution (b). Dissolve 1.5 mg of the substance to be examined and 1.5 mg of *ropivacaine impurity G CRS* in *water R* and dilute to 100 ml with the same solvent.

Capillary:

– *material*: fused silica;

– *size*: effective length = about 72 cm, total length = 80 cm, Ø = 50 µm.

Temperature: 30 °C.

CZE buffer: prepare a 13.3 g/l solution of *dimethyl-β-cyclodextrin R* in an 11.5 g/l solution of *phosphoric acid R* previously adjusted to pH 3.0 with *triethanolamine R*. The CZE buffer is prepared and filtered through a 0.45 µm membrane filter immediately before use.

Detection: spectrophotometer at 206 nm.

Preconditioning of the capillary: rinse the capillary at 100 kPa with *water R* for 1 min, with *0.1 M sodium hydroxide* for 10 min and with *water R* for 3 min. If the capillary is new or dry, increase the sodium hydroxide rinse to 30 min.

Between-run rinsing: rinse the capillary at 100 kPa with *water R* for 1 min, with *0.1 M sodium hydroxide* for 4 min, with *water R* for 1 min and with the CZE buffer for 4 min.

Injection: under pressure (5 kPa) for 5 s.

Migration: apply a field strength of 375 V/cm with an initial ramp of 500 V/s and a positive polarity corresponding to a current of 40-45 µA.

Run time: 30 min.

System suitability:

– *resolution*: minimum 3.7 between the peaks due to impurity G (1st peak) and (*S*)-ropivacaine in the electropherogram obtained with reference solution (b); if necessary, increase the dimethyl-β-cyclodextrin concentration in the CZE buffer or vary the pH between 2.9 and 3.1 or lower the temperature;

– *signal-to-noise ratio*: minimum 10 for the principal peak in the electropherogram obtained with reference solution (a).

Limit:

– *impurity G*: maximum 0.5 per cent.

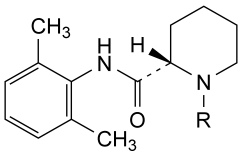
Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with test B. Prepare the reference solution using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution R (100 ppm Pb)* with a mixture of 15 volumes of *water R* and 85 volumes of *methanol R*.

Water (*2.5.12*): 5.0 per cent to 6.0 per cent, determined on 0.100 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



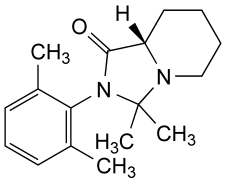
Dissolve 0.250 g in a mixture of 10 ml of *water R* and 40 ml of *ethanol (96 per cent) R*. Add 5.0 ml of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 31.09 mg of $C_{17}H_{27}ClN_2O$.

IMPURITIES

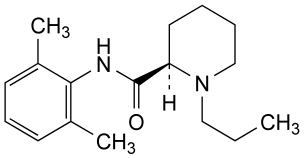
Specified impurities: A, G, H.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, E, F.*



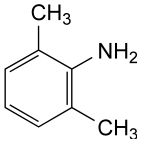
A. R = $[CH_2]_3$-CH_3: (*S*)-bupivacaine,

B. R = H: (–)-(2*S*)-*N*-(2,6-dimethylphenyl)piperidine-2-carboxamide,



C. R = CH_3: (–)-(2*S*)-*N*-(2,6-dimethylphenyl)-1-methylpiperidine-2-carboxamide ((*S*)-mepivacaine),

D. R = C_2H_5: (–)-(2*S*)-*N*-(2,6-dimethylphenyl)-1-ethylpiperidine-2-carboxamide,



E. R = $CH(CH_3)_2$: (–)-(2*S*)-*N*-(2,6-dimethylphenyl)-1–(1-methylethyl)piperidine-2-carboxamide,

F. (8a*S*)-2-(2,6-dimethylphenyl)-3,3-dimethylhexahydroimidazo[1,5-*a*]pyridin-1(5*H*)-one (acetone adduct),

G. (+)-(2*R*)-*N*-(2,6-dimethylphenyl)-1-propylpiperidine-2-carboxamide ((*R*)-ropivacaine),

H. 2,6-dimethylaniline.

01/2008:1623
corrected 6.0

ROSELLE

Hibisci sabdariffae flos

DEFINITION

Whole or cut dried calyces and epicalyces of *Hibiscus sabdariffa* L. collected during fruiting.

Content: minimum 13.5 per cent of acids, expressed as citric acid ($C_6H_8O_7$; M_r 192.1) (dried drug).

CHARACTERS

Acidic taste.

IDENTIFICATION

A. The calyx is joined in the lower half to form an urceolate structure, the upper half dividing to form 5 long acuminate recurved tips. The tips have a prominent, slightly protruding midrib and a large, thick nectary gland about 1 mm in diameter. The epicalyx consist of 8-12 small, obovate leaflets which are adnate to the base of the calyx. The calyx and epicalyx are fleshy, dry, easily fragmented and bright red or deep purple, somewhat lighter at the base of the inner side.

B. Reduce to a powder (355) (*2.9.12*). The powder is red or purplish-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: predominantly red fragments of the parenchyme containing numerous crystal clusters of calcium oxalate and, sporadically, mucilage filled cavities, sometimes associated with polygonal epidermal cells and anisocytic stomata (*2.8.3*); numerous fragments of vascular bundles with spiral and reticulate vessels; sclerenchymatous fibres with a wide lumen; rarely, rectangular, pitted parenchymatous cells; fragments of unicellular, smooth, bent covering trichomes and occasional glandular trichomes; rounded pollen grains with spiny exine.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *ethanol (60 per cent) V/V R*. Shake for 15 min and filter.

Reference solution. Dissolve 2.5 mg of *quinaldine red R* in 10 ml of *ethanol (96 per cent) R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *acetic acid R, water R, butanol R* (15:30:60 *V/V/V*).

Application: 20 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Quinaldine red: an orange-red zone	
	A pale violet zone
	A violet-blue zone
	A violet-blue zone
	A violet-blue zone
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 2 per cent of fragments of fruits (red funicles and parts of the 5 caverned capsule with yellowish-grey pericarp, whose thin walls consist of several layers of differently directed fibres; flattened, reniform seeds with a dotted surface).

Loss on drying (*2.2.32*): maximum 11.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 10.0 per cent.

Colouring power. Reduce to a coarse powder (1400) (*2.9.12*) and homogenise 100 g of drug. Reduce about 10 g of this mixture to a powder (355) (*2.9.12*). To 1.0 g of the powdered drug (355) (*2.9.12*) add 25 ml of boiling *water R* in a 100 ml flask and heat for 15 min on a water-bath with frequent shaking. Filter the hot mixture into a 50 ml graduated flask; rinse successively the 100 ml flask and the filter with 3 quantities, each of 5 ml, of warm *water R*. After cooling dilute to 50 ml with *water R*. Dilute 5 ml of this solution to 50 ml with *water R*. Measure the absorbance (*2.2.25*) at 520 nm using *water R* as the compensation liquid. The absorbance is not less than 0.350 for the whole drug and not less than 0.250 for the cut drug.

ASSAY

Shake 1.000 g of the powdered drug (355) (*2.9.12*) with 100 ml of *carbon dioxide free water R* for 15 min. Filter. To 50.0 ml of the filtrate add 100 ml of *carbon dioxide free water R*. Titrate with *0.1 M sodium hydroxide* until pH 7.0, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M sodium hydroxide* is equivalent to 6.4 mg of citric acid.

01/2008:1560

ROSEMARY LEAF

Rosmarini folium

DEFINITION

Whole, dried leaf of *Rosmarinus officinalis* L.

Content:

– minimum 12 ml/kg of essential oil (anhydrous drug),

– minimum 3 per cent of total hydroxycinnamic derivatives, expressed as rosmarinic acid ($C_{18}H_{16}O_8$; M_r 360) (anhydrous drug).

CHARACTERS

Strongly aromatic odour.

IDENTIFICATION

A. The leaves are sessile, tough, linear to linear-lanceolate, 1 cm to 4 cm long and 2 mm to 4 mm wide, with recurved edges. The upper surface is dark green, glabrous and grainy, the lower surface is greyish-green and densely tomentose with a prominent midrib.

B. Reduce to a powder (355) (*2.9.12*). The powder is greyish-green to yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of lower epidermis with straight to sinuous-walled cells and numerous diacytic stomata (*2.8.3*); fragments of the upper epidermis with straight-walled cells, slightly thickened and pitted, and an underlying hypodermis composed of large, irregular cells with thickened and beaded anticlinal walls; fragments in sectional view showing the hypodermal cells extending across the lamina at intervals, separating the one or two-layered palisade into large, crescent-shaped areas; numerous multicellular, extensively branched, covering trichomes of the lower epidermis and rare conical covering trichomes of the upper epidermis; glandular trichomes of 2 types, the majority with a short, unicellular stalk and a radiate head composed of 8 cells, others, less abundant, with a unicellular stalk and a spherical, unicellular or bicellular head.

C. Thin-layer chromatography (*2.2.27*).

Test solution.Dissolve 20 µl of the oil obtained in the assay in 1 ml of *hexane R*.

Reference solution. Dissolve 5 mg of *borneol R*, 5 mg of *bornyl acetate R* and 10 µl of *cineole R* in 1 ml of *hexane R*.

Plate: *TLC silica gel G plate R*.

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R*. Heat at 100-105 °C for 10 min. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
	A red zone
Bornyl acetate: a yellowish-brown zone	A yellowish-brown zone of low intensity
	A coloured zone of low intensity
Cineole: a violet zone	A violet zone
	Coloured zones of low intensity
Borneol: a violet-brown zone	A violet-brown zone
	A coloured zone of low intensity
Reference solution	**Test solution**

D. Thin-layer chromatography (*2.2.27*).

Test solution. Grind 1.0 g of the drug in 10 ml of *methanol R* and filter.

Reference solution. Dissolve 5.0 mg of *rosmarinic acid R* and 1.0 mg of *caffeic acid R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, acetone R, methylene chloride R* (8.5:25:85 *V/V/V*).

Application: 10 µl of the test solution and 20 µl of the reference solution, as bands.

Development: over a path of 8 cm.

Drying: in air.

Detection: examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
	A pink fluorescent zone
Caffeic acid: a light blue fluorescent zone	A blue fluorescent zone of low intensity
Rosmarinic acid: a light blue fluorescent zone	An intense light blue fluorescent zone
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 5 per cent of stems and maximum 2 per cent of other foreign matter.

Water (*2.2.13*): maximum 100 ml/kg, determined on 20.0 g of the powdered drug (355) (*2.9.12*).

Total ash (*2.4.16*): maximum 9.0 per cent.

ASSAY

Total hydroxycinnamic derivatives

Stock solution. To 0.200 g of the powdered drug (355) (*2.9.12*) add 80 ml of *alcohol (50 per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Rinse the filter with 10 ml of *alcohol (50 per cent V/V) R*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 100.0 ml with *alcohol (50 per cent V/V) R*.

Test solution. To 1.0 ml of the stock solution add 2 ml of *0.5 M hydrochloric acid*, 2 ml of a solution prepared by dissolving 10 g of *sodium nitrite R* and 10 g of *sodium molybdate R* in 100 ml of *water R* and then add 2 ml of *dilute sodium hydroxide solution R* and dilute to 10.0 ml with *water R*; mix.

Compensation solution. Dilute 1.0 ml of the stock solution to 10.0 ml with *water R*.

Measure immediately the absorbance (*2.2.25*) of the test solution at 505 nm.

Calculate the percentage content of total hydroxycinnamic derivatives, expressed as rosmarinic acid, from the expression:

$$\frac{A \times 2.5}{m}$$

i.e. taking the specific absorbance of rosmarinic acid to be 400.

A = absorbance of the test solution at 505 nm,

m = mass of the substance to be examined, in grams.

Essential oil (*2.8.12*). Use 25.0 g of the crushed drug, a 1000 ml flask and 300 ml of *water R* as the distillation liquid. Distil at a rate of 2-3 ml/min for 3 h.

01/2008:1846

ROSEMARY OIL

Rosmarini aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the flowering aerial parts of *Rosmarinus officinalis* L.

CHARACTERS

Appearance: clear, mobile, colourless to pale yellow liquid with a characteristic odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.5 ml of the substance to be examined in *toluene R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 mg of *borneol R*, 50 mg of *bornyl acetate R* and 100 µl of *cineole R* in *toluene R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray the plate with *vanillin reagent R* and heat the plate at 100-105 °C for 10 min. Examine immediately in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, several violet-blue to

violet-grey zones of medium intensity (terpene alcohols) are present in the lower third of the chromatogram obtained with the test solution.

Top of the plate	
	An intense violet zone
	A violet-grey zone
———	———
Bornyl acetate: a bluish-grey zone of low intensity	A bluish-grey zone of low intensity (bornyl acetate)
	A violet-pink zone
———	———
Cineole: an intense blue zone	An intense blue zone (cineole)
Borneol: a violet-blue zone of medium intensity	A violet -blue zone of medium intensity (borneol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*): 0.895 to 0.920.

Refractive index (*2.2.6*): 1.464 to 1.473.

Optical rotation (*2.2.7*): – 5° to + 8°.

Acid value (*2.5.1*): maximum 1.0.

Chromatographic profile. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Dissolve 0.20 ml of the substance to be examined in *hexane R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dissolve 20 µl of *α-pinene R*, 10 mg of *camphene R*, 20 µl of *β-pinene R*, 10 µl of *β-myrcene R*, 20 µl of *limonene R*, 50 µl of *cineole R*, 10 µl of *p-cymene R*, 50 mg of *camphor R*, 30 mg of *bornyl acetate R*, 10 mg of *α-terpineol R*, 10 mg of *borneol R* and 10 µl of *verbenone R* in *hexane R* and dilute to 10.0 ml with the same solvent.

Column:

– *material*: fused silica,
– *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm,
– *stationary phase*: *macrogol 20 000 R*.

Carrier gas: *helium for chromatography R*.

Flow rate: 1 ml/min.

Split ratio: 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	50
	10 - 85	50 → 200
	85 - 110	200
Injection port		200
Detector		250

Detection: flame ionisation.

Injection: 1 µl.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

– *resolution*: minimum 1.5 between the peaks due to limonene and cineole and minimum 1.5 between the peaks due to α-terpineol and borneol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components.

For rosemary oil, Spanish type, the percentages are within the following ranges:

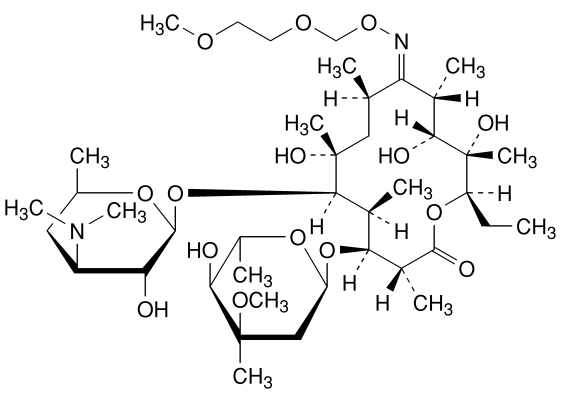
– *α-pinene*: 18 per cent to 26 per cent,
– *camphene*: 8.0 per cent to 12.0 per cent,
– *β-pinene*: 2.0 per cent to 6.0 per cent,
– *β-myrcene*: 1.5 per cent to 5.0 per cent,
– *limonene*: 2.5 per cent to 5.0 per cent,
– *cineole*: 16.0 per cent to 25.0 per cent,
– *p-cymene*: 1.0 per cent to 2.2 per cent,
– *camphor*: 13.0 per cent to 21.0 per cent,
– *bornyl acetate*: 0.5 per cent to 2.5 per cent,
– *α-terpineol*: 1.0 per cent to 3.5 per cent,
– *borneol*: 2.0 per cent to 4.5 per cent,
– *verbenone*: 0.7 per cent to 2.5 per cent.

For rosemary oil, Moroccan and Tunisian type, the percentages are within the following ranges:

– *α-pinene*: 9.0 per cent to 14.0 per cent,
– *camphene*: 2.5 per cent to 6.0 per cent,
– *β-pinene*: 4.0 per cent to 9.0 per cent,
– *β-myrcene*: 1.0 per cent to 2.0 per cent,
– *limonene*: 1.5 per cent to 4.0 per cent,
– *cineole*: 38.0 per cent to 55.0 per cent,
– *p-cymene*: 0.8 per cent to 2.5 per cent,
– *camphor*: 5.0 per cent to 15.0 per cent,
– *bornyl acetate*: 0.1 per cent to 1.5 per cent,
– *α-terpineol*: 1.0 per cent to 2.6 per cent,
– *borneol*: 1.5 per cent to 5.0 per cent,
– *verbenone*: maximum 0.4 per cent.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.



LABELLING

The label states that the content is Spanish type or Moroccan and Tunisian type.

01/2008:1146
corrected 6.0

ROXITHROMYCIN

Roxithromycinum

$C_{41}H_{76}N_2O_{15}$ M_r 837
[80214-83-1]

DEFINITION

(3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*S*,12*R*,13*S*,14*R*)-4-[(2,6-Dideoxy-3-*C*-methyl-3-*O*-methyl-α-L-*ribo*-hexopyranosyl)oxy]-14-ethyl-7,12,13-trihydroxy-10-[(*E*)-[(2-methoxyethoxy)methoxy]imino]-3,5,7,9,11,13-hexamethyl-6-[[3,4,6-trideoxy-3-(dimethylamino)-β-D-*xylo*-hexopyranosyl]oxy]oxacyclotetradecan-2-one (erythromycin 9-(*E*)-[*O*-[(2-methoxyethoxy)methyl]oxime]).

Semi-synthetic product derived from a fermentation product.

Content: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very slightly soluble in water, freely soluble in acetone, in alcohol and in methylene chloride. It is slightly soluble in dilute hydrochloric acid.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *roxithromycin CRS*.

If the spectra obtained shows differences, prepare further spectra using 90 g/l solutions in *methylene chloride R*.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 0.2 g in *methanol R* and dilute to 20 ml with the same solvent.

Specific optical rotation (*2.2.7*): – 93 to – 96 (anhydrous substance).

Dissolve 0.500 g in *acetone R* and dilute to 50.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Solution A. Mix 30 volumes of *acetonitrile R* and 70 volumes of a 48.6 g/l solution of *ammonium dihydrogen phosphate R*, adjusted to pH 5.3 with *dilute sodium hydroxide solution R*.

Test solution. Dissolve 50.0 mg of the substance to be examined in solution A and dilute to 25.0 ml with solution A.

Reference solution (a). Dissolve 50.0 mg of *roxithromycin CRS* in solution A and dilute to 25.0 ml with solution A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with solution A.

Reference solution (c). Dissolve 2.0 mg of *roxithromycin for system suitability CRS* in solution A and dilute to 1.0 ml with solution A.

Reference solution (d). Dilute 1.0 ml of *toluene R* to 100.0 ml with *acetonitrile R*. Dilute 0.2 ml of this solution to 200.0 ml with solution A.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 μm) with a 10 nm pore size and a carbon loading of about 19 per cent,
– *temperature*: 15 °C.

Mobile phase:

– *mobile phase A*: mix 26 volumes of *acetonitrile R* and 74 volumes of a 59.7 g/l solution of *ammonium dihydrogen phosphate R*, adjusted to pH 4.3 with *dilute sodium hydroxide solution R*,
– *mobile phase B*: *water R, acetonitrile R* (30:70 *V/V*),

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 50	100	0
50 - 51	100 → 90	0 → 10
51 - 80	90	10
80 - 81	90 → 100	10 → 0
81 - 100	100	0

Flow rate: 1.1 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 20 μl, using an injector maintained at 8 °C, of the test solution and reference solutions (b), (c) and (d).

Relative retention with reference to roxithromycin (retention time = about 22 min): impurity A = about 0.28; impurity B = about 0.31; impurity C = about 0.33; impurity D = about 0.62; impurity E = about 0.67; impurity F = about 0.83; impurity G = about 1.15; impurity K = about 1.7; impurity H = about 1.85; impurity J = about 2.65; impurity I = about 3.1.

System suitability: reference solution (c):

– *peak-to-valley ratio*: minimum 2.0, where H_p = height above the baseline of the peak due to impurity G and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to roxithromycin.

Limits:

– *impurity G*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),

– *impurities A, B, C, D, E, F, H, I, J*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),

– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent). Disregard any peak due to toluene (use reference solution (d) to identify it).

Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *acetone R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with the limit test B. Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *acetone R*.

Water (*2.5.12*): maximum 3.0 per cent, determined on 0.200 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances, with the following modifications.

Column:

– *size*: *l* = 0.25 m.

Mobile phase: mix 307 volumes of *acetonitrile R* and 693 volumes of a 49.1 g/l solution of *ammonium dihydrogen phosphate R* adjusted to pH 5.3 with *dilute sodium hydroxide solution R*.

Flow rate: 1.5 ml/min.

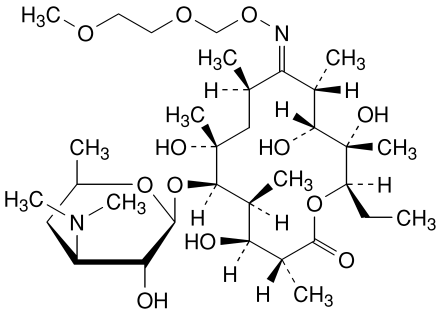
Injection: test solution and reference solutions (a) and (c).

Retention time: roxithromycin = about 12 min.

System suitability: reference solution (c):

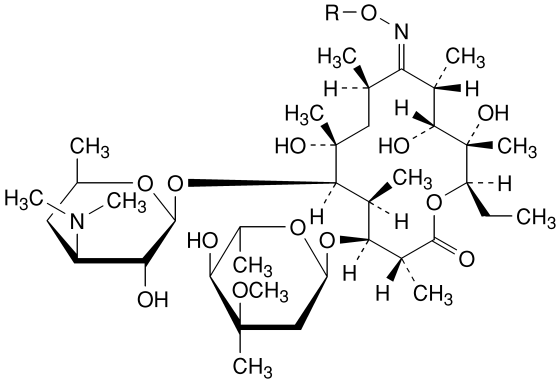
– *peak-to-valley ratio*: minimum 1.5, where H_p = height above the baseline of the peak due to impurity G and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to roxithromycin.

STORAGE



In an airtight container.

IMPURITIES



Specified impurities: A, B, C, D, E, F, G, H, I, J.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): K.

A. (3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-4-[(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl-α-L-*ribo*-hexopyranosyl)oxy]-14-ethyl-7,12,13-trihydroxy-3,5,7,9,11,13-hexamethyl-6-[[3,4,6-trideoxy-3-(dimethylamino)-β-D-*xylo*-hexopyranosyl]oxy]oxacyclotetradecane-2,10-dione (erythromycin A),

B. 3-*O*-de(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl-α-L-*ribo*-hexopyranosyl)erythromycin 9-(*E*)-[*O*-[(2-methoxyethoxy)methyl]oxime],

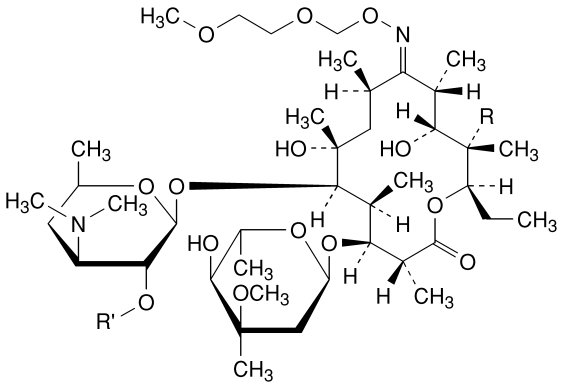
J. R = CH_2-O-CH_2-CH_2Cl: erythromycin 9-(*E*)-[*O*-[(2-chloroethoxy)methyl]oxime],

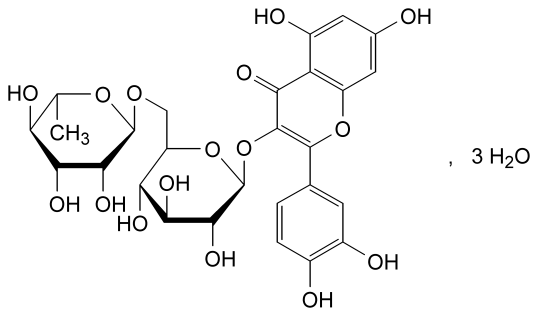
K. R = CH_2-O-CH_2-CH_2-O-CH_2OH: erythromycin 9-(*E*)-[*O*-[[2-(hydroxymethoxy)ethoxy]methyl]oxime],



D. erythromycin 9-(*Z*)-[*O*-[(2-methoxyethoxy)methyl]oxime],

E. R = H, R′ = CH_3: 3″-*O*-demethylerythromycin 9-(*E*)-[*O*-[(2-methoxyethoxy)methyl]oxime],

F. R = CH_3, R′ = H: 3′-*N*-demethylerythromycin 9-(*E*)-[*O*-[(2-methoxyethoxy)methyl]oxime],



H. R = R′ = H: 12-deoxyerythromycin 9-(*E*)-[*O*-[(2-methoxyethoxy)methyl]oxime],

I. R = OH, R′ = CH_2-O-CH_2-CH_2-OCH_3: 2′-*O*-[(2-methoxyethoxy)methyl]erythromycin 9-(*E*)-[*O*-[(2-methoxyethoxy)methyl]oxime].

01/2008:1795

RUTOSIDE TRIHYDRATE

Rutosidum trihydricum

$C_{27}H_{30}O_{16},3H_2O$ M_r 665

DEFINITION

3-[[6-*O*-(6-Deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-2-(3,4-dihydroxyphenyl)-5,7-dihydroxy-4*H*-1-benzopyran-4-one.

Content: 95.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: yellow or greenish-yellow, crystalline powder.

Solubility: practically insoluble in water, soluble in methanol, sparingly soluble in ethanol, practically insoluble in methylene chloride. It dissolves in solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Dissolve 50.0 mg in *methanol R*, dilute to 250.0 ml with the same solvent and filter if necessary. Dilute 5.0 ml of the solution to 50.0 ml with *methanol R*. Examined between 210 nm and 450 nm (*2.2.25*), the solution shows 2 absorption maxima, at 257 nm and 358 nm. The specific absorbance at the maximum at 358 nm is 305 to 330, calculated with reference to the anhydrous substance.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *rutoside trihydrate CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dissolve 25 mg of *rutoside trihydrate CRS* in *methanol R* and dilute to 10.0 ml with the same solvent.

Plate: *TLC silica gel G plate R*.

Mobile phase: *butanol R, anhydrous acetic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (5:10:10:30:50 *V/V/V/V/V*).

Application: 10 µl.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with a mixture of 7.5 ml of a 10 g/l solution of *potassium ferricyanide R* and 2.5 ml of *ferric chloride solution R1* and examine for 10 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve 10 mg in 5 ml of *alcohol R*, add 1 g of *zinc R* and 2 ml of *hydrochloric acid R1*. A red colour develops.

TESTS

Light absorbing impurities (*2.2.25*): maximum 0.10 at wavelengths between 450 nm and 800 nm.

Dissolve 0.200 g in 40 ml of *2-propanol R*. Stir for 15 min, dilute to 50.0 ml with *2-propanol R* and filter.

Substances insoluble in methanol: maximum 3 per cent.

Shake 2.5 g for 15 min in 50 ml of *methanol R* at 20-25 °C. Filter under reduced pressure through a sintered-glass filter (1.6) (*2.1.2*) previously dried for 15 min at 100-105 °C, allowed to cool in a desiccator and tared. Wash the filter 3 times with 20 ml of *methanol R*. Dry the filter for 30 min at 100-105 °C. Allow to cool and weigh. The residue weighs a maximum of 75 mg.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.10 g of the substance to be examined in 20 ml of *methanol R* and dilute to 100.0 ml with mobile phase B.

Reference solution (a). Dissolve 10.0 mg of *rutoside trihydrate CRS* in 10.0 ml of *methanol R*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 50.0 ml with mobile phase B.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm,

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm),
– *temperature*: 30 °C.

Mobile phase:
– *mobile phase A*: mix 5 volumes of *tetrahydrofuran R* with 95 volumes of a 15.6 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 3.0 with *phosphoric acid R*,
– *mobile phase B*: mix 40 volumes of *tetrahydrofuran R* with 60 volumes of a 15.6 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 3.0 with *phosphoric acid R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 10	50 → 0	50 → 100
10 - 15	0	100
15 - 16	0 → 50	100 → 50
16 - 20	50	50

Flow rate: 1 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl.

Relative retention with reference to rutoside (retention time = about 7 min): impurity B = about 1.1; impurity A = about 1.2; impurity C = about 2.5.

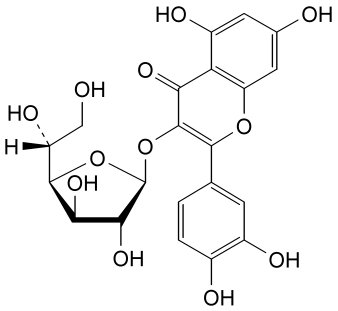
System suitability: reference solution (a):
– *peak-to-valley ratio*: minimum 10, where H_p = height above the baseline of the peak due to impurity B and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to rutoside.

Limits: locate the impurities by comparison with the chromatogram provided with *rutoside trihydrate CRS*.
– *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.8; impurity C = 0.5,
– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
– *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (4.0 per cent),
– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Water (*2.5.12*): 7.5 per cent to 9.5 per cent, determined on 0.100 g.

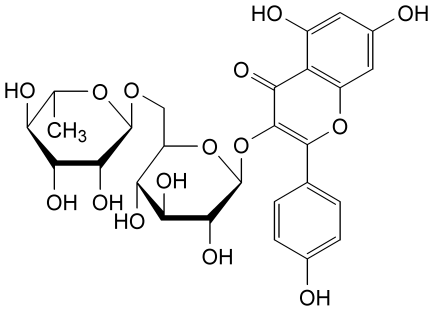
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



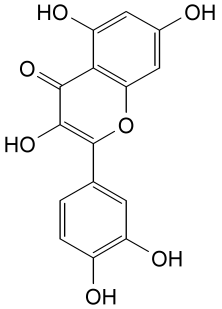
Dissolve 0.200 g in 20 ml of *dimethylformamide R*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 30.53 mg of $C_{27}H_{30}O_{16}$.



STORAGE

Protected from light.



IMPURITIES

A. 2-(3,4-dihydroxyphenyl)-3-(β-D-glucofuranosyloxy)-5,7-dihydroxy-4*H*-1-benzopyran-4-one (isoquercitroside),

B. 3-[[6-*O*-(6-deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-5,7-dihydroxy-2-(4-hydroxyphenyl)-4*H*-1-benzopyran-4-one (kaempferol 3-rutinoside),

C. 2-(3,4-dihydroxyphenyl)-3,5,7-trihydroxy-4*H*-1-benzopyran-4-one (quercetin).

SACCHARIN

Saccharinum

$C_7H_5NO_3S$ M_r 183.2
[81-07-2]

DEFINITION

1,2-Benzisothiazol-3(2*H*)-one 1,1-dioxide.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: sparingly soluble in boiling water and in ethanol (96 per cent), slightly soluble in cold water. It dissolves in dilute solutions of alkali hydroxides and carbonates.

IDENTIFICATION

First identification: C.

Second identification: A, B, D, E.

A. A saturated solution, prepared without heating, turns *blue litmus paper R* red.

B. Melting point (*2.2.14*): 226 °C to 230 °C.

C. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *saccharin CRS.*

D. Mix about 10 mg with about 10 mg of *resorcinol R*, add 0.25 ml of *sulphuric acid R* and carefully heat the mixture over a naked flame until a dark green colour is produced. Allow to cool, add 10 ml of *water R* and *dilute sodium hydroxide solution R* until an alkaline reaction is produced. An intense green fluorescence develops.

E. To 0.2 g add 1.5 ml of *dilute sodium hydroxide solution R*, evaporate to dryness and heat the residue carefully until it melts, avoiding carbonisation. Allow to cool, dissolve the mass in about 5 ml of *water R*, add *dilute hydrochloric acid R* until a weak acid reaction is produced and filter, if necessary. To the filtrate add 0.2 ml of *ferric chloride solution R2*. A violet colour develops.

TESTS

Solution S. Dissolve 5.0 g in 20 ml of a 200 g/l solution of *sodium acetate R* and dilute to 25 ml with the same solution.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

***o*- and *p*-Toluenesulphonamide**. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 25 mg of *caffeine R* in *methylene chloride R* and dilute to 100 ml with the same solvent.

Test solution. Suspend 10.0 g of the substance to be examined in 20 ml of *water R* and dissolve using 5-6 ml of *strong sodium hydroxide solution R*. If necessary adjust the solution to pH 7-8 with *1 M sodium hydroxide* or *1 M hydrochloric acid* and dilute to 50 ml with *water R*. Shake the solution with 4 quantities, each of 50 ml, of *methylene chloride R*. Combine the lower layers, dry over *anhydrous sodium sulphate R* and filter. Wash the filter and the sodium sulphate with 10 ml of *methylene chloride R*. Combine the solution and the washings and evaporate almost to dryness in a water-bath at a temperature not exceeding 40 °C. Using a small quantity of *methylene chloride R*, quantitatively transfer the residue into a suitable 10 ml tube, evaporate to dryness in a current of nitrogen and dissolve the residue in 1.0 ml of the internal standard solution.

Blank solution. Evaporate 200 ml of *methylene chloride R* to dryness in a water-bath at a temperature not exceeding 40 °C. Dissolve the residue in 1 ml of *methylene chloride R*.

Reference solution. Dissolve 20.0 mg of *o-toluenesulphonamide R* and 20.0 mg of *p-toluenesulphonamide R* in *methylene chloride R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *methylene chloride R*. Evaporate 5.0 ml of the final solution to dryness in a current of nitrogen. Dissolve the residue in 1.0 ml of the internal standard solution.

Column:

– *material*: fused silica,
– *size*: *l* = 10 m, Ø = 0.53 mm,
– *stationary phase*: *polymethylphenylsiloxane R* (film thickness 2 µm).

Carrier gas: *nitrogen for chromatography R.*

Flow rate: 10 ml/min.

Split ratio: 1:2.

Temperature:

– *column*: 180 °C,
– *injection port and detector*: 250 °C.

Detection: flame ionisation.

Injection: 1 µl.

Order of elution: *o*-toluenesulphonamide, *p*-toluenesulphonamide, caffeine.

System suitability:

– *resolution*: minimum 1.5 between the peaks due to *o*-toluenesulphonamide and *p*-toluenesulphonamide in the chromatogram obtained with the reference solution,
– the chromatogram obtained with the blank solution does not show any peak with the same retention times as the internal standard, *o*-toluenesulphonamide and *p*-toluenesulphonamide.

Limits:

– *o-toluenesulphonamide*: the ratio of its area to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the reference solution (10 ppm),
– *p-toluenesulphonamide*: the ratio of its area to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the reference solution (10 ppm).

Readily carbonisable substances. Dissolve 0.20 g in 5 ml of *sulphuric acid R* and keep at 48-50 °C for 10 min. When viewed against a white background, the solution is not more intensely coloured than a solution prepared by mixing 0.1 ml of red primary solution, 0.1 ml of blue primary solution and 0.4 ml of yellow primary solution (*2.2.2*) with 4.4 ml of *water R*.

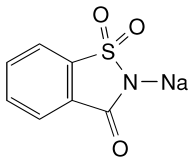
Heavy metals (*2.4.8*): maximum 20 ppm.

Dilute 10 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.500 g in 40 ml of *ethanol (96 per cent) R*. Add 40 ml of *water R*. Titrate with *0.1 M sodium hydroxide*, using a 10 g/l solution of *phenolphthalein R* in *ethanol (96 per cent) R* as indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 18.32 mg of $C_7H_5NO_3S$.

01/2008:0787

SACCHARIN SODIUM

Saccharinum natricum

$C_7H_4NNaO_3S$ M_r 205.2
[128-44-9]

DEFINITION

2-Sodio-1,2-benzisothiazol-3(2*H*)-one 1,1-dioxide.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

It may contain a variable quantity of water.

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals, efflorescent in dry air.

Solubility: freely soluble in water, sparingly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

A. Melting point (*2.2.14*): 226 °C to 230 °C.
To 5 ml of solution S (see Tests) add 3 ml of *dilute hydrochloric acid R*. A white precipitate is formed. Filter and wash with *water R*. Dry the precipitate at 100-105 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
Preparation: discs; dry the substances at 100-105 °C before use.
Comparison: *saccharin sodium CRS*.

C. Mix about 10 mg with about 10 mg of *resorcinol R*, add 0.25 ml of *sulphuric acid R* and carefully heat the mixture over a naked flame until a dark green colour is produced. Allow to cool, add 10 ml of *water R* and *dilute sodium hydroxide solution R* until an alkaline reaction is produced. An intense green fluorescence develops.

D. To 0.2 g add 1.5 ml of *dilute sodium hydroxide solution R*, evaporate to dryness and heat the residue carefully until it melts, avoiding carbonisation. Allow to cool, dissolve the mass in about 5 ml of *water R*, add *dilute hydrochloric acid R* until a weak acid reaction is produced and filter, if necessary. To the filtrate add 0.2 ml of *ferric chloride solution R2*. A violet colour develops.

E. Solution S gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 5.0 g in 25 ml of *carbon dioxide-free water R*.

Acidity or alkalinity. To 10 ml of solution S add about 0.05 ml of a 10 g/l solution of *phenolphthalein R* in *ethanol (96 per cent) R*. The solution is not pink. Add 0.1 ml of *sodium hydroxide 0.1 M*. The solution becomes pink.

***o*- and *p*-Toluenesulphonamide.** Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 25 mg of *caffeine R* in *methylene chloride R* and dilute to 100 ml with the same solvent.

Test solution. Dissolve 10.0 g of the substance to be examined in 50 ml of *water R*. If necessary adjust the solution to pH 7-8 by addition of *1 M sodium hydroxide* or *1 M hydrochloric acid*. Shake the solution with 4 quantities, each of 50 ml, of *methylene chloride R*. Combine the lower layers, dry over *anhydrous sodium sulphate R* and filter. Wash the filter and the sodium sulphate with 10 ml of *methylene chloride R*. Combine the solution and the washings and evaporate almost to dryness in a water-bath at a temperature not exceeding 40 °C. Using a small quantity of *methylene chloride R*, quantitatively transfer the residue into a suitable 10 ml tube, evaporate to dryness in a current of *nitrogen R* and add 1.0 ml of the internal standard solution.

Blank solution. Evaporate 200 ml of *methylene chloride R* to dryness in a water-bath at a temperature not exceeding 40 °C. Dissolve the residue in 1 ml of *methylene chloride R*.

Reference solution. Dissolve 20.0 mg of *o-toluenesulphonamide R* and 20.0 mg of *p-toluenesulphonamide R* in *methylene chloride R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *methylene chloride R*. Evaporate 5.0 ml of the final solution to dryness in a current of *nitrogen R*. Take up the residue using 1.0 ml of the internal standard solution.

Column:
- *material*: fused silica,
- *size*: *l* = 10 m, Ø = 0.53 mm,
- *stationary phase*: *polymethylphenylsiloxane R* (film thickness 2 µm).

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 10 ml/min.

Split ratio: 1:2.

Temperature:
- *column*: 180 °C,
- *injection port and detector*: 250 °C.

Detection: flame ionisation.

Injection: 1 µl.

Elution order: *o*-toluenesulphonamide, *p*-toluenesulphonamide, caffeine.

System suitability:
- *resolution*: minimum 1.5 between the peaks due to *o*-toluenesulphonamide and *p*-toluenesulphonamide in the chromatogram obtained with the reference solution,
- the chromatogram obtained with the blank solution does not show any peak with the same retention times as the internal standard, *o*-toluenesulphonamide and *p*-toluenesulphonamide.

Limits:

– *o-toluenesulphonamide*: the ratio of its area to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the reference solution (10 ppm),

– *p-toluenesulphonamide*: the ratio of its area to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the reference solution (10 ppm).

Readily carbonisable substances. Dissolve 0.20 g in 5 ml of *sulphuric acid R* and keep at 48-50 °C for 10 min. When viewed against a white background, the solution is not more intensely coloured than a solution prepared by mixing 0.1 ml of red primary solution, 0.1 ml of blue primary solution and 0.4 ml of yellow primary solution (*2.2.2*) with 4.4 ml of *water R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Water (*2.5.12*): maximum 15.0 per cent, determined on 0.200 g.

ASSAY

Dissolve 0.150 g in 50 ml of *anhydrous acetic acid R*, with slight heating if necessary. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 20.52 mg of $C_7H_4NNaO_3S$.

STORAGE

In an airtight container.

01/2008:2386

SAFFLOWER FLOWER

Carthami flos

DEFINITION

Dried flower of *Carthamus tinctorius* L.

Content: minimum 1.0 per cent of total flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

A. The orange-yellow or reddish-orange, tubular, gametalous, actinomorphic florets are separate from the capitulum. Each consists of a long, filiform tube, about 1 cm long divided into 5 equal, narrow, lanceolate lobes, about 0.5 cm long. From the opening of the tube emerges the hollow cylinder formed by the fused yellow anthers, in which the filiform style persists, thickened near the apex.

B. Reduce to a powder (355) (*2.9.12*). The powder is orange-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of the corolla tube with epidermis consisting of elongated, thin-walled polygonal cells; fragments of the lobes of the corolla showing at their apices a large number of small, rounded, very prominent papillae; fragments of parenchyma containing vascular bundles surrounded by secretory canals with reddish-brown contents; fragments of anthers consisting of irregularly shaped cells whose walls show thickenings in characteristic bands; fragments of the style, whose lower part consists of elongated cells and which ends in a stigma, bristling with rather long, conical, confluent papillae; rounded or elliptical triporate pollen grains up to 60 µm in diameter with an echinulate exine; calcium oxalate prisms, either isolated or present in parenchyma cells.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methanol R*. Sonicate for 10 min and centrifuge.

Reference solution. Dissolve 1 mg of *rutin R* and 5 mg of *quercetin dihydrate R* in 50 ml of *methanol R*.

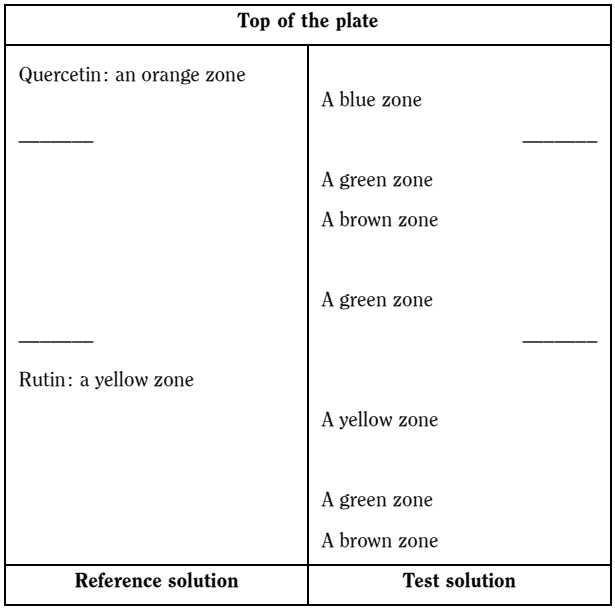
Plate: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase: *anhydrous formic acid R, acetic acid R, water R, ethyl acetate R* (11:11:27:100 *V/V/V/V*).

Application: 25 µl as bands of 15 mm [or 10 µl as bands of 8 mm].

Development: over a path of 12 cm [or 7 cm].

Drying: in air.



Detection A: examine in daylight.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Quercetin: a light yellow zone	
_____	_____
_____	_____
Rutin: a light yellow zone	
	A red zone
	A yellow zone
	A yellow zone
Reference solution	**Test solution**

Detection B: heat the plate at 100 °C for 3 min; spray the plate whilst still hot with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow the plate to dry in air for about 30 min; examine in ultraviolet light at 365 nm.

Results B: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

TESTS

Absorbance (*2.2.25*).

A. *Yellow pigment*: macerate 0.1 g of the powdered drug (355) (*2.9.12*) in 150 ml of *water R*, stir for 1 h, filter through a sintered-glass filter (40) (*2.1.2*) and dilute to 500.0 ml, washing the residue, with *water R*. The absorbance is not less than 0.40 at 401 nm.

B. *Red pigment*: to 0.25 g of the powdered drug (355) (*2.9.12*) add 50 ml of a mixture of 20 volumes of *water R* and 80 volumes of *acetone R*. Heat on a water-bath at 50 °C for 90 min. Allow to cool, filter through a sintered-glass filter (40) (*2.1.2*) and dilute to 100.0 ml, washing the residue with a mixture of 20 volumes of *water R* and 80 volumes of *acetone R*. The absorbance is not less than 0.40 at 518 nm.

Loss on drying (*2.2.32*): maximum 11.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 10.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 3.0 per cent.

ASSAY

Solution A. Place 0.250 g of the powdered drug (180) (*2.9.12*) in a 250 ml flask and add 95 ml of *methanol R*. Heat under a reflux condenser on a water-bath for 30 min. Allow to cool and filter. Rinse the filter with 5 ml of *methanol R*. Combine the filtrate and the rinsing solution in a volumetric flask and dilute to 100.0 ml with *methanol R*.

Test solution. Place 5.0 ml of solution A in a volumetric flask and dilute to 20.0 ml with a 20 g/l solution of *aluminium chloride R* in *methanol R*.

Compensation solution. Place 5.0 ml of solution A in a volumetric flask and dilute to 20.0 ml with *methanol R*.

After exactly 15 min, measure the absorbance (*2.2.25*) of the test solution at 420 nm by comparison with the compensation solution. Calculate the percentage content of total flavonoids, expressed as hyperoside, using the following expression:

$$\frac{A}{4 \times m}$$

taking the specific absorbance of hyperoside at 420 nm to be 400.

A = absorbance of the test solution, at 420 nm;

m = mass of the substance to be examined, in grams.

01/2008:2088

SAFFLOWER OIL, REFINED

Carthami oleum raffinatum

DEFINITION

Fatty oil obtained from seeds of *Carthamus tinctorius* L. (type I) or from seeds of hybrids of *Carthamus tinctorius* L. (type II), by expression and/or extraction followed by refining. Type II refined safflower oil is rich in oleic (*cis*-9-octadecenoic) acid.

It may contain a suitable antioxidant.

CHARACTERS

Appearance: clear, viscous, yellow to pale yellow liquid.

Solubility: miscible with light petroleum (bp: 40-60 °C), practically insoluble in alcohol.

	Refined safflower oil (type I)	Refined safflower oil (type II)
Relative density	about 0.922	about 0.914
Refractive index	about 1.476	about 1.472

IDENTIFICATION

First identification: B.

Second identification: A.

A. Carry out the identification of fatty oils by thin-layer chromatography (*2.3.2*). The chromatogram obtained is comparable with the type chromatogram for type I or type II refined safflower oil.

B. It complies with the test for composition of fatty acids (see Tests).

TESTS

Acid value (*2.5.1*): maximum 0.5.

Peroxide value (*2.5.5*): maximum 10.0. Maximum 5.0, if intended for the manufacture of parenteral dosage forms.

Unsaponifiable matter (*2.5.7*): maximum 1.5 per cent, determined on 5.0 g.

Alkaline impurities (*2.4.19*). It complies with the test for alkaline impurities in fatty oils.

Composition of fatty acids (*2.4.22, Method A*). Use the mixture of calibrating substances in Table 2.4.22.-3.

Composition of the fatty acid fraction of type I refined safflower oil:

- *saturated fatty acids of chain length less than C14*: maximum 0.2 per cent,
- *myristic acid*: maximum 0.2 per cent,
- *palmitic acid*: 4.0 per cent to 10.0 per cent,
- *stearic acid*: 1.0 per cent to 5.0 per cent,
- *oleic acid* (equivalent chain length on polyethyleneglycol adipate 18.3): 8.0 per cent to 21.0 per cent,
- *linoleic acid* (equivalent chain length on polyethyleneglycol adipate 18.9): 68.0 per cent to 83.0 per cent,
- *linolenic acid* (equivalent chain length on polyethyleneglycol adipate 19.7): maximum 0.5 per cent,
- *arachidic acid*: maximum 0.5 per cent,

– *eicosenoic acid* (equivalent chain length on polyethyleneglycol adipate 20.3): maximum 0.5 per cent,
– *behenic acid*: maximum 1.0 per cent.

Composition of the fatty acid fraction of type II refined safflower oil:

– *saturated fatty acids of chain length less than C14*: maximum 0.2 per cent,
– *myristic acid*: maximum 0.2 per cent,
– *palmitic acid*: 3.6 per cent to 6.0 per cent,
– *stearic acid*: 1.0 per cent to 5.0 per cent,
– *oleic acid* (equivalent chain length on polyethyleneglycol adipate 18.3): 70.0 per cent to 84.0 per cent,
– *linoleic acid* (equivalent chain length on polyethyleneglycol adipate 18.9): 7.0 per cent to 23.0 per cent,
– *linolenic acid* (equivalent chain length on polyethyleneglycol adipate 19.7): maximum 0.5 per cent,
– *arachidic acid*: maximum 1.0 per cent,
– *eicosenoic acid* (equivalent chain length on polyethyleneglycol adipate 20.3): maximum 1.0 per cent,
– *behenic acid*: maximum 1.2 per cent.

Brassicasterol (*2.4.23*): maximum 0.3 per cent of brassicasterol in the sterol fraction of the oil.

Water (*2.5.32*): maximum 0.1 per cent, determined on 5.00 g, if intended for use in the manufacture of parenteral dosage forms.

STORAGE

In a well-filled, airtight container, protected from light.

LABELLING

The label states:

– where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
– the type of oil (type I or type II).

01/2008:1370

SAGE LEAF (SALVIA OFFICINALIS)

Salviae officinalis folium

DEFINITION

Whole or cut dried leaves of *Salvia officinalis* L.

Content: minimum 15 ml/kg of essential oil for the whole drug and minimum 10 ml/kg of essential oil for the cut drug (anhydrous drug).

CHARACTERS

Sage leaf (*Salvia officinalis*) oil is rich in thujone.

IDENTIFICATION

A. The lamina of whole sage leaf (Salvia officinalis) is about 2 cm to 10 cm long and 1 cm to 2 cm wide, oblong-ovate, elliptical. The margin is finely crenate to smooth. The apex is rounded or subacute and the base is shrunken at the petiole and rounded or cordate. The upper surface is greenish-grey and finely granular; the lower surface is white and pubescent and shows a dense network of raised veinlets.

B. Reduce to a powder (355) (*2.9.12*). The powder is light grey to brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: very numerous articulated and bent trichomes with narrow elongated cells and a very thick cell at the base as well as fragments of these trichomes; fragments of the upper epidermis with pitted, somewhat polygonal cells; fragments of the lower epidermis with sinuous cells and numerous diacytic stomata (*2.8.3*); rare single glandular trichomes with a uni- or bicellular head and a stalk consisting of 1 to 4 cells; abundant glandular trichomes with a unicellular stalk and a head composed of 8 radiating cells with a raised common cuticle.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Shake 0.5 g of the freshly powdered drug (355) (*2.9.12*) with 5 ml of *ethanol R* for 5 min.

Reference solution. Dissolve 20 µl of *thujone R* and 25 µl of *cineole R* in 20 ml of *ethanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray the plate with a 200 g/l solution of *phosphomolybdic acid R* in *ethanol R* and heat at 100-105 °C for 10 min. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
	A blue zone (near the solvent front)
α-Thujone and β-thujone: 2 pinkish-violet zones	2 pinkish-violet zones (α-thujone and β-thujone)
Cineole: a blue zone	A blue zone (cineole)
	Blue zones
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 3 per cent of stems and maximum 2 per cent of other foreign matter.

Water (*2.2.13*): maximum 100 ml/kg, determined on 20.0 g.

Total ash (*2.4.16*): maximum 10.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs (*2.8.12*). Use 20.0 g of the substance to be examined, cut, if necessary, immediately before the assay, a 500 ml flask, 250 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

01/2008:1561

SAGE LEAF, THREE-LOBED

Salviae trilobae folium

DEFINITION

Whole or cut, dried leaves of *Salvia fructicosa* Mill. (*S. triloba* L. fil).

Content: minimum 18 ml/kg of essential oil in the whole drug (anhydrous drug) and minimum 12 ml/kg of essential oil in the cut drug (anhydrous drug).

CHARACTERS

Spicy odour when ground, similar to eucalyptus oil.

IDENTIFICATION

A. The lamina of the whole three-lobed sage leaf is about 8-50 mm long and about 4-20 mm wide, and oblong-ovate or lanceolate. The margin is finely crenate and undulate but indistinct owing to the dense hairy covering on both surfaces. The base is obtuse and sometimes bears 1 or 2 more or less developed lobes. The upper surface is grey-tomentose pubescent, the lower surface is densely white-tomentose pubescent; the venation is indistinct. The densely white-tomentose pubescent petiole is about 1 mm in diameter.

B. Reduce to a powder (355) (*2.9.12*). The powder is greyish-green and tomentose. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: very numerous, whole or fragmented, covering and glandular trichomes, scattered and attached to fragments of the epidermises; covering trichomes articulated, uniseriate, thick-walled and bluntly tapering, those on the upper epidermis straight, those on the lower epidermis longer, tortuous and more densely packed; glandular trichomes, some with a unicellular or bicellular head and a stalk consisting of from 1-4 cells, the majority having a short, unicellular stalk and a head composed of 8 radiating cells with a raised common cuticle; the upper epidermis with pitted and beaded cells, somewhat polygonal, with a few diacytic stomata (*2.8.3*); the lower epidermis with sinuous or wavy-walled cells and numerous diacytic stomata.

C. Examine the chromatogram obtained in the test for thujone.

Results: the chromatogram obtained with the test solution shows a blue zone due to cineole, equal or greater in size and intensity to the zone in the chromatogram obtained with the reference solution. Further zones are present.

TESTS

Thujone. Thin-layer chromatography (*2.2.27*).

Test solution. Shake 0.3 g of the freshly powdered drug (355) (*2.9.12*) with 5.0 ml of *anhydrous ethanol R* for 5 min.

Reference solution. Dissolve 20 µl of *thujone R* and 25 µl of *cineole R* in 20 ml of *anhydrous ethanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 200 g/l solution of *phosphomolybdic acid R* in *anhydrous ethanol R* and heat at 100-105 °C for 10 min. Examine in daylight.

Results: the chromatogram obtained with the reference solution shows in the middle part a blue zone (cineole) and in the upper part a pink-blue zone (thujone). The chromatogram obtained with the test solution shows no zone or a very faint pink-blue zone due to thujone.

Foreign matter (*2.8.2*): maximum 8 per cent of stems and maximum 2 per cent of other foreign matter.

Water (*2.2.13*): maximum 100 ml/kg, determined on 20.0 g.

Total ash (*2.4.16*): maximum 10.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs (*2.8.12*). Use 20.0 g of drug, if necessary cut immediately before the assay, a 500 ml flask, 250 ml of *water R* as the distillation liquid. Add 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

01/2008:1889

SAGE TINCTURE

Salviae tinctura

DEFINITION

Tincture produced from *Sage leaf (Salvia officinalis) (1370).*

Content: minimum 0.1 per cent *m/m* of essential oil.

PRODUCTION

The tincture is produced from 1 part of comminuted drug and 10 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

Appearance: brownish liquid with a characteristic odour.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. The tincture to be examined.

Reference solution. Dissolve 20 µl of *thujone R* and 25 µl of *cineole R* in 20 ml of *ethanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 200 g/l solution of *phosphomolybdic acid R* in *ethanol R* and heat at 100-105 °C for 10 min. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

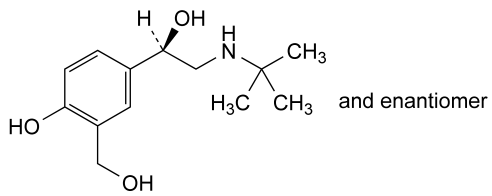
Top of the plate	
	A blue zone (near the solvent front)
———	———
α-Thujone and β-thujone: 2 pinkish-violet zones Cineole: a blue zone	2 pinkish-violet zones (α-thujone and β-thujone) A blue zone (cineole)
———	———
	Blue zones
Reference solution	**Test solution**

TESTS

Ethanol content (*2.9.10*): 64 per cent *V/V* to 69 per cent *V/V*.

Methanol and 2-propanol (*2.9.11*): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent of 2-propanol.

Dry residue (*2.8.16*): minimum 2.0 per cent *m/m*, determined on 3.00 g.



ASSAY

In a 500 ml round-bottomed flask, place 30.0 g of the tincture and add 100 ml of *water R*. Distil, using a descending condenser, into a separating funnel which has been marked beforehand at 50 ml. Stop the distillation process as soon as the distillate reaches the 50 ml mark. Rinse the condenser with 10 ml of *pentane R*. Dissolve in the distillate sufficient *sodium chloride R* to produce a saturated solution. Shake with 3 quantities, each of 20 ml, of *pentane R*. Dry the combined pentane layers, including the pentane from rinsing the condenser, over *anhydrous sodium sulphate R* and filter through a plug of absorbent cotton into a weighed 100 ml round-bottomed flask. Wash the sodium sulphate several times with small quantities of *pentane R*. Remove the pentane carefully at a temperature not exceeding 40 °C. Dry the residue in a desiccator over *diphosphorus pentoxide R* and hard paraffin at atmospheric pressure and at room temperature for 2 h. Weigh the residue (essential oil).

corrected 6.0

SALBUTAMOL

Salbutamolum

$C_{13}H_{21}NO_3$ M_r 239.3
[18559-94-9]

DEFINITION

(1*RS*)-2-[(1,1-Dimethylethyl)amino]-1-[4-hydroxy-3-(hydroxymethyl)phenyl]ethanol.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: sparingly soluble in water, soluble in ethanol (96 per cent).

mp: about 155 °C, with decomposition.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Dissolve 80.0 mg in a 10 g/l solution of *hydrochloric acid R* and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of the solution to 100.0 ml with a 10 g/l solution of *hydrochloric acid R*. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 276 nm. The specific absorbance at the absorption maximum is 66 to 75.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *salbutamol CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 50 ml with the same solvent.

Reference solution. Dissolve 10 mg of *salbutamol CRS* in *methanol R* and dilute to 50 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *concentrated ammonia R, water R, ethyl acetate R, 2-propanol R, methyl isobutyl ketone R* (3:18:35:45:50 *V/V/V/V/V*).

Application: 5 µl.

Development: over a path of 18 cm.

Drying: in air.

Detection: spray with a 1 g/l solution of *methylbenzothiazolone hydrazone hydrochloride R* in a 90 per cent *V/V* solution of *methanol R*, followed by a 20 g/l solution of *potassium ferricyanide R* in a mixture of 1 volume of *concentrated ammonia R1* and 3 volumes of *water R*, followed by a further spraying with a 1 g/l solution of *methylbenzothiazolone hydrazone hydrochloride R* in a 90 per cent *V/V* solution of *methanol R*.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve about 10 mg in 50 ml of a 20 g/l solution of *disodium tetraborate R*. Add 1 ml of a 30 g/l solution of *aminopyrazolone R*, 10 ml of *methylene chloride R* and 10 ml of a 20 g/l solution of *potassium ferricyanide R*. Shake and allow to separate. An orange-red colour develops in the methylene chloride layer.

TESTS

Solution S. Dissolve 0.50 g in *methanol R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

Optical rotation (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 2.0 mg of *salbutamol CRS*, 2.0 mg of *salbutamol impurity B CRS*, 3.0 mg of *salbutamol impurity D CRS*, 3.0 mg of *salbutamol impurity F CRS* and

3.0 mg of *salbutamol impurity G CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve the contents of 1 vial of *salbutamol impurity I CRS* with 1 ml of the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 3.9 mm,

– *stationary phase*: spherical *end-capped octylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 335 m^2/g, a pore size of 10 nm and a carbon loading of 11.7 per cent.

Mobile phase: mix 22 volumes of *acetonitrile R* and 78 volumes of a solution containing 2.87 g/l of *sodium heptanesulphonate R* and 2.5 g/l of *potassium dihydrogen phosphate R* previously ajusted to pH 3.65 with *dilute phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl.

Run time: 25 times the retention time of salbutamol.

Relative retention with reference to salbutamol (retention time = about 1.9 min): impurity B = about 1.3; impurity A = about 1.7; impurity C = about 2.0; impurity D = about 2.7; impurity H = about 3.0; impurity E = about 3.1; impurity G = about 4.1; impurity F = about 6.2; impurity I = about 23.2.

Identification of impurities: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity I.

System suitability: reference solution (a):

– *resolution*: minimum 3.0 between the peaks due to salbutamol and impurity B.

Limits:

– *impurity D*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.3 per cent),

– *impurity F*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.3 per cent),

– *impurity G*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.3 per cent),

– *impurities A, B, C, E, H, I*: for each impurity, not more than 1.5 times the area of the peak due to salbutamol in the chromatogram obtained with reference solution (a) (0.3 per cent),

– *total*: maximum 1.0 per cent,

– *disregard limit*: 0.05 per cent.

Impurity J: maximum 0.2 per cent.

Dissolve 50.0 mg in a 1 g/l solution of *hydrochloric acid R* and dilute to 25.0 ml with the same solvent. The absorbance (*2.2.25*) of the solution measured at 310 nm is not greater than 0.10.

Boron: maximum 50 ppm.

Test solution. To 50 mg of the substance to be examined add 5 ml of a solution containing 13 g/l of *anhydrous sodium carbonate R* and 17 g/l of *potassium carbonate R*. Evaporate to dryness on a water-bath and dry at 120 °C. Ignite the residue rapidly until the organic matter has been destroyed, allow to cool and add 0.5 ml of *water R* and 3.0 ml of a freshly prepared 1.25 g/l solution of *curcumin R* in *glacial acetic acid R*. Warm gently to effect solution, allow to cool and add 3.0 ml of a mixture prepared by adding 5 ml of *sulphuric acid R*, slowly and with stirring, to 5 ml of *glacial acetic acid R*. Mix and allow to stand for 30 min. Dilute to 100.0 ml with *ethanol (96 per cent) R*, filter and use the filtrate.

Reference solution. Dissolve 0.572 g of *boric acid R* in 1000.0 ml of *water R*. Dilute 1.0 ml to 100.0 ml with *water R*. To 2.5 ml of the solution add 5 ml of a solution containing 13 g/l of *anhydrous sodium carbonate R* and 17 g/l of *potassium carbonate R*, and treat this mixture in the same manner as the test solution.

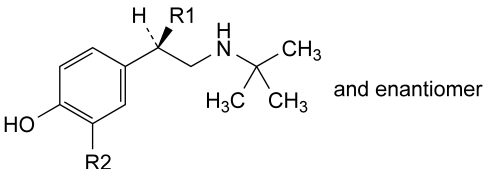
Measure the absorbance (*2.2.25*) of the test solution and of the reference solution at the maximum at about 555 nm. The absorbance of the test solution is not greater than that of the reference solution.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 30 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



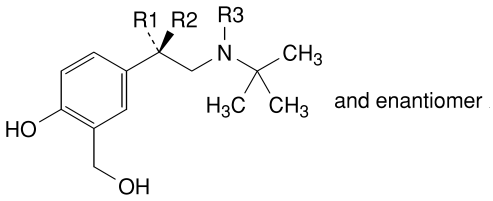
1 ml of *0.1 M perchloric acid* is equivalent to 23.93 mg of $C_{13}H_{21}NO_3$.

STORAGE

Protected from light.

IMPURITIES

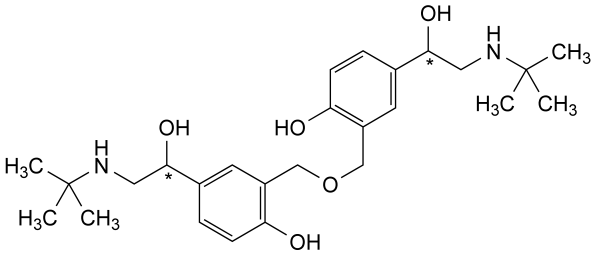
Specified impurities: A, B, C, D, E, F, G, H, I, J.



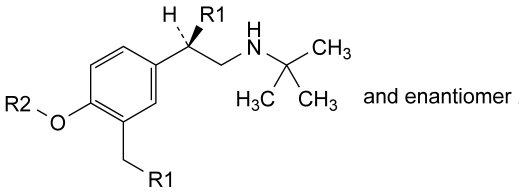
A. R1 = OCH_3, R2 = CH_2OH: [5-[(1*RS*)-2-[(1,1-dimethylethyl)amino]-1-methoxyethyl]-2-hydroxyphenyl]methanol,

B. R1 = OH, R2 = H: (1*RS*)-2-[(1,1-dimethylethyl)amino]-1-(4-hydroxyphenyl)ethanol,

C. R1 = OH, R2 = CH_3: (1*RS*)-2-[(1,1-dimethylethyl)amino]-1-(4-hydroxy-3-methylphenyl)ethanol,



D. R1 = OH, R2 = CHO: 5-[(1*RS*)-2-[(1,1-dimethylethyl)amino]-1-hydroxyethyl]-2-hydroxybenzaldehyde,

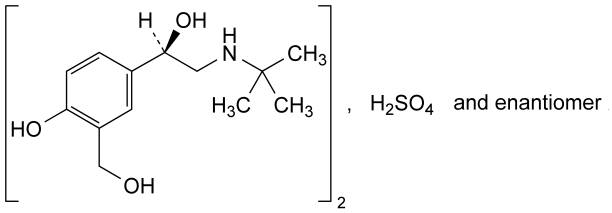


E. R1 = H, R2 = OH, R3 = CH_2-C_6H_5: (1*RS*)-2-[benzyl(1,1-dimethylethyl)amino]-1-[4-hydroxy-3-(hydroxymethyl)phenyl]ethanol,

G. R1 + R2 = O, R3 = CH_2-C_6H_5: 2-[benzyl(1,1-dimethylethyl)amino]-1-[4-hydroxy-3-(hydroxymethyl)phenyl]ethanone,

J. R1 + R2 = O, R3 = H: 2-[(1,1-dimethylethyl)amino]-1-[4-hydroxy-3-(hydroxymethyl)phenyl]ethanone (salbutamone),

F. 1,1′-[oxybis[methylene(4-hydroxy-1,3-phenylene)]]bis[2-[(1,1-dimethylethyl)amino]ethanol],



H. R1 = R2 = H: 4-[2-[(1,1-dimethylethyl)amino]ethyl]-2-methylphenol,

I. R1 = OH, R2 = CH_2-C_6H_5: (1*RS*)-2-[(1,1-dimethylethyl)amino]-1-[3-(hydroxymethyl)-4-benzyloxyphenyl]ethanol.

SALBUTAMOL SULPHATE

Salbutamoli sulfas

$C_{26}H_{44}N_2O_{10}S$ M_r 576.7
[51022-70-9]

DEFINITION

Bis[(1*RS*)-2-[(1,1-dimethylethyl)amino]-1-[4-hydroxy-3-(hydroxymethyl)phenyl]ethanol] sulphate.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, practically insoluble or very slightly soluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

A. Dissolve 80.0 mg in a 10 g/l solution of *hydrochloric acid R* and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of the solution to 100.0 ml with a 10 g/l solution of *hydrochloric acid R*. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 276 nm. The specific absorbance at the absorption maximum is 55 to 64.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs of *potassium bromide R*.

Comparison: *salbutamol sulphate CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 12 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 12 mg of *salbutamol sulphate CRS* in *water R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *concentrated ammonia R, water R, ethyl acetate R, 2-propanol R, methyl isobutyl ketone R* (3:18:35:45:50 *V/V/V/V/V*).

Application: 1 µl.

Development: over a path of 18 cm.

Drying: in air.

Detection: spray with a 1 g/l solution of *methylbenzothiazolone hydrazone hydrochloride R* in a 90 per cent *V/V* solution of *methanol R*, followed by a 20 g/l solution of *potassium ferricyanide R* in a mixture of 1 volume of *concentrated ammonia R1* and 3 volumes of *water R*, followed by a further spraying with a 1 g/l solution of *methylbenzothiazolone hydrazone hydrochloride R* in a 90 per cent *V/V* solution of *methanol R*.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve about 10 mg in 50 ml of a 20 g/l solution of *disodium tetraborate R*. Add 1 ml of a 30 g/l solution of *aminopyrazolone R*, 10 ml of *methylene chloride R* and 10 ml of a 20 g/l solution of *potassium ferricyanide R*. Shake and allow to separate. An orange-red colour develops in the methylene chloride layer.

E. It gives reaction (a) of sulphates (*2.3.1*).

TESTS

Solution S. Dissolve 0.250 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Optical rotation (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

Acidity or alkalinity. To 10 ml of solution S add 0.15 ml of *methyl red solution R* and 0.2 ml of *0.01 M sodium hydroxide*. The solution is yellow. Not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to red.

Impurity J: maximum 0.2 per cent.

Dissolve 60.0 mg in a 1 g/l solution of *hydrochloric acid R* and dilute to 25.0 ml with the same solvent. The absorbance (*2.2.25*) of the solution measured at 310 nm is not greater than 0.10.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 2.4 mg of *salbutamol sulphate CRS*, 2.0 mg of *salbutamol impurity B CRS*, 3.0 mg of *salbutamol impurity D CRS*, 3.0 mg of *salbutamol impurity F CRS* and 3.0 mg of *salbutamol impurity G CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve the contents of one vial of *salbutamol impurity I CRS* with 1 ml of the mobile phase.

Column:

- *size*: *l* = 0.15 m, Ø = 3.9 mm,
- *stationary phase*: spherical *end-capped octylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 335 m^2/g, a pore size of 10 nm and a carbon loading of 11.7 per cent.

Mobile phase: mix 22 volumes of *acetonitrile R* and 78 volumes of a solution containing 2.87 g/l of *sodium heptanesulphonate R* and 2.5 g/l of *potassium dihydrogen phosphate R* previously adjusted to pH 3.65 with *dilute phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl.

Run time: 25 times the retention time of salbutamol.

Relative retention with reference to salbutamol (retention time = about 1.9 min): impurity B = about 1.3, impurity A = about 1.7, impurity C = about 2.0, impurity D = about 2.7, impurity H = about 3.0, impurity E = about 3.1, impurity G = about 4.1, impurity F = about 6.2, impurity I = about 23.2.

Identification of impurities: use the chromatogram obtained with reference solution (b) to identify the peak due to impurity I.

System suitability: reference solution (a):

- *resolution*: minimum 3.0 between the peaks due to salbutamol and impurity B.

Limits:

- *impurity D*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- *impurity F*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- *impurity G*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- *impurities A, B, C, E, H, I*: for each impurity, not more than 1.5 times the area of the peak due to salbutamol in the chromatogram obtained with reference solution (a) (0.3 per cent),
- *total*: maximum 1.0 per cent,
- *disregard limit*: 0.05 per cent.

Boron: maximum 50 ppm.

Test solution. To 50 mg of the substance to be examined add 5 ml of a solution containing 13 g/l of *anhydrous sodium carbonate R* and 17 g/l of *potassium carbonate R*. Evaporate to dryness on a water-bath and dry at 120 °C. Ignite the residue rapidly until the organic matter has been destroyed, allow to cool and add 0.5 ml of *water R* and 3.0 ml of a freshly prepared 1.25 g/l solution of *curcumin R* in *glacial acetic acid R*. Warm gently to effect solution, allow to cool and add 3.0 ml of a mixture prepared by adding 5 ml of *sulphuric acid R*, slowly and with stirring, to 5 ml of *glacial acetic acid R*. Mix and allow to stand for 30 min. Dilute to 100.0 ml with *ethanol (96 per cent) R*, filter and use the filtrate.

Reference solution. Dissolve 0.572 g of *boric acid R* in 1000.0 ml of *water R*. Dilute 1.0 ml to 100.0 ml with *water R*. To 2.5 ml of the solution add 5 ml of a solution containing 13 g/l of *anhydrous sodium carbonate R* and 17 g/l of *potassium carbonate R*, and treat this mixture in the same manner as the test solution.

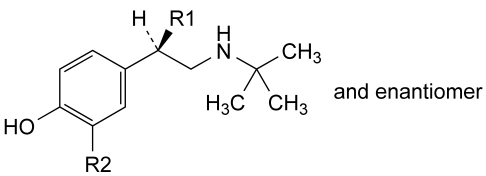
Measure the absorbance (*2.2.25*) of the test solution and of the reference solution at the maximum at about 555 nm. The absorbance of the test solution is not greater than that of the reference solution.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 5 ml of *anhydrous formic acid R* and add 35 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



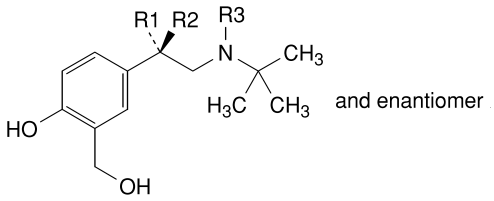
1 ml of *0.1 M perchloric acid* is equivalent to 57.67 mg of $C_{26}H_{44}N_2O_{10}S$.

STORAGE

Protected from light.

IMPURITIES

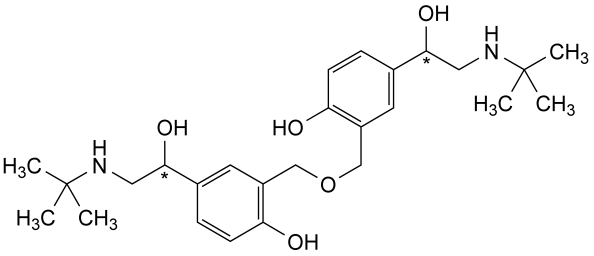
Specified impurities: A, B, C, D, E, F, G, H, I, J.



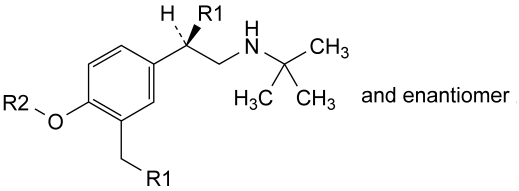
A. R1 = OCH_3, R2 = CH_2OH: [5-[(1*RS*)-2-[(1,1-dimethylethyl)amino]-1-methoxyethyl]-2-hydroxyphenyl]methanol,

B. R1 = OH, R2 = H: (1*RS*)-2-[(1,1-dimethylethyl)amino]-1-(4-hydroxyphenyl)ethanol,

C. R1 = OH, R2 = CH_3: (1*RS*)-2-[(1,1-dimethylethyl)amino]-1-(4-hydroxy-3-methylphenyl)ethanol,



D. R1 = OH, R2 = CHO: 5-[(1*RS*)-2-[(1,1-dimethylethyl)amino]-1-hydroxyethyl]-2-hydroxybenzaldehyde,

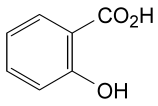


E. R1 = H, R2 = OH, R3 = CH_2-C_6H_5: (1*RS*)-2-[benzyl(1,1-dimethylethyl)amino]-1-[4-hydroxy-3-(hydroxymethyl)phenyl]ethanol,

G. R1 + R2 = O, R3 = CH_2-C_6H_5: 2-[benzyl(1,1-dimethylethyl)amino]-1-[4-hydroxy-3-(hydroxymethyl)phenyl]ethanone,

J. R1 + R2 = O, R3 = H: 2-[(1,1-dimethylethyl)amino]-1-[4-hydroxy-3-(hydroxymethyl)phenyl]ethanone (salbutamone),

F. 1,1′-[oxybis[methylene(4-hydroxy-1,3-phenylene)]]bis[2-[(1,1-dimethylethyl)amino]ethanol],



H. R1 = R2 = H: 4-[2-[(1,1-dimethylethyl)amino]ethyl]-2-methylphenol,

I. R1 = OH, R2 = CH_2-C_6H_5: (1*RS*)-2-[(1,1-dimethylethyl)amino]-1-[3-(hydroxymethyl)-4-benzyloxyphenyl]ethanol.

corrected 6.0

SALICYLIC ACID

Acidum salicylicum

$C_7H_6O_3$ M_r 138.1
[69-72-7]

DEFINITION

2-Hydroxybenzenecarboxylic acid.

Content: 99.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or white or colourless, acicular crystals.

Solubility: slightly soluble in water, freely soluble in ethanol (96 per cent), sparingly soluble in methylene chloride.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. Melting point (*2.2.14*): 158 °C to 161 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *salicylic acid CRS*.

C. Dissolve about 30 mg in 5 ml of *0.05 M sodium hydroxide*, neutralise if necessary and dilute to 20 ml with *water R*. 1 ml of the solution gives reaction (a) of salicylates (*2.3.1*).

TESTS

Solution S. Dissolve 2.5 g in 50 ml of boiling *distilled water R*, cool and filter.

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 1 g in 10 ml of *ethanol (96 per cent) R*.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.50 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 10 mg of *phenol R* (impurity C) in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *salicylic acid impurity B CRS* in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (c). Dissolve 50 mg of *4-hydroxybenzoic acid R* (impurity A) in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (e). Dilute a mixture of 1.0 ml of each of reference solutions (a), (b) and (c) to 10.0 ml with the mobile phase.

Reference solution (f). Dilute a mixture of 0.1 ml of each of reference solutions (a), (b) and (c) to 10.0 ml with the mobile phase.

Column:
- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: non-deactivated *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *glacial acetic acid R, methanol R, water R* (1:40:60 *V/V/V*).

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 270 nm.

Injection: 10 µl of the test solution and reference solutions (d), (e) and (f).

Relative retention with reference to impurity C: impurity A = about 0.70; impurity B = about 0.90.

System suitability: reference solution (e):
- the 3rd peak in the chromatogram corresponds to the peak due to phenol in the chromatogram obtained with reference solution (d);
- *resolution*: minimum 1.0 between the peaks due to impurities B and C; if necessary, adjust the quantity of acetic acid in the mobile phase.

Limits:
- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.1 per cent);

– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.05 per cent);
– *impurity C*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.02 per cent);
– *any other impurity*: for each impurity, not more than the area of the peak due to impurity B in the chromatogram obtained with reference solution (f) (0.05 per cent);
– *total*: not more than twice the area of the peak due to impurity A in the chromatogram obtained with reference solution (f) (0.2 per cent);
– *disregard limit*: 0.01 times the area of the principal peak in the chromatogram obtained with reference solution (f).

Chlorides (*2.4.4*): maximum 100 ppm.

Dilute 10 ml of solution S to 15 ml with *water R*.

Sulphates: maximum 200 ppm.

Dissolve 1.0 g in 5 ml of *dimethylformamide R* and add 4 ml of *water R*. Mix thoroughly. Add 0.2 ml of *dilute hydrochloric acid R* and 0.5 ml of a 25 per cent *m/m* solution of *barium chloride R*. After 15 min any opalescence in the solution is not more intense than that in a standard prepared as follows: to 2 ml of *sulphate standard solution (100 ppm SO_4) R* add 0.2 ml of *dilute hydrochloric acid R*, 0.5 ml of a 25 per cent *m/m* solution of *barium chloride R*, 3 ml of *water R* and 5 ml of *dimethylformamide R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

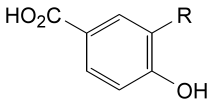
Dissolve 2.0 g in 15 ml of *ethanol (96 per cent) R* and add 5 ml of *water R*. 12 ml of the solution complies with test B. Prepare the reference solution using lead standard solution (2 ppm Pb) prepared by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 5 volumes of *water R* and 15 volumes of *ethanol (96 per cent) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in a desiccator.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 2.0 g.

ASSAY

Dissolve 0.120 g in 30 ml of *ethanol (96 per cent) R* and add 20 ml of *water R*. Titrate with *0.1 M sodium hydroxide*, using 0.1 ml of *phenol red solution R* as indicator.



1 ml of *0.1 M sodium hydroxide* is equivalent to 13.81 mg of $C_7H_6O_3$.

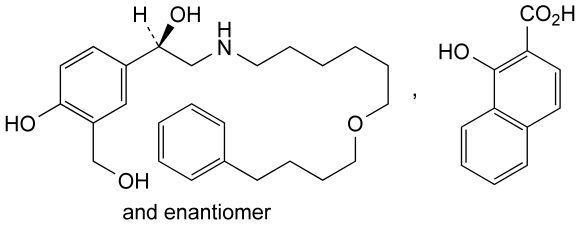
STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C.

A. R = H: 4-hydroxybenzoic acid,



B. R = CO_2H: 4-hydroxyisophthalic acid,

C. phenol.

01/2008:1765

SALMETEROL XINAFOATE

Salmeteroli xinafoas

and enantiomer

$C_{36}H_{45}NO_7$ M_r 604
[94749-08-3]

DEFINITION

(1*RS*)-1-[4-Hydroxy-3-(Hydroxymethyl)phenyl]-2-[[6-(4-phenylbutoxy)hexyl]amino]ethanol 1-hydroxynaphthalene-2-carboxylate.

Content: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, soluble in methanol, slightly soluble in anhydrous ethanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *salmeterol xinafoate CRS*.

TESTS

Related substances. Liquid chromatography (*2.2.29*). *Protect the solutions from light.*

Solvent mixture: *acetonitrile R, water R* (50:50 *V/V*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dissolve 11 mg of *salmeterol xinafoate for system suitability CRS* (salmeterol containing impurities E and G) in the solvent mixture and dilute to 2 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: mix 24 volumes of a 7.71 g/l solution of *ammonium acetate R* with 24 volumes of a 28.84 g/l solution of *sodium dodecyl sulphate R* and adjust to pH 2.7 with *glacial acetic acid R*; mix with 52 volumes of *acetonitrile R*;
– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 16	100	0
16 - 36	100 → 30	0 → 70
36 - 45	30	70
45 - 50	30 → 100	70 → 0

Flow rate: 2 ml/min.

Detection: spectrophotometer at 278 nm.

Injection: 20 µl; inject the solvent mixture as a blank solution.

Relative retention with reference to salmeterol (retention time = about 13 min): xinafoic acid = about 0.2; impurity A = about 0.3; impurity B = about 0.5; impurity C = about 0.7; impurity D = about 0.8; impurity E = about 0.9; impurity F = about 1.6; impurity G = about 2.7.

System suitability: reference solution (a):

– *peak-to-valley ratio*: minimum 10, where H_p = height above the baseline of the peak due to impurity E and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to salmeterol,
– the chromatogram obtained is similar to the chromatogram supplied with *salmeterol xinafoate for system suitability CRS*.

Limits:

– *impurity D*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
– *impurities A, F, G*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
– *impurities B, C, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
– *total*: not more than 9 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.9 per cent),
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard the peak due to xinafoic acid and any peaks due to the blank.

Water (*2.5.12*): maximum 0.5 per cent, determined on 1.000 g.

Dissolve the sample with 30 ml of *anhydrous methanol R*.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Dissolve 12.50 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 12.50 mg of *salmeterol xinafoate CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) described in the test for related substances to 20 ml with the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 24 volumes of a 7.71 g/l solution of *ammonium acetate R* with 24 volumes of a 28.84 g/l solution of *sodium dodecyl sulphate R* and adjust to pH 2.7 with *glacial acetic acid R*. Mix with 52 volumes of *acetonitrile R*.

Flow rate: 2 ml/min.

Detection: spectrophotometer at 278 nm.

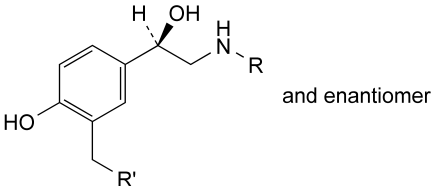
Injection: 20 µl.

Run time: until complete elution of the peak due to salmeterol (about 16 min).

System suitability: reference solution (b):

– *peak-to-valley ratio*: minimum 10, where H_p = height above the baseline of the peak due to impurity E and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to salmeterol.

The stationary phase may be regenerated using the gradient described under the test for related substances.



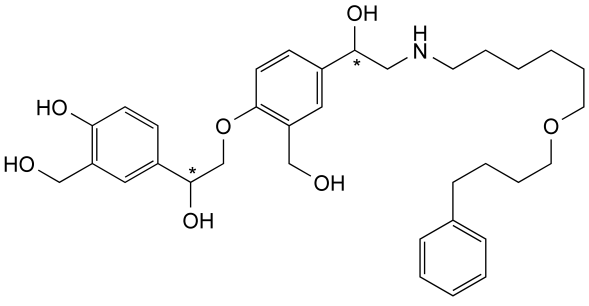
Calculate the percentage content of $C_{36}H_{45}NO_7$ using the chromatogram obtained with reference solution (a) and the declared content of $C_{36}H_{45}NO_7$ in *salmeterol xinafoate CRS*.

STORAGE

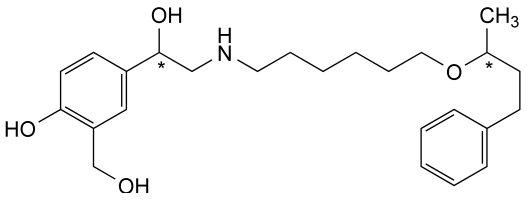
Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G.

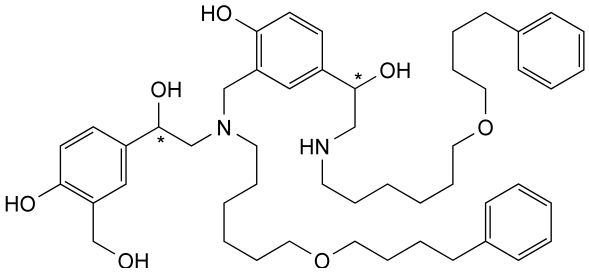


A. R = $[CH_2]_4$-C_6H_5, R′ = OH: (1*RS*)-1-[4-hydroxy-3-(hydroxymethyl)phenyl]-2-[(4-phenylbutyl)amino]ethanol,



B. R = $[CH_2]_6$-O-$[CH_2]_2$-C_6H_5, R′ = OH: (1*RS*)-1-[4-hydroxy-3-(hydroxymethyl)phenyl]-2-[[6-(2-phenylethoxy)hexyl]amino]ethanol,

C. R = $[CH_2]_6$-O-$[CH_2]_3$-C_6H_5, R′ = OH: (1*RS*)-1-[4-hydroxy-3-(hydroxymethyl)phenyl]-2-[[6-(3-phenylpropoxy)hexyl]amino]ethanol,



F. R = $[CH_2]_6$-O-$[CH_2]_4$-C_6H_5, R′ = H: (1*RS*)-1-(4-hydroxy-3-methylphenyl)-2-[[6-(4-phenylbutoxy)hexyl]amino]ethanol,

D. 1-[4-[2-hydroxy-2-[4-hydroxy-3-(hydroxymethyl)phenyl]ethoxy]-3-(hydroxymethyl)phenyl]-2-[[6-(3-phenylbutoxy)hexyl]amino]ethanol,

E. 1-[4-hydroxy-3-(hydroxymethyl)phenyl]-2-[[6-(1-methyl-3-phenylpropoxy)hexyl]amino]ethanol,

G. 1-[4-hydroxy-3-[[[2-hydroxy-2-[4-hydroxy-3-(hydroxymethyl)phenyl]ethyl][6-(4-phenylbutoxy)hexyl]amino]methyl]phenyl]-2-[[6-(4-phenylbutoxy)hexyl]amino]ethanol.

01/2008:1910

SALMON OIL, FARMED

Salmonis domestici oleum

DEFINITION

Purified fatty oil obtained from fresh farmed *Salmo salar*. The positional distribution (β(2)-acyl) is 60-70 per cent for cervonic (docosahexaenoic) acid (C22:6 n-3; DHA), 25-35 per cent for timnodonic (eicosapentaenoic) acid (C20:5 n-3; EPA) and 40-55 per cent for moroctic acid (C18:4 n-3).

Content:

– sum of the contents of EPA and DHA (expressed as triglycerides): 10.0 per cent to 28.0 per cent.

Authorised antioxidants in concentrations not exceeding the levels specified by the competent authority may be added.

PRODUCTION

The fish shall only be given feed with a composition that is in accordance with the relevant EU or other applicable regulations.

The oil is produced by mechanical expression of fresh raw materials, either from the whole fish, or fish where the fillets have been removed, at a temperature not exceeding 100 °C, and without using solvents. After centrifugation, solid substances may be removed from the oil by cooling and filtering (winterisation).

CHARACTERS

Appearance: pale pink liquid.

Solubility: practically insoluble in water, very soluble in acetone and in heptane, slightly soluble in anhydrous ethanol.

IDENTIFICATION

Examine the ^{13}C NMR spectra obtained in the assay for positional distribution (β(2)-acyl) of fatty acids. The spectra contain peaks between 172 ppm and 173 ppm with shifts similar to those in the type spectrum (Figure 1910.-2). The oil to be examined complies with the limits of this assay.

TESTS

Absorbance (*2.2.25*): minimum 0.10, measured at the maximum between 470 nm and 480 nm.

Dissolve 5.0 ml in 5.0 ml of *trimethylpentane R*.

Acid value (*2.5.1*): maximum 2.0.

Anisidine value (*2.5.36*): maximum 10.0.

Peroxide value (*2.5.5, Method A*): maximum 5.0.

Unsaponifiable matter (*2.5.7*): maximum 1.5 per cent, determined on 5.0 g.

Linoleic acid (*2.4.29*): maximum 11.0 per cent.

Identify the peak due to linoleic acid using the chromatogram in Figure 1910.-1. Determine the percentage content by normalisation.

ASSAY

Positional distribution (β(2)-acyl) of fatty acids (*2.2.33*)
Use a high resolution FT-NMR spectrometer operating at minimum 300 MHz.

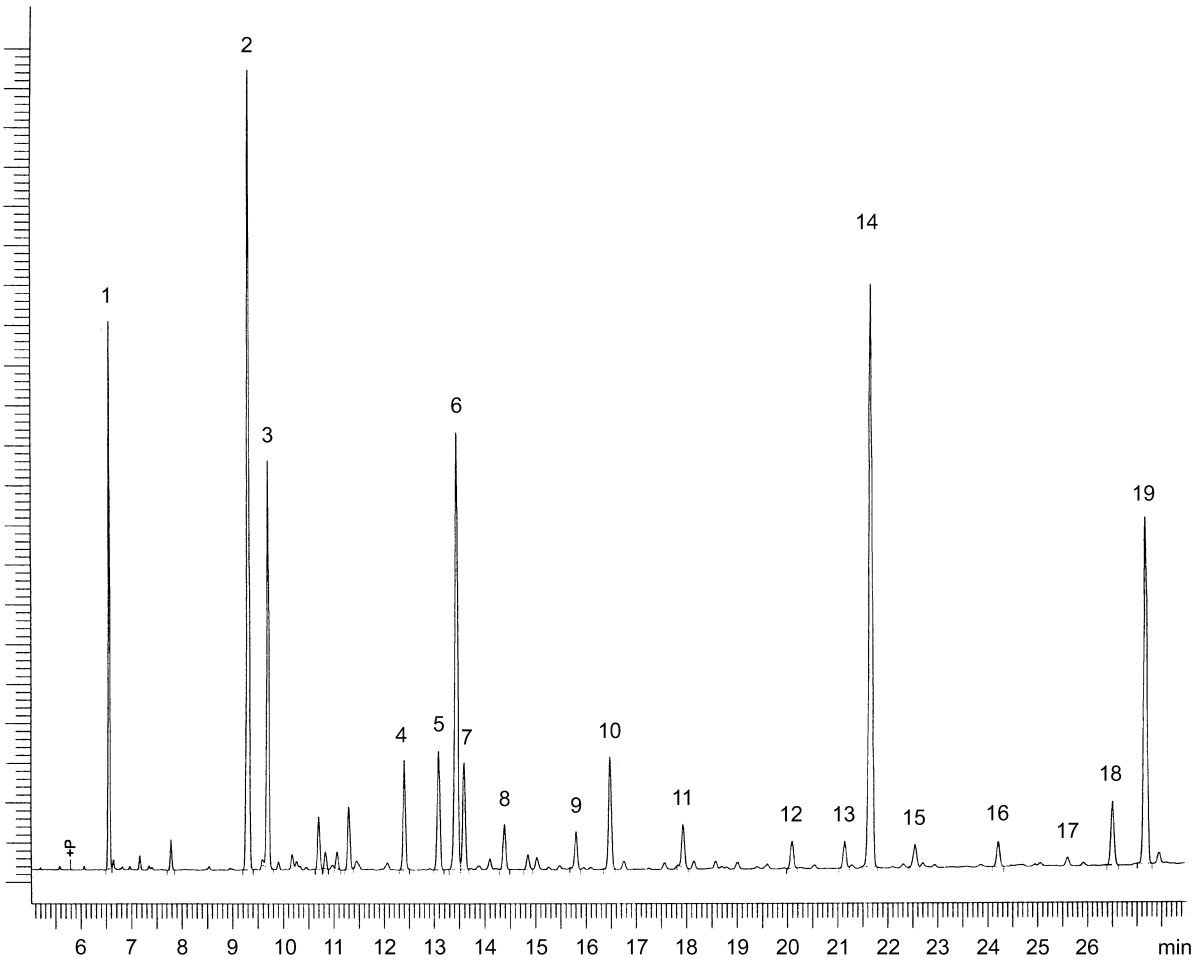
Test solution. Dissolve 190-210 mg of fresh salmon oil in 500 µl of *deuterated chloroform R*. Prepare at least 3 samples and examine within 3 days.

Acquisition of ^{13}C NMR spectra. The following parameters may be used.

– *sweep width*: 200 ppm (– 5 to 195 ppm),
– *irradiation frequency offset*: 95 ppm,
– *time domain*: 64 K,
– *pulse delay*: 2 s,
– *pulse program*: zgig 30 (inverse gated, 30° excitation pulse),
– *dummy scans*: 4,
– *number of scans*: 4096.

Processing and plotting. The following parameters may be used:

– *size*: 64 K (zero-filling),
– *window multiplication*: exponential,
– *Lorentzian broadening factor*: 0.2 Hz.



Use the $CDCl_3$ signal for shift referencing. The shift of the central peak of the 1:1:1 triplet is set to 77.16 ppm.

Plot the spectral region δ 171.5-173.5 ppm. Compare the spectrum with the reference spectrum in Figure 1910.-2. The shift values lie within the ranges given in Table 1910.-1.

Table 1910.-1 – Shift values

Signal	Shift range (ppm)
β DHA	172.05 - 172.09
α DHA	172.43 - 172.47
β EPA	172.52 - 172.56
α EPA	172.90 - 172.94
β C18:4	172.56 - 172.60
α C18:4	172.95 - 172.99

System suitability: calculate the signal-to-noise ratio for the smallest relevant peak corresponding to α C18:4 signal (in the range δ 172.95-172.99 ppm). Measure the peak width at half-height for the central $CDCl_3$ signal (at δ 77.16 ppm). The system suitability criteria in Table 1910.-2 are fulfilled.

1. C14:0	6. C18:1 n-9	11. C20:1 n-9	16. C21:5 n-3
2. C16:0	7. C18:1 n-7	12. C20:4 n-6	17. C22:5 n-6
3. C16:1 n-7	8. C18:2 n-6	13. C20:4 n-3	18. C22:5 n-3
4. C16:4 n-1	9. C18:3 n-3	14. EPA	19. DHA
5. C18:0	10. C18:4 n-3	15. C22:1 n-11	

Figure 1910.-1. – *Chromatogram for the composition of fatty acids in farmed salmon oil*

Table 1910.-2 – System suitability criteria

S/N smallest peak	Peak width (ppm)
minimum 5	maximum 0.02

Calculation of positional distribution: calculate the positional distribution (β(2)-acyl) using the expression:

$$\frac{\beta}{\alpha + \beta} \times 100$$

α = peak area of the corresponding α-carbonyl peak,

β = peak area of β-carbonyl peak from C22:6 n-3, C20:5 n-3 or C18:4 n-3, respectively.

Limits:

	Positional distribution (mole (%))		
	β DHA	**β EPA**	**β C18:4**
Limits	60 - 70	25 - 35	40 - 55

EPA and DHA (*2.4.29*). See Figure 1910.-1.

STORAGE

In an airtight, well-filled container, protected from light, under inert gas.

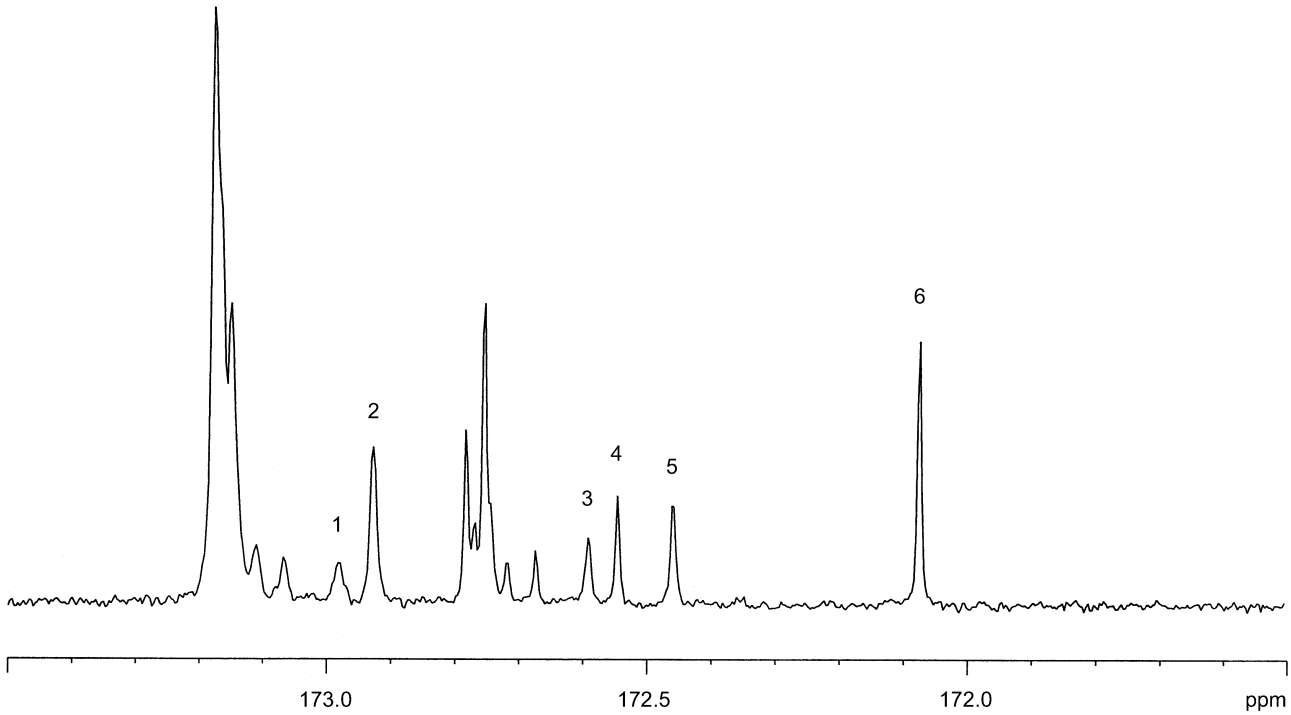


Figure 1910.-2. – *^{13}C NMR spectrum carbonyl region of farmed salmon oil*

01/2008:1848
corrected 6.0

SAW PALMETTO FRUIT

Sabalis serrulatae fructus

DEFINITION

Dried ripe fruit of *Serenoa repens* (Bartram) Small. (*Sabal serrulata* (Michaux) Nichols).

Content: minimum 11.0 per cent of total fatty acids (dried drug).

CHARACTERS

Characteristic, strong, unpleasant but not rancid odour.

IDENTIFICATION

First identification: A, B, D.

Second identification: A, B, C.

A. The fruit is an ovoid to subspherical drupe, with a dark brown to blackish, roughly wrinkled surface and more or less coppery sheen, up to 2.5 cm long and 1.5 cm in diameter. The apex sometimes bears the remains of the style and tubular calyx, with 3 teeth, and the base bears a small depression with the scar of the stalk. The epicarp and underlying mesocarp form a thin fragile layer, which partially peels off, revealing the thin, hard, pale brown endocarp, which is fibrous and easily separable. The seed is irregularly spherical to ovoid, up to 12 mm long and 8 mm in diameter, with a hard, smooth or finely pitted surface which is reddish-brown with a paler, raised and membranous area over the raphe and micropyle; cut transversely, the seed has a thin testa, narrow perisperm and a large area of dense, horny, greyish-white endosperm, with the embryo positioned to one side.

B. Reduce to a powder (710) (*2.9.12*). The powder is reddish or blackish-brown and oily. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of epicarp composed of several layers of thin-walled, reddish-brown, pigmented, polyhedral cells (10 µm to 40 µm) which are strongly cuticularised; those of the outer layers are much smaller than those of the inner layers. Parenchyma cells of the mesocarp may be large and filled with oil droplets, or smaller and containing nodules of silica. Groups of xylem tissue of the mesocarp show small lignified, annular or spirally thickened vessels. Stone cells of the mesocarp (20 µm to 200 µm) may be found scattered, usually singly but sometimes in small groups, the walls are moderately thickened, distinctly striated and finely pitted. Fragments of endocarp contain groups of elongated sclereids about 300 µm long, with strongly thickened walls and numerous pits. The seed testa consists of small, thin-walled cells with brownish contents and underlying sclereids; albumen cells are thick-walled with large conspicuous pits and contain aleurone grains and fixed oil.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.5 g of the powdered drug (710) (*2.9.12*), add 20 ml of *alcohol R* and stir for 15 min. Filter.

Reference solution. Dissolve 4 mg of *β-amyrin R* and 10 mg of *β-sitosterol R* in 10 ml of *alcohol R*.

Plate: *TLC silica gel plate R* (2-10 µm).

Mobile phase: *acetic acid R, ethyl acetate R, toluene R* (1:30:70 *V/V/V*).

Application: 8 µl of the test solution and 2 µl of the reference solution, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R*; dry the plate at 100-105 °C for 5-10 min; examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones are present, especially in the lower third, in the chromatogram obtained with the test solution.

Top of the plate	
	A strong blue zone
_____	_____
	A faint blue zone
β-Amyrin: a blue zone	A faint blue zone
	A strong bluish-violet zone
β-Sitosterol: a blue zone	
	A faint blue zone
_____	_____
	A faint blue zone
Reference solution	**Test solution**

D. Examine the chromatograms obtained in the assay of total fatty acids.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to the characteristic peaks in the chromatogram obtained with the reference solution. The principal peak is due to lauric acid.

TESTS

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 5.0 per cent.

ASSAY

Total fatty acids. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 0.47 g of *methyl pelargonate R* and 0.47 g of *methyl margarate R* in 20.0 ml of *dimethylformamide R* and dilute to 100.0 ml with the same solvent.

Test solution. Reduce 50 g of the drug to a powder (200). Place 4.0 g of the powdered drug in a 100 ml volumetric flask. Add 60.0 ml of *dimethylformamide R*. Mix using sonication for 15 min and then shake for 30 min. Dilute to 100.0 ml with *dimethylformamide R*. Allow to stand for a few minutes and filter. To 20.0 ml of this solution add 4.0 ml of the internal standard solution and dilute to 25.0 ml with *dimethylformamide R*. To 0.4 ml of this solution add 0.6 ml of an 18.84 g/l solution of *trimethylsulphonium hydroxide R* in *methanol R* and mix.

Reference solution. Dissolve 32.0 mg of *caproic acid R*, 62.0 mg of *caprylic acid R*, 68.0 mg of *capric acid R*, 0.699 g of *lauric acid R*, 0.267 g of *myristic acid R*, 10.0 mg of *palmitoleic acid R*, 0.217 g of *palmitic acid R*, 0.115 g of *linoleic acid R*, 18.0 mg of *linolenic acid R*, 0.870 g of *oleic acid R* and 49.0 mg of *stearic acid R* in *dimethylformamide R* and dilute to 10.0 ml with the same solvent. To 1.0 ml of the solution add 4.0 ml of the internal standard solution and dilute to 25.0 ml with *dimethylformamide R*. To 0.4 ml of this solution add 0.6 ml of an 18.84 g/l solution of *trimethylsulphonium hydroxide R* in *methanol R* and mix.

Column:

– *material*: fused silica,

– *size*: *l* = 25 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.20-0.53 mm,

– *stationary phase*: *poly(dimethyl)siloxane R*.

Carrier gas: *helium for chromatography R*.

Flow rate: 0.5 ml/min.

Split ratio: 1:40.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	150
	2 - 7	150 → 190
	7 - 22	190 → 220
Injection port		300
Detector		300

Detection: flame ionisation.

Injection: 1.0 µl.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution.

Use the expression below to determine the percentage content of the different fatty acids. Determine the content of caproic acid, caprylic acid, capric acid and lauric acid using methyl pelargonate as the internal standard. Determine the content of myristic acid, palmitoleic acid, palmitic acid, linoleic acid, linolenic acid, oleic acid and stearic acid using methyl margarate as the internal standard. The peak area of lauric acid is not less than 20 per cent of the total area of the peaks.

$$\frac{A_1}{A_3} \times \frac{A_2}{A_4} \times \frac{m_2}{m_1} \times p \times 0.5$$

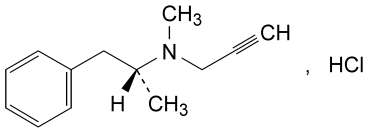
A_1 = area of the peak due to the considered derivatised fatty acid in the chromatogram obtained with the test solution,

A_2 = area of the peak due to methyl pelargonate or methyl margarate in the chromatogram obtained with the reference solution,

A_3 = area of the peak due to methyl pelargonate or methyl margarate in the chromatogram obtained with the test solution,

A_4 = area of the peak due to the considered derivatised fatty acid in the chromatogram obtained with the reference solution,

m_1 = mass of the test sample, in grams,



m_2 = mass of the considered fatty acid in the reference solution, in grams,

p = percentage purity of the considered fatty acid in the reference solution.

01/2008:1260

SELEGILINE HYDROCHLORIDE

Selegilini hydrochloridum

$C_{13}H_{18}ClN$ M_r 223.7
[14611-52-0]

DEFINITION

N-Methyl-*N*-[(1*R*)-1-methyl-2-phenylethyl]prop-2-yn-1-amine hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water and in methanol, slightly soluble in acetone.

mp: about 143 °C.

IDENTIFICATION

A. Specific optical rotation (*2.2.7*): – 10.0 to – 12.0 (dried substance).

Dissolve 2.000g in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs of *potassium chloride R*.

Comparison: *selegiline hydrochloride CRS*.

C. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

pH (*2.2.3*): 3.5 to 4.5.

Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *selegiline hydrochloride CRS* and 10.0 mg of *butyl parahydroxybenzoate R* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dilute 500 ml of *acetonitrile R* to 1000.0 ml with a butylammonium acetate buffer solution pH 6.5 prepared as follows: dissolve 4 ml of *butylamine R* in 900 ml of *water R*, adjust to pH 6.5 with *acetic acid R* and dilute to 1000.0 ml with *water R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 20 µl.

Run time: 1.7 times the retention time of selegiline.

System suitability: reference solution (a):

– *resolution*: minimum 3 between the peaks due to selegiline and butyl parahydroxybenzoate.

Limits:

– *impurities A, B, C, D*: for each impurity, not more than the area of the peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent); disregard any peak due to chlorides.

Impurity E. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in a mixture of 1 ml of *2-propanol R* and 10 µl of *butylamine R* and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 8.0 mg of *(RS)-selegiline hydrochloride CRS* in a mixture of 10 µl of *butylamine R* and 1 ml of *2-propanol R* and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 0.5 ml of reference solution (a) to 20.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *silica gel OD for chiral separations R*.

Mobile phase: *2-propanol R, cyclohexane R* (0.2:99.8 *V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl.

Retention time: impurity E = about 10 min.

System suitability: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to impurity E and (*R*)-selegiline; if necessary, adjust the concentration of 2-propanol in the mobile phase.

Limit:

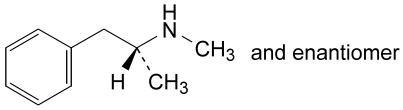
– *impurity E*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 0.5 kPa.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.180 g in 50 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



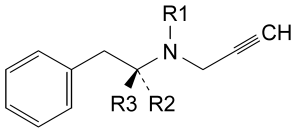
1 ml of *0.1 M perchloric acid* is equivalent to 22.37 mg of $C_{13}H_{18}ClN$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.



and enantiomer

A. (2*RS*)-*N*-methyl-1-phenylpropan-2-amine [(*RS*)-metamphetamine],

B. (2*R*)-1-phenylpropan-2-amine (amphetamine),

C. (1*RS*,2*SR*)-2-amino-1-phenylpropan-1-ol (phenylpropanolamine),

D. R1 = R3 = H, R2 = CH_3: *N*-[(1*R*)-1-methyl-2-phenylethyl]prop-2-yn-1-amine (demethylselegiline),

E. R1 = R3 = CH_3, R2 = H: *N*-methyl-*N*-[(1*S*)-1-methyl-2-phenylethyl]prop-2-yn-1-amine [(*S*)-selegiline].

01/2008:1147

SELENIUM DISULPHIDE

Selenii disulfidum

SeS_2 M_r 143.1
[7488-56-4]

DEFINITION

Content: 52.0 per cent to 55.5 per cent of Se.

CHARACTERS

Appearance: bright orange or reddish-brown powder.

Solubility: practically insoluble in water.

IDENTIFICATION

A. Gently boil about 50 mg with 5 ml of *nitric acid R* for 30 min. Dilute to 50 ml with *water R* and filter. To 5 ml of the filtrate add 10 ml of *water R* and 5 g of *urea R*. Heat to boiling, cool and add 1.5 ml of *potassium iodide solution R*. A yellow or orange colour is produced which darkens rapidly on standing. This solution is used in identification test B.

B. Allow the coloured solution obtained under identification A to stand for 10 min and filter through *kieselguhr for chromatography R*. 5 ml of the filtrate gives reaction (a) of sulphates (*2.3.1*).

TESTS

Soluble selenium compounds: maximum 5 ppm, calculated as Se.

To 10 g add 100 ml of *water R*, mix well, allow to stand for 1 h with frequent shaking and filter. To 10 ml of the filtrate add 2 ml of a 115 g/l solution of *anhydrous formic acid R*, dilute to 50 ml with *water R* and adjust to pH 2.0-3.0 with an 115 g/l solution of *anhydrous formic acid R*. Add 2 ml of a 5 g/l solution of *3,3′-diaminobenzidine tetrahydrochloride R*. Allow to stand for 45 min and then adjust to pH 6.0-7.0 with *dilute ammonia R1*. Shake the solution for 1 min with 10 ml of *toluene R* and allow the phases to separate. The absorbance (*2.2.25*) of the upper layer measured at 420 nm is not greater than that of a standard prepared at the same time and in the same manner beginning at the words “add 2 ml of an 115 g/l solution of *anhydrous formic acid R*” and using 5 ml of *selenium standard solution (1 ppm Se) R* instead of 10 ml of the filtrate.

ASSAY

To 0.100 g add 25 ml of *fuming nitric acid R* and heat on a water-bath for 1 h; a small insoluble residue may remain. Cool and dilute to 100.0 ml with *water R*. To 25.0 ml of this solution add 50 ml of *water R* and 5 g of *urea R* and heat to boiling. Cool, add 7 ml of *potassium iodide solution R* and 3 ml of *starch solution R*. Titrate immediately with *0.1 M sodium thiosulphate*. Carry out a blank titration.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 1.974 mg of Se.

01/2008:0202

SENEGA ROOT

Polygalae radix

DEFINITION

Dried and usually fragmented root and root crown of *Polygala senega* L. or of certain other closely related species or of a mixture of these *Polygala* species.

CHARACTERS

Faint, sweet odour, slightly rancid or reminiscent of methyl salicylate.

Reduced to a powder, it is irritant and sternutatory. Shaken with water, the powder produces a copious froth.

IDENTIFICATION

A. The root crown is greyish-brown and wider than the root; it forms an irregular head consisting of numerous remains of stems and tightly packed purplish-brown buds. The taproot is brown or yellow, occasionally branched, sometimes flexuous, usually tortuous and without secondary roots, except in the Japanese varieties and species, which contain numerous fibrous rootlets. The diameter is usually 1-8 mm at the crown, gradually tapering to the tip; the surface is transversely and longitudinally striated and often shows a more or less distinct decurrent, elongated spiral keel. The fracture is short and shows a yellowish cortex of varying thickness surrounding a paler central woody area somewhat circular or irregular in shape depending on the species.

B. Examine under a microscope using *chloral hydrate solution R*. The transverse section of the root shows the following diagnostic characters: cork formed from several layers of thin-walled cells, phelloderm of slightly collenchymatous cells containing droplets of oil; the phloem and xylem arrangement is usually normal, especially near the crown but where a keel is present this is formed by increased development of phloem; other anomalous secondary development sometimes occurs, resulting in the formation of 1 or 2 large wedge-shaped rays in the phloem and xylem, the parenchymatous cells of which contain droplets of oil. The xylem is usually central and consists of vessels up to 60 µm in diameter associated with numerous thin-walled tracheids and a few small lignified parenchymatous cells.

C. Reduce to a powder (355) (*2.9.12*). The powder is light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: longitudinal fragments of lignified

tissue made up of pitted tracheids and somewhat larger vessels with numerous bordered pits or with reticulate thickening; yellowish parenchyma and collenchymatous cells containing droplets of oil; occasional fragments of cork, and of epidermal tissue with stomata and unicellular trichomes from the bud scales. Crystals and stone cells are absent.

D. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *ethanol (70 per cent V/V) R*, boil under a reflux condenser for 15 min, filter and allow to cool.

Reference solution. Dissolve 10 mg of *aescin R* in *ethanol (70 per cent V/V) R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: the upper layer of a mixture of 10 volumes of *glacial acetic acid R*, 40 volumes of *water R* and 50 volumes of *butanol R*.

Application: 10 µl of the test solution and 10 µl and 40 µl of the reference solution, as bands of 20 mm by 3 mm.

Development: over a path of 12 cm.

Drying: at 100-105 °C.

Detection A: spray with about 10 ml of *anisaldehyde solution R* for a plate 200 mm square and heat again at 100-105 °C until red zones due to saponosides appear in the chromatogram obtained with the test solution.

Results A: in the chromatogram obtained with the test solution, 3-5 red zones appear in the lower and middle parts, similar in position to the grey-violet zones due to aescin in the chromatogram obtained with the reference solution.

Detection B: spray with about 10 ml of a 200 g/l solution of *phosphomolybdic acid R* in *anhydrous ethanol R* and heat at 100-105 °C until the zones due to saponosides become blue.

Results B: the intensity and size of the zones in the chromatogram obtained with the test solution are between those of the 2 bands due to aescin in the chromatograms obtained with 10 µl and 40 µl of the reference solution.

TESTS

Total ash (*2.4.16*): maximum 6.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 3.0 per cent.

STORAGE

Store protected from humidity.

01/2008:0206
corrected 6.0

SENNA LEAF

Sennae folium

DEFINITION

Dried leaflets of *Cassia senna* L. (*C. acutifolia* Delile), known as Alexandrian or Khartoum senna, or *Cassia angustifolia* Vahl, known as Tinnevelly senna, or a mixture of the 2 species.

Content: minimum 2.5 per cent of hydroxyanthracene glycosides, expressed as sennoside B ($C_{42}H_{38}O_{20}$; M_r 863) (dried drug).

CHARACTERS

Slight characteristic odour.

IDENTIFICATION

A. *C. senna* occurs as greyish-green or brownish-green, thin, fragile leaflets, lanceolate, mucronate, asymmetrical at the base, usually 15-40 mm long and 5-15 mm wide, the maximum width being at a point slightly below the centre; the lamina is slightly undulant with both surfaces covered with fine, short trichomes. Pinnate venation is visible mainly on the lower surface, with lateral veins leaving the midrib at an angle of about 60° and anastomosing to form a ridge near the margin.

Stomatal index (*2.8.3*): 10-12.5-15.

C. angustifolia occurs as yellowish-green or brownish-green leaflets, elongated and lanceolate, slightly asymmetrical at the base, usually 20-50 mm long and 7-20 mm wide at the centre. Both surfaces are smooth with a very small number of short trichomes and are frequently marked with transverse or oblique lines.

Stomatal index (*2.8.3*): 14-17.5-20

B. Reduce to a powder (355) (*2.9.12*). The powder is light green or greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: polygonal epidermal cells showing paracytic stomata (*2.8.3*); unicellular trichomes, conical in shape, with warted walls, isolated or attached to fragments of epidermis; fibres with a crystal sheath of prismatic crystals of calcium oxalate; cluster crystals isolated or in fragments of parenchyma.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 0.5 g of the powdered drug (180) (*2.9.12*) add 5 ml of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* and heat to boiling. Centrifuge and use the supernatant liquid.

Reference solution. Dissolve 10 mg of *senna extract CRS* in 1 ml of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* (a slight residue remains).

Plate: *TLC silica gel G plate R.*

Mobile phase: *glacial acetic acid R, water R, ethyl acetate R, propanol R* (1:30:40:40 *V/V/V/V*).

Application: 10 µl, as bands of 20 mm by 2 mm.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with a 20 per cent *V/V* solution of *nitric acid R* and heat at 120 °C for 10 min. Allow to cool and spray with a 50 g/l solution of *potassium hydroxide R* in *alcohol (50 per cent V/V) R* until the zones appear.

Results: the principal zones in the chromatogram obtained with the test solution are similar in position (sennosides B, A, D and C in the order of increasing R_F value), colour and size to the principal zones in the chromatogram obtained with the reference solution. Between the zones due to sennosides D and C a red zone due to rhein-8-glucoside may be visible.

D. Place about 25 mg of the powdered drug (180) (*2.9.12*) in a conical flask and add 50 ml of *water R* and 2 ml of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 ml of *ether R*. Separate the ether layer, dry over *anhydrous sodium sulphate R*, evaporate 5 ml to dryness and to the cooled residue add 5 ml of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

Foreign matter (*2.8.2*): maximum 3 per cent of foreign organs and maximum 1 per cent of foreign elements.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 12.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 2.5 per cent.

ASSAY

Carry out the assay protected from bright light.

Place 0.150 g of the powdered drug (180) (*2.9.12*) in a 100 ml flask. Add 30.0 ml of *water R*, mix, weigh and place in a water-bath. Heat under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 20.0 ml of the supernatant liquid to a 150 ml separating funnel. Add 0.1 ml of *dilute hydrochloric acid R* and shake with 3 quantities, each of 15 ml, of *chloroform R*. Allow to separate and discard the chloroform layer. Add 0.10 g of *sodium hydrogen carbonate R* and shake for 3 min. Centrifuge and transfer 10.0 ml of the supernatant liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Heat for 20 min in a water-bath under a reflux condenser with the water level above that of the liquid in the flask; add 1 ml of *hydrochloric acid R* and heat for a further 20 min, with frequent shaking, to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the 3 ether layers and wash with 2 quantities, each of 15 ml, of *water R*. Transfer the ether layer to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 10.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (*2.2.25*) at 515 nm, using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene glycosides, expressed as sennoside B, using the following expression:

$$\frac{A \times 1.25}{m}$$

i. e. taking the specific absorbance of sennoside B to be 240.

A = absorbance at 515 nm,

m = mass of the substance to be examined, in grams.

STORAGE

Protected from moisture.

01/2008:1261

SENNA LEAF DRY EXTRACT, STANDARDISED

Sennae folii extractum siccum normatum

[8055-96-7]

DEFINITION

Standardised senna leaf dry extract is produced from *Senna leaf (0206)*. It contains not less than 5.5 per cent and not more than 8.0 per cent of hydroxyanthracene glycosides, calculated as sennoside B ($C_{42}H_{38}O_{20}$; M_r 863) with reference to the dried extract.

The measured content does not deviate from the value stated on the label by more than ± 10 per cent.

PRODUCTION

The extract is produced from the drug and ethanol 50 to 80 per cent *V/V* with an appropriate procedure.

CHARACTERS

Brownish or brown powder.

IDENTIFICATION

A. Examine by thin-layer chromatography (*2.2.27*), using a suitable silica gel as the coating substance.

Test solution. To 0.1 g of the extract add 5 ml of a mixture of equal volumes of *alcohol R* and *water R* and heat to boiling. Cool and centrifuge. Use the supernatant liquid.

Reference solution. Dissolve 10 mg of *senna extract CRS* in 1 ml of a mixture of equal volumes of *alcohol R* and *water R* (a slight residue remains).

Apply separately to the plate, as bands, 10 µl of each solution. Develop over a path of 10 cm using a mixture of 1 volume of *glacial acetic acid R*, 30 volumes of *water R*, 40 volumes of *ethyl acetate R* and 40 volumes of *1-propanol R*. Allow the plate to dry in air, spray with a 20 per cent *V/V* solution of *nitric acid R* and heat at 120 °C for 10 min. Allow to cool and spray with a 50 g/l solution of *potassium hydroxide R* in *alcohol (50 per cent V/V R)* until the zones appear. The principal zones in the chromatogram obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the reference solution. The chromatograms show in the lower third a prominent brown zone corresponding to sennoside B and above it a yellow zone followed by another prominent brown zone corresponding to sennoside A. In the upper half of the chromatograms are visible, in increasing R_F value, a prominent reddish-brown band and an orange-brown zone followed by a faint pink band and two yellow bands. Close to the solvent front a dark pink zone appears, which may be followed by several faint bands.

B. Place about 25 mg of the extract in a conical flask and add 50 ml of *water R* and 2 ml of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 ml of *ether R*. Separate the ether, dry over *anhydrous sodium sulphate R*, evaporate 5 ml to dryness and to the cooled residue add 5 ml of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

Loss on drying (*2.8.17*): maximum 5.0 per cent.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^4 micro-organisms per gram, of which not more than 10^2 fungi per gram, determined by plate-count. It complies with the tests for *Escherichia coli* and for *Salmonella* (*2.6.13*).

ASSAY

Carry out the assay protected from bright light.

Place 0.150 g of the extract in a 100 ml flask, dissolve in *water R* and dilute to 100.0 ml with the same solvent. Filter the solution, discard the first 10 ml of the filtrate. Transfer 20.0 ml of the filtrate to a 150 ml separating funnel. Add 0.1 ml of *dilute hydrochloric acid R* and shake with three quantities, each of 15 ml, of *ether R*. Allow the layers to separate and discard the ether layer. Add 0.10 g of *sodium hydrogen carbonate R* to the aqueous layer and shake for 3 min. Centrifuge and transfer 10.0 ml of the supernatant

liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Heat for 20 min under a reflux condenser in a water-bath with the water level above that of the liquid in the flask; add 3 ml of *hydrochloric acid R* and heat for a further 30 min with frequent shaking to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with three quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the ether layers and wash with two quantities, each of 15 ml, of *water R*. Transfer the ether layers to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 10.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5.0 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (*2.2.25*) at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage of hydroxyanthracene glycosides expressed as sennoside B from the expression:

$$\frac{A \times 4.167}{m}$$

i.e. taking the specific absorbance of sennoside B to be 240.

A = absorbance at 515 nm,

m = mass of the substance to be examined, in grams.

STORAGE

Store in an airtight container.

LABELLING

The label states the content of hydroxyanthracene glycosides.

01/2008:0207
corrected 6.0

SENNA PODS, ALEXANDRIAN

Sennae fructus acutifoliae

DEFINITION

Dried fruit of *Cassia senna* L. (*C. acutifolia* Delile).

Content: minimum 3.4 per cent of hydroxyanthracene glycosides, expressed as sennoside B ($C_{42}H_{38}O_{20}$; M_r 863) (dried drug).

CHARACTERS

Slight odour.

IDENTIFICATION

A. Flattened reniform pods, green or greenish-brown with brown patches at the positions corresponding to the seeds, usually 40-50 mm long and at least 20 mm wide. At one end is a stylar point and at the other a short stalk. The pods contain 6-7 flattened and obovate seeds, green or pale brown, with a continuous network of prominent ridges on the testa.

B. Reduce to a powder (355) (*2.9.12*). The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: epicarp with polygonal cells and a small number of conical warty trichomes and occasional anomocytic or paracytic stomata (*2.8.3*); fibres in 2 crossed layers accompanied by a crystal sheath of calcium oxalate prisms; characteristic palisade cells in the seed and stratified cells in the endosperm; clusters and prisms of calcium oxalate.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 0.5 g of the powdered drug (180) (*2.9.12*) add 5 ml of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* and heat to boiling. Centrifuge and use the supernatant liquid.

Reference solution. Dissolve 10 mg of *senna extract CRS* in 1 ml of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* (a slight residue remains).

Plate: *TLC silica gel G plate R.*

Mobile phase: *glacial acetic acid R, water R, ethyl acetate R, propanol R* (1:30:40:40 *V/V/V/V*).

Application: 10 µl, as bands of 20 mm by 2 mm.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with a 20 per cent *V/V* solution of *nitric acid R* and heat at 120 °C for 10 min; allow to cool and spray with a 50 g/l solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* until the zones appear.

Results: the principal zones in the chromatogram obtained with the test solution are similar in position (sennosides B, A, D and C in order of increasing R_F value), colour and size to the principal zones in the chromatogram obtained with the reference solution; between the zones due to sennosides D and C, a red zone due to rhein-8-glucoside may be visible; the zones due to sennosides D and C are faint in the chromatogram obtained with the test solution.

D. Place about 25 mg of the powdered drug (180) (*2.9.12*) in a conical flask and add 50 ml of *water R* and 2 ml of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 ml of *ether R*. Separate the ether layer, dry over *anhydrous sodium sulphate R*, evaporate 5 ml to dryness and to the cooled residue add 5 ml of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

Foreign matter (*2.8.2*): maximum 1 per cent.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 9.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 2.0 per cent.

ASSAY

Carry out the assay protected from bright light.

Place 0.150 g of the powdered drug (180) (*2.9.12*) in a 100 ml flask. Add 30.0 ml of *water R*, mix, weigh and place in a water-bath. Heat under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 20.0 ml of the supernatant liquid to a 150 ml separating funnel. Add 0.1 ml of *dilute hydrochloric acid R* and shake with 3 quantities, each of 15 ml, of *chloroform R*. Allow to separate and discard the chloroform layer. Add 0.10 g of *sodium hydrogen carbonate R* and shake for 3 min. Centrifuge and transfer 10.0 ml of the supernatant liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Place the flask in a water-bath so that the water level is above that of the liquid in the flask, and heat under a reflux condenser for 20 min. Add 1 ml of *hydrochloric acid R* and heat for a further 20 min, with frequent shaking, to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 ml,

of *ether R* previously used to rinse the flask. Combine the 3 ether layers and wash with 2 quantities, each of 15 ml, of *water R*. Transfer the ether layers to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 10.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (*2.2.25*) at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene glycosides, expressed as sennoside B, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of sennoside B to be 240.

A = absorbance at 515 nm;

m = mass of the substance to be examined, in grams.

STORAGE

Protected from moisture.

corrected 6.0

SENNA PODS, TINNEVELLY

Sennae fructus angustifoliae

DEFINITION

Dried fruit of *Cassia angustifolia* Vahl.

Content: minimum 2.2 per cent of hydroxyanthracene glycosides, expressed as sennoside B ($C_{42}H_{38}O_{20}$; M_r 863) (dried drug).

CHARACTERS

Slight odour.

IDENTIFICATION

A. Flattened, slightly reniform pods, yellowish-brown or brown with dark brown patches at the positions corresponding to the seeds, usually 35-60 mm long and 14-18 mm wide. At one end is a stylar point and at the other a short stalk. The pods contain 5-8 flattened and obovate seeds, green or pale brown, with incomplete, wavy, transverse ridges on the testa.

B. Reduce to a powder (355) (*2.9.12*). The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: epicarp with polygonal cells and a small number of conical warty trichomes and occasional anomocytic or paracytic stomata (*2.8.3*); fibres in 2 crossed layers accompanied by a crystal sheath of calcium oxalate prisms; characteristic palisade cells in the seed and stratified cells in the endosperm; clusters and prisms of calcium oxalate.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 0.5 g of the powdered drug (180) (*2.9.12*) add 5 ml of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* and heat to boiling. Centrifuge and use the supernatant liquid.

Reference solution. Dissolve 10 mg of *senna extract CRS* in 1 ml of a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* (a slight residue remains).

Plate: *TLC silica gel G plate R.*

Mobile phase: *glacial acetic acid R, water R, ethyl acetate R, propanol R* (1:30:40:40 *V/V/V/V*).

Application: 10 µl, as bands of 20 mm by 2 mm.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with a 20 per cent *V/V* solution of *nitric acid R* and heat at 120 °C for 10 min; allow to cool and spray with a 50 g/l solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* until the zones appear.

Results: the principal zones in the chromatogram obtained with the test solution are similar in position (sennosides B, A, D and C in the order of increasing R_F value), colour and size to the principal zones in the chromatogram obtained with the reference solution. Between the zones due to sennosides D and C a red zone due to rhein-8-glucoside may be visible. The zones due to sennosides D and C are faint in the chromatogram obtained with the test solution.

D. Place about 25 mg of the powdered drug (180) (*2.9.12*) in a conical flask and add 50 ml of *water R* and 2 ml of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 ml of *ether R*. Separate the ether layer, dry over *anhydrous sodium sulphate R*, evaporate 5 ml to dryness and to the cooled residue add 5 ml of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

Foreign matter (*2.8.2*): maximum 1 per cent.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 9.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 2.0 per cent.

ASSAY

Carry out the assay protected from bright light.

Place 0.150 g of the powdered drug (180) (*2.9.12*) in a 100 ml flask. Add 30.0 ml of *water R*, mix, weigh and place in a water-bath. Heat under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 20.0 ml of the supernatant liquid to a 150 ml separating funnel. Add 0.1 ml of *dilute hydrochloric acid R* and shake with 3 quantities, each of 15 ml, of *chloroform R*. Allow to separate and discard the chloroform layer. Add 0.10 g of *sodium hydrogen carbonate R* and shake for 3 min. Centrifuge and transfer 10.0 ml of the supernatant liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Heat for 20 min in a water-bath under a reflux condenser, with the water level above that of the liquid in the flask; add 1 ml of *hydrochloric acid R* and heat for a further 20 min, with frequent shaking, to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the 3 ether layers and wash with 2 quantities, each of 15 ml, of *water R*. Transfer the ether layer to a volumetric flask and dilute to 100.0 ml with *ether R*. Carefully evaporate 10.0 ml to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (*2.2.25*) at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene glycosides, expressed as sennoside B, using the following expression:

$$\frac{A \times 1.25}{m}$$

taking the specific absorbance of sennoside B to be 240.

A = absorbance at 515 nm;

m = mass of the substance to be examined, in grams.

SERINE

Serinum

$C_3H_7NO_3$ M_r 105.1
[56-45-1]

DEFINITION

Serine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*S*)-2-amino-3-hydroxypropanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *serine CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To 1 ml of a 10 g/l solution of the substance to be examined in a test-tube, add 5 ml of a 20 g/l solution of *sodium periodate R*. Heat on a water-bath and collect the vapour on glass wool moistened with *water R* and inserted in the opening of the test tube. After heating for 5 min, transfer the glass wool to a test-tube containing 1 ml of a 15 g/l solution of *chromotropic acid, sodium salt R* and 3 ml of *sulphuric acid R*. Heat on a water-bath for 10 min. A violet-red colour is produced.

TESTS

Solution S. Dissolve 2.5 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*). Dissolve 2.50 g in *dilute hydrochloric acid R* and dilute to 25.0 ml with the same acid. The specific optical rotation is + 14.0 to + 16.0, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *0.1 M hydrochloric acid* and dilute to 10 ml with the same acid.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *serine CRS* in *0.1 M hydrochloric acid* and dilute to 50 ml with the same acid.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *methionine CRS* and 10 mg of *serine CRS* in *0.1 M hydrochloric acid* and dilute to 25 ml with the same acid.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (*2.4.4*). Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (*2.4.13*). Dilute 10 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (*2.4.1*). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (*2.4.9*). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (*2.4.8*). Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

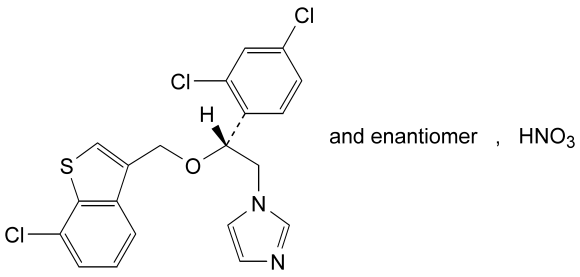
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 3 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Using 0.1 ml of *naphtholbenzein solution R* as indicator, titrate with *0.1 M perchloric acid* until the colour changes from brownish-yellow to green.

1 ml of *0.1 M perchloric acid* is equivalent to 10.51 mg of $C_3H_7NO_3$.



STORAGE

Store protected from light.

01/2008:1148

SERTACONAZOLE NITRATE

Sertaconazoli nitras

$C_{20}H_{16}Cl_3N_3O_4S$ M_r 500.8

[99592-39-9]

DEFINITION

(*RS*)-1-[2-[(7-Chloro-1-benzothiophen-3-yl)methoxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole nitrate.

Content: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, soluble in methanol, sparingly soluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

A. Melting point (*2.2.14*): 156 °C to 161 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 0.1 g in *methanol R* and dilute to 100 ml with the same solvent. Dilute 10 ml of this solution to 100 ml with *methanol R*.

Spectral range: 240-320 nm.

Absorption maxima: at 260 nm, 293 nm and 302 nm.

Absorbance ratio: A_{302}/A_{293} = 1.16 to 1.28.

C. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: dry the substances at 100-105 °C for 2 h and examine as discs of *potassium bromide R*.

Comparison: *sertaconazole nitrate CRS*.

D. Thin-layer chromatography (*2.2.27*).

Solvent mixture: *concentrated ammonia R, methanol R* (10:90 *V/V*).

Test solution. Dissolve 40 mg of the substance to be examined in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (a). Dissolve 40 mg of *sertaconazole nitrate CRS* in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (b). Dissolve 20 mg of *miconazole nitrate CRS* in reference solution (a) and dilute to 5 ml with reference solution (a).

Plate: *TLC silica gel G plate R.*

Mobile phase: *concentrated ammonia R, toluene R, dioxan R* (1:40:60 *V/V/V*).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in a current of air for 15 min.

Detection: expose to iodine vapour for 30 min.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

E. About 1 mg gives the reaction of nitrates (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_5 (*2.2.2, Method II*).

Dissolve 0.1 g in *ethanol (96 per cent) R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *sertaconazole nitrate CRS* and 5.0 mg of *miconazole nitrate CRS* in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;

– *stationary phase*: *nitrile silica gel for chromatography R1* (10 µm).

Mobile phase: *acetonitrile R*, 1.5 g/l solution of *sodium dihydrogen phosphate R* (37:63 *V/V*).

Flow rate: 1.6 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl.

Run time: 1.3 times the retention time of sertaconazole.

Retention time: nitrate ion = about 1 min; miconazole = about 17 min; sertaconazole = about 19 min.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to miconazole and sertaconazole.

Limits:

– *impurities A, B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);

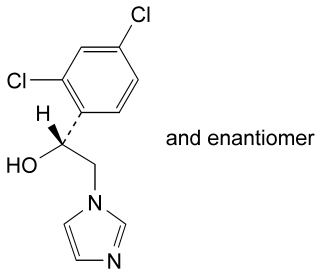
– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent); disregard the peak due to the nitrate ion.

Water (*2.5.12*): maximum 1.0 per cent, determined on 0.50 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

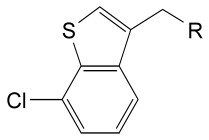
ASSAY

Dissolve 0.400 g in 50 ml of a mixture of equal volumes of *anhydrous acetic acid R* and *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid,* determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.



1 ml of *0.1 M perchloric acid* is equivalent to 50.08 mg of $C_{20}H_{16}Cl_3N_3O_4S$.

STORAGE



Protected from light.

IMPURITIES

Specified impurities: *A, B, C.*

A. (1*RS*)-1-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-yl)ethanol,

B. R = Br: 3-(bromomethyl)-7-chloro-1-benzothiophen,

C. R = OH: (7-chloro-1-benzothiophen-3-yl)methanol.

01/2008:0433

SESAME OIL, REFINED

Sesami oleum raffinatum

DEFINITION

Fatty oil obtained from the ripe seeds of *Sesamum indicum* L. by expression or extraction. It is then refined. Improved colour and odour may be obtained by further refining. It may contain a suitable antioxidant.

CHARACTERS

Appearance: clear, light yellow liquid, almost colourless.

Solubility: practically insoluble in ethanol (96 per cent), miscible with light petroleum.

Relative density: about 0.919.

Refractive index: about 1.473.

It solidifies to a butter-like mass at about – 4 °C.

IDENTIFICATION

First identification: A.

Second identification: B.

A. Composition of triglycerides (see Tests).

B. Carry out the identification of fatty oils by thin-layer chromatography (*2.3.2*). The chromatogram obtained is similar to the typical chromatogram for sesame oil.

TESTS

Acid value (*2.5.1*): maximum 0.5, determined on 10.0 g; maximum 0.3 if intended for use in the manufacture of parenteral dosage forms.

Peroxide value (*2.5.5*): maximum 10.0; maximum 5.0 if intended for use in the manufacture of parenteral dosage forms.

Unsaponifiable matter (*2.5.7*): maximum 2.0 per cent, determined on 5.0 g.

Alkaline impurities (*2.4.19*). It complies with the test for alkaline impurities in fatty oils.

Cottonseed oil. Mix 5 ml in a test-tube with 5 ml of a mixture of equal volumes of *pentanol R* and a 10 g/l solution of *sulphur R* in *carbon disulphide R*. Warm the mixture carefully until the carbon disulphide is expelled, and immerse the tube to 1/3 of its depth in boiling *saturated sodium chloride solution R*. No reddish colour develops within 15 min.

Composition of triglycerides. Liquid chromatography (*2.2.29*).

Test solution. Dilute 50.0 mg of the substance to be examined to 10.0 ml with a mixture of equal volumes of *acetone R* and *methylene chloride R*.

Reference solutions. Dissolve 80.0 mg of *triolein R* in a mixture of equal volumes of *acetone R* and *methylene chloride R* and dilute to 50.0 ml with the same mixture of solvents. Prepare 5 reference solutions by dilution of this solution so as to cover concentrations ranging from the disregard limit (0.5 per cent) to the upper limit for OLL (30.0 per cent).

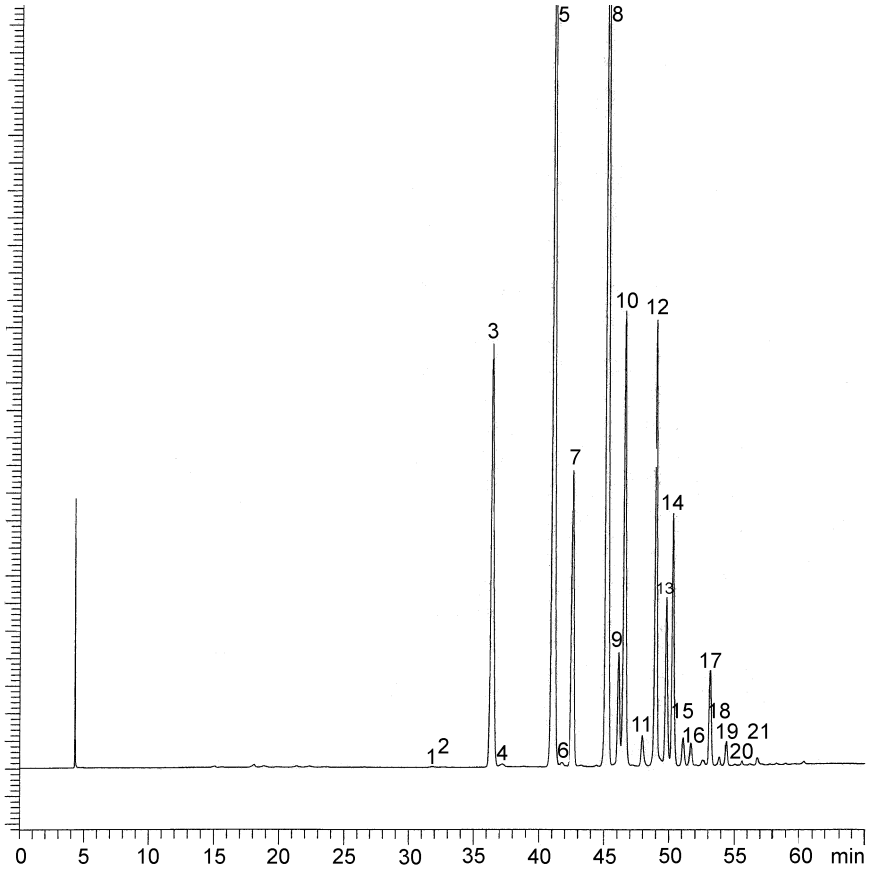
Plot the logarithm of the area of the peak due to triolein against the logarithm of the mass of triolein in the reference solution, in milligrams.

Column: 2 columns coupled in series:

– *size of each column*: *l* = 0.25 m, Ø = 4 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (4 µm).

Mobile phase:



– *mobile phase A*: *acetone R, methylene chloride R, acetonitrile R* (5:15:80 *V/V/V*);

– *mobile phase B*: *acetone R, acetonitrile R, methylene chloride R* (20:20:60 *V/V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	100 → 75	0 → 25
15 - 25	75	25
25 - 70	75 → 0	25 → 100
70 - 75	0 → 100	100 → 0
75 - 80	100	0

Flow rate: 1.0 ml/min.

Detection: evaporative light-scattering detector; the following settings have been found to be suitable; if the detector has different setting parameters, adjust the detector settings so as to comply with the system suitability criterion:

1. LLLn	4. OLLn	7. PLL	10. POL	13. SOL	16. PPO	19. SSL
2. OLnLn	5. OLL	8. OOL	11. PPL	14. POO	17. SOO	20. PPS
3. LLL	6. OOLn	9. SLL	12. OOO	15. PSL	18. PSO	21. SSO

Figure 0433.-1. – *Typical chromatogram for the composition of triglycerides in refined sesame oil*

– *carrier gas*: *nitrogen R*;
– *flow rate*: 0.7 l/min;
– *evaporator temperature*: 85 °C;
– *nebuliser temperature*: 45 °C.

Injection: 20 µl.

Identification of peaks: use the chromatograms obtained with the reference solutions to identify the peak due to triolein; identify the other peaks using the chromatogram shown in Figure 0433.-1. The fatty acids are designated as linolenic (Ln), linoleic (L), oleic (O), palmitic (P) and stearic (S).

System suitability: test solution:

– *resolution*: minimum 1.5 between the peaks due to OOO (triolein) and SOL.

Using the calibration curve obtained with the reference solutions, determine the percentage content of each peak with an area greater than that of the peak corresponding to the disregard limit (0.5 per cent). Assuming that the sum of these peak areas is 100 per cent, normalise the percentage content of each of the 8 triglycerides specified below.

Composition of triglycerides:

– *LLL*: 7.0 per cent to 19.0 per cent;
– *OLL*: 13.0 per cent to 30.0 per cent;
– *PLL*: 5.0 per cent to 9.0 per cent;
– *OOL*: 12.0 per cent to 23.0 per cent;
– *POL*: 6.0 per cent to 14.0 per cent;
– *OOO*: 5.0 per cent to 14.0 per cent;
– *SOL*: 2.0 per cent to 8.0 per cent;
– *POO*: 2.0 per cent to 10.0 per cent.

Water (*2.5.12*): maximum 0.05 per cent, determined on 5.0 g, if intended for use in the manufacture of parenteral dosage forms.

STORAGE

In an airtight, well-filled container, protected from light; if intended for use in the manufacture of parenteral dosage forms store under an inert gas in an airtight container.

When the container has been opened, its contents are to be used as soon as possible. Any part of the contents not used at once is protected by an atmosphere of an inert gas.

LABELLING

The label states:

– whether the oil is obtained by expression or extraction;
– where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms;
– where applicable, the name of the inert gas used.

01/2008:1149

SHELLAC

Lacca

DEFINITION

Shellac is a purified material obtained from the resinous secretion of the female insect *Kerria lacca* (Kerr) Lindinger (*Laccifer lacca* Kerr). There are four types of shellac depending on the nature of the treatment of crude secretion (seedlac): wax-containing shellac, bleached shellac, dewaxed shellac and bleached, dewaxed shellac.

Wax-containing shellac is obtained from seedlac; it is purified by filtration of the molten substance and/or by hot extraction using a suitable solvent.

Bleached shellac is obtained from seedlac by treatment with sodium hypochlorite after dissolution in a suitable alkaline solution, precipitation by dilute acid and drying.

Dewaxed shellac is obtained from wax-containing shellac or seedlac by treatment with a suitable solvent and removal of the insoluble wax by filtering.

Bleached, dewaxed shellac is obtained from wax-containing shellac or seedlac by treatment with sodium hypochlorite after dissolution in a suitable alkaline solution; the insoluble wax is removed by filtration. It is precipitated by dilute acid and dried.

CHARACTERS

Shellac occurs as brownish-orange or yellow, shining, translucent, hard or brittle, more or less thin flakes (wax-containing shellac and dewaxed shellac), or a creamy white or brownish-yellow powder (bleached shellac and bleached, dewaxed shellac).

Shellac is practically insoluble in water. With ethanol, it gives a more or less opalescent solution (wax containing shellac and bleached shellac) or a clear solution (dewaxed shellac and bleached, dewaxed shellac). When warmed, it is sparingly soluble or soluble in alkaline solutions.

IDENTIFICATION

A. Examine by thin-layer chromatography (*2.2.27*), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Heat 0.25 g of the powdered substance (500) (*2.9.12*) on a water-bath with 2 ml of *dilute sodium hydroxide solution R* for 5 min. Cool, add 5 ml of *ethyl acetate R* and slowly, with stirring, 2 ml of *dilute acetic acid R*. Shake and filter the upper layer through *anhydrous sodium sulphate R*.

Reference solution. Dissolve 6.0 mg of *aleuritic acid R* in 1.0 ml of *methanol R*, heating slightly if necessary.

Apply to the plate as bands 10 µl of each solution. Develop twice over a path of 15 cm using a mixture of 1 volume of *acetic acid R*, 8 volumes of *methanol R*, 32 volumes of *methylene chloride R* and 60 volumes of *ethyl acetate R*. Allow the plate to dry in air. Spray the plate with *anisaldehyde solution R*. Heat the plate at 100° C to 105 °C for 5 min to 10 min and examine in daylight. The chromatogram obtained with the test solution shows several coloured zones, one of which is similar in position and colour to the zone in the chromatogram obtained with the reference solution. Above this zone the chromatogram obtained with the test solution shows a pink zone and below it several violet zones. Below the zone corresponding to aleuritic acid, there is a light blue zone (shellolic acid) accompanied by zones of the same colour but of lower intensity. Other faint grey and violet zones may be visible.

B. Examine the chromatograms obtained in the test for colophony. For wax-containing shellac, in the chromatogram obtained with the test solution, a more or less strong bluish-grey zone is visible, just above the zone due to thymolphthalein in the chromatogram obtained with the reference solution. For dewaxed shellac, no such zone is visible just above the zone due to thymolphthalein in the chromatogram obtained with the reference solution.

TESTS

Colophony. Examine by thin-layer chromatography (*2.2.27*), as described under identification test A with the following modifications.

Test solution. Dissolve 50 mg of the powdered substance (500) (*2.9.12*), while heating, in a mixture of 0.5 ml of *methylene chloride R* and 0.5 ml of *methanol R*.

Reference solution. Dissolve 2.0 mg of *thymolphthalein R* in 1.0 ml of *methanol R*.

Examine the plate in ultraviolet light at 254 nm. Mark the quenching zones in the chromatogram obtained with the test solution that have similar R_F values to that of the quenching zone of thymolphthalein in the chromatogram obtained with the reference solution. Spray with *anisaldehyde solution R*, heat the plate at 100 °C to 105 °C for 5 min to 10 min and examine in daylight. The chromatogram obtained with the reference solution shows a principal zone with a reddish- violet colour (thymolphthalein). None of the quenching zones in the chromatogram obtained with the test solution that have an R_F value similar to the zone due to thymolphthalein in the reference solution show a more or less strong violet or brownish colour (colophony). Disregard any faint violet zone at this level that does not show quenching before spraying and heating.

Acid value (*2.5.1*): 65 to 95, calculated with reference to the dried substance. Examine 1.00 g of the coarsely ground substance. Determine the end-point by potentiometry (*2.2.20*).

Arsenic (*2.4.2*). Introduce 0.33 g of the substance to be examined and 5 ml of *sulphuric acid R* into a combustion flask. Carefully add a few millilitres of *strong hydrogen peroxide solution R* and heat to boiling until a clear, colourless solution is obtained. Continue heating to eliminate the water and as much sulphuric acid as possible and dilute to 25 ml with *water R*. The solution complies with limit test A for arsenic (3 ppm).

Heavy metals (*2.4.8*). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 2.0 per cent for unbleached shellac and not more than 6.0 per cent for bleached shellac, determined on 1.000 g of the powdered substance (500) (*2.9.12*) by drying in an oven at 40 °C to 45 °C for 24 h.

STORAGE

Store protected from light. Store bleached shellac and bleached, dewaxed shellac at a temperature not exceeding 15 °C.

LABELLING

The label indicates the type of shellac.

corrected 6.0

SILICA, COLLOIDAL ANHYDROUS

Silica colloidalis anhydrica

SiO_2 M_r 60.1
[7631-86-9]

DEFINITION

Colloidal anhydrous silica contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of SiO_2, determined on the ignited substance.

CHARACTERS

A light, fine, white or almost white, amorphous powder, with a particle size of about 15 nm, practically insoluble in water and in mineral acids except hydrofluoric acid. It dissolves in hot solutions of alkali hydroxides.

IDENTIFICATION

About 20 mg gives the reaction of silicates (*2.3.1*).

TESTS

pH (*2.2.3*). Shake 1.0 g with 30 ml of *carbon dioxide-free water R*. The pH of the suspension is 3.5 to 5.5.

Chlorides (*2.4.4*). To 1.0 g add a mixture of 20 ml of *dilute nitric acid R* and 30 ml of *water R* and heat on a water-bath for 15 min, shaking frequently. Dilute to 50 ml with *water R* if necessary, filter and cool. 10 ml of the filtrate diluted to 15 ml with *water R* complies with the limit test for chlorides (250 ppm).

Heavy metals (*2.4.8*). Suspend 2.5 g in sufficient *water R* to produce a semi-fluid slurry. Dry at 140 °C. When the dried substance is white, break up the mass with a glass rod. Add 25 ml of *1 M hydrochloric acid* and boil gently for 5 min, stirring frequently with the glass rod. Centrifuge for 20 min and filter the supernatant liquid through a membrane filter. To the residue in the centrifuge tube add 3 ml of *dilute hydrochloric acid R* and 9 ml of *water R* and boil. Centrifuge for 20 min and filter the supernatant liquid through the same membrane filter. Wash the residue with small quantities of *water R*, combine the filtrates and washings and dilute to 50 ml with *water R*. To 20 ml of the solution add 50 mg of *ascorbic acid R* and 1 ml of *concentrated ammonia R*. Neutralise with *dilute ammonia R2*. Dilute to 25 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (25 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on ignition. Not more than 5.0 per cent, determined on 0.200 g by ignition in a platinum crucible at 900 ± 50 °C for 2 h. Allow to cool in a desiccator before weighing.

ASSAY

To the residue obtained in the test for loss on ignition add 0.2 ml of *sulphuric acid R* and sufficient *alcohol R* to moisten the residue completely. Add 6 ml of *hydrofluoric acid R* and evaporate to dryness on a hot-plate at 95 °C to 105 °C, taking care to avoid loss from sputtering. Wash down the sides of the dish with 6 ml of *hydrofluoric acid R* and evaporate to dryness. Ignite at 900 ± 50 °C, allow to cool in a desiccator and weigh.

The difference between the mass of the final residue and the mass of the residue obtained in the test for loss on ignition gives the amount of SiO_2 in the quantity of the substance to be examined used.

corrected 6.0

SILICA, COLLOIDAL HYDRATED

Silica colloidalis hydrica

[63231-67-4]

DEFINITION

Colloidal hydrated silica contains not less than 98.0 per cent and not more than the equivalent of 100.5 per cent of SiO_2 (M_r 60.1), determined on the ignited substance.

CHARACTERS

A white or almost white, light, fine, amorphous powder, practically insoluble in water and in mineral acids, with the exception of hydrofluoric acid. It dissolves in hot solutions of alkali hydroxides.

IDENTIFICATION

A. About 20 mg gives the reaction of silicates (*2.3.1*).

B. When heated in an oven at 100 °C to 105 °C for 2 h, it shows a loss of mass not less than 3.0 per cent.

TESTS

Solution S. To 2.5 g add 50 ml of *hydrochloric acid R* and mix. Heat on a water-bath for 30 min, stirring from time to time. Maintain the original volume by adding *dilute hydrochloric acid R*. Evaporate to dryness. Add to the residue a mixture of 8 ml of *dilute hydrochloric acid R* and 24 ml of *water R*. Heat to boiling and filter under reduced pressure through a sintered-glass filter (16) (*2.1.2*). Wash the residue on the filter with a hot mixture of 3 ml of *dilute hydrochloric acid R* and 9 ml of *water R*. Wash with small quantities of *water R*, combine the filtrate and washings and dilute to 50 ml with *water R*.

pH (*2.2.3*). Suspend 1.0 g in 30 ml of a 75 g/l solution of *potassium chloride R*. The pH of the suspension is 4.0 to 7.0.

Water-absorption capacity. In a mortar, triturate 5 g with 5 ml of *water R*, added drop by drop. The mixture remains powdery.

Substances soluble in hydrochloric acid. In a platinum dish, evaporate to dryness 10.0 ml of solution S and dry to constant mass at 100 °C to 105 °C. The mass of the residue is not more than 10 mg (2.0 per cent).

Chlorides (*2.4.4*). Heat 0.5 g with 50 ml of *water R* on a water-bath for 15 min. Dilute to 100 ml with *water R* and centrifuge at 1500 *g* for 5 min. 10 ml of the supernatant solution diluted to 15 ml with *water R* complies with the limit test for chlorides (0.1 per cent).

Sulphates (*2.4.13*). Dilute 2 ml of solution S to 100 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates (1 per cent).

Iron (*2.4.9*). To 2 ml of solution S add 28 ml of *water R*. 10 ml of the solution complies with the limit test for iron (300 ppm).

Heavy metals (*2.4.8*). To 20 ml of solution S add 50 mg of *hydroxylamine hydrochloride R* and 1 ml of *concentrated ammonia R*. Adjust to pH 3.5 by adding *dilute ammonia R2*, monitoring the pH potentiometrically. Dilute to 25 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (25 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on ignition. Not more than 20.0 per cent, determined on 0.200 g in a platinum crucible by heating at 100 °C to 105 °C for 1 h and then at 900 ± 50 °C for 2 h.

ASSAY

To the residue obtained in the test for loss on ignition add 0.2 ml of *sulphuric acid R* and a quantity of *alcohol R* sufficient to moisten the residue completely. Add 6 ml of *hydrofluoric acid R* and evaporate to dryness at 95 °C to 105 °C, taking care to avoid loss from sputtering. Wash the inside of the dish with 6 ml of *hydrofluoric acid R* and evaporate to dryness again. Ignite at 900 ± 50 °C, allow to cool in a desiccator and weigh. The difference between the mass of the final residue and that of the mass obtained in the test for loss on ignition corresponds to the mass of SiO_2 in the test sample.

01/2008:1562
corrected 6.0

SILICA, DENTAL TYPE

Silica ad usum dentalem

DEFINITION

Amorphous silica (precipitated, gel or obtained by flame hydrolysis).

Content: 94.0 per cent to 100.5 per cent of SiO_2 (ignited substance).

CHARACTERS

Appearance: white or almost white, light, fine amorphous powder.

Solubility: practically insoluble in water and in mineral acids. It dissolves in hydrofluoric acid and hot solutions of alkali hydroxides.

IDENTIFICATION

About 20 mg gives the reaction of silicates (*2.3.1*).

TESTS

Solution S. To 2.5 g add 50 ml of *hydrochloric acid R* and mix. Heat on a water-bath for 30 min, stirring from time to time. Evaporate to dryness. Add to the residue a mixture of 8 ml of *dilute hydrochloric acid R* and 24 ml of *water R*. Heat to boiling and filter under reduced pressure through a sintered-glass filter (16) (*2.1.2*). Wash the residue on the filter with a hot mixture of 3 ml of *dilute hydrochloric acid R* and 9 ml of *water R*. Wash with small quantities of *water R*, combine the washings and the filtrate, then dilute to 50 ml with *water R*.

pH (*2.2.3*): 3.2 to 8.9.

Suspend 5 g in a mixture of 5 ml of a 7.46 g/l solution of *potassium chloride R* and 90 ml of *carbon dioxide-free water R*.

Chlorides. Liquid chromatography (*2.2.29*) as described in the test for sulphates.

Retention time: chlorides = about 4 min.

Limit:

– *chlorides*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.3 per cent).

Sulphates. Liquid chromatography (*2.2.29*).

Test solution. To 0.625 g of the substance to be examined add 30 ml of *water R* and boil for 2 h. Allow to cool and quantitatively transfer to a 50 ml graduated flask. Dilute to 50.0 ml with *water R*. Dilute 5.0 ml of the supernatant to 50.0 ml with *water R* and filter through a membrane filter (nominal pore size 0.45 µm).

Reference solution. Dissolve 0.50 g of *anhydrous sodium sulphate R* and 0.062 g of *sodium chloride R* in *water R* and dilute to 1000.0 ml with *water R*. Dilute 5.0 ml of this solution to 50.0 ml with *water R*.

Column:

– *material*: non-metallic;
– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: suitable anion-exchange resin (30-50 µm).

Mobile phase: dissolve 0.508 g of *sodium carbonate R* and 0.05 g of *sodium hydrogen carbonate R* in *water R*, then dilute to 1000 ml with the same solvent.

Flow rate: 1.2 ml/min.

Detection: conductivity detector.

Injection: 25 µl.

Retention time: sulphates = about 8 min.

Limit:

– *sulphates*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (4.0 per cent, expressed as sodium sulphate).

Iron (*2.4.9*): maximum 400 ppm.

Dilute 2 ml of solution S to 40 ml with *water R*.

Heavy metals (*2.4.8*): maximum 25 ppm.

To 20 ml of solution S, add 50 mg of *hydroxylamine hydrochloride R* and 1 ml of *concentrated ammonia R*. Adjust to pH 3.5 by adding *dilute ammonia R2*, monitoring the pH potentiometrically. Dilute to 25 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on ignition: maximum 25.0 per cent, determined on 0.200 g in a platinum crucible by heating at 100-105 °C for 1 h and then at 1000 ± 50 °C for 2 h.

ASSAY

To the residue obtained in the test for loss on ignition add 0.2 ml of *sulphuric acid R* and a quantity of *ethanol (96 per cent) R* sufficient to moisten the residue completely. Add 6 ml of *hydrofluoric acid R* and evaporate to dryness at 95-105 °C, taking care to avoid loss from sputtering. Wash the inside of the crucible with 6 ml of *hydrofluoric acid R* and evaporate to dryness again. Ignite at 900 ± 50 °C, allow to cool in a desiccator and weigh. The difference between the mass of the final residue and that of the mass obtained in the test for loss on ignition corresponds to the mass of SiO_2 in the test sample.

01/2008:2208
corrected 6.0

SILICA, HYDROPHOBIC COLLOIDAL

Silica hydrophobica colloidalis

DEFINITION

Colloidal silicon dioxide partly alkylated for hydrophobation.

Content: 99.0 per cent to 101.0 per cent SiO_2 (ignited substance).

CHARACTERS

Appearance: light, fine, white or almost white, amorphous powder, not wettable by water.

Solubility: practically insoluble in water and mineral acids except hydrofluoric acid. It dissolves slowly in hot solutions of alkali hydroxides.

IDENTIFICATION

A. About 25 mg ignited at 900 ± 50 °C in a platinum crucible for 2 h gives the reaction of silicates (*2.3.1*).

B. Water-dispersible fraction (see Tests).

TESTS

Chlorides (*2.4.4*): maximum 250 ppm.

To 1.0 g add 30 ml of *methanol R* and 20 ml of *dilute nitric acid R*. Heat on a water-bath for 15 min stirring frequently. Cool, dilute to 50 ml with *water R* and filter. Dilute 10 ml of the filtrate to 15 ml with *water R*.

Heavy metals (*2.4.8*): maximum 25 ppm.

Suspend 2.5 g in 30 ml of *methanol R*, stir and add 30 ml of *dilute ammonia R1*. With frequent stirring evaporate on a water-bath and dry the residue in an oven at 140 °C. When the dried substance is white, break up the mass with a glass rod. Reduce the residue to a powder and add 15 ml of *methanol R* and 25 ml of *1 M hydrochloric acid*. Boil gently for 5 min, stirring frequently with the glass rod. Centrifuge for 20 min and filter the supernatant liquid through a membrane filter. To the residue in the centrifuge tube add 3 ml of *dilute hydrochloric acid R* and 9 ml of *water R* and boil. Centrifuge for 20 min and filter the supernatant liquid through the same membrane filter. Wash the residue with small quantities of *water R*, combine the filtrates and washings and dilute to 50 ml with *water R*. To 20 ml of this solution add 50 mg of *ascorbic acid R* and 1 ml of *concentrated ammonia R*. Neutralise with *dilute ammonia R2*. Dilute to 25 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water-dispersible fraction: maximum 3.0 per cent.

Place 0.400 g in a 500 ml separating funnel, add 100 ml of *water R* and shake for 1 min. Allow to stand for 1 h. Allow 90 ml of the aqueous phase to run out dropwise without filtration into a suitable dish dried at 140 °C and cooled in a desiccator. Evaporate to dryness at 140 °C, starting at a low temperature to avoid splashing. Cool in a desiccator. The residue weighs a maximum of 12 mg.

Loss on ignition: maximum 6.0 per cent, determined on 0.200 g by ignition in a platinum crucible at 900 ± 50 °C for 2 h. It is advisable to place the crucible in a cold oven and then to heat up the oven. Allow to cool in a desiccator before weighing.

ASSAY

To the residue obtained in the test for loss on ignition add sufficient *ethanol (96 per cent) R* to moisten the residue completely and 0.2 ml of *sulphuric acid R*. Add 6 ml of *hydrofluoric acid R* and evaporate to dryness on a hot-plate at about 100 °C, taking care to avoid loss from sputtering. Wash down the sides of the platinum crucible with 6 ml of *hydrofluoric acid R* and evaporate to dryness. Ignite at 900 ± 50 °C, allow to cool in a desiccator and weigh.

The difference between the mass of the residue obtained in the test for loss on ignition and the mass of the final residue gives the amount of SiO_2 in the quantity of the substance to be examined.

01/2008:2281
corrected 6.0

SILVER, COLLOIDAL, FOR EXTERNAL USE

Argentum colloidale ad usum externum

DEFINITION

Colloidal metallic silver containing protein.

Content: 70.0 per cent to 80.0 per cent of Ag (dried substance).

CHARACTERS

Appearance: green or bluish-black metallic shiny flakes or powder, hygroscopic.

Solubility: freely soluble or soluble in water, practically insoluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

A. To 5 ml of the filtrate obtained in the test for alkalinity (see Tests) add 0.05 ml of *copper sulphate solution R* and 1 ml of *dilute sodium hydroxide solution R*. Shake. A violet colour appears within 15 min.

B. To 1 ml of solution S (see Tests), add 2 ml of *sodium chloride solution R*. A precipitate is formed which dissolves in an exces of water.

C. Ignite 0.05 g of the substance to be examined. Dissolve the residue in 10 ml of *nitric acid R*. The filtrate gives the reaction of silver (*2.3.1*).

TESTS

Solution S. Dissolve 1.25 g of the substance to be examined in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent. Allow to stand for 5 min then shake vigorously. Filter through a tared sintered-glass filter (16) (*2.1.2*) after 30 min.

Alkalinity. To 40.0 ml of solution S add 10.0 ml of *0.05 M sulphuric acid R* and 2.0 g of *anhydrous sodium sulphate R*. Shake and filter several times if necessary. To 25.0 ml of the clear and colourless solution add 0.1 ml of *phenolphthalein solution R*. Not less than 1.5 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to pink.

Silver ions. To 0.50 g of the substance to be examined add 5 ml of *anhydrous ethanol R*. Shake for 1 min, filter and add 2 ml of *hydrochloric acid R* to the filtrate. No precipitate is formed.

Sensitivity to electrolytes. Dissolve 0.1 g of the substance to be examined in 100 ml of *water R*. Transfer a part of the solution into a test tube. When examined viewing horizontally the solution appears clear and reddish-brown. When examined viewing vertically, the solution appears turbid with a greenish-brown fluorescence. To 5 ml of the solution add 5 ml of a solution of 0.50 g/l *sodium chloride R* and mix by shaking for 1 minute. When examined viewing horizontally the solution remains clear and reddish-brown.

Water insoluble substances: maximum 1.0 per cent.

Wash the residue obtained on the filter during preparation of solution S 5 times with 10 ml of *water R*. Dry the filter to constant mass at 100-105 °C. The residue weighs a maximum of 12.5 mg.

Loss on drying (*2.2.32*): maximum 8.0 per cent, determined on 0.500 g by drying in an oven at 80 °C.

ASSAY

Ignite 0.200 g of the substance to be examined at 650 ± 50 °C until the residue is white. Allow to cool, add 10 ml of a mixture of equal volumes of *nitric acid R* and *water R* and boil for 1 min. Transfer the contents of the crucible into a flask and titrate with *0.1 M ammonium thiocyanate* using 50 mg *ferric sulphate R* as indicator, until a reddish-brown colour appears.

1 ml of *0.1 M ammonium thiocyanate* is equivalent to 10.79 mg of Ag.

STORAGE

In an airtight container.

01/2008:0009
corrected 6.0

SILVER NITRATE

Argenti nitras

$AgNO_3$ M_r 169.9
[7761-88-8]

DEFINITION

Content: 99.0 per cent to 100.5 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder or transparent, colourless crystals.

Solubility: very soluble in water, soluble in ethanol (96 per cent).

IDENTIFICATION

A. 10 mg gives the reaction of nitrates (*2.3.1*).

B. 10 mg gives the reaction of silver (*2.3.1*).

TESTS

Solution S. Dissolve 2.0 g in *water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 2 ml of solution S add 0.1 ml of *bromocresol green solution R*. The solution is blue. To 2 ml of solution S add 0.1 ml of *phenol red solution R*. The solution is yellow.

Foreign salts: maximum 0.3 per cent.

To 30 ml of solution S, add 7.5 ml of *dilute hydrochloric acid R*, shake vigorously, heat for 5 min on a water-bath and filter. Evaporate 20 ml of the filtrate to dryness on a water-bath and dry at 100-105 °C. The residue weighs a maximum of 2 mg.

Aluminium, lead, copper and bismuth. Dissolve 1.0 g in a mixture of 4 ml of *concentrated ammonia R* and 6 ml of *water R*. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

ASSAY

Dissolve 0.300 g in 50 ml of *water R*, add 2 ml of *dilute nitric acid R* and 2 ml of *ferric ammonium sulphate solution R2*. Titrate with *0.1 M ammonium thiocyanate* until a reddish-yellow colour is obtained.

1 ml of *0.1 M ammonium thiocyanate* is equivalent to 16.99 mg of $AgNO_3$.

STORAGE

In a non-metallic container, protected from light.

01/2008:1470

SIMETICONE

Simeticonum

DEFINITION

Simeticone is prepared by incorporation of 4 per cent to 7 per cent silica into poly(dimethylsiloxane) with a degree of polymerisation between 20 and 400.

Content: 90.5 per cent to 99.0 per cent of poly(dimethylsiloxane).

PRODUCTION

Poly(dimethylsiloxane) is obtained by hydrolysis and polycondensation of dichlorodimethylsilane and chlorotrimethylsilane and the silica is modified at the surface by incorporation of methylsilyl groups.

CHARACTERS

Appearance: viscous, greyish-white, opalescent liquid.

Solubility: practically insoluble in water, very slightly soluble or practically insoluble in anhydrous ethanol, practically insoluble in methanol, partly miscible with ethyl acetate, with methylene chloride, with methyl ethyl ketone and with toluene.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: thin films between plates of *sodium chloride R*.

Absorption maxima: at 2964 cm^{-1}, 2905 cm^{-1}, 1412 cm^{-1}, 1260 cm^{-1} and 1020 cm^{-1}.

B. Heat 0.5 g in a test-tube over a small flame until white fumes begin to appear. Invert the tube over a 2nd tube containing 1 ml of a 1 g/l solution of *chromotropic acid, sodium salt R* in *sulphuric acid R* so that the fumes reach the solution. Shake the 2nd tube for about 10 s and heat on a water-bath for 5 min. The solution is violet.

C. The residue obtained in the test for silica under Assay, gives the reaction of silicates (*2.3.1*).

TESTS

Acidity. To 2.0 g add 25 ml of a mixture of equal volumes of *anhydrous ethanol R* and *ether R* previously neutralised to 0.2 ml of *bromothymol blue solution R1*, and shake. Not more than 3.0 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to blue.

Defoaming activity

Foaming solution. Dissolve 5.0 g of *docusate sodium R* in 1 litre of *water R*, warm to 50 °C if necessary.

Defoaming solution. To 50 ml of *methyl ethyl ketone R* add 0.250 g of the substance to be examined, warm to not more than 50 °C with shaking.

Into a 250 ml cylindrical tube about 5 cm in diameter introduce 100 ml of foaming solution and 1 ml of defoaming solution. Close tightly and fix the tube on a suitable oscillating shaker that complies with the following conditions:

– 250-300 oscillations per minute,

– angle of oscillation of about 10°,

– oscillation radius of about 10 cm.

Shake for 10 s and record the time between the end of the shaking and the instant the 1st portion of foam-free liquid surface appears.

This duration is not longer than 15 s.

Mineral oils. Place 2.0 g in a test-tube and examine in ultraviolet light at 365 nm. The fluorescence is not more intense than that of a solution containing 0.1 ppm of *quinine sulphate R* in *0.005 M sulphuric acid* examined in the same conditions.

Phenylated compounds: the corrected absorbance (*2.2.25*) is not greater than 0.2.

Test solution. Dissolve 5.0 g with shaking in 10.0 ml of *cyclohexane R*.

Spectral range: 200-350 nm.

Calculate the corrected absorbance using the following expression:

$$B - C$$

B = absorbance at the absorption maximum between 250 nm and 270 nm,

C = absorbance at 300 nm.

Heavy metals: maximum 5 ppm.

Mix 1.0 g with *methylene chloride R* and dilute to 20 ml with the same solvent. Add 1.0 ml of a freshly prepared 0.02 g/l solution of *dithizone R* in *methylene chloride R*, 0.5 ml of *water R* and 0.5 ml of a mixture of 1 volume of *dilute ammonia R2* and 9 volumes of a 2 g/l solution of *hydroxylamine hydrochloride R*. At the same time, prepare the reference solution as follows: to 20 ml of *methylene chloride R* add 1.0 ml of a freshly prepared 0.02 g/l solution of *dithizone R* in *methylene chloride R*, 0.5 ml of *lead standard solution (10 ppm Pb) R* and 0.5 ml of a mixture of 1 volume of *dilute ammonia R2* and 9 volumes of a 2 g/l solution of *hydroxylamine hydrochloride R*. Immediately shake each solution vigorously for 1 min. Any red colour in the test solution is not more intense than that in the reference solution.

Volatile matter: maximum 1.0 per cent, determined on 1.00 g by heating in an oven at 150 °C for 2 h. Carry out the test using a dish 60 mm in diameter and 10 mm deep.

ASSAY

Silica. Heat not less than 20.0 mg to 800 °C increasing the temperature by 20 °C/min under a current of *nitrogen R* at a flow rate of 200 ml/min and weigh the residue (silica).

Poly(dimethylsiloxane). Infrared absorption spectrophotometry (*2.2.24*).

Test solution. Place about 50 mg (*E*) in a screw-capped 125 ml cylindrical tube, add 25.0 ml of *toluene R*, swirl manually to disperse and add 50 ml of *dilute hydrochloric acid R*, close the tube and place on a vortex mixer; shake for 5 min. Transfer the contents of the tube to a separating funnel, allow to settle and transfer 5 ml of the upper layer to a screw-capped test tube containing 0.5 g of *anhydrous sodium sulphate R*. Cap and shake vigorously manually. Centrifuge to obtain a clear solution.

Reference solution. Introduce about 0.20 g of *dimeticone CRS* (poly(dimethylsiloxane)) into 100.0 ml of *toluene R*. Prepare the reference solution in the same way as for the test solution, using 25.0 ml of the dimeticone solution obtained above.

Blank solution. Shake 10 ml of *toluene R* with 1 g of *anhydrous sodium sulphate R*. Centrifuge the resulting suspension.

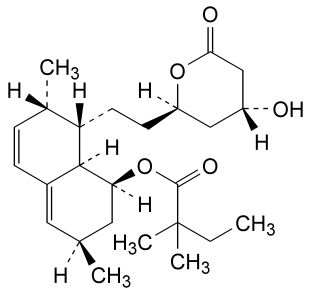
Record the infrared absorption spectra for the test solution and the reference solution in 0.5 mm cells, from 1330 cm^{-1} to 1180 cm^{-1}. Determine the absorbance of the band at 1260 cm^{-1}.

Calculate the percentage content of poly(dimethylsiloxane) using the following expression:

$$\frac{25 \times C \times A_M \times 100}{A_E \times E}$$

A_M = absorbance of the test solution,

A_E = absorbance of the reference solution,



C = concentration of the reference solution, in milligrams per millilitre,

E = mass of the substance to be examined, in milligrams.

01/2008:1563

SIMVASTATIN

Simvastatinum

$C_{25}H_{38}O_5$ M_r 418.6

[79902-63-9]

DEFINITION

Simvastatin contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of (1*S*,3*R*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate, calculated with reference to the dried substance. A suitable antioxidant may be added.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, very soluble in methylene chloride, freely soluble in alcohol.

IDENTIFICATION

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *simvastatin CRS*. Examine the substances prepared as discs.

TESTS

Appearance of solution. Dissolve 0.200 g in *methanol R* and dilute to 20 ml with the same solvent. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*). Dissolve 0.125 g in *acetonitrile R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 285 to + 300, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (*2.2.29*) as prescribed under Assay.

Inject 5 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 20 per cent of the full scale of the recorder. Inject 5 µl of test solution (a) and continue the chromatography for five times the retention time of simvastatin. When the chromatograms are recorded under the prescribed conditions the relative retentions are: impurity A about 0.45, lovastatin (impurity E) and epilovastatin (impurity F) about 0.60, impurity G about 0.80, impurity B about 2.38, impurity C about 2.42 and impurity D about 3.80 (retention time of simvastatin: about 2.6 min). In the chromatogram obtained with test solution (a): the area of the peak due to lovastatin and epilovastatin is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent); the area of any peak apart from the principal peak and the peak due to lovastatin and epilovastatin is not greater than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent); the sum of the areas of all peaks, apart from the principal peak and the peak due to lovastatin and epilovastatin, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in a desiccator under high vacuum at 60 °C for 3 h.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Solvent mixture. Prepare a mixture of 40 volumes of a solution of a 1.4 g/l solution of *potassium dihydrogen phosphate R*, adjusted to pH 4.0 with *phosphoric acid R*, and 60 volumes of *acetonitrile R*. Filter.

Test solution (a). Dissolve 75.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Test solution (b). Dissolve 40.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 1.0 mg of *simvastatin CRS* and 1.0 mg of *lovastatin CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 40.0 mg of *simvastatin CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.033 m long and 4.6 mm in internal diameter packed with *end-capped octadecylsilyl silica gel for chromatography R* (3 µm),

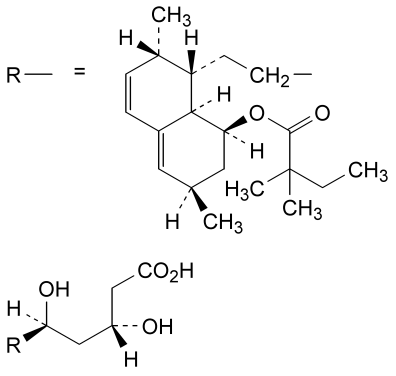
– as mobile phase at a flow rate of 3.0 ml/min:

Mobile phase A. Mix 50 volumes of *acetonitrile R* and 50 volumes of a 0.1 per cent *V/V* solution of *phosphoric acid R*,

Mobile phase B. A 0.1 per cent *V/V* solution of *phosphoric acid R* in *acetonitrile R*,

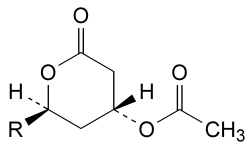
Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)	Comment
0 - 4.5	100	0	isocratic
4.5 - 4.6	100 → 95	0 → 5	linear gradient
4.6 - 8.0	95 → 25	5 → 75	linear gradient
8.0 - 11.5	25	75	isocratic
11.5 - 11.6	25 → 100	75 → 0	linear gradient
11.6 - 13	100	0	re-equilibration

– as detector a spectrophotometer set at 238 nm.



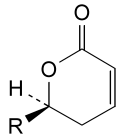
Inject 5 µl of reference solution (a). The test and the assay are not valid unless, in the chromatogram obtained, the resolution between the peak corresponding to lovastatin and epilovastatin and the peak corresponding to simvastatin is at least 5.0. When the chromatograms are recorded under the prescribed conditions the retention times are: lovastatin and epilovastatin about 1.6 min and simvastatin about 2.6 min. Inject 5 µl of reference solution (c). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject 5 µl of test solution (b).

Calculate the content of simvastatin from the peak areas in the chromatograms obtained with test solution (b) and reference solution (c) and the declared content of *simvastatin CRS*.

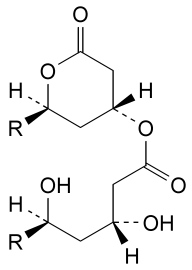


STORAGE

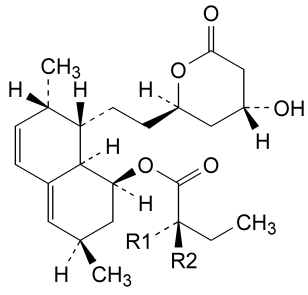
Store under nitrogen, in an airtight container, protected from light.



IMPURITIES

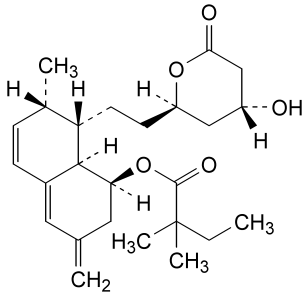


A. (3*R*,5*R*)-7-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-8-[(2,2-dimethylbutanoyl)oxy]-2,6-dimethyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]-3,5-dihydroxyheptanoic acid (hydroxy acid),



B. (1*S*,3*R*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-(acetyloxy)-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate (acetate ester),

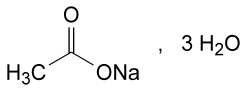
C. (1*S*,3*R*,7*S*,8*S*,8a*R*)-3,7-dimethyl-8-[2-[(2*R*)-6-oxo-3,6-dihydro-2*H*-pyran-2-yl]ethyl]-1,2,3,7,8,8a-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate (anhydrosimvastatin),



D. (2*R*,4*R*)-2-[[(1*S*,2*S*,6*R*,8*S*,8a*R*)-8-[(2,2-dimethylbutanoyl)oxy]-2,6-dimethyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]ethyl]-6-oxotetrahydro-2*H*-pyran-4-yl (3*R*,5*R*)-7-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-8-[(2,2-dimethylbutanoyl)oxy]-2,6-dimethyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]-3,5-dihydroxyheptanoate (dimer),

E. R1 = CH_3, R2 = H: (1*S*,3*R*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl (2*S*)-2-methylbutanoate (lovastatin),

F. R1 = H, R2 = CH_3: (1*S*,3*R*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl (2*R*)-2-methylbutanoate (epilovastatin),



G. (1*S*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-7-methyl-3-methylene-1,2,3,7,8,8a-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate.

01/2008:0411

SODIUM ACETATE TRIHYDRATE

Natrii acetas trihydricus

$C_2H_3NaO_2,3H_2O$ M_r 136.1
[6131-90-4]

DEFINITION

Sodium ethanoate trihydrate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: colourless crystals.

Solubility: very soluble in water, soluble in ethanol (96 per cent).

IDENTIFICATION

A. 1 ml of solution S (see Tests) gives reaction (b) of acetates (*2.3.1*).

B. 1 ml of solution S gives reaction (a) of sodium (*2.3.1*).

C. Loss on drying (see Tests).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 7.5 to 9.0.

Dilute 5 ml of solution S to 10 ml with *carbon dioxide-free water R*.

Reducing substances. Dissolve 5.0 g in 50 ml of *water R*, then add 5 ml of *dilute sulphuric acid R* and 0.5 ml of *0.002 M potassium permanganate*. The pink colour persists for at least 1 h. Prepare a blank in the same manner but without the substance to be examined.

Chlorides (*2.4.4*): maximum 200 ppm.

Dilute 2.5 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 200 ppm.

Dilute 7.5 ml of solution S to 15 ml with *distilled water R*.

Aluminium (*2.4.17*): maximum 0.2 ppm, if intended for use in the manufacture of dialysis solutions.

Prescribed solution. Dissolve 20 g in 100 ml of *water R* and adjust to pH 6.0 by the addition of *1 M hydrochloric acid* (about 10 ml).

Reference solution. Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Arsenic (*2.4.2, Method A*): maximum 2 ppm, determined on 0.5 g.

Calcium and magnesium: maximum 50 ppm, calculated as Ca.

To 200 ml of *water R* add 10 ml of *ammonium chloride buffer solution pH 10.0 R*, 0.1 g of *mordant black 11 triturate R*, 2.0 ml of *0.05 M zinc chloride* and, dropwise, *0.02 M sodium edetate* until the colour changes from violet to blue. Add to the solution 10.0 g of the substance to be examined and shake to dissolve. Titrate with *0.02 M sodium edetate* until the blue colour is restored. Not more than 0.65 ml of *0.02 M sodium edetate* is required.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Iron (*2.4.9*): maximum 10 ppm, determined on 10 ml of solution S.

Loss on drying (*2.2.32*): 39.0 per cent to 40.5 per cent, determined on 1.000 g by drying in an oven at 130 °C. Introduce the substance to be examined into the oven while the latter is cold.

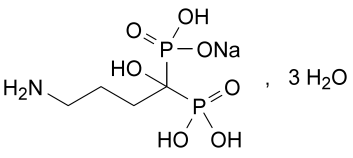
ASSAY

Dissolve 0.250 g in 50 ml of *anhydrous acetic acid R*, add 5 ml of *acetic anhydride R*, mix and allow to stand for 30 min. Using 0.3 ml of *naphtholbenzein solution R* as indicator, titrate with *0.1 M perchloric acid* until a green colour is obtained.

1 ml of *0.1 M perchloric acid* is equivalent to 8.20 mg of $C_2H_3NaO_2$.

STORAGE

In an airtight container.



LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of dialysis solutions.

01/2008:1564

SODIUM ALENDRONATE

Natrii alendronas

$C_4H_{12}NNaO_7P_2,3H_2O$ M_r 325.1
[121268-17-5]

DEFINITION

Sodium alendronate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (4-amino-1-hydroxybutylidene)bisphosphonic acid monosodium salt, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, soluble in water, very slightly soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sodium alendronate CRS*. Examine the substances prepared as discs.

B. It gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution B_7 or BY_7 (*2.2.2, Method II*).

pH (*2.2.3*). The pH of is 4.0 to 5.0.

4-aminobutanoic acid. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution. Dissolve 0.10 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 0.10 g of *4-aminobutanoic acid R* in *water R* and dilute to 200 ml with the same solvent.

Reference solution (b). Dilute 1 ml of reference solution (a) to 10 ml with *water R*.

Apply to the plate 5 µl of the test solution and 5 µl of reference solution (b). Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 20 volumes of *water R*, 20 volumes of *glacial acetic acid R* and 60 volumes of *butanol R*. Dry the plate in a current of warm air. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spots corresponding to 4-aminobutanoic acid in the chromatogram obtained with the test solution are not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Phosphate and phosphite. Examine the chromatograms obtained in the assay. In the chromatogram obtained with the test solution: the area of any peak corresponding to phosphate is not greater than that of the peak due to phosphate in the chromatogram obtained with reference solution (d) (0.5 per cent); the area of any peak corresponding to phosphite is not greater than that of the peak due to phosphite in the chromatogram obtained with reference solution (d) (0.5 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test F for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): 16.1 per cent to 17.1 per cent, determined on 1.000 g by drying in an oven at 140 °C to 145 °C.

ASSAY

Examine by liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 50.0 mg of *sodium alendronate CRS* in *water R* and dilute to 25.0 ml with the same solvent.

Reference solution (b). Dissolve 3.0 g of *phosphoric acid R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *water R.*

Reference solution (c). Dissolve 2.5 g of *phosphorous acid R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *water R.*

Reference solution (d). Mix 2.0 ml of reference solution (b) and 2.0 ml of reference solution (c) and dilute to 50.0 ml with *water R.*

The chromatographic procedure may be carried out using:

– a column 0.15 m long and 4.6 mm in internal diameter packed with *anion exchange resin R1* (7 µm),
– as mobile phase at a flow rate of 1.2 ml/min a solution of 0.2 ml of *anhydrous formic acid R* in 1000 ml of *water R,* adjusted to pH 3.5 with *2 M sodium hydroxide R,*
– as detector a refractometer,
– a 100 µl loop injector,

maintaining the temperature of the column at 35 °C.

Inject reference solution (a) six times. The assay is not valid unless the relative standard deviation of the peak area of sodium alendronate is at most 1.0 per cent. Inject the test solution, reference solution (a) and reference solution (d). The retention time of sodium alendronate is about 16 min and the relative retention times are: phosphate about 1.3 and phosphite about 1.6. Record the chromatograms for twice the retention time of the principal peak in the chromatogram obtained with the test solution.

Calculate the percentage content of $C_4H_{12}NNaO_7P_2$ from the peak areas and the declared content of *sodium alendronate CRS.*

IMPURITIES

A. 4-aminobutanoic acid,

B. phosphate,

C. phosphite.

01/2008:0625
corrected 6.0

SODIUM ALGINATE

Natrii alginas

DEFINITION

Sodium alginate consists mainly of the sodium salt of alginic acid, which is a mixture of polyuronic acids $[C_6H_8O_6)_n]$ composed of residues of D-mannuronic acid and L-guluronic acid. Sodium alginate is obtained mainly from algae belonging to the Phaeophyceae.

CHARACTERS

Appearance: white or pale yellowish-brown powder.

Solubility: slowly soluble in water forming a viscous, colloidal solution, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 0.2 g with shaking in 20 ml of *water R.* To 5 ml of this solution add 1 ml of *calcium chloride solution R.* A voluminous gelatinous mass is formed.

B. To 10 ml of the solution prepared in identification test A add 1 ml of *dilute sulphuric acid R.* A gelatinous mass is formed.

C. To 5 mg add 5 ml of *water R,* 1 ml of a freshly prepared 10 g/l solution of *1,3-dihydroxynaphthalene R* in *ethanol (96 per cent) R* and 5 ml of *hydrochloric acid R.* Boil for 3 min, cool, add 5 ml of *water R,* and shake with 15 ml of *di-isopropyl ether R.* Carry out a blank test. The upper layer obtained with the substance to be examined exhibits a deeper bluish-red colour than that obtained with the blank.

D. It complies with the test for sulphated ash. The residue obtained, dissolved in 2 ml of *water R,* gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 0.10 g in *water R,* with constant stirring, dilute to 30 ml with the same solvent and allow to stand for 1 h.

Appearance of solution. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

Dilute 1 ml of solution S to 10 ml with *water R.*

Chlorides: maximum 1.0 per cent.

To 2.50 g add 50 ml of *dilute nitric acid R,* shake for 1 h and dilute to 100.0 ml with *dilute nitric acid R.* Filter. To 50.0 ml of the filtrate add 10.0 ml of *0.1 M silver nitrate* and 5 ml of *toluene R.* Titrate with *0.1 M ammonium thiocyanate,* using 2 ml of *ferric ammonium sulphate solution R2* as indicator and shaking vigorously towards the end point.

1 ml of *0.1 M silver nitrate* is equivalent to 3.545 mg of Cl.

Calcium: maximum 1.50 per cent.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Dissolve 0.10 g in 50 ml of *dilute ammonia R2,* heating on a water-bath. Allow to cool and dilute to 100.0 ml with *distilled water R* (solution (a)). Dilute 3.0 ml of solution (a) to 100.0 ml with *distilled water R.*

Reference solutions. Prepare 3 reference solutions in the same manner as the test solution but add 0.75 ml, 1.0 ml and 1.5 ml respectively of *calcium standard solution (100 ppm Ca) R* to the 3.0 ml of solution (a).

Set the zero of the instrument using a mixture of 1.5 volumes of *dilute ammonia R2* and 98.5 volumes of *distilled water R.*

Source: calcium hollow-cathode lamp.

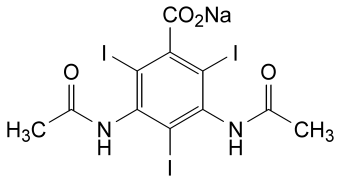
Wavelength: 422.7 nm.

Atomisation device: air-acetylene flame.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test F. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R.*

Loss on drying (*2.2.32*): maximum 15.0 per cent, determined on 0.1000 g by drying in an oven at 105 °C for 4 h.



Sulphated ash (*2.4.14*): 30.0 per cent to 36.0 per cent (dried substance), determined on 0.1000 g.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 micro-organisms per gram, determined by plate-count. It complies with the tests for *Escherichia coli* and *Salmonella* (*2.6.13*).

01/2008:1150

SODIUM AMIDOTRIZOATE

Natrii amidotrizoas

$C_{11}H_8I_3N_2NaO_4$ M_r 636
[737-31-5]

DEFINITION

Sodium amidotrizoate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of sodium 3,5-bis(acetylamino)-2,4,6-tri-iodobenzoate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, freely soluble in water, slightly soluble in alcohol, practically insoluble in acetone.

It melts at about 261 °C with decomposition.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sodium amidotrizoate CRS*. Dry both the substance to be examined and the reference substance at 100 °C to 105 °C for 3 h.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (b).

C. Heat 50 mg gently in a small porcelain dish over a naked flame. Violet vapour is evolved.

D. It gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 10 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Dilute 1 ml of solution S to 10 ml with *water R*. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*). The pH of solution S is 7.5 to 9.5.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel GF_{254} plate R. Prepare the solutions in subdued light and develop the chromatograms protected from light.*

Test solution (a). Dissolve 0.50 g of the substance to be examined in a 3 per cent *V/V* solution of *ammonia R* in *methanol R* and dilute to 10 ml with the same solution.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a 3 per cent *V/V* solution of *ammonia R* in *methanol R*.

Reference solution (a). Dilute 1 ml of test solution (b) to 50 ml with a 3 per cent *V/V* solution of *ammonia R* in *methanol R*.

Reference solution (b). Dissolve 50 mg of *sodium amidotrizoate CRS* in a 3 per cent *V/V* solution of *ammonia R* in *methanol R* and dilute to 10 ml with the same solution.

Apply separately to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *anhydrous formic acid R*, 25 volumes of *methyl ethyl ketone R* and 60 volumes of *toluene R*. Allow the plate to dry until the solvents have evaporated and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent).

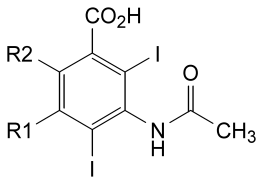
Free aromatic amines. *Maintain the solutions and reagents in iced water, protected from light.* To 0.50 g in a 50 ml volumetric flask add 15 ml of *water R*. Shake and add 1 ml of *dilute sodium hydroxide solution R*. Cool in iced water, add 5 ml of a freshly prepared 5 g/l solution of *sodium nitrite R* and 12 ml of *dilute hydrochloric acid R*. Shake gently and allow to stand for exactly 2 min after adding the hydrochloric acid. Add 10 ml of a 20 g/l solution of *ammonium sulphamate R*. Allow to stand for 5 min, shaking frequently, and add 0.15 ml of a 100 g/l solution of *α-naphthol R* in *alcohol R*. Shake and allow to stand for 5 min. Add 3.5 ml of *buffer solution pH 10.9 R*, mix and dilute to 50.0 ml with *water R*. The absorbance (*2.2.25*), measured within 20 min at 485 nm using as the compensation liquid a solution prepared at the same time and in the same manner but omitting the substance to be examined, is not greater than 0.30.

Free iodine and iodides. Not more than 50 ppm. Dissolve 1.0 g in *distilled water R* and dilute to 10 ml with the same solvent. Add dropwise *dilute nitric acid R* until the precipitation is complete, then add 3 ml of *dilute nitric acid R*. Filter and wash the precipitate with 5 ml of *water R*. Collect the filtrate and washings. Add 1 ml of *strong hydrogen peroxide solution R* and 1 ml of *methylene chloride R*. Shake. The lower layer is not more intensely coloured than a reference solution prepared simultaneously and in the same manner, using a mixture of 5 ml of *iodide standard solution (10 ppm I) R*, 3 ml of *dilute nitric acid R* and 15 ml of *water R*.

Heavy metals (*2.4.8*). Dilute 4 ml of solution S to 20 ml with *water R*. 12 ml of this solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Water (*2.5.12*). Not more than 11.0 per cent, determined on 0.400 g by the semi-micro determination of water.

ASSAY



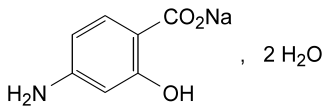
To 0.150 g in a 250 ml round-bottomed flask add 5 ml of *strong sodium hydroxide solution R*, 20 ml of *water R*, 1 g of *zinc powder R* and a few glass beads. Boil under a reflux condenser for 30 min. Allow to cool and rinse the condenser with 20 ml of *water R*, adding the rinsings to the flask. Filter through a sintered-glass filter (*2.1.2*) and wash the filter with several quantities of *water R*. Collect the filtrate and washings. Add 40 ml of *dilute sulphuric acid R* and titrate immediately with *0.1 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*), using a suitable electrode system such as silver-mercurous sulphate.

1 ml of *0.1 M silver nitrate* is equivalent to 21.20 mg of $C_{11}H_8I_3N_2NaO_4$.

STORAGE

Store protected from light.

IMPURITIES



A. R1 = NH_2, R2 = I: 3-acetylamino-5-amino-2,4,6-triiodobenzoic acid,

B. R1 = $NHCOCH_3$, R2 = H: 3,5-bis(acetylamino)-2,4-diiodobenzoic acid.

01/2008:1993 corrected 6.0

SODIUM AMINOSALICYLATE DIHYDRATE

Natrii aminosalicylas dihydricus

$C_7H_6NNaO_3,2H_2O$ M_r 211.2
[6018-19-5]

DEFINITION

Sodium 4-amino-2-hydroxybenzoate dihydrate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white crystalline powder or crystals, slightly hygroscopic.

Solubility: freely soluble in water, sparingly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *Ph. Eur. reference spectrum of sodium aminosalicylate dihydrate.*

B. Introduce 0.3 g into a porcelain crucible. Cautiously heat on a small flame until vapour is evolved. Cover the crucible with a watch glass and collect the white sublimate. The melting point (*2.2.14*) of the sublimate is 120 °C to 124 °C.

C. To 0.1 ml of solution S (see Tests) add 5 ml of *water R* and 0.1 ml of *ferric chloride solution R1*. A reddish-brown colour develops.

D. 2 ml of solution S gives the reaction of primary aromatic amines (*2.3.1*).

E. 0.5 ml of solution S gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. The freshly prepared solution is clear (*2.2.1*) and not more intensely coloured than reference solution B_5 (*2.2.2, Method II*).

Dissolve 2.5 g in *water R* and dilute to 25 ml with the same solvent.

pH (*2.2.3*): 6.5 to 8.5 for solution S.

Related substances. Liquid chromatography (*2.2.29*). *Use freshly prepared solutions and mobile phases.*

Test solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *3-aminophenol R* in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dissolve 5.0 mg of *mesalazine CRS* in *water R* and dilute to 100.0 ml with the same solvent. To 10.0 ml of this solution add 1.0 ml of reference solution (a) and dilute to 50.0 ml with *water R*.

Column:
- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: spherical *base-deactivated octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:
- *mobile phase A*: dissolve 2.2 g of *perchloric acid R* and 1.0 g of *phosphoric acid R* in *water R* and dilute to 1000.0 ml with the same solvent,
- *mobile phase B*: dissolve 1.7 g of *perchloric acid R* and 1.0 g of *phosphoric acid R* in *acetonitrile R* and dilute to 1000.0 ml with the same solvent,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	100	0
15 - 30	100 → 40	0 → 60
30 - 35	40 → 100	60 → 0
35 - 45	100	0

Flow rate: 1.25 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 10 µl.

Relative retention with reference to 4-aminosalicylate (retention time = about 12 min): impurity A = about 0.30; impurity B = about 0.37.

System suitability: reference solution (b):
- *resolution*: minimum 4.0 between the peaks due to impurity A and impurity B.

Limits:
- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *any other impurity*: for each impurity, not more than 0.1 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total*: not more than the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *disregard limit*: 0.05 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

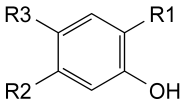
2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): 16.0 per cent to 17.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Pyrogens (*2.6.8*). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass, 10 ml of a 20 mg/ml solution of the substance to be examined in *water for injections R*.

ASSAY

Dissolve 0.150 g in 20 ml of *water R*. Add 10 ml of a 500 g/l solution of *sodium bromide R* and 25 ml of *glacial acetic acid R*. Add 5 ml of *0.1 M sodium nitrite* rapidly and continue the titration with the same titrant, determining the end-point potentiometrically (*2.2.20*).



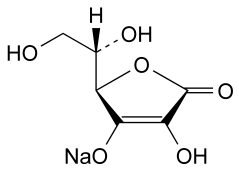
1 ml of *0.1 M sodium nitrite* is equivalent to 17.52 mg of $C_7H_6NNaO_3$.

STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

IMPURITIES

Specified impurities: A, B.



A. R1 = R3 = H, R2 = NH_2: 3-aminophenol,

B. R1 = CO_2H, R2 = H, R3 = NH_2: 5-amino-2-hydroxybenzoic acid (mesalazine).

01/2008:1791
corrected 6.0

SODIUM ASCORBATE

Natrii ascorbas

$C_6H_7NaO_6$ M_r 198.1
[134-03-2]

DEFINITION

Sodium (2*R*)-2-[(1*S*)-1,2-dihydroxyethyl]-4-hydroxy-5-oxo-2,5-dihydrofuran-3-olate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish, crystalline powder or crystals.

Solubility: freely soluble in water, sparingly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Specific optical rotation (*2.2.7*) (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *sodium ascorbate CRS*.

C. To 1 ml of solution S (see Tests) add 0.2 ml of *dilute nitric acid R* and 0.2 ml of *silver nitrate solution R2*. A grey precipitate is formed.

D. 1 ml of solution S gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 or BY_6 (*2.2.2, Method II*). Examine the colour immediately after preparation of the solution.

pH (*2.2.3*): 7.0 to 8.0 for solution S.

Specific optical rotation (*2.2.7*): + 103 to + 108 (dried substance), determined on freshly prepared solution S.

Oxalic acid: maximum 0.3 per cent.

Test solution. Dissolve 0.25 g in 5 ml of *water R*. Add 1 ml of *dilute acetic acid R* and 0.5 ml of *calcium chloride solution R*.

Reference solution. Dissolve 70 mg of *oxalic acid R* in *water R* and dilute to 500 ml with the same solvent; to 5 ml of the solution add 1 ml of *dilute acetic acid R* and 0.5 ml of *calcium chloride solution R*.

Allow the solutions to stand for 1 h. Any opalescence in the test solution is not more intense than that in the reference solution.

Related substances. The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

Benzene (*2.4.24, System A*): maximum 2 ppm.

Sulphates (*2.4.13*): maximum 150 ppm.

To 10 ml of solution S add 2 ml of *hydrochloric acid R1* and dilute to 15 ml with *distilled water R*.

Copper: maximum 5.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 2.0 g in *0.1 M nitric acid* and dilute to 25.0 ml with the same solvent.

Reference solutions. Prepare reference solutions (0.2 ppm, 0.4 ppm and 0.6 ppm) by diluting *copper standard solution (10 ppm Cu) R* with *0.1 M nitric acid*.

Source: copper hollow-cathode lamp.

Wavelength: 324.8 nm.

Atomisation device: air-acetylene flame.

Iron: maximum 2.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 5.0 g in *0.1 M nitric acid* and dilute to 25.0 ml with the same solvent.

Reference solutions. Prepare reference solutions (0.2 ppm, 0.4 ppm and 0.6 ppm) by diluting *iron standard solution (20 ppm Fe) R* with *0.1 M nitric acid*.

Source: iron hollow-cathode lamp.

Wavelength: 248.3 nm.

Atomisation device: air-acetylene flame.

Nickel: maximum 1.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 10.0 g in *0.1 M nitric acid* and dilute to 25.0 ml with the same solvent.

Reference solutions. Prepare reference solutions (0.2 ppm, 0.4 ppm and 0.6 ppm) by diluting *nickel standard solution (10 ppm Ni) R* with *0.1 M nitric acid*.

Source: nickel hollow-cathode lamp.

Wavelength: 232.0 nm.

Atomisation device: air-acetylene flame.

Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.25 per cent, determined on 1.000 g by drying in an oven at 105 °C.

ASSAY

Dissolve 80 mg in a mixture of 10 ml of *dilute sulphuric acid R* and 80 ml of *carbon dioxide-free water R*. Add 1 ml of *starch solution R*. Titrate with *0.05 M iodine* until a persistent violet-blue colour is obtained.

1 ml of *0.05 M iodine* is equivalent to 9.91 mg of $C_6H_7NaO_6$.

STORAGE

In a non-metallic container, protected from light.

01/2008:1994
corrected 6.0

SODIUM AUROTHIOMALATE

Natrii aurothiomalas

DEFINITION

Mixture of monosodium and disodium salts of (2*RS*)-2-(aurosulphanyl)butanedioic acid.

Content:

– *gold* (Au; A_r 197.0): 44.5 per cent to 46.0 per cent (dried substance);
– *sodium* (Na; A_r 22.99): 10.8 per cent to 11.8 per cent (dried substance).

CHARACTERS

Appearance: fine, pale yellow, hygroscopic powder.

Solubility: very soluble in water, practically insoluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

A. Dissolve 20 mg in *water R* and dilute to 2 ml with the same solvent. Add 2 ml of *strong hydrogen peroxide solution R* and 1 ml of *sodium hydroxide solution R*. Carefully heat to boiling and boil for 30 s. A precipitate is produced that appears brownish-black by reflected light and bluish-green by transmitted light.
B. To 20 mg add 2 ml of *water R*. The solution gives reaction (a) of sodium (*2.3.1*).
C. Ignite 100 mg, dissolve the residue in *hydrochloric acid R* and dilute to 10 ml with the same acid. Allow to stand. 5 ml of the clear supernatant gives reaction (a) of sulphates (*2.3.1*).

TESTS

Appearance of solution. Dissolve 1.0 g in *water R* and dilute to 10 ml with the same solvent. Filter, seal in an ampoule and heat at 100 °C for 1 h. Cool and dilute the contents of the ampoule to 100 ml with *water R*. The solution remains clear and is not more intensely coloured than a 0.100 g/l solution of *potassium ferricyanide R*.

pH (*2.2.3*): 6.0 to 7.0.

Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 0.200 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of *fumaric acid R* and 100.0 mg of *thiomalic acid R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 25.0 ml with *water R*.

Reference solution (b). Dissolve 12.0 mg of *thiomalic acid R* in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (c). Dissolve 10.0 mg of *maleic acid R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 25.0 ml with *water R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 90 volumes of a 10.5 g/l solution of *phosphoric acid R*, 100 volumes of *methanol R2* and 810 volumes of *water R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 10 µl.

Run time: twice the retention time of impurity C.

Relative retention with reference to impurity C (retention time = about 8 min): impurity A = about 0.4; impurity B = about 0.6. Aurothiomalate does not elute under the chromatographic conditions described.

System suitability: reference solution (a):

– *resolution*: minimum 5.0 between the peaks due to impurities B and C.

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent);
– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (6.0 per cent).

Glycerol: maximum 8.0 per cent.

Test solution. Dissolve 0.50 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 0.80 g of *glycerol R* to 100.0 ml with *water R*.

Reference solution (b). To 2.5 ml of reference solution (a) add 7.5 ml of *water R*.

Reference solution (c). To 5.0 ml of reference solution (a) add 5.0 ml of *water R*.

Reference solution (d). To 7.5 ml of reference solution (a) add 2.5 ml of *water R*.

Blank solution. 10 ml of *water R*.

To the test solution, reference solutions (b), (c) and (d) and the blank solution, add 2.5 ml of a freshly prepared 235 g/l solution of *sodium hydroxide R* and mix. Add dropwise in 0.2 ml increments a 38.0 g/l solution of *cupric chloride R*, shaking vigorously after each addition, until the solutions become slightly turbid. Then add 0.2 ml of the 38.0 g/l solution of *cupric chloride R*. Stopper and shake vigorously for 1 min. Dilute to 25.0 ml with *water R* and mix. Centrifuge for 2 min. Measure the absorbance (*2.2.25*) of the supernatant solution of a 1 cm layer at 635 nm. Use the solution prepared from the blank solution as the compensation liquid. Draw a calibration curve and calculate the content of glycerol in the sample.

Loss on drying (*2.2.32*): maximum 2.0 per cent, determined on 1.000 g by drying over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa for 24 h.

ASSAY

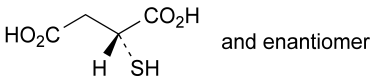
Gold. Heat 0.2 g with 10 ml of *sulphuric acid R* and continue to boil gently until a clear, pale yellow liquid is produced. Cool, add about 1 ml of *nitric acid R* dropwise and boil for 1 h. Cool, dilute to 70 ml with *water R*, boil for 5 min and filter. Wash the residue of gold with *water R* at 60 °C. Dry and ignite at a temperature of at least 600 °C for 3 h. Weigh the residue and calculate the percentage content of Au.

Sodium. Evaporate to dryness the filtrate and washings obtained in the assay for gold, moisten with *sulphuric acid R* and ignite at 600 ± 50 °C for 3 h.

1.000 g of residue is equivalent to 0.324 g of Na.

STORAGE

In an airtight container.

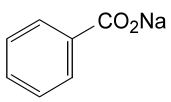


IMPURITIES

Specified impurities: A, B, C.

A. maleic acid,

B. (2*E*)-butenedioic acid (fumaric acid),



C. (2*RS*)-2-sulphanylbutanedioic acid (thiomalic acid).

01/2008:0123
corrected 6.0

SODIUM BENZOATE

Natrii benzoas

$C_7H_5NaO_2$ M_r 144.1
[532-32-1]

DEFINITION

Sodium benzenecarboxylate.

Content: 99.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline or granular powder or flakes, slightly hygroscopic.

Solubility: freely soluble in water, sparingly soluble in ethanol (90 per cent *V/V*).

IDENTIFICATION

A. It gives reactions (b) and (c) of benzoates (*2.3.1*).

B. It gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 10 ml of *carbon dioxide-free water R* and 0.2 ml of *phenolphthalein solution R*. Not more than 0.2 ml of *0.1 M sodium hydroxide* or *0.1 M hydrochloric acid* is required to change the colour of the indicator.

Halogenated compounds: maximum 200 ppm for ionised chlorine and maximum 300 ppm for total chlorine.

All glassware used must be chloride-free and may be prepared by soaking overnight in a 500 g/l solution of nitric acid R, rinsed with water R and stored full of water R. It is recommended that glassware be reserved exclusively for this test.

Test solution. To 20.0 ml of solution S add 5 ml of *water R* and dilute to 50.0 ml with *ethanol (96 per cent) R*.

Determination of ionised chlorine

In three 25 ml volumetric flasks, prepare the following solutions.

Solution (a). To 4.0 ml of the test solution add 3 ml of *dilute sodium hydroxide solution R* and 3 ml of *ethanol (96 per cent) R*. This solution is used to prepare solution A.

Solution (b). To 3 ml of *dilute sodium hydroxide solution R* add 2 ml of *water R* and 5 ml of *ethanol (96 per cent) R*. This solution is used to prepare solution B.

Solution (c). To 4.0 ml of *chloride standard solution (8 ppm Cl) R* add 6.0 ml of *water R*. This solution is used to prepare solution C.

In a fourth 25 ml volumetric flask, place 10 ml of *water R*. To each flask add 5 ml of *ferric ammonium sulphate solution R5*, mix and add dropwise and with swirling 2 ml of *nitric acid R* and 5 ml of *mercuric thiocyanate solution R*. Shake. Dilute the contents of each flask to 25.0 ml with *water R* and allow the solutions to stand in a water-bath at 20 °C for 15 min. Measure at 460 nm in a 2 cm cell the absorbance (*2.2.25*) of solution A using solution B as the compensation liquid, and the absorbance of solution C using the solution obtained with 10 ml of *water R* as the compensation liquid. The absorbance of solution A is not greater than that of solution C.

Determination of total chlorine

Solution (a). To 10.0 ml of the test solution add 7.5 ml of *dilute sodium hydroxide solution R* and 0.125 g of *nickel-aluminium alloy R* and heat on a water-bath for 10 min. Allow to cool to room temperature, filter into a 25 ml volumetric flask and wash the filter with 3 quantities, each of 2 ml, of *ethanol (96 per cent) R* (a slight precipitate may form that disappears on acidification). Dilute the filtrate and washings to 25.0 ml with *water R*. This solution is used to prepare solution A.

Solution (b). In the same manner, prepare a similar solution replacing the test solution by a mixture of 5 ml of *ethanol (96 per cent) R* and 5 ml of *water R*. This solution is used to prepare solution B.

Solution (c). To 6.0 ml of *chloride standard solution (8 ppm Cl) R* add 4.0 ml of *water R*. This solution is used to prepare solution C.

In four 25 ml volumetric flasks, place separately 10 ml of solution (a), 10 ml of solution (b), 10 ml of solution (c) and 10 ml of *water R*. To each flask add 5 ml of *ferric ammonium sulphate solution R5*, mix and add dropwise and with swirling 2 ml of *nitric acid R* and 5 ml of *mercuric thiocyanate solution R*. Shake. Dilute the contents of each flask to 25.0 ml with *water R* and allow the solutions to stand in a water-bath at 20 °C for 15 min. Measure at 460 nm in a 2 cm cell the absorbance (*2.2.25*) of solution A using solution B as the compensation liquid, and the absorbance of solution C using the solution obtained with 10 ml of *water R* as the compensation liquid. The absorbance of solution A is not greater than that of solution C.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 2.0 per cent, determined on 1.00 g by drying in an oven at 105 °C.

ASSAY

Dissolve 0.250 g in 20 ml of *anhydrous acetic acid R*, heating to 50 °C if necessary. Cool. Using 0.05 ml of *naphtholbenzein solution R* as indicator, titrate with *0.1 M perchloric acid* until a green colour is obtained.

1 ml of *0.1 M perchloric acid* is equivalent to 14.41 mg of $C_7H_5NaO_2$.

corrected 6.0

SODIUM BROMIDE

Natrii bromidum

NaBr M_r 102.9
[7647-15-6]

DEFINITION

Content: 98.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, granular powder or small, colourless, transparent or opaque crystals, slightly hygroscopic.

Solubility: freely soluble in water, soluble in alcohol.

IDENTIFICATION

A. It gives reaction (a) of bromides (*2.3.1*).

B. Solution S (see Tests) gives the reactions of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Bromates. To 10 ml of solution S add 1 ml of *starch solution R*, 0.1 ml of a 100 g/l solution of *potassium iodide R* and 0.25 ml of *0.5 M sulphuric acid* and allow to stand protected from light for 5 min. No blue or violet colour develops.

Chlorides: maximum 0.6 per cent.

In a conical flask, dissolve 1.000 g in 20 ml of *dilute nitric acid R*. Add 5 ml of *strong hydrogen peroxide solution R* and heat on a water-bath until the solution is completely decolourised. Wash down the sides of the flask with a little *water R* and heat on a water-bath for 15 min. Allow to cool, dilute to 50 ml with *water R* and add 5.0 ml of *0.1 M silver nitrate* and 1 ml of *dibutyl phthalate R*. Shake and titrate with *0.1 M ammonium thiocyanate*, using 5 ml of *ferric ammonium sulphate solution R2* as indicator. Not more than 1.7 ml of *0.1 M silver nitrate* is used. Note the volume of *0.1 M silver nitrate* used (see Assay). Carry out a blank test.

Iodides. To 5 ml of solution S add 0.15 ml of *ferric chloride solution R1* and 2 ml of *methylene chloride R*. Shake and allow to separate. The lower layer is colourless (*2.2.2, Method I*).

Sulphates (*2.4.13*): maximum 100 ppm.

15 ml of solution S complies with the limit test for sulphates.

Iron (*2.4.9*): maximum 20 ppm.

5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron.

Magnesium and alkaline-earth metals (*2.4.7*): maximum 200 ppm, calculated as Ca.

10.0 g complies with the limit test for magnesium and alkaline-earth metals. The volume of *0.01 M sodium edetate* used does not exceed 5.0 ml.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 3.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

ASSAY

Dissolve 2.000 g in *water R* and dilute to 100.0 ml with the same solvent. To 10.0 ml of the solution add 50 ml of *water R*, 5 ml of *dilute nitric acid R*, 25.0 ml of *0.1 M silver nitrate* and 2 ml of *dibutyl phthalate R*. Shake. Titrate with *0.1 M ammonium thiocyanate*, using 2 ml of *ferric ammonium sulphate solution R2* as indicator and shaking vigorously towards the end-point.

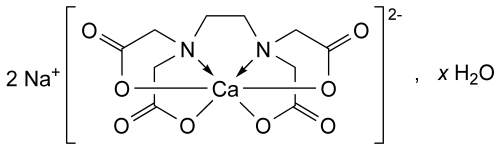
1 ml of *0.1 M silver nitrate* is equivalent to 10.29 mg of NaBr.

Calculate the percentage content of NaBr from the expression:

$$a - 2.902\,b$$

a = percentage content of NaBr and NaCl obtained in the assay and calculated as NaBr,

b = percentage content of Cl in the test for chlorides.



STORAGE

In an airtight container.

01/2008:0231

SODIUM CALCIUM EDETATE

Natrii calcii edetas

$C_{10}H_{12}CaN_2Na_2O_8,xH_2O$ M_r 374.3 (anhydrous substance)
[62-33-9]

DEFINITION

Disodium [(ethylenedinitrilo)tetraacetato]calciate(2–).

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

It contains a variable amount of water of crystallisation.

CHARACTERS

Appearance: white or almost white, hygroscopic powder.

Solubility: freely soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, C, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *sodium calcium edetate CRS.*

B. Dissolve 2 g in 10 ml of *water R*, add 6 ml of *lead nitrate solution R*, shake and add 3 ml of *potassium iodide solution R*. No yellow precipitate is formed. Make alkaline to *red litmus paper R* by the addition of *dilute ammonia R2* and add 3 ml of *ammonium oxalate solution R*. A white precipitate is formed.

C. Ignite. The residue gives reaction (b) of calcium (*2.3.1*).

D. Dissolve 0.5 g in 10 ml of *water R* and add 10 ml of *potassium pyroantimonate solution R*. A white, crystalline precipitate is formed. The formation of the precipitate is accelerated by rubbing the wall of the tube with a glass rod.

TESTS

Solution S. Dissolve 5.0 g in *water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 6.5 to 8.0.

Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Impurity A. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

Solvent mixture. Dissolve 10.0 g of *ferric sulphate pentahydrate R* in 20 ml of *0.5 M sulphuric acid* and add 780 ml of *water R*. Adjust to pH 2.0 with *1 M sodium hydroxide* and dilute to 1000 ml with *water R*.

Test solution. Dissolve 0.100 g of the substance to be examined in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution. Dissolve 40.0 mg of *nitrilotriacetic acid R* (impurity A) in the solvent mixture and dilute to 100.0 ml with the solvent mixture. To 1.0 ml of this solution add 0.1 ml of the test solution and dilute to 100.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm;
– *stationary phase*: spherical *graphitised carbon for chromatography R1* (5 µm) with a specific surface area of 120 m^2/g and a pore size of 25 nm.

Mobile phase: dissolve 50.0 mg of *ferric sulphate pentahydrate R* in 50 ml of *0.5 M sulphuric acid* and add 750 ml of *water R*; adjust to pH 1.5 with *0.5 M sulphuric acid* or *1 M sodium hydroxide*, add 20 ml of *ethylene glycol R* and dilute to 1000 ml with *water R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 273 nm.

Injection: 20 µl; filter the solutions and inject immediately.

Run time: 4 times the retention time of the iron complex of impurity A.

Retention time: iron complex of impurity A = about 5 min; iron complex of edetic acid = about 10 min.

System suitability: reference solution:

– *resolution*: minimum 7 between the peaks due to the iron complex of impurity A and the iron complex of edetic acid;
– *signal-to-noise ratio*: minimum 50 for the peak due to impurity A.

Limit:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent).

Disodium edetate: maximum 1.0 per cent.

Dissolve 5.0 g in 250 ml of *water R*. Add 10 ml of *ammonium chloride buffer solution pH 10.0 R* and about 50 mg of *mordant black 11 triturate R*. Not more than 1.5 ml of *0.1 M magnesium chloride* is required to change the colour of the indicator to violet.

Chlorides: maximum 0.1 per cent.

Dissolve 0.7 g in *water R* and dilute to 20 ml with the same solvent. Add 30 ml of *dilute nitric acid R*, allow to stand for 30 min and filter. Dilute 10 ml of the filtrate to 50 ml with *water R*. Use this solution as the test solution. Prepare the reference solution using 0.40 ml of *0.01 M hydrochloric acid*, add 6 ml of *dilute nitric acid R* and dilute to 50 ml with *water R*. Filter both solutions if necessary. Add 1 ml of *silver nitrate solution R2* to the test solution and to the reference solution and mix. After standing for 5 min protected from light, any opalescence in the test solution is not more intense than that in the reference solution.

Iron (*2.4.9*): maximum 80 ppm.

Dilute 2.5 ml of solution S to 10 ml with *water R*. Add 0.25 g of *calcium chloride R* to the test solution and the standard before the addition of the *thioglycollic acid R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test F. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

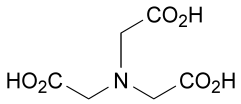
Water (*2.5.12*): 5.0 per cent to 13.0 per cent, determined on 0.200 g.

ASSAY

Dissolve 0.500 g in *water R* and dilute to 200 ml with the same solvent. To 20.0 ml of this solution, add 80 ml of *water R* and adjust to pH 2 with *dilute nitric acid R*. Titrate

Monographs Q-S

with *0.01 M bismuth nitrate*, using 0.1 ml of a 1 g/l solution of *xylenol orange R* as indicator. The colour of the solution changes from yellow to red.



1 ml of *0.01 M bismuth nitrate* is equivalent to 3.74 mg of $C_{10}H_{12}CaN_2Na_2O_8$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A.

A. nitrilotriacetic acid.

corrected 6.0

SODIUM CAPRYLATE

Natrii caprylas

$C_8H_{15}NaO_2$ M_r 166.2
[1984-06-1]

DEFINITION

Sodium octanoate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very soluble or freely soluble in water, freely soluble in acetic acid, sparingly soluble in ethanol (96 per cent), practically insoluble in acetone.

IDENTIFICATION

A. Examine the chromatograms obtained in the test for related substances.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

B. To 0.2 ml of solution S (see Tests) add 0.3 ml of *water R*. The solution gives reaction (b) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 8.0 to 10.5 for solution S.

Related substances. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Dissolve 0.116 g in *water R* and dilute to 5 ml with the same solvent. Add 1 ml of a 2.8 per cent *V/V* solution of *sulphuric acid R* and shake with 10 ml of *ethyl acetate R*. Separate the organic layer and dry over *anhydrous sodium sulphate R*.

Reference solution (a). Dissolve 0.10 g of *caprylic acid CRS* in *ethyl acetate R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of the test solution to 100 ml with *ethyl acetate R*. Dilute 5 ml of this solution to 50 ml with *ethyl acetate R*.

Column:

- *material*: fused silica;
- *size*: *l* = 30 m, Ø = 0.25 mm;
- *stationary phase*: *macrogol 20 000 2-nitroterephthalate R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.5 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	100
	1 - 25	100 → 220
	25 - 35	220
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 1 µl.

System suitability: reference solution (b):

- *signal-to-noise ratio*: minimum 5 for the principal peak.

Limits:

- *any impurity*: for each impurity, maximum 0.3 per cent;
- *total*: maximum 0.5 per cent;
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in *glacial acetic acid R* and dilute to 10 ml with the same acid. Add 10 ml of *ethanol (96 per cent) R*. 12 ml of the solution complies with test B. Prepare the reference solution using 1 ml of *lead standard solution (10 ppm Pb) R* and 9 ml of a mixture of equal volumes of *glacial acetic acid R* and *ethanol (96 per cent) R*.

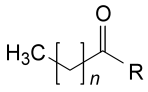
Water (*2.5.12*): maximum 3.0 per cent, determined on 1.000 g.

ASSAY

Dissolve 0.150 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 16.62 mg of $C_8H_{15}NaO_2$.

IMPURITIES



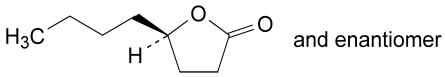
A. $n = 4$: hexanoic acid,

B. $n = 5$: heptanoic acid,

C. $n = 7$: nonanoic acid,

D. $n = 8$: decanoic acid,

E. valproic acid,



F. R = OCH_3, $n = 6$: methyl octanoate,

G. R = OC_2H_5, $n = 6$: ethyl octanoate,

H. R = OCH_3, $n = 8$: methyl decanoate,

I. R = CH_3, $n = 8$: undecan-2-one,

J. (*RS*)-5-butyltetrahydrofuran-2-one (γ-hydroxyoctanoic acid lactone).

01/2008:0773

SODIUM CARBONATE, ANHYDROUS

Natrii carbonas anhydricus

Na_2CO_3 M_r 106.0
[497-19-8]

DEFINITION

Content: 99.5 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, slightly granular powder, hygroscopic.

Solubility: freely soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 1 g in *water R* and dilute to 10 ml with the same solvent. The solution is strongly alkaline (*2.2.4*).

B. The solution prepared for identification test A gives the reaction of carbonates (*2.3.1*).

C. The solution prepared for identification test A gives reaction (a) of sodium (*2.3.1*).

D. Loss on drying (see Tests).

TESTS

Solution S. Dissolve 2.0 g in portions in a mixture of 5 ml of *hydrochloric acid R* and 25 ml of *distilled water R*. Heat to boiling and cool. Add *dilute sodium hydroxide solution R* until the solution is neutral and dilute to 50 ml with *distilled water R*.

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method I*).

Dissolve 2.0 g in 10 ml of *water R*.

Alkali hydroxides and bicarbonates. Dissolve 0.4 g in 20 ml of *water R*. Add 20 ml of *barium chloride solution R1* and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R*. The solution does not become red. Boil the remainder of the filtrate for 2 min. The solution remains clear (*2.2.1*).

Chlorides (*2.4.4*): maximum 125 ppm.

Dissolve 0.4 g in *water R*, add 4 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 250 ppm, determined on solution S.

Arsenic (*2.4.2, Method A*): maximum 5 ppm, determined on 5 ml of solution S.

Iron (*2.4.9*): maximum 50 ppm.

Dilute 5 ml of solution S to 10 ml with *water R*.

Heavy metals (*2.4.8*): maximum 50 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying at 300 ± 15 °C.

ASSAY

Dissolve 1.000 g in 25 ml of *water R*. Add 0.2 ml of *methyl orange solution R* as indicator. Titrate with *1 M hydrochloric acid* until the colour changes from yellow to red.

1 ml of *1 M hydrochloric acid* is equivalent to 52.99 mg of Na_2CO_3.

STORAGE

In an airtight container.

01/2008:0191

SODIUM CARBONATE DECAHYDRATE

Natrii carbonas decahydricus

$Na_2CO_3,10H_2O$ M_r 286.1
[6132-02-1]

DEFINITION

Content: 36.7 per cent to 40.0 per cent of Na_2CO_3.

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless, transparent crystals, efflorescent.

Solubility: freely soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 1 g in *water R* and dilute to 10 ml with the same solvent. The solution is strongly alkaline (*2.2.4*).

B. The solution prepared for identification test A gives the reaction of carbonates (*2.3.1*).

C. The solution prepared for identification test A gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in portions in a mixture of 5 ml of *hydrochloric acid R* and 25 ml of *distilled water R*. Heat the solution to boiling and cool. Add *dilute sodium hydroxide solution R* until the solution is neutral and dilute to 50 ml with *distilled water R*.

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method I*).

Dissolve 4.0 g in 10 ml of *water R*.

Alkali hydroxides and bicarbonates. Dissolve 1.0 g in 20 ml of *water R*, add 20 ml of *barium chloride solution R1* and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R*. The solution does not become red. Heat the remainder of the filtrate to boiling for 2 min. The solution remains clear (*2.2.1*).

Chlorides (*2.4.4*): maximum 50 ppm.

Dissolve 1.0 g in *water R*, add 4 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 100 ppm, determined on solution S.

Arsenic (*2.4.2, Method A*): maximum 2 ppm, determined on 5 ml of solution S.

Iron (*2.4.9*): maximum 20 ppm.

Dilute 5 ml of solution S to 10 ml with *water R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

ASSAY

Dissolve 2.000 g in 25 ml of *water R*. Titrate with *1 M hydrochloric acid*, using 0.2 ml of *methyl orange solution R* as indicator.

1 ml of *1 M hydrochloric acid* is equivalent to 52.99 mg of Na_2CO_3.

STORAGE

In an airtight container.

01/2008:0192

SODIUM CARBONATE MONOHYDRATE

Natrii carbonas monohydricus

Na_2CO_3,H_2O M_r 124.0
[5968-11-6]

DEFINITION

Content: 83.0 per cent to 87.5 per cent of Na_2CO_3.

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: freely soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 1 g in *water R* and dilute to 10 ml with the same solvent. The solution is strongly alkaline (*2.2.4*).

B. The solution prepared for identification test A gives the reaction of carbonates (*2.3.1*).

C. The solution prepared for identification test A gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 2.0 g in portions in a mixture of 5 ml of *hydrochloric acid R* and 25 ml of *distilled water R*. Heat the solution to boiling and cool. Add *dilute sodium hydroxide solution R* until the solution is neutral and dilute to 50 ml with *distilled water R*.

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method I*).

Dissolve 2.0 g in 10 ml of *water R*.

Alkali hydroxides and bicarbonates. Dissolve 0.4 g in 20 ml of *water R*, add 20 ml of *barium chloride solution R1* and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R*. The solution does not become red. Heat the remainder of the filtrate to boiling for 2 min. The solution remains clear (*2.2.1*).

Chlorides (*2.4.4*): maximum 125 ppm.

Dissolve 0.4 g in *water R*, add 4 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 250 ppm, determined on solution S.

Arsenic (*2.4.2, Method A*): maximum 5 ppm, determined on 5 ml of solution S.

Iron (*2.4.9*): maximum 50 ppm.

Dilute 5 ml of solution S to 10 ml with *water R*.

Heavy metals (*2.4.8*): maximum 50 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

ASSAY

Dissolve 1.000 g in 25 ml of *water R*. Titrate with *1 M hydrochloric acid*, using 0.2 ml of *methyl orange solution R* as indicator.

1 ml of *1 M hydrochloric acid* is equivalent to 52.99 mg of Na_2CO_3.

STORAGE

In an airtight container.

01/2008:0847

SODIUM CETOSTEARYL SULPHATE

Natrii cetylo- et stearylosulfas.

DEFINITION

Mixture of sodium cetyl sulphate ($C_{16}H_{33}NaO_4S$; M_r 344.5) and sodium stearyl sulphate ($C_{18}H_{37}NaO_4S$; M_r 372.5).
A suitable buffer may be added.

Content:

– *sodium cetostearyl sulphate*: minimum 90.0 per cent (anhydrous substance),

– *sodium cetyl sulphate*: minimum 40.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or pale yellow, amorphous or crystalline powder.

Solubility: soluble in hot water giving an opalescent solution, practically insoluble in cold water, partly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: B, D, F.

Second identification: A, C, D, E, F.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 50 mg of the substance to be examined in 10 ml of *ethanol (70 per cent V/V) R*, heating on a water-bath.

Reference solution. Dissolve 50 mg of *sodium cetostearyl sulphate CRS* in 10 ml of *ethanol (70 per cent V/V) R*, heating on a water-bath.

Plate: *TLC silanised silica gel plate R.*

Mobile phase: *water R, acetone R, methanol R* (20:40:40 *V/V/V*).

Application: 2 µl.

Development: over a path of 12 cm.

Drying: in air.

Detection: spray with a 50 g/l solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R*. Heat at 120 °C until the spots appear (about 3 h).

Results: the principal spots in the chromatogram obtained with the test solution are similar in position and colour to the principal spots in the chromatogram obtained with the reference solution.

B. Examine the chromatograms obtained in the assay.

Results: the 2 principal peaks in the chromatogram obtained with test solution (c) are similar in retention time to the 2 principal peaks in the chromatogram obtained with the reference solution.

C. Dissolve 0.1 g in 10 ml of *water R* and shake. A foam is formed.

D. It gives a yellow colour to a non-luminous flame.

E. To 0.1 ml of the solution prepared for identification test C add 0.1 ml of a 1 g/l solution of *methylene blue R* and 2 ml of *dilute sulphuric acid R*. Add 2 ml of *methylene chloride R* and shake. The methylene chloride layer has an intense blue colour.

F. Mix about 10 mg with 10 ml of *anhydrous ethanol R*. Heat to boiling on a water-bath, shaking frequently. Filter immediately and evaporate to dryness. Dissolve the residue in 7 ml of *water R*, add 3 ml of *dilute hydrochloric acid R* and evaporate the solution to half its volume. Allow to cool. Filter. To the filtrate add 1 ml of *barium chloride solution R1*. A white, crystalline precipitate is formed.

TESTS

Acidity or alkalinity. Dissolve 0.5 g with heating in a mixture of 10 ml of *water R* and 15 ml of *ethanol (90 per cent V/V) R*. Add 0.1 ml of *phenolphthalein solution R1*. The solution is colourless. Add 0.1 ml of *0.1 M sodium hydroxide*. The solution is red.

Sodium chloride and sodium sulphate: maximum 8.0 per cent for the sum of the percentage contents.

Sodium chloride. Dissolve 5.00 g in 50 ml of *water R*, add *dilute nitric acid R* dropwise until the solution is neutral to *blue litmus paper R*. Add 2 ml of *potassium chromate solution R* and titrate with *0.1 M silver nitrate*.

1 ml of *0.1 M silver nitrate* is equivalent to 5.844 mg of NaCl.

Sodium sulphate. Dissolve 0.500 g in 20 ml of *water R*, warming gently if necessary, and add 1 ml of a 0.5 g/l solution of *dithizone R* in *acetone R*. If the solution is red, add *1 M nitric acid*, dropwise, until a bluish-green colour is obtained. Add 2.0 ml of *dichloroacetic acid solution R* and 80 ml of *acetone R*. Titrate with *0.01 M lead nitrate* until a persistent orange-red colour is obtained.

1 ml of *0.01 M lead nitrate* is equivalent to 1.420 mg of Na_2SO_4.

Free cetostearyl alcohol: maximum 4.0 per cent.

From the chromatogram obtained with test solution (a) in the assay, calculate the percentage content of free cetostearyl alcohol in the substance to be examined, using the following expression:

$$S \frac{100 \times m_H}{S_{Ha(corr)} \times m}$$

S = sum of the areas of the peaks due to cetyl alcohol and stearyl alcohol in the chromatogram obtained with test solution (a),

m_H = mass of the internal standard added in the preparation of test solution (a), in milligrams,

$S_{Ha(corr)}$ = corrected area of the peak due to the internal standard in the chromatogram obtained with test solution (a),

m = mass of sodium cetostearyl sulphate used for the preparation of test solution (a), in milligrams.

Water (*2.5.12*): maximum 1.5 per cent, determined on 5.00 g.

ASSAY

Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 0.20 g of *heptadecanol CRS* in *anhydrous ethanol R* and dilute to 50 ml with the same solvent.

Test solution (a). Dissolve 0.300 g of the substance to be examined in 50 ml of *anhydrous ethanol R* and add 2 ml of the internal standard solution and 48 ml of *water R*. Shake with 4 quantities, each of 25 ml, of *pentane R*, adding *sodium chloride R*, if necessary, to facilitate the separation of the layers. Combine the organic layers. Reserve the hydro-alcoholic layer for the preparation of test solutions (c) and (d). Wash the organic layer with 2 quantities, each of 30 ml, of *water R*. Dry over *anhydrous sodium sulphate R* and filter.

Test solution (b). Dissolve 0.300 g of the substance to be examined in 50 ml of *anhydrous ethanol R* and add 50 ml of *water R*. Shake with 4 quantities, each of 25 ml, of *pentane R*, adding *sodium chloride R*, if necessary, to facilitate the separation of the layers. Combine the organic layers, wash with 2 quantities, each of 30 ml, of *water R*. Dry over *anhydrous sodium sulphate R* and filter.

Test solution (c). Transfer 25 ml of the hydro-alcoholic solution obtained in the preparation of test solution (a) to a 200 ml flask that can be fitted with a reflux condenser. Add 20 ml of *hydrochloric acid R* and 10 ml of the internal standard solution. Boil under a reflux condenser for 2 h. Allow to cool and shake with 4 quantities, each of 20 ml, of *pentane R*. Combine the organic layers and wash with 2 quantities, each of 20 ml, of *water R*. Dry over *anhydrous sodium sulphate R* and filter.

Test solution (d). Transfer 25 ml of the hydro-alcoholic solution obtained in the preparation of test solution (a) to a 200 ml flask that can be fitted with a reflux condenser. Add 20 ml of *hydrochloric acid R* and 10 ml of *anhydrous ethanol R*. Boil under a reflux condenser for 2 h. Allow to cool and shake with 4 quantities, each of 20 ml, of *pentane R*. Combine the organic layers and wash with 2 quantities, each of 20 ml, of *water R*. Dry over *anhydrous sodium sulphate R* and filter.

Reference solution. Dissolve 50 mg of *cetyl alcohol CRS* and 50 mg of *stearyl alcohol CRS* in *anhydrous ethanol R* and dilute to 10 ml with the same solvent.

Column:

– *material*: fused silica,

– *size*: *l* = 25 m, Ø = 0.25 mm,

– *stationary phase*: *poly(dimethyl)siloxane R* or another suitable polar phase.

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 1 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 20	150 → 250
Injection port		250
Detector		250

Detection: flame ionisation.

Elution order: cetyl alcohol, heptadecanol (internal standard) and stearyl alcohol.

Inject 1 µl of test solution (a) and test solution (b). If the chromatogram obtained with test solution (b) shows a peak with the same retention time as the peak due to the internal standard in the chromatogram obtained with test solution (a), calculate the ratio *r* using the following expression:

$$\frac{S_{ci}}{S_i}$$

S_{ci} = area of the peak due to cetyl alcohol in the chromatogram obtained with test solution (b),

S_i = area of the peak with the same retention time as the peak due to the internal standard in the chromatogram obtained with test solution (a).

If *r* is less than 300, calculate the corrected area $S_{Ha(corr)}$ of the peak due to the internal standard in the chromatogram obtained with test solution (a) using the following expression:

$$S'_{Ha} - \frac{S_i \times S_c}{S_{ci}}$$

S'_{Ha} = area of the peak due to the internal standard in the chromatogram obtained with test solution (a),

S_c = area of the peak due to cetyl alcohol in the chromatogram obtained with test solution (a).

Inject 1 µl of test solution (c) and test solution (d). Carry out the correction for interference in the same manner as for test solution (a) and calculate the corrected area $S_{Hc(corr)}$ of the peak due to the internal standard in the chromatogram obtained with test solution (c).

Inject equal volumes of the reference solution, test solution (c) and test solution (d). Identify the peaks in the chromatograms obtained with the test solutions by comparison of their retention times with those of the peaks in the chromatogram obtained with the reference solution. Determine the area of each peak.

Calculate the percentage content of sodium cetyl sulphate in the substance to be examined, using the following expression:

$$\frac{(A \times 1.421) \times m'_H \times 100}{S_{Hc(corr)} \times m'}$$

A = area of the peak due to cetyl alcohol in the chromatogram obtained with test solution (c),

m'_H = mass of the internal standard added in the preparation of test solution (c), in milligrams,

$S_{Hc(corr)}$ = corrected area of the peak due to the internal standard in the chromatogram obtained with test solution (c),

m' = mass of the substance to be examined in test solution (c), in milligrams.

Calculate the percentage content of sodium stearyl sulphate in the substance to be examined, using the following expression:

$$\frac{(B \times 1.377) \times m'_H \times 100}{S_{Hc(corr)} \times m'}$$

B = area of the peak due to stearyl alcohol in the chromatogram obtained with test solution (c).

The percentage content of sodium cetostearyl sulphate corresponds to the sum of the percentage content of sodium cetyl sulphate and the percentage content of sodium stearyl sulphate.

LABELLING

The label states, where appropriate, the name and concentration of any added buffer.

corrected 6.0

SODIUM CHLORIDE

Natrii chloridum

NaCl M_r 58.44
[7647-14-5]

DEFINITION

Content: 99.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals or white or almost white pearls.

Solubility: freely soluble in water, practically insoluble in anhydrous ethanol.

IDENTIFICATION

A. It gives the reactions of chlorides (*2.3.1*).

B. It gives the reactions of sodium (*2.3.1*).

TESTS

If the substance is in the form of pearls crush before use.

Solution S. Dissolve 20.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 20 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Bromides: maximum 100 ppm.

To 0.5 ml of solution S add 4.0 ml of *water R*, 2.0 ml of *phenol red solution R2* and 1.0 ml of a 0.1 g/l solution of *chloramine R* and mix immediately. After exactly 2 min, add 0.15 ml of *0.1 M sodium thiosulphate*, mix and dilute to 10.0 ml with *water R*. The absorbance (*2.2.25*) of the solution measured at 590 nm, using *water R* as the compensation liquid, is not greater than that of a standard prepared at the same time and in the same manner, using 5.0 ml of a 3.0 mg/l solution of *potassium bromide R*.

Ferrocyanides. Dissolve 2.0 g in 6 ml of *water R*. Add 0.5 ml of a mixture of 5 ml of a 10 g/l solution of *ferric ammonium sulphate R* in a 2.5 g/l solution of *sulphuric acid R* and 95 ml of a 10 g/l solution of *ferrous sulphate R*. No blue colour develops within 10 min.

Iodides. Moisten 5 g by the dropwise addition of a freshly prepared mixture of 0.15 ml of *sodium nitrite solution R*, 2 ml of *0.5 M sulphuric acid*, 25 ml of *iodide-free starch solution R* and 25 ml of *water R*. After 5 min, examine in daylight. The mixture shows no blue colour.

Nitrites. To 10 ml of solution S add 10 ml of *water R*. The absorbance (*2.2.25*) is not greater than 0.01 at 354 nm.

Phosphates (*2.4.11*): maximum 25 ppm.

Dilute 2 ml of solution S to 100 ml with *water R*.

Sulphates (*2.4.13*): maximum 200 ppm.

Dilute 7.5 ml of solution S to 30 ml with *distilled water R*.

Aluminium (*2.4.17*): maximum 0.2 ppm, if intended for use in the manufacture of peritoneal dialysis solutions, haemodialysis solutions or haemofiltration solutions.

Prescribed solution. Dissolve 20.0 g in 100 ml of *water R* and add 10 ml of *acetate buffer solution pH 6.0 R*.

Reference solution. Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Arsenic (*2.4.2, Method A*): maximum 1 ppm, determined on 5 ml of solution S.

Barium. To 5 ml of solution S add 5 ml of *distilled water R* and 2 ml of *dilute sulphuric acid R*. After 2 h, any opalescence in the solution is not more intense than that in a mixture of 5 ml of solution S and 7 ml of *distilled water R*.

Iron (*2.4.9*): maximum 2 ppm, determined on solution S.

Prepare the standard using a mixture of 4 ml of *iron standard solution (1 ppm Fe) R* and 6 ml of *water R*.

Magnesium and alkaline-earth metals (*2.4.7*): maximum 100 ppm, calculated as Ca and determined on 10.0 g.

Use 150 mg of *mordant black 11 triturate R*. The volume of *0.01 M sodium edetate* used is not more than 2.5 ml.

Potassium: maximum 5.00×10^2 ppm, if intended for use in the manufacture of parenteral dosage forms or haemodialysis, haemofiltration or peritoneal dialysis solutions.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution. Dissolve 1.00 g in *water R* and dilute to 100.0 ml with the same solvent.

Reference solutions. Dissolve 1.144 g of *potassium chloride R*, previously dried at 100-105 °C for 3 h, in *water R* and dilute to 1000.0 ml with the same solvent (600 µg of K per millilitre). Dilute as required.

Wavelength: 766.5 nm.

Heavy metals (*2.4.8*): maximum 5 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

Bacterial endotoxins (*2.6.14*): less than 5 IU/g, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

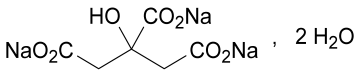
ASSAY

Dissolve 50.0 mg in *water R* and dilute to 50 ml with the same solvent. Titrate with *0.1 M silver nitrate* determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M silver nitrate* is equivalent to 5.844 mg of NaCl.

LABELLING

The label states:



– where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,

– where applicable, that the substance is suitable for use in the manufacture of peritoneal dialysis solutions, haemodialysis solutions or haemofiltration solutions.

corrected 6.0

SODIUM CITRATE

Natrii citras

$C_6H_5Na_3O_7,2H_2O$ M_r 294.1
[6132-04-3]

DEFINITION

Trisodium 2-hydroxypropane-1,2,3-tricarboxylate dihydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or white or almost white, granular crystals, slightly deliquescent in moist air.

Solubility: freely soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. To 1 ml of solution S (see Tests) add 4 ml of *water R*. The solution gives the reaction of citrates (*2.3.1*).

B. 1 ml of solution S gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. Not more than 0.2 ml of *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Readily carbonisable substances. To 0.20 g of the powdered substance to be examined add 10 ml of *sulphuric acid R* and heat in a water-bath at 90 ± 1 °C for 60 min. Cool rapidly. The solution is not more intensely coloured than reference solution Y_2 or GY_2 (*2.2.2, Method II*).

Chlorides (*2.4.4*): maximum 50 ppm.

Dilute 10 ml of solution S to 15 ml with *water R*.

Oxalates: maximum 300 ppm.

Dissolve 0.50 g in 4 ml of *water R*, add 3 ml of *hydrochloric acid R* and 1 g of *zinc R* in granules and heat on a water-bath for 1 min. Allow to stand for 2 min, decant the liquid into a test-tube containing 0.25 ml of a 10 g/l solution of *phenylhydrazine hydrochloride R* and heat to boiling. Cool rapidly, transfer to a graduated cylinder and add an equal volume of *hydrochloric acid R* and 0.25 ml of *potassium ferricyanide solution R*. Shake and allow to stand for 30 min. Any pink colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using 4 ml of a 50 mg/l solution of *oxalic acid R*.

Sulphates (*2.4.13*): maximum 150 ppm.

To 10 ml of solution S add 2 ml of *hydrochloric acid R1* and dilute to 15 ml with *distilled water R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

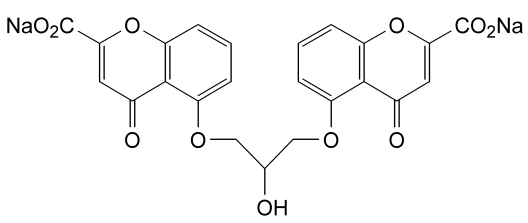
Water (*2.5.12*): 11.0 per cent to 13.0 per cent, determined on 0.300 g. After adding the substance to be examined, stir for 15 min before titrating.

Pyrogens (*2.6.8*). If intended for use in the manufacture of large-volume parenteral dosage forms, the competent authority may require that it comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 ml of a freshly prepared solution in *water for injections R* containing per millilitre 10.0 mg of the substance to be examined and 7.5 mg of pyrogen-free *calcium chloride R*.

ASSAY

Dissolve 0.150 g in 20 ml of *anhydrous acetic acid R*, heating to about 50 °C. Allow to cool. Titrate with *0.1 M perchloric acid*, using 0.25 ml of *naphtholbenzein solution R* as indicator until a green colour is obtained.

1 ml of *0.1 M perchloric acid* is equivalent to 8.602 mg of $C_6H_5Na_3O_7$.



STORAGE

In an airtight container.

corrected 6.0

SODIUM CROMOGLICATE

Natrii cromoglicas

$C_{23}H_{14}Na_2O_{11}$ M_r 512.3
[15826-37-6]

DEFINITION

Sodium cromoglicate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of disodium 5,5′-[(2-hydroxypropane-1,3-diyl)bis(oxy)]bis(4-oxo-4*H*-1-benzopyran-2-carboxylate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, soluble in water, practically insoluble in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Dissolve 10.0 mg in *phosphate buffer solution pH 7.4 R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with the same solvent. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows two absorption maxima, at 239 nm and 327 nm. The ratio of the absorbance at the maximum at 327 nm to that at the maximum at 239 nm is 0.25 to 0.30.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sodium cromoglicate CRS*. Examine the substances prepared as discs.

C. Dissolve about 5 mg in 0.5 ml of *methanol R*. Add 3 ml of a solution in *methanol R* containing 5 g/l of *aminopyrazolone R* and 1 per cent *V/V* of *hydrochloric acid R*. Allow to stand for 5 min. The solution shows an intense yellow colour.

D. It gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Add 0.2 ml of *0.01 M sodium hydroxide*. The solution is pink. Add 0.4 ml of *0.01 M hydrochloric acid*. The solution is colourless. Add 0.25 ml of *methyl red solution R*. The solution is red.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in a mixture of 1 volume of *acetone R*, 4 volumes of *tetrahydrofuran R* and 6 volumes of *water R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 10 mg of *1,3-bis(2-acetyl-3-hydroxyphenoxy)-2-propanol CRS* in *chloroform R* and dilute to 100 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 5 volumes of *glacial acetic acid R*, 50 volumes of *ethyl acetate R* and 50 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot (which remains at the starting point), is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Oxalate. Dissolve 0.10 g in 20 ml of *water R*, add 5.0 ml of *iron salicylate solution R* and dilute to 50.0 ml with *water R*. Determine the absorbance (*2.2.25*) at 480 nm. The

absorbance is not less than that of a standard prepared in the same manner using 0.35 mg of *oxalic acid R* instead of the substance to be examined.

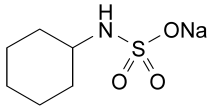
Heavy metals (*2.4.8*). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 10.0 per cent, determined on 1.000 g by drying over *diphosphorus pentoxide R* at 105 °C and at a pressure of 300 Pa to 600 Pa.

ASSAY

Dissolve 0.200 g with heating in a mixture of 5 ml of *2-propanol R* and 25 ml of *ethylene glycol R*. Cool and add 30 ml of *dioxan R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 25.62 mg of $C_{23}H_{14}Na_2O_{11}$.



STORAGE

Store in an airtight container, protected from light.

01/2008:0774
corrected 6.0

SODIUM CYCLAMATE

Natrii cyclamas

$C_6H_{12}NNaO_3S$ M_r 201.2
[139-05-9]

DEFINITION

Sodium *N*-cyclohexylsulphamate.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: freely soluble in water, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *sodium cyclamate CRS*.

B. Examine the chromatograms obtained in the test for impurity A.
Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. To 1 ml of solution S (see Tests), add 1 ml of *water R* and 2 ml of *silver nitrate solution R1*, then shake. A white, crystalline precipitate is formed.

D. To 1 ml of solution S add 5 ml of *water R*, 2 ml of *dilute hydrochloric acid R* and 4 ml of *barium chloride solution R1* and mix. The solution is clear. Add 2 ml of *sodium nitrite solution R*. A voluminous white precipitate is formed and gas is given off.

E. A mixture of 1 ml of solution S and 1 ml of *water R* gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 5.5 to 7.5 for solution S.

Absorbance (*2.2.25*): maximum 0.10, determined at 270 nm on solution S.

Impurity A. Thin-layer chromatography (*2.2.27*).

Test solution (a). Solution S.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *water R*.

Reference solution (a). Dissolve 0.10 g of *sodium cyclamate CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *sulphamic acid R* (impurity A) in *water R* and dilute to 100 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: *concentrated ammonia R, water R, ethyl acetate R, propanol R* (10:10:20:70 *V/V/V/V*).

Application: 2 µl.

Development: over a path of 12 cm.

Drying: in a current of warm air, then heat at 105 °C for 5 min.

Detection: spray the hot plate with *strong sodium hypochlorite solution R* diluted to a concentration of 5 g/l of active chlorine. Place in a current of cold air until an area of coating below the points of application gives at most a faint blue colour with a drop of *potassium iodide and starch solution R*; avoid prolonged exposure to cold air. Spray with *potassium iodide and starch solution R* and examine the chromatograms within 5 min.

Limit: test solution (a):

– *impurity A*: any spot due to impurity A is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (0.1 per cent).

Impurities B, C and D. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 2 µl of *tetradecane R* in *methylene chloride R* and dilute to 100 ml with the same solvent.

Test solution. Dissolve 2.00 g of the substance to be examined in 20 ml of *water R*, add 0.5 ml of *strong sodium hydroxide solution R* and shake with 30 ml of *toluene R*. Shake 20 ml of the upper layer with 4 ml of a mixture of equal volumes of *dilute acetic acid R* and *water R*. Separate the lower layer, add 0.5 ml of *strong sodium hydroxide solution R* and 0.5 ml of the internal standard solution and shake. Use the lower layer immediately after separation.

Reference solution. Dissolve 10.0 mg (about 12 µl) of *cyclohexylamine R* (impurity C), 1.0 mg (about 1.1 µl) of *dicyclohexylamine R* (impurity D) and 1.0 mg (about 1 µl) of *aniline R* (impurity B) in *water R*, then dilute to 1000 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with *water R* (solution A). To 20.0 ml of solution A, add 0.5 ml of *strong sodium hydroxide solution R* and extract with 30 ml of *toluene R*. Shake 20 ml of the upper layer with 4 ml of a mixture of equal volumes of *dilute acetic acid R* and *water R*. Separate the lower layer, add 0.5 ml of *strong sodium hydroxide solution R* and 0.5 ml of the internal standard solution and shake. Use the lower layer immediately after separation.

Column:

– *material*: fused silica;

– *size*: *l* = 25 m, Ø = 0.32 mm;

– *stationary phase*: *poly(dimethyl)(diphenyl)siloxane R* (film thickness 0.51 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.8 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	85
	1 - 9	85 → 150
	9 - 13	150
Injection port		250
Detector		270

Detection: flame ionisation.

Injection: 1.5 µl; use a split vent at a flow rate of 20 ml/min.

Relative retention with reference to impurity C (retention time = about 2.3 min): impurity B = about 1.4; tetradecane = about 4.3; impurity D = about 4.5.

Limits:

– *impurity C*: maximum 10 ppm;

– *impurities B, D*: for each impurity, maximum 1 ppm.

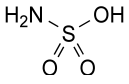
Sulphates (*2.4.13*): maximum 0.1 per cent.

Dilute 1.5 ml of solution S to 15 ml with *distilled water R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

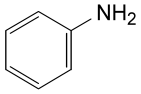
12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.



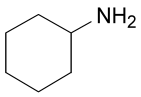
ASSAY

Dissolve without heating 0.150 g in 60 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

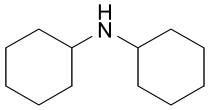


1 ml of *0.1 M perchloric acid* is equivalent to 20.12 mg of $C_6H_{12}NNaO_3S$.

IMPURITIES



Specified impurities: A, B, C, D.



A. sulphamic acid,

B. aniline (phenylamine),

C. cyclohexanamine,

D. *N*-cyclohexylcyclohexanamine.

corrected 6.0

SODIUM DIHYDROGEN PHOSPHATE DIHYDRATE

Natrii dihydrogenophosphas dihydricus

$NaH_2PO_4,2H_2O$ M_r 156.0
[13472-35-0]

DEFINITION

Content: 98.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder or colourless crystals.

Solubility: very soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Solution S (see Tests) is slightly acid (*2.2.4*).

B. Solution S gives the reactions of phosphates (*2.3.1*).

C. Solution S previously neutralised using a 100 g/l solution of *potassium hydroxide R* gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 4.2 to 4.5.

To 5 ml of solution S add 5 ml of *carbon dioxide-free water R*.

Reducing substances. To 5 ml of solution S add 0.25 ml of *0.02 M potassium permanganate* and 5 ml of *dilute sulphuric acid R* and heat in a water-bath for 5 min. The solution retains a slight red colour.

Chlorides (*2.4.4*): maximum 200 ppm.

Dilute 2.5 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 300 ppm.

To 5 ml of solution S add 0.5 ml of *hydrochloric acid R* and dilute to 15 ml with *distilled water R*.

Arsenic (*2.4.2, Method A*): maximum 2 ppm, determined on 0.5 g.

Iron (*2.4.9*): maximum 10 ppm, determined on solution S.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): 21.5 per cent to 24.0 per cent, determined on 0.50 g by drying in an oven at 130 °C.

ASSAY

Dissolve 2.500 g in 40 ml of *water R*. Titrate with carbonate-free *1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *1 M sodium hydroxide* is equivalent to 0.120 g of NaH_2PO_4.

01/2008:0514

SODIUM FLUORIDE

Natrii fluoridum

NaF M_r 41.99
[7681-49-4]

DEFINITION

Content: 98.5 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder or colourless crystals.

Solubility: soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. To 2 ml of solution S (see Tests) add 0.5 ml of *calcium chloride solution R*. A gelatinous white precipitate is formed that dissolves on adding 5 ml of *ferric chloride solution R1*.

B. To about 4 mg add a mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R* and mix. The colour changes from red to yellow.

C. Solution S gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* without heating and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. Dissolve 2.5 g of *potassium nitrate R* in 40 ml of solution S and dilute to 50 ml with *carbon dioxide-free water R*. Cool to 0 °C and add 0.2 ml of *phenolphthalein solution R*. If the solution is colourless, not more than 1.0 ml of *0.1 M sodium hydroxide* is required to produce a red colour that persists for at least 15 s. If the solution is red, not more than 0.25 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator.

Chlorides (*2.4.4*): maximum 200 ppm.

Dilute 10 ml of solution S to 15 ml with *water R*.

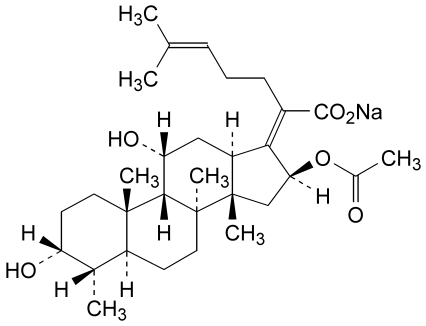
Fluorosilicates. Heat to boiling the neutralised solution obtained in the test for acidity or alkalinity and titrate whilst hot. Not more than 0.75 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to red.

Sulphates (*2.4.13*): maximum 200 ppm.

Dissolve 0.25 g in 10 ml of a saturated solution of *boric acid R* in *distilled water R*. Add 5 ml of *distilled water R* and 0.6 ml of *hydrochloric acid R1*. Prepare the standard by mixing 0.6 ml of *hydrochloric acid R1*, 5 ml of *sulphate standard solution (10 ppm SO_4) R* and 10 ml of a saturated solution of *boric acid R* in *distilled water R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 130 °C for 3 h.

ASSAY



Dissolve 0.100 g in *water R* and dilute to 60 ml with the same solvent. Titrate with *0.1 M lanthanum nitrate*, determining the end-point potentiometrically (*2.2.20*) using a fluoride-selective indicator electrode and a silver-silver chloride reference electrode.

1 ml of *0.1 M lanthanum nitrate* is equivalent to 12.60 mg of NaF.

01/2008:0848

SODIUM FUSIDATE

Natrii fusidas

$C_{31}H_{47}NaO_6$ M_r 538.7
[751-94-0]

DEFINITION

Sodium (*Z*)-*ent*-16α-(acetyloxy)-3β,11β-dihydroxy-4β,8,14-trimethyl-18-nor-5β,10α-cholesta-17(20),24-dien-21-oate.

Antimicrobial substance produced by the growth of certain strains of *Fusidium coccineum* or by any other means.

Content: 97.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder, slightly hygroscopic.

Solubility: freely soluble in water and in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: dissolve 0.1 g in 5 ml of *water R*, add 5 ml of *chloroform R* and 0.1 ml of *dilute phosphoric acid R*. Shake vigorously for 1 min, allow to separate and filter the lower layer through absorbent cotton covered with *anhydrous sodium sulphate R*. Repeat the extraction with 2 quantities, each of 5 ml, of *chloroform R* and evaporate the combined extracts to dryness under reduced pressure. Dry the residue over *diphosphorus pentoxide R* under reduced pressure for 2 h, dissolve in 1 ml of *chloroform R*.

Comparison: *Ph. Eur. reference spectrum of fusidic acid*.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 24 mg of *diethanolamine fusidate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *methanol R, cyclohexane R, glacial acetic acid R, chloroform R* (2.5:10:10:80 *V/V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in a current of warm air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. Ignite 1 g. The residue gives reaction (a) of sodium (*2.3.1*).

TESTS

Appearance of solution. The solution is not more intensely coloured than reference solution B_6 (*2.2.2, Method II*).

Dissolve 1.5 g in 10 ml of *water R*.

pH (*2.2.3*): 7.5 to 9.0.

Dissolve 0.125 g in 10 ml of *carbon dioxide-free water R*.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *3-ketofusidic acid CRS* in 5 ml of the mobile phase. To 1.0 ml of this solution add 0.20 ml of the test solution and dilute to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 20 µl of the test solution to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.125-0.15 m, Ø = 4-5 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *methanol R*, 10 g/l solution of *phosphoric acid R, water R, acetonitrile R* (10:20:20:50 *V/V/V/V*).

Flow rate: 2 ml/min.

Detection: spectrophotometer at 235 nm.

Injection: 20 µl.

Run time: 3.5 times the retention time of sodium fusidate.

System suitability:

– *resolution*: minimum 2.5 between the peaks due to 3-ketofusidic acid and sodium fusidate in the chromatogram obtained with reference solution (a);

– *signal-to-noise ratio*: minimum 3 for the principal peak in the chromatogram obtained with reference solution (b).

Limits:

– *total*: not more than twice the area of the peak due to sodium fusidate in the chromatogram obtained with reference solution (a) (2.0 per cent);

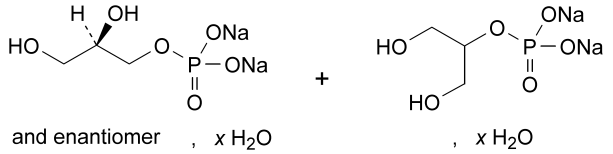
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Water (*2.5.12*): maximum 2.0 per cent, determined on 0.50 g.

ASSAY

Dissolve 0.500 g in 30 ml of *water R* and add 40 ml of *ethanol (96 per cent) R*. Titrate with *0.1 M hydrochloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M hydrochloric acid* is equivalent to 53.87 mg of $C_{31}H_{47}NaO_6$.



STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

01/2008:1995
corrected 6.0

SODIUM GLYCEROPHOSPHATE, HYDRATED

Natrii glycerophosphas hydricus

$C_3H_7Na_2O_6P, xH_2O$ M_r 216.0 (anhydrous substance)

DEFINITION

Mixture of variable proportions of sodium (2*RS*)-2,3-dihydroxypropyl phosphate and sodium 2-hydroxy-1-(hydroxymethyl)ethyl phosphate. The degree of hydration is 4 to 6.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or crystals.

Solubility: freely soluble in water, practically insoluble in acetone and in alcohol.

IDENTIFICATION

A. Solution S (see Tests) gives reaction (a) of sodium (*2.3.1*).

B. To 0.1 g add 5 ml of *dilute nitric acid R*. Heat to boiling and boil for 1 min. Cool. The solution gives reaction (b) of phosphates (*2.3.1*).

C. In a test-tube fitted with a glass tube, mix 0.1 g with 5 g of *potassium hydrogen sulphate R*. Heat strongly and direct the white vapour into 5 ml of *decolorised fuchsin solution R*. A violet-red colour develops which becomes violet upon heating for 30 min on a water-bath.

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Alkalinity. To 10 ml of solution S add 0.2 ml of *phenolphthalein solution R*. Not more than 1.0 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator, (n_2).

Glycerol and alcohol-soluble substances: maximum 1.0 per cent.

Shake 1.000 g with 25 ml of *alcohol R* for 10 min. Filter. Evaporate the filtrate on a water-bath and dry the residue at 70 °C for 1 h. The residue weighs not more than 10 mg.

Chlorides (*2.4.4*): maximum 200 ppm.

Dilute 2.5 ml of solution S to 15 ml with *water R*.

Phosphates (*2.4.11*): maximum 0.1 per cent.

Dilute 1 ml of solution S to 10 ml with *water R*. Dilute 1 ml of this solution to 100 ml with *water R*.

Sulphates (*2.4.13*): maximum 500 ppm.

Dilute 3 ml of solution S to 15 ml with *water R*.

Iron (*2.4.9*): maximum 20 ppm.

Dilute 5 ml of solution S to 10 ml with *water R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

Dilute 10 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): 25.0 per cent to 35.0 per cent, determined on 0.100 g.

ASSAY

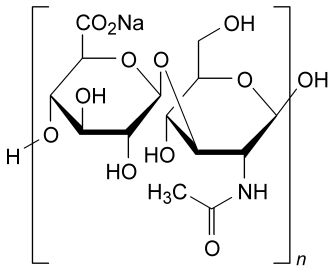
Dissolve 0.250 g in 30 ml of *water R*. Titrate with *0.05 M sulphuric acid*, determining the end-point potentiometrically (*2.2.20*), (n_1).

Calculate the percentage content of sodium glycerophosphate (anhydrous substance) from the expression:

$$\frac{216.0\left(n_1 - \frac{n_2}{4}\right)}{m\,(100 - a)}$$

a = percentage content of water,

n_1 = volume of *0.05 M sulphuric acid* used in the assay, in millilitres,



n_2 = volume of *0.1 M hydrochloric acid* used in the test for alkalinity, in millilitres,

m = mass of the substance to be examined, in grams.

01/2008:1472

SODIUM HYALURONATE

Natrii hyaluronas

$(C_{14}H_{20}NNaO_{11})_n$
[9067-32-7]

DEFINITION

Sodium salt of hyaluronic acid, a glycosaminoglycan consisting of D-glucuronic acid and *N*-acetyl-D-glucosamine disaccharide units.

Content: 95.0 per cent to 105.0 per cent (dried substance).

Intrinsic viscosity: 90 per cent to 120 per cent of the value stated on the label.

PRODUCTION

It is extracted from cocks' combs or obtained by fermentation from *Streptococci*, Lancefield Groups A and C. When produced by fermentation of gram-positive bacteria, the process must be shown to reduce or eliminate pyrogenic or inflammatory components of the cell wall.

CHARACTERS

Appearance: white or almost white, very hygroscopic powder or fibrous aggregate.

Solubility: sparingly soluble or soluble in water, practically insoluble in acetone and in anhydrous ethanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of sodium hyaluronate*.

B. It gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Weigh a quantity of the substance to be examined equivalent to 0.10 g of the dried substance and add 30.0 ml of a 9 g/l solution of *sodium chloride R*. Mix gently on a shaker until dissolved (about 12 h).

Appearance of solution. Solution S is clear (*2.2.1*) and its absorbance (*2.2.25*) at 600 nm is maximum 0.01.

pH (*2.2.3*): 5.0 to 8.5.

Dissolve the substance to be examined in *carbon dioxide-free water R* to obtain a solution containing a quantity equivalent to 5 mg of the dried substance per millilitre.

Intrinsic viscosity. *Sodium hyaluronate is very hygroscopic and must be protected from moisture during weighing.*

Buffer solution (0.15 M sodium chloride in 0.01 M phosphate buffer solution pH 7.0). Dissolve 0.78 g of *sodium dihydrogen phosphate R* and 4.50 g of *sodium chloride R* in *water R* and dilute to 500.0 ml with the same solvent (solution A). Dissolve 1.79 g of *disodium hydrogen phosphate R* and 4.50 g of *sodium chloride R* in *water R* and dilute to 500.0 ml with the same solvent (solution B). Mix solutions A and B until a pH of 7.0 is reached. Filter through a sintered-glass filter (4).

Test solution (a). Weigh 0.200 g (m_{0p}) *(NOTE: this value is only indicative and should be adjusted after an initial measurement of the viscosity of test solution (a))* of the substance to be examined and dilute with 50.0 g (m_{0s}) of buffer solution at 4 °C. Mix the solution by shaking at 4 °C during 24 h. Weigh 5.00 g (m_{1p}) of the solution and dilute with 100.0 g (m_{1s}) of buffer solution at 25 °C. Mix this solution by shaking for 20 min. Filter the solution through a sintered-glass filter (100), and discard the first 10 ml.

Test solution (b). Weigh 30.0 g (m_{2p}) of test solution (a) and dilute with 10.0 g (m_{2s}) of buffer solution at 25 °C. Mix this solution by shaking for 20 min. Filter the solution through a sintered-glass filter (100) and discard the first 10 ml.

Test solution (c). Weigh 20.0 g (m_{3p}) of test solution (a) and dilute with 20.0 g (m_{3s}) of buffer solution at 25 °C. Mix this solution by shaking for 20 min. Filter the solution through a sintered-glass filter (100) and discard the first 10 ml.

Test solution (d). Weigh 10.0 g (m_{4p}) of test solution (a) and dilute with 30.0 g (m_{4s}) of buffer solution at 25 °C. Mix this solution by shaking for 20 min. Filter the solution through a sintered-glass filter (100) and discard the first 10 ml.

Determine the flow-times (*2.2.9*) for the buffer solution (t_0) and for the 4 test solutions (t_1, t_2, t_3 and t_4), at 25.00 ± 0.03 °C. Use an appropriate suspended level viscometer (specifications: viscometer constant about 0.005 mm^2/s^2, kinematic viscosity of 1-5 mm^2/s, internal diameter of tube *R* 0.53 mm, volume of bulb *C* 5.6 ml, internal diameter of tube *N* 2.8-3.2 mm) with a funnel-shaped lower capillary end. Use the same viscometer for all measurements; measure all outflow times in triplicate. The test is not valid unless the results do not differ by more than

0.35 per cent from the mean and if the flow time t_1 is not less than 1.6 and not more than 1.8 times t_0. If this is not the case, adjust the value of m_{0p} and repeat the procedure.

Calculation of the relative viscosities

Since the densities of the sodium hyaluronate solutions and of the solvent are almost equal, the relative viscosities η_{ri} (being η_{r1}, η_{r2}, η_{r3} and η_{r4}) can be calculated from the ratio of the flow times for the respective solutions t_i (being t_1, t_2, $t_3$and t_4) to the flow time of the solvent t_0, but taking into account the kinetic energy correction factor for the capillary (B = 30 800 s^3), using the following expression:

$$\frac{t_i - \frac{B}{t_i^2}}{t_0 - \frac{B}{t_0^2}}$$

Calculation of the concentrations

Calculate the concentration c_1 (expressed in kg/m^3) of sodium hyaluronate in test solution (a) using the following expression:

$$\frac{m_{0p} \times x \times (100 - h) \times m_{1p} \times \rho_{25}}{100 \times 100 \times (m_{0p} + m_{0s}) \times (m_{1p} + m_{1s})}$$

x = percentage content of sodium hyaluronate as determined under Assay;

h = percentage loss on drying;

ρ_{25} = 1005 kg/m^3 (density of the test solution at 25 °C).

Calculate the concentration c_2 (expressed in kg/m^3) of sodium hyaluronate in test solution (b) using the following expression:

$$c_1 \times \frac{m_{2p}}{m_{2s} + m_{2p}}$$

Calculate the concentration c_3 (expressed in kg/m^3) of sodium hyaluronate in test solution (c) using the following expression:

$$c_1 \times \frac{m_{3p}}{m_{3s} + m_{3p}}$$

Calculate the concentration c_4 (expressed in kg/m^3) of sodium hyaluronate in test solution (d) using the following expression:

$$c_1 \times \frac{m_{4p}}{m_{4s} + m_{4p}}$$

Calculation of the intrinsic viscosity

Calculate the intrinsic viscosity $[\eta]$ by linear least-squares regression analysis using the Martin equation:

$$\log\left(\frac{\eta_r - 1}{c}\right) = \log[\eta] + k[\eta]c$$

The decimal antilogarithm of the intercept is the intrinsic viscosity expressed in m^3/kg.

Sulphated glycosaminoglycans: maximum 1 per cent, if the product is extracted from cocks' combs.

Appropriate safety precautions are to be taken when handling perchloric acid at elevated temperature.

Test solution. Introduce a quantity of the substance to be examined equivalent to 50.0 mg of the dried substance into a test-tube 150 mm long and 16 mm in internal diameter and dissolve in 1.0 ml of *perchloric acid R*.

Reference solution. Dissolve 0.149 g of *anhydrous sodium sulphate R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml to 100.0 ml with *water R*. Evaporate 1.0 ml in a test-tube 150 mm long and 16 mm in internal diameter in a heating block at 90-95 °C, and dissolve the residue in 1.0 ml of *perchloric acid R*.

Plug each test-tube with a piece of glass wool. Place the test-tubes in a heating block or a silicone oil bath maintained at 180 °C and heat until clear, colourless solutions are obtained (about 12 h). Remove the test-tubes and cool to room temperature. Add to each test-tube 3.0 ml of a 33.3 g/l solution of *barium chloride R*, cap and shake vigorously. Allow the test-tubes to stand for 30 min. Shake each test-tube once again, and determine the absorbance (*2.2.25*) at 660 nm, using *water R* as a blank.

The absorbance obtained with the test solution is not greater than the absorbance obtained with the reference solution.

Nucleic acids. The absorbance (*2.2.25*) of solution S at 260 nm is maximum 0.5.

Protein: maximum 0.3 per cent; maximum 0.1 per cent, if intended for use in the manufacture of parenteral dosage forms.

Test solution (a). Dissolve the substance to be examined in *water R* to obtain a solution containing a quantity equivalent to about 10 mg of the dried substance per millilitre.

Test solution (b). Mix equal volumes of test solution (a) and *water R*.

Reference solutions. Prepare a 0.5 mg/ml stock solution of *bovine albumin R* in *water R*. Prepare 5 dilutions of the stock solution containing between 5 µg/ml and 50 µg/ml of *bovine albumin R*.

Add 2.5 ml of freshly prepared *cupri-tartaric solution R3* to test-tubes containing 2.5 ml of *water R* (blank), 2.5 ml of the test solutions (a) or (b) or 2.5 ml of the reference solutions. Mix after each addition. After about 10 min, add to each test-tube 0.50 ml of a mixture of equal volumes of *phosphomolybdotungstic reagent R* and *water R* prepared immediately before use. Mix after each addition. After 30 min, measure the absorbance (*2.2.25*) of each solution at 750 nm against the blank. From the calibration curve obtained with the 5 reference solutions determine the content of protein in the test solutions.

Chlorides (*2.4.4*): maximum 0.5 per cent.

Dissolve 67 mg in 100 ml of *water R*.

Iron: maximum 80.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Dissolve a quantity of the substance to be examined equivalent to 0.25 g of the dried substance in 1 ml of *nitric acid R* by heating on a water-bath. Cool and dilute to 10.0 ml with *water R*.

Reference solutions. Prepare 2 reference solutions in the same manner as the test solution, adding 1.0 ml and 2.0 ml respectively of *iron standard solution (10 ppm Fe) R* to the dissolved substance to be examined.

Source: iron hollow-cathode lamp using a transmission band of 0.2 nm.

Wavelength: 248.3 nm.

Atomisation device: air-acetylene flame.

Loss on drying (*2.2.32*): maximum 20.0 per cent, determined on 0.500 g by drying at 100-110 °C over *diphosphorus pentoxide R* for 6 h.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^2 micro-organisms per gram. Use 1 g of the substance to be examined.

Bacterial endotoxins (*2.6.14*): less than 0.5 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins; less than 0.05 IU/mg, if intended for use in the manufacture of intra-ocular preparations or intra-articular preparations without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Determine the glucuronic acid content by reaction with carbazole as described below.

Reagent A. Dissolve 0.95 g of *disodium tetraborate R* in 100.0 ml of *sulphuric acid R*.

Reagent B. Dissolve 0.125 g of *carbazole R* in 100.0 ml of *anhydrous ethanol R*.

Test solution. Prepare this solution in triplicate. Dissolve 0.170 g of the substance to be examined in *water R* and dilute to 100.0 g with the same solvent. Dilute 10.0 g of this solution to 200.0 g with *water R*.

Reference stock solution. Dissolve 0.100 g of *D-glucuronic acid R*, previously dried to constant mass in vacuum over *diphosphorus pentoxide R* (*2.2.32*), in *water R* and dilute to 100.0 g with the same solvent.

Reference solutions. Prepare 5 dilutions of the reference stock solution containing between 6.5 µg/g and 65 µg/g of *D-glucuronic acid R*.

Place 25 test-tubes, numbered 1 to 25, in iced water. Add 1.0 ml of the 5 reference solutions in triplicate to the test-tubes 1 to 15 (reference tubes), 1.0 ml of the 3 test solutions in triplicate to the test-tubes 16 to 24 (sample tubes), and 1.0 ml of *water R* to test-tube 25 (blank). Add 5.0 ml of freshly prepared reagent A to each test-tube. Tightly close the test-tubes with plastic caps, shake the contents, and place on a water bath for exactly 15 min. Cool in iced water, and add to each test tube 0.20 ml of reagent B. Recap the tubes, shake, and put them again on a water-bath for exactly 15 min. Cool to room temperature and measure the absorbance (*2.2.25*) of the solutions at 530 nm, against the blank.

From the calibration curve obtained with the mean absorbances read for each reference solution, determine the mean concentrations of D-glucuronic acid in the test solutions.

Calculate the percentage content of sodium hyaluronate using the following expression:

$$\frac{c_g}{c_s} \times Z \times \frac{100}{100 - h} \times \frac{401.3}{194.1}$$

c_g = mean of concentrations of D-glucuronic acid in the test solutions, in milligrams per gram;

c_s = mean of concentrations of the substance to be examined in the test solutions, in milligrams per gram;

Z = determined percentage content of $C_6H_{10}O_7$ in *D-glucuronic acid R*;

h = percentage loss on drying;

401.3 = relative molecular mass of the disaccharide fragment;

194.1 = relative molecular mass of glucuronic acid.

STORAGE

In an airtight container, protected from light and humidity. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the intrinsic viscosity,
- the origin of the substance,
- the intended use of the substance,
- where applicable, that the substance is suitable for parenteral administration other than intra-articular administration,
- where applicable, that the substance is suitable for parenteral administration, including intra-articular administration,
- where applicable that the material is suitable for intra-ocular use.

SODIUM HYDROGEN CARBONATE

Natrii hydrogenocarbonas

$NaHCO_3$ M_r 84.0
[144-55-8]

DEFINITION

Content: 99.0 per cent to 101.0 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water, practically insoluble in ethanol (96 per cent).

When heated in the dry state or in solution, it gradually changes into sodium carbonate.

IDENTIFICATION

A. To 5 ml of solution S (see Tests) add 0.1 ml of *phenolphthalein solution R*. A pale pink colour is produced. Heat; gas is evolved and the solution becomes red.

B. It gives the reaction of carbonates and bicarbonates (*2.3.1*).

C. Solution S gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in 90 ml of *carbon dioxide-free water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Carbonates. The pH (*2.2.3*) of freshly prepared solution S is not greater than 8.6.

Chlorides (*2.4.4*): maximum 150 ppm.

To 7 ml of solution S add 2 ml of *nitric acid R* and dilute to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 150 ppm.

To a suspension of 1.0 g in 10 ml of *distilled water R* add *hydrochloric acid R* until neutral and about 1 ml in excess. Dilute to 15 ml with *distilled water R*.

Ammonium (*2.4.1*): maximum 20 ppm.

Dilute 10 ml of solution S to 15 ml with *water R*. Prepare the standard using a mixture of 5 ml of *water R* and 10 ml of *ammonium standard solution (1 ppm NH_4) R*.

Arsenic (*2.4.2, Method A*): maximum 2 ppm, determined on 0.5 g.

Calcium (*2.4.3*): maximum 100 ppm.

To a suspension of 1.0 g in 10 ml of *distilled water R* add *hydrochloric acid R* until neutral and dilute to 15 ml with *distilled water R*.

Iron (*2.4.9*): maximum 20 ppm.

Dissolve 0.5 g in 5 ml of *dilute hydrochloric acid R* and dilute to 10 ml with *water R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in a mixture of 2 ml of *hydrochloric acid R* and 18 ml of *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 1.500 g in 50 ml of *carbon dioxide-free water R*. Titrate with *1 M hydrochloric acid*, using 0.2 ml of *methyl orange solution R* as indicator.

1 ml of *1 M hydrochloric acid* is equivalent to 84.0 mg of $NaHCO_3$.

01/2008:0677
corrected 6.0

SODIUM HYDROXIDE

Natrii hydroxidum

NaOH M_r 40.00
[1310-73-2]

DEFINITION

Content: 97.0 per cent to 100.5 per cent.

CHARACTERS

Appearance: white or almost white, crystalline masses, supplied as pellets, sticks or slabs, deliquescent, readily absorbing carbon dioxide.

Solubility: very soluble in water, freely soluble in ethanol (96 per cent).

IDENTIFICATION

A. pH (*2.2.3*): minimum 11.0.

Dissolve 0.1 g in 10 ml of *water R*. Dilute 1 ml of the solution to 100 ml with *water R*.

B. 2 ml of solution S (see Tests) gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. *Carry out the procedure described below with caution*. Dissolve 5.0 g in 12 ml of *distilled water R*. Add 17 ml of *hydrochloric acid R1*, adjust to pH 7 with *1 M hydrochloric acid* and dilute to 50 ml with *distilled water R*.

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 1.0 g in 10 ml of *water R*.

Carbonates: maximum 2.0 per cent, calculated as Na_2CO_3 as determined in the assay.

Chlorides (*2.4.4*): maximum 50 ppm.

Dissolve 1.0 g in 5 ml of *water R*, acidify the solution with about 4 ml of *nitric acid R* and dilute to 15 ml with *water R*. The solution, without addition of *dilute nitric acid R*, complies with the test.

Sulphates (*2.4.13*): maximum 50 ppm.

Dissolve 3.0 g in 6 ml of *distilled water R*, adjust to pH 7 with *hydrochloric acid R* (about 7.5 ml) and dilute to 15 ml with *distilled water R*.

Iron (*2.4.9*): maximum 10 ppm, determined on solution S.

Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

ASSAY

Dissolve 2.000 g in about 80 ml of *carbon dioxide-free water R*. Add 0.3 ml of *phenolphthalein solution R* and titrate with *1 M hydrochloric acid*. Add 0.3 ml of *methyl orange solution R* and continue the titration with *1 M hydrochloric acid*.

1 ml of *1 M hydrochloric acid* used in the 2nd part of the titration is equivalent to 0.1060 g of Na_2CO_3.

1 ml of *1 M hydrochloric acid* used in the combined titrations is equivalent to 40.00 mg of total alkali, calculated as NaOH.

STORAGE

In an airtight, non-metallic container.

01/2008:0196
corrected 6.0

SODIUM IODIDE

Natrii iodidum

NaI M_r 149.9
[7681-82-5]

DEFINITION

Content: 99.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals, hygroscopic.

Solubility: very soluble in water, freely soluble in ethanol (96 per cent).

IDENTIFICATION

A. Solution S (see Tests) gives the reactions of iodides (*2.3.1*).

B. Solution S gives the reactions of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Alkalinity. To 12.5 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.7 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator.

Iodates. To 10 ml of solution S add 0.25 ml of *iodide-free starch solution R* and 0.2 ml of *dilute sulphuric acid R* and allow to stand protected from light for 2 min. No blue colour develops.

Sulphates (*2.4.13*): maximum 150 ppm.

Dilute 10 ml of solution S to 15 ml with *distilled water R*.

Thiosulphates. To 10 ml of solution S add 0.1 ml of *starch solution R* and 0.1 ml of *0.005 M iodine*. A blue colour is produced.

Iron (*2.4.9*): maximum 20 ppm.

Dilute 5 ml of solution S to 10 ml with *water R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 3.0 per cent, determined on 1.00 g by drying in an oven at 105 °C for 3 h.

ASSAY

Dissolve 1.300 g in *water R* and dilute to 100.0 ml with the same solvent. To 20.0 ml of the solution add 40 ml of *hydrochloric acid R* and titrate with *0.05 M potassium iodate* until the colour changes from red to yellow. Add 5 ml of *chloroform R* and continue the titration, shaking vigorously, until the chloroform layer is decolorised.

1 ml of *0.05 M potassium iodate* is equivalent to 14.99 mg of NaI.

STORAGE

Protected from light.

01/2008:1151

SODIUM LACTATE SOLUTION

Natrii lactatis solutio

DEFINITION

Solution of a mixture of the enantiomers of sodium 2-hydroxypropanoate in approximately equal proportions.

Content: minimum 50.0 per cent *m/m* of sodium 2-hydroxypropanoate ($C_3H_5NaO_3$; M_r 112.1); 96.0 per cent to 104.0 per cent of the content of sodium lactate stated on the label.

CHARACTERS

Appearance: clear, colourless, slightly syrupy liquid.

Solubility: miscible with water and with alcohol.

IDENTIFICATION

A. To 0.1 ml add 10 ml of *water R*. 5 ml of the solution gives the reaction of lactates (*2.3.1*).

B. It gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dilute a quantity of the substance to be examined corresponding to 40.0 g of sodium lactate to 200 ml with *distilled water R*.

Appearance of solution. The substance to be examined is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

pH (*2.2.3*): 6.5 to 9.0 for the substance to be examined.

Reducing sugars and sucrose. To 5 ml of the substance to be examined add 2 ml of *dilute sodium hydroxide solution R* and 0.2 ml of *copper sulphate solution R*. The solution is clear and blue and remains so on boiling. Add to the hot solution 4 ml of *hydrochloric acid R*. Boil for 1 min. Add 6 ml of *strong sodium hydroxide solution R* and heat to boiling again. The solution is clear and blue.

Methanol. Gas chromatography (*2.4.24*).

Limit:

– *methanol*: maximum 50 ppm, calculated with reference to sodium lactate, if intended for use in the manufacture of parenteral dosage forms, dialysis, haemodialysis or haemofiltration solutions.

Chlorides (*2.4.4*): maximum 50 ppm calculated with reference to sodium lactate.

Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Oxalates and phosphates. To 1 ml of the substance to be examined add 15 ml of *alcohol R* and 2 ml of *calcium chloride solution R*. Heat at 75 °C for 5 min. Any opalescence in the solution is not more intense than that of a standard prepared at the same time and in the same manner using a mixture of 1 ml of the substance to be examined, 15 ml of *alcohol R* and 2 ml of *water R*.

Sulphates (*2.4.13*): maximum 100 ppm calculated with reference to sodium lactate.

To 7.5 ml of solution S, add 1.9 ml of *hydrochloric acid R1* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates without addition of 0.5 ml of *acetic acid R*. Acidify the standard solution with 0.05 ml of *hydrochloric acid R1* instead of 0.5 ml of *acetic acid R*.

Aluminium: maximum 0.1 ppm, if intended for use in the manufacture of parenteral dosage forms, dialysis, haemodialysis or haemofiltration solutions.

Atomic absorption spectrometry (*2.2.23, Method I*). For the preparation of the solutions, use equipment that is aluminium-free or that will not release aluminium under the conditions of use (glass, polyethylene, etc).

Modifier solution. Dissolve 100.0 g of *ammonium nitrate R* in a mixture of 50 ml of *water R* and 4 ml of *nitric acid R* and dilute to 200 ml with *water R*.

Blank solution. Dilute to 2.0 ml of the modifier solution to 25.0 ml with *water R*.

Test solution. To 1.25 g add 2.0 ml of the modifier solution and dilute to 25.0 ml with *water R*.

Reference solutions. Prepare the reference solutions immediately before use (0.010 ppm to 0.050 ppm of aluminium) using *aluminium standard solution (200 ppm Al) R*.

Source: aluminium hollow-cathode lamp.

Wavelength: 309.3 nm.

Atomisation device: a graphite furnace.

Carrier gas: *argon R*.

Conditions: the device is equipped with a non-specific absorption correction system. Heat the oven to 120 °C for as many seconds as there are microlitres of solution introduced into the apparatus, then heat at 1000 °C for 30 s and finally at 2700 °C for 6 s.

Barium. To 10 ml of solution S add 10 ml of *calcium sulphate solution R*. Allow to stand for 30 min. Any opalescence (*2.2.1*) in the solution is not more intense than

that of a standard prepared at the same time and in the same manner using a mixture of 10 ml of solution S and 10 ml of *distilled water R*.

Iron (*2.4.9*): maximum 10 ppm calculated with reference to sodium lactate.

Dilute 5 ml of solution S to 10 ml with *water R*. The solution complies with the limit test for iron.

Heavy metals (*2.4.8*): maximum 10 ppm calculated with reference to sodium lactate.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Bacterial endotoxins (*2.6.14*): less than 5 IU/g, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve a quantity of the substance to be examined corresponding to 75.0 mg of sodium lactate in a mixture of 10 ml of *glacial acetic acid R* and 20 ml of *acetic anhydride R*. Allow to stand for 15 min. Add 1 ml of *naphtholbenzein solution R* and titrate with *0.1 M perchloric acid*.

1 ml of *0.1 M perchloric acid* is equivalent to 11.21 mg of $C_3H_5NaO_3$.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of dialysis, haemodialysis and haemofiltration solutions,
- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- the declared content of sodium lactate.

01/2008:2033

SODIUM (*S*)-LACTATE SOLUTION

Natrii (*S*)-lactatis solutio

DEFINITION

Content: minimum 50.0 per cent *m/m* of sodium (*S*)-2-hydroxypropanoate ($C_3H_5NaO_3$; M_r 112.1); 96.0 per cent to 104.0 per cent of the content of sodium lactate stated on the label, not less than 95.0 per cent of which is the (*S*)-enantiomer.

CHARACTERS

Appearance: clear, colourless, slightly syrupy liquid.

Solubility: miscible with water and with alcohol.

IDENTIFICATION

A. To 0.1 ml add 10 ml of *water R*. 5 ml of the solution gives the reaction of lactates (*2.3.1*).

B. It gives reaction (a) of sodium (*2.3.1*).

C. It complies with the limits of the assay.

TESTS

Solution S. Dilute a quantity of the substance to be examined corresponding to 40.0 g of sodium lactate to 200 ml with *distilled water R*.

Appearance of solution. The substance to be examined is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

pH (*2.2.3*): 6.5 to 9.0 for the substance to be examined.

Reducing sugars and sucrose. To 5 ml of the substance to be examined add 2 ml of *dilute sodium hydroxide solution R* and 0.2 ml of *copper sulphate solution R*. The solution is clear and blue and remains so on boiling. Add to the hot solution 4 ml of *hydrochloric acid R*. Boil for 1 min. Add 6 ml of *strong sodium hydroxide solution R* and heat to boiling again. The solution is clear and blue.

Methanol. Gas chromatography (*2.4.24*).

Limit:

- *methanol*: maximum 50 ppm, calculated with reference to sodium lactate, if intended for use in the manufacture of parenteral dosage forms, dialysis, haemodialysis or haemofiltration solutions.

Chlorides (*2.4.4*): maximum 50 ppm calculated with reference to sodium lactate.

Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Oxalates and phosphates. To 1 ml of the substance to be examined add 15 ml of *alcohol R* and 2 ml of *calcium chloride solution R*. Heat at 75 °C for 5 min. Any opalescence in the solution is not more intense than that of a standard prepared at the same time and in the same manner using a mixture of 1 ml of the substance to be examined, 15 ml of *alcohol R* and 2 ml of *water R*.

Sulphates (*2.4.13*): maximum 100 ppm calculated with reference to sodium lactate.

To 7.5 ml of solution S, add 1.9 ml of *hydrochloric acid R1* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates without addition of 0.5 ml of *acetic acid R*. Acidify the standard solution with 0.05 ml of *hydrochloric acid R1* instead of 0.5 ml of *acetic acid R*.

Aluminium: maximum 0.1 ppm, if intended for use in the manufacture of parenteral dosage forms, dialysis, haemodialysis or haemofiltration solutions.

Atomic absorption spectrometry (*2.2.23, Method I*). For the preparation of the solutions, use equipment that is aluminium-free or that will not release aluminium under the conditions of use (glass, polyethylene, etc).

Modifier solution. Dissolve 100.0 g of *ammonium nitrate R* in a mixture of 50 ml of *water R* and 4 ml of *nitric acid R* and dilute to 200 ml with *water R*.

Blank solution. Dilute 2.0 ml of the modifier solution to 25.0 ml with *water R*.

Test solution. To 1.25 g add 2.0 ml of the modifier solution and dilute to 25.0 ml with *water R*.

Reference solutions. Prepare the reference solutions immediately before use (0.010 ppm to 0.050 ppm of aluminium) using *aluminium standard solution (200 ppm Al) R*.

Source: aluminium hollow-cathode lamp.

Wavelength: 309.3 nm.

Atomisation device: a graphite furnace.

Carrier gas: *argon R*.

Conditions: the device is equipped with a non-specific absorption correction system. Heat the oven to 120 °C for as many seconds as there are microlitres of solution introduced into the apparatus, then heat at 1000 °C for 30 s and finally at 2700 °C for 6 s.

Barium. To 10 ml of solution S add 10 ml of *calcium sulphate solution R*. Allow to stand for 30 min. Any opalescence (*2.2.1*) in the solution is not more intense than

that of a standard prepared at the same time and in the same manner using a mixture of 10 ml of solution S and 10 ml of *distilled water R*.

Iron (*2.4.9*): maximum 10 ppm calculated with reference to sodium lactate.

Dilute 5 ml of solution S to 10 ml with *water R*. The solution complies with the limit test for iron.

Heavy metals (*2.4.8*): maximum 10 ppm calculated with reference to sodium lactate.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Bacterial endotoxins (*2.6.14*): less than 5 IU/g if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve a quantity of the substance to be examined corresponding to 75.0 mg of sodium lactate in a mixture of 10 ml of *glacial acetic acid R* and 20 ml of *acetic anhydride R*. Allow to stand for 15 min. Add 1 ml of *naphtholbenzein solution R* and titrate with *0.1 M perchloric acid*.

1 ml of *0.1 M perchloric acid* is equivalent to 11.21 mg of $C_3H_5NaO_3$.

(*S*)-enantiomer. Transfer a quantity of the substance to be examined corresponding to 2.50 g of sodium lactate into a 50 ml volumetric flask, dilute with about 30 ml of *water R* and add 5.0 g of *ammonium molybdate R*. Dissolve and dilute with *water R* to 50.0 ml. Measure the angle of optical rotation (*2.2.7*). Calculate the percentage content of (*S*)-enantiomer using the expression:

$$50 + \left(24.04 \times \alpha \times \frac{5.0}{m} \times \frac{50}{c} \right)$$

α = angle of optical rotation (absolute value),

m = mass of the substance to be examined, in grams,

c = percentage content of $C_3H_5NaO_3$ in the substance to be examined.

The complex of sodium (*S*)-lactate formed under these test conditions is leavorotatory.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of dialysis, haemodialysis and haemofiltration solutions,
- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- the declared content of sodium lactate.

01/2008:0098

SODIUM LAURILSULFATE

Natrii laurilsulfas

DEFINITION

Mixture of sodium alkyl sulphates consisting chiefly of sodium dodecyl sulphate ($C_{12}H_{25}NaO_4S$; M_r 288.4).

Content:

– *sodium alkyl sulphates*: minimum 85.0 per cent, expressed as $C_{12}H_{25}NaO_4S$.

CHARACTERS

Appearance: white or pale yellow, powder or crystals.

Solubility: freely soluble in water giving an opalescent solution, partly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 0.1 g in 10 ml of *water R* and shake. A copious foam is formed.

B. To 0.1 ml of the solution prepared for identification test A, add 0.1 ml of a 1 g/l solution of *methylene blue R* and 2 ml of *dilute sulphuric acid R*. Add 2 ml of *methylene chloride R* and shake. An intense blue colour develops in the methylene chloride layer.

C. Mix about 10 mg with 10 ml of *anhydrous ethanol R*. Heat to boiling on a water-bath, shaking frequently. Filter immediately and evaporate the ethanol. Dissolve the residue in 8 ml of *water R*, add 3 ml of *dilute hydrochloric acid R*, evaporate the solution to half its volume and allow to cool. Separate the congealed fatty alcohols by filtration. To the filtrate add 1 ml of *barium chloride solution R1*. A white, crystalline precipitate is formed.

D. Ignite 0.5 g. The residue gives reaction (a) of sodium (*2.3.1*).

TESTS

Alkalinity. Dissolve 1.0 g in 100 ml of *carbon dioxide-free water R* and add 0.1 ml of *phenol red solution R*. Not more than 0.5 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator.

Non-esterified alcohols: maximum 4 per cent.

Dissolve 10 g in 100 ml of *water R*, add 100 ml of *ethanol (96 per cent) R* and shake the solution with 3 quantities, each of 50 ml, of *pentane R*, adding *sodium chloride R*, if necessary, to promote separation of the 2 layers. Wash the combined organic layers with 3 quantities, each of 50 ml, of *water R*, dry over *anhydrous sodium sulphate R*, filter and evaporate on a water-bath until the solvent has evaporated. Heat the residue at 105 °C for 15 min and cool. The residue weighs a maximum of 0.4 g.

Sodium chloride and sodium sulphate: maximum 8.0 per cent for the total percentage content.

Sodium chloride. Dissolve 5.00 g in 50 ml of *water R*, add *dilute nitric acid R* dropwise until the solution is neutral to *blue litmus paper R*, add 2 ml of *potassium chromate solution R* and titrate with *0.1 M silver nitrate*.

1 ml of *0.1 M silver nitrate* is equivalent to 5.844 mg of NaCl.

Sodium sulphate. Dissolve 0.500 g in 20 ml of *water R*, warming gently if necessary, then add 1 ml of a 0.5 g/l solution of *dithizone R1* in *acetone R*. If the solution is red, add *1 M nitric acid*, dropwise, until the solution becomes bluish-green. Add 2.0 ml of *dichloroacetic acid solution R* and 80 ml of *acetone R*. Titrate with *0.01 M lead nitrate* until a persistent violet-red or orange-red colour is obtained. Carry out a blank titration.

1 ml of *0.01 M lead nitrate* is equivalent to 1.420 mg of Na_2SO_4.

ASSAY

Dissolve 1.15 g in *water R*, warming if necessary, and dilute to 1000.0 ml with the same solvent. To 20.0 ml of the solution add 15 ml of *chloroform R* and 10 ml of *dimidium bromide-sulphan blue mixed solution R*. Titrate with *0.004 M benzethonium chloride*, shaking vigorously and

allowing the layers to separate before each addition, until the pink colour of the chloroform layer is completely discharged and a greyish-blue colour is obtained.

1 ml of *0.004 M benzethonium chloride* is equivalent to 1.154 mg of sodium alkyl sulphates, expressed as $C_{12}H_{25}NaO_4S$.

01/2008:0849

SODIUM METABISULPHITE

Natrii metabisulfis

$Na_2S_2O_5$ M_r 190.1
[7681-57-4]

DEFINITION

Sodium metabisulphite also called sodium disulphite.

Content: 95.0 per cent to 100.5 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: freely soluble in water, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

A. pH (see Tests).

B. To 0.4 ml of *iodinated potassium iodide solution R* add 8 ml of *distilled water R* and 1 ml of solution S diluted 1 to 10 in *distilled water R*. The solution is colourless and gives reaction (a) of sulphates (*2.3.1*).

C. Solution S gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 3.5 to 5.0 for solution S.

Thiosulphates. To 5 ml of solution S add 5 ml of *dilute hydrochloric acid R*. The solution remains clear (*2.2.1*) for at least 15 min.

Arsenic (*2.4.2, Method A*): maximum 5 ppm.

Mix 0.20 g with 2 ml of *water R* in a dish. Add, drop by drop, 1.5 ml of *nitric acid R*. Evaporate the mixture to dryness on a water-bath. Heat over a flame until no more vapour is evolved. Take up the residue in 25 ml of *water R*.

Iron (*2.4.9*): maximum 20 ppm, determined on solution S.

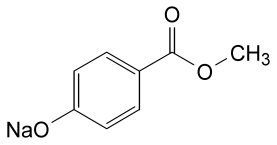
Heavy metals (*2.4.8*): maximum 20 ppm.

To 40 ml of solution S in a silica crucible, add 10 ml of *hydrochloric acid R* and evaporate to dryness. Dissolve the residue in 19 ml of *water R* and add 1 ml of a 40 g/l solution of *sodium fluoride R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

ASSAY

Dissolve 0.200 g in 50.0 ml of *0.05 M iodine*. Add 5 ml of *dilute hydrochloric acid R*. Titrate with *0.1 M sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator.

1 ml of *0.05 M iodine* is equivalent to 4.753 mg of $Na_2S_2O_5$.



STORAGE

Protected from light.

01/2008:1262
corrected 6.0

SODIUM METHYL PARAHYDROXYBENZOATE

Methylis parahydroxybenzoas natricus

$C_8H_7NaO_3$ M_r 174.1
[5026-62-0]

DEFINITION

Sodium methyl parahydroxybenzoate contains not less than 99.0 per cent and not more than the equivalent of 102.0 per cent of sodium 4-(methoxycarbonyl)phenolate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, sparingly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

A. Dissolve 0.5 g in 50 ml of *water R*. Immediately add 5 ml of *hydrochloric acid R1*. Filter and wash the precipitate with *water R*. Dry under vacuum at 80 °C for 2 h. The precipitate obtained melts (*2.2.14*) at 125 °C to 128 °C.

B. Examine the precipitate obtained in identification test A by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *methyl parahydroxybenzoate CRS*.

C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (c).

D. To about 10 mg in a test-tube add 1 ml of *sodium carbonate solution R*, boil for 30 s and cool. Add 5 ml of *aminopyrazolone solution R* and 1 ml of *potassium ferricyanide solution R* and mix. An orange to red colour develops.

E. To 1 ml of solution S (see Tests) add 1 ml of *water R*. The solution gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S examined immediately after preparation is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method I*).

pH (*2.2.3*). Dilute 1 ml of solution S to 100 ml with *carbon dioxide-free water R*. The pH of the solution is 9.5 to 10.5.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using as the coating substance a suitable octadecylsilyl silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 0.100 g in 10 ml of *water R*. Immediately add 2 ml of *hydrochloric acid R* and shake with 50 ml of *ether R*. Evaporate the upper layer to dryness and dissolve the residue to 10 ml with *acetone R*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dissolve 34.3 mg of *4-hydroxybenzoic acid R* in *acetone R* and dilute to 100 ml with the same solvent.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100 ml with *acetone R*.

Reference solution (c). Dissolve 10 mg of *methyl parahydroxybenzoate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

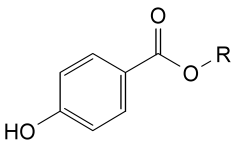
Reference solution (d). Dissolve 10 mg of *ethyl parahydroxybenzoate CRS* in 1 ml of test solution (a) and dilute to 10 ml with *acetone R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *glacial acetic acid R*, 30 volumes of *water R* and 70 volumes of *methanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with test solution (a): any spot due to 4-hydroxybenzoic acid is not more intense than the spot in the chromatogram obtained with reference solution (a) (4 per cent) and any spot, apart from the principal spot and the spot due to 4-hydroxybenzoic acid, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated principal spots.

Chlorides (*2.4.4*). To 10 ml of solution S, add 30 ml of *water R* and 1 ml of *nitric acid R* and dilute to 50 ml with *water R*. Shake and filter. Dilute 10 ml of the filtrate to 15 ml with *water R*. The solution complies with the limit test for chlorides (350 ppm). Prepare the standard using 14 ml of *chloride standard solution (5 ppm Cl) R* to which 1 ml of *water R* has been added.

Sulphates (*2.4.13*). To 25 ml of solution S, add 5 ml of *distilled water R* and 10 ml of *hydrochloric acid R* and dilute to 50 ml with *distilled water R*. Shake and filter. Dilute 10 ml of the filtrate to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Heavy metals (*2.4.8*). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.



Water (*2.5.12*). Not more than 5.0 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

Dissolve 0.150 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 17.41 mg of $C_8H_7NaO_3$.

IMPURITIES

A. R = H: 4-hydroxybenzoic acid,

B. R = CH_2-CH_3: ethyl 4-hydroxybenzoate,

C. R = CH_2-CH_2-CH_3: propyl 4-hydroxybenzoate,

D. R = CH_2-CH_2-CH_2-CH_3: butyl 4-hydroxybenzoate.

SODIUM MOLYBDATE DIHYDRATE

Natrii molybdas dihydricus

$Na_2MoO_4,2H_2O$ M_r 241.9
[10102-40-6]

DEFINITION

Content: 98.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder or colourless crystals.

Solubility: freely soluble in water.

IDENTIFICATION

A. Loss on drying (see Tests).

B. Dissolve 0.2 g in 5 ml of a mixture of equal volumes of *nitric acid R* and *water R* and add 0.1 g of *ammonium chloride R*. Add 0.3 ml of *disodium hydrogen phosphate solution R* and heat slowly at 50-60 °C. A yellow precipitate is formed.

C. Dissolve 0.15 g in 2 ml of *water R*, the solution gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 10.0 g in *water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Chlorides: maximum 50 ppm.

To 10 ml of a mixture of equal volumes of *nitric acid R* and *water R* add 10 ml of solution S with shaking. Add 1 ml of *0.1 M silver nitrate*. Any opalescence in the solution is not more intense after 5 min than that of a standard solution prepared at the same time in the same manner with 2 ml of *chloride standard solution (50 ppm Cl) R*.

Phosphates: maximum 200 ppm.

Dissolve 2.0 g by heating in 13 ml of *water R*. In the still hot solution, dissolve 8.0 g of *ammonium nitrate R1*. Add this solution to 27 ml of a mixture of equal volumes of *nitric acid R* and *water R*. Any yellow colour or opalescence in the solution is not more intense within 3 h than that in a standard solution prepared at the same time as follows: dissolve 1.0 g in 12 ml of *water R* and add 1 ml of *phosphate standard solution (200 ppm PO_4) R*.

Ammonium (*2.4.1, Method B*): maximum 10 ppm, determined on 0.10 g.

Prepare the standard using 1 ml of *ammonium standard solution (1 ppm NH_4) R*.

Heavy metals: maximum 10 ppm.

To 10 ml of solution S, add 2 ml of *water R*, 6 ml of a 168 g/l solution of *sodium hydroxide R* and 2 ml of *concentrated ammonia R* (solution A). To 0.5 ml of *thioacetamide reagent R* add a mixture of 15 ml of solution A and 5 ml of *water R*. Any coloration of the solution is not more intense after 2 min than that of a reference solution prepared at the same time as follows: to 0.5 ml of *thioacetamide reagent R* add a mixture of 5 ml of solution A, 1 ml of *lead standard solution (10 ppm Pb) R* and 14 ml of *water R*.

Loss on drying (*2.2.32*): 14.0 per cent to 16.0 per cent, determined on 1.000 g by drying in an oven at 140 °C for 3 h.

ASSAY

Dissolve 0.100 g in 30 ml of *water R*, add 0.5 g of *hexamethylenetetramine R* and 0.1 ml of a 250 g/l solution of *nitric acid R*. Heat to 60 °C. Titrate with *0.05 M lead nitrate* using *4-(2-pyridylazo)resorcinol monosodium salt R* as indicator.

1 ml of *0.05 M lead nitrate* is equivalent to 10.30 mg of Na_2MoO_4.

01/2008:1996

SODIUM NITRITE

Natrii nitris

$NaNO_2$ M_r 69.0
[7632-00-0]

DEFINITION

Content: 98.5 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: colourless crystals or mass or yellowish rods, hygroscopic.

Solubility: freely soluble in water, soluble in alcohol.

IDENTIFICATION

A. Dilute 1 ml of solution S1 (see Tests) to 25 ml with *water R*. To 0.1 ml of the solution add 1 ml of *sulphanilic acid solution R1*. Allow to stand for 2-3 min. Add 1 ml of *β-naphthol solution R* and 1 ml of *dilute sodium hydroxide solution R*. An intense red colour develops.

B. To 1 ml of the solution prepared for identification test A add 3 ml of a 20 g/l solution of *phenazone R* and 0.4 ml of *dilute sulphuric acid R*. An intense green colour develops.

C. To 0.15 ml of solution S1, add 0.35 ml of *water R*. The solution gives reaction (b) of sodium (*2.3.1*).

TESTS

Solution S1. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Solution S2. Dissolve 3 g in *distilled water R*. Cautiously add 10 ml of *nitric acid R* and evaporate to dryness. Dissolve the residue in 10 ml of *distilled water R*, neutralise with *dilute sodium hydroxide solution R* and dilute to 30 ml with *distilled water R*.

Appearance of solution. Solution S1 is clear (*2.2.1*) and not more intensely coloured than reference solution B_6 (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S1, add 0.05 ml of *phenol red solution R*. Add 0.1 ml of *0.01 M sodium hydroxide*. The solution is red. Add 0.3 ml of *0.01 M hydrochloric acid*. The solution is yellow.

Chlorides (*2.4.4*): maximum 50 ppm.

Dilute 10 ml of solution S2 to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Sulphates (*2.4.13*): maximum 200 ppm.

Dilute 7.5 ml of solution S2 to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates.

Heavy metals (*2.4.8*): maximum 20 ppm.

Dilute 10 ml of solution S2 to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying *in vacuo*.

ASSAY

Dissolve 0.400 g in 100.0 ml of *water R*. Introduce 20.0 ml of the solution, while stirring continuously and keeping the tip of the pipette below the surface of the liquid, into a conical flask containing 30.0 ml of *0.1 M cerium sulphate*. Immediately stopper the flask and allow to stand for 2 min. Add 10 ml of a 200 g/l solution of *potassium iodide R* and 2 ml of *starch solution R*.

While stirring continuously, titrate with *0.1 M sodium thiosulphate* until the blue colour disappears. Carry out a blank titration.

1 ml of *0.1 M cerium sulphate* is equivalent to 3.45 mg of $NaNO_2$.

STORAGE

In an airtight container.

01/2008:0565

SODIUM NITROPRUSSIDE

Natrii nitroprussias

$Na_2[Fe(CN)_5(NO)],2H_2O$ M_r 298.0
[13755-38-9]

DEFINITION

Sodium pentacyanonitrosylferrate (III) dihydrate.

Content: 99.0 per cent to 100.5 per cent (anhydrous substance).

CHARACTERS

Appearance: reddish-brown powder or crystals.

Solubility: freely soluble in water, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 0.700 g in *water R* and dilute to 100.0 ml with the same solvent. Examine the solution immediately after preparation.

Spectral range: 350-600 nm.

Absorption maximum: at 395 nm.

Shoulder: at about 510 nm.

Absorption minimum: at 370 nm.

Specific absorbance at the absorption maximum: 0.65 to 0.80.

B. Dissolve about 20 mg in 2 ml of *water R* and add 0.1 ml of *sodium sulphide solution R*. A deep violet-red colour is produced.

C. Dissolve 50 mg in 1 ml of *water R* and acidify the solution by the addition of *hydrochloric acid R*. Place a drop of the solution in an oxidising flame. A persistent yellow colour is produced.

TESTS

Insoluble matter: maximum 100 ppm.

Dissolve 10 g without heating in 50 ml of *water R*. Allow to stand for 30 min and filter through a sintered-glass filter (16) (*2.1.2*). Wash the filter with cold *water R* until the filtrate is colourless. Dry the residue on the filter at 105 °C. The residue weighs a maximum of 1 mg.

Chlorides (*2.4.4*): maximum 200 ppm.

In a metallic crucible (nickel) mix 1.0 g with 8 ml of a 200 g/l solution of *sodium hydroxide R*. Heat slowly and evaporate carefully to dryness over a small flame, then heat to a dull red colour for 30 min. Allow to cool and transfer the solid residue with 3 quantities, each of 8 ml, of *dilute sulphuric acid R*. Filter the sulphuric acid extracts on a filter paper and collect the filtrates. Render the filtrate acid to *litmus paper R* by adding, if necessary, a few drops of *dilute sulphuric acid R*. Wash the crucible and the filter paper with 3 quantities, each of 10 ml, of *water R*, add the washings to the main sulphuric acid solution and dilute to 60 ml with *water R*. Mix.

Ferricyanides: maximum 200 ppm.

Dissolve 1.25 g in *acetate buffer solution pH 4.6 R* and dilute to 50.0 ml with the same buffer solution. Use three 50 ml volumetric flasks (*A, B, C*). To flask *B* add 1.0 ml of *ferricyanide standard solution (50 ppm $Fe(CN)_6$) R*. To flasks *A* and *B* add 1 ml of a 5 g/l solution of *ferrous ammonium sulphate R*. To the 3 flasks add 10.0 ml of the solution of the substance to be examined. Dilute the contents of each flask to 50.0 ml with *water R*. Allow to stand for 30 min. The absorbance (*2.2.25*) of the solution in flask *A* measured at 720 nm using the solution in flask *C* as the compensation liquid is not greater than the absorbance of the solution in flask *B* measured at 720 nm using the solution in flask *A* as the compensation liquid.

Ferrocyanides: maximum 200 ppm.

Dissolve 4.0 g in *water R* and dilute to 100.0 ml with the same solvent. Use three 50 ml volumetric flasks (*A, B, C*). To flask *B* add 2.0 ml of *ferrocyanide standard solution (100 ppm $Fe(CN)_6$) R*. To flasks *A* and *B* add 1 ml of *ferric chloride solution R2*. To the 3 flasks add 25.0 ml of the solution of the substance to be examined. Dilute the contents of each flask to 50.0 ml with *water R*. Allow to stand for 30 min. The absorbance (*2.2.25*) of the solution in flask *A* measured at 695 nm using the solution in flask *C* as the compensation liquid is not greater than the absorbance of the solution in flask *B* measured at 695 nm using the solution in flask *A* as the compensation liquid.

Sulphates: maximum 100 ppm.

Test solution. Dissolve 3.6 g in 120 ml of *distilled water R*, add with mixing 4 ml of *sulphate standard solution (10 ppm SO_4) R* and 20 ml of a 250 g/l solution of *cupric chloride R* and dilute to 150.0 ml with *distilled water R*. Allow to stand for 16 h and filter or centrifuge until a clear light-blue solution is obtained.

Reference solution. To 40 ml of *sulphate standard solution (10 ppm SO_4) R* add 80 ml of *distilled water R* and 12-13 ml of a 250 g/l solution of *cupric chloride R*. Dilute to 150.0 ml with *distilled water R*. The volume of cupric chloride solution added is such that the colour of the final solution matches that of the test solution.

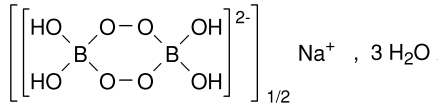
Allow the solutions to stand. Filter both solutions, discarding the first 25 ml of filtrate. To 100 ml of each filtrate, add 0.5 ml of *acetic acid R*. Mix and add 2 ml of a 250 g/l solution of *barium chloride R* and mix again. The test solution is not more opalescent than the reference solution.

Water (*2.5.12*): 9.0 per cent to 15.0 per cent, determined on 0.250 g.

ASSAY

Dissolve 0.250 g in 100 ml of *water R* and add 0.1 ml of *dilute sulphuric acid R*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*) with a silver-mercurous sulphate electrode system.

1 ml of *0.1 M silver nitrate* is equivalent to 13.10 mg of $Na_2[Fe(CN)_5(NO)]$.



STORAGE

Protected from light.

01/2008:1997
corrected 6.0

SODIUM PERBORATE, HYDRATED

Natrii perboras hydricus

$NaBO_3,4H_2O$ or $NaBO_2,H_2O_2,3H_2O$ M_r 153.9

DEFINITION

Content: 96.0 per cent to 103.0 per cent.

CHARACTERS

Appearance: colourless, prismatic crystals or white or almost white powder, stable in the crystalline form.

Solubility: sparingly soluble in water, with slow decomposition. It dissolves in dilute mineral acids.

IDENTIFICATION

A. Mix 1 ml of a saturated solution with a mixture of 1 ml of *dilute sulphuric acid R* and 0.2 ml of a 70 g/l solution of *potassium dichromate R*, shake with 2 ml of *ether R* and allow to stand. A blue colour is produced in the ether layer.

B. The mixture obtained by treating about 100 mg with 0.1 ml of *sulphuric acid R* and 5 ml of *methanol R* burns with a greenish flame when ignited.

C. It gives reaction (a) of sodium (*2.3.1*).

TESTS

Chlorides (*2.4.4*): maximum 330 ppm.

Dissolve 0.15 g in 15 ml of *water R*. The solution complies with the limit test for chlorides.

Sulphates (*2.4.13*): maximum 1.2 per cent.

Dissolve 0.13 g in 150 ml of *distilled water R*. 15 ml of the solution complies with the limit test for sulphates.

Iron (*2.4.9*): maximum 20 ppm.

Dissolve 2.5 g in 10 ml of *dilute hydrochloric acid R* with heating, evaporate to dryness, with stirring, and dissolve the residue in 25 ml of hot *water R*. Dilute 5 ml of the obtained solution to 10 ml with *water R*. The solution complies with the limit test for iron.

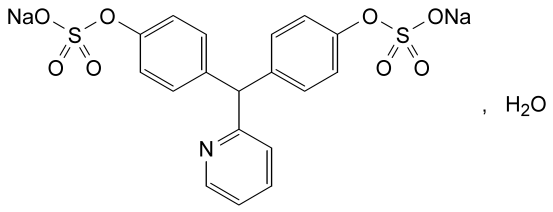
Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of the solution obtained in the test for iron complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 0.300 g in 50.0 ml of *water R*. Dilute 10.0 ml of the solution to 50 ml with *water R* and add 10 ml of *dilute sulphuric acid R*. Titrate with *0.02 M potassium permanganate*.

1 ml of *0.02 M potassium permanganate* is equivalent to 7.693 mg of NaH_8BO_7.



STORAGE

In an airtight container.

01/2008:1031

SODIUM PICOSULFATE

Natrii picosulfas

$C_{18}H_{13}NNa_2O_8S_2,H_2O$ M_r 499.4

DEFINITION

Sodium picosulfate contains not less than 98.5 per cent and not more than the equivalent of 100.5 per cent of 4,4′-(pyridin-2-ylmethylene)bisphenyl bis(sodium sulphate), calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sodium picosulfate CRS*. Examine the substances prepared as discs.

B. Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

C. To 5 ml of solution S (see Tests) add 1 ml of *dilute hydrochloric acid R* and heat to boiling. Add 1 ml of *barium chloride solution R1*. A white precipitate is formed.

D. To about 10 mg add 3 ml of *sulphuric acid R* and 0.1 ml of *potassium dichromate solution R1*. A violet colour develops.

E. The solution S gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 2.5 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution GY_7 (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.25 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *sodium picosulfate CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 2 ml of test solution (b) to 100 ml with *methanol R*.

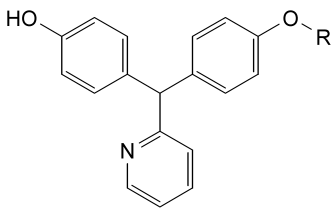
Reference solution (c). Dissolve 0.20 g of the substance to be examined in 2 ml of a 103 g/l solution of *hydrochloric acid R*. Heat rapidly to boiling and maintain boiling for 10 s. Cool in iced water and dilute to 10 ml with *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 2.5 volumes of *anhydrous formic acid R*, 12.5 volumes of *water R*, 25 volumes of *methanol R* and 60 volumes of *ethyl acetate R*. Dry the plate in a current of hot air for 15 min and examine in ultraviolet light at 254 nm. Spray with a 200 g/l solution of *hydrochloric acid R* in *methanol R* and heat at 110 °C for 10 min. Spray the hot plate with a freshly prepared solution containing 50 g/l of *ferric chloride R* and 1 g/l of *potassium ferricyanide R*. Examine the wet plate. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows three clearly separated spots. A fourth spot may be present on the starting-line.

Chlorides (*2.4.4*). Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (*2.4.13*). Dilute 7.5 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (400 ppm).

Heavy metals (*2.4.8*). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.



Water (*2.5.12*): 3.0 per cent to 5.0 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

Dissolve 0.400 g in 80 ml of *methanol R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 48.14 mg of $C_{18}H_{13}NNa_2O_8S_2$.

IMPURITIES

A. R = SO_3Na: 4-[(pyridin-2-yl)(4-hydroxyphenyl)methyl]phenyl sodium sulphate,

B. R = H: 4,4′-[(pyridin-2-yl)methylene]bisphenol.

01/2008:1909
corrected 6.0

SODIUM POLYSTYRENE SULPHONATE

Natrii polystyrenesulfonas

DEFINITION

Polystyrene sulphonate resin prepared in the sodium form.

Exchange capacity: 2.8 mmol to 3.4 mmol of potassium per gram (dried substance).

Content: 9.4 per cent to 11.0 per cent of Na (dried substance).

CHARACTERS

Appearance: almost white or light brown powder.

Solubility: practically insoluble in water, in alcohol and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs using finely ground substance.

Comparison: *Ph. Eur. reference spectrum of sodium polystyrene sulphonate.*

B. Suspend 0.1 g in *water R*, add 2 ml of a 150 g/l solution of *potassium carbonate R*, and heat to boiling. Allow to cool and filter. To the filtrate add 4 ml of *potassium pyroantimonate solution R* and heat to boiling. Allow to cool in iced water and if necessary rub the inside of the test-tube with a glass rod. A dense white precipitate is formed.

TESTS

Styrene. Liquid chromatography (*2.2.29*).

Test solution. Shake 10.0 g of the substance to be examined with 10 ml of *acetone R* for 30 min, centrifuge and use the supernatant liquid.

Reference solution. Dissolve 10 mg of *styrene R* in *acetone R* and dilute to 100 ml with the same solvent. Dilute 1 ml of this solution to 100 ml with *acetone R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *acetonitrile R, water R* (1:1 *V/V*).

Flow rate: 2 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

Limit:

– *styrene*: not more than the area of the principal peak in the chromatogram obtained with the reference solution (1 ppm).

Calcium: maximum 0.10 per cent.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution. To 1.10 g add 5 ml of *hydrochloric acid R*, heat to boiling, cool and add 10 ml of *water R*. Filter, wash the filter and residue with *water R* and dilute the filtrate and washing to 25.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *calcium standard solution (400 ppm Ca) R*, diluted as necessary with *water R*.

Wavelength: 422.7 nm.

Potassium: maximum 0.10 per cent.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution. To 1.10 g add 5 ml of *hydrochloric acid R*, heat to boiling, cool and add 10 ml of *water R*. Filter, wash the filter and residue with *water R* and dilute the filtrate and washings to 25.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *potassium standard solution (100 ppm K) R*, diluted as necessary with *water R*.

Wavelength: 766.5 nm.

Heavy metals (*2.4.8*): maximum 10 ppm.

Treat 1.0 g as described in limit test F. After the addition of the *buffer solution pH 3.5 R* and of the *thioacetamide reagent R*, dilute to 50 ml with *water R* and continue as described in limit test E, beginning at the words “mix and allow to stand for 10 min...”.

Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 7.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Microbial contamination (*2.6.13*): not more than 10^2 enterobacteria and certain other gram-negative bacteria per gram.

ASSAY

Sodium. Atomic emission spectrometry (*2.2.22, Method I*).

Test solution. In a platinum crucible moisten 0.90 g with a few drops of *sulphuric acid R*, ignite very gently and allow to cool. Moisten with a few drops of *sulphuric acid R* again, ignite at 800 ± 50 °C until a carbon-free ash is obtained and allow to cool.

Add 20 ml of *water R* to the crucible, warm gently on a water-bath until dissolution, cool, transfer quantitatively to a 100 ml graduated flask and dilute to 100.0 ml with *water R*. Dilute 5 ml of this solution to 1000.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*, diluted as necessary with *water R*.

Wavelength: 589 nm.

Exchange capacity. Atomic emission spectrometry (*2.2.22, Method I*).

Solution A. 9.533 g/l solution of *potassium chloride R*.

Test solution. To 1.6 g of the substance to be examined in a dry 250 ml ground-glass-stoppered flask add 100 ml of solution A, stopper and shake for 15 min. Filter, discard the first 20 ml of the filtrate and dilute 4 ml of the filtrate to 1000 ml with *water R*.

Reference solutions. Prepare the reference solutions by diluting 0, 1, 2, 3 and 4 ml of solution A respectively and 4, 3, 2, 1 and 0 ml of a 7.63 g/l solution of *sodium chloride R* to 1000 ml with *water R*.

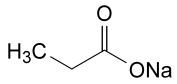
Wavelength: 766.5 nm.

Prepare a calibration curve using the reference solutions and calculate the potassium exchange capacity of the substance to be examined in millimoles per gram taking the concentration of potassium in solution A as 128 mmoles of K per litre.

STORAGE

In an airtight container.

IMPURITIES



Specified impurities: A.

A. styrene.

corrected 6.0

SODIUM PROPIONATE

Natrii propionas

$C_3H_5NaO_2$ M_r 96.1
[137-40-6]

DEFINITION

Sodium propanoate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: colourless crystals or, white or almost white powder, slightly hygroscopic.

Solubility: freely soluble in water, sparingly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *Ph. Eur. reference spectrum of sodium propionate.*

B. Dissolve 0.1 g in a mixture of 2 ml of *copper sulphate solution R* and 2 ml of *methylene chloride R*. Shake vigorously and allow to stand. Both the upper and the lower layer show a blue colour.

C. To 5 ml of solution S (see Tests) add 2 ml of *0.1 M silver nitrate*. A white precipitate is formed.

D. Solution S gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 10 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 7.8 to 9.2.

Dilute 1 ml of solution S to 5 ml with *water R*.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.250 g of the substance to be examined in *water R* and dilute to 100 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of the substance to be examined and 10 mg of *sodium acetate R* in *water R* and dilute to 100 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100 ml with *water R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dilute 1 ml of *phosphoric acid R* to 1000 ml with *water R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

System suitability: reference solution (a):

– *resolution*: minimum 5 between the peaks due to sodium acetate and sodium propionate.

Limits:

– *any impurity*: not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
– *total*: not more than half the area of the principal peak in the chromatrogram obtained with reference solution (b) (0.5 per cent),
– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Readily oxidisable substances. In a ground-glass-stoppered conical flask introduce 10 g of the substance to be examined. Add 100 ml of *water R* and stir to dissolve. Add 25 ml of *sodium hypobromite solution R* and 10 ml of a 200 g/l solution of *sodium acetate R*, stopper the flask and allow to stand for 15 min. Add 10 ml of *potassium iodide solution R* and 20 ml of *hydrochloric acid R* while cooling. Titrate with *0.2 M sodium thiosulphate*, adding 2 ml of *starch solution R* towards the end of the titration. Carry out a blank titration. The difference between the volumes used in the 2 titrations is not greater than 2.2 ml.

Iron (*2.4.9*): maximum 10 ppm.

10 ml of solution S complies with the limit test for iron.

Heavy metals (*2.4.8*): maximum 10 ppm.

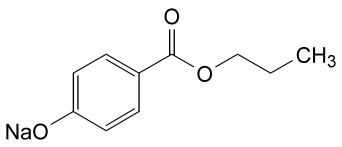
12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by heating in an oven at 105 °C for 3 h.

ASSAY

Dissolve 80.0 mg in 30 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 9.61 mg of $C_3H_5NaO_2$.



STORAGE

In an airtight container.

corrected 6.0

SODIUM PROPYL PARAHYDROXYBENZOATE

Propylis parahydroxybenzoas natricus

$C_{10}H_{11}NaO_3$ M_r 202.2
[35285-69-9]

DEFINITION

Sodium propyl parahydroxybenzoate contains not less than 99.0 per cent and not more than the equivalent of 104.0 per cent of sodium 4-(propoxycarbonyl)phenolate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, sparingly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

A. Dissolve 0.5 g in 50 ml of *water R*. Immediately add 5 ml of *hydrochloric acid R1*. Filter, and wash the precipitate with *water R*. Dry at 80 °C *in vacuo* for 2 h. The melting point (*2.2.14*) of the precipitate is 96 °C to 99 °C.

B. Examine the precipitate obtained in identification test A by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *propyl parahydroxybenzoate CRS*.

C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (c).

D. To about 10 mg in a test-tube add 1 ml of *sodium carbonate solution R*, boil for 30 s and cool. Add 5 ml of *aminopyrazolone solution R* and 1 ml of *potassium ferricyanide solution R* and mix. An orange to red colour develops.

E. To 1 ml of solution S (see Tests) add 1 ml of *water R*. The solution gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R*, and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S, examined immediately after preparation, is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

pH (*2.2.3*). Dilute 1 ml of solution S to 100 ml with *carbon dioxide-free water R*. The pH of the solution is 9.5 to 10.5.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using as the coating substance a suitable octadecylsilyl silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 0.100 g of the substance to be examined in 10 ml of *water R*. Immediately add 2 ml of *hydrochloric acid R* and shake with 50 ml of *ether R*. Evaporate the upper layer to dryness and take up the residue with 10 ml of *acetone R*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dissolve 34.3 mg of *4-hydroxybenzoic acid R* in *acetone R* and dilute to 100 ml with the same solvent.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100 ml with *acetone R*.

Reference solution (c). Dissolve 10 mg of *propyl parahydroxybenzoate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

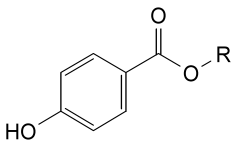
Reference solution (d). Dissolve 10 mg of *ethyl parahydroxybenzoate CRS* in 1 ml of test solution (a) and dilute to 10 ml with *acetone R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *glacial acetic acid R*, 30 volumes of *water R* and 70 volumes of *methanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with test solution (a): any spot due to 4-hydroxybenzoic acid is not more intense than the spot in the chromatogram obtained with reference solution (a) (4 per cent); and any spot, apart from the principal spot and the spot due to 4-hydroxybenzoic acid, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated principal spots.

Chlorides (*2.4.4*). To 10 ml of solution S add 30 ml of *water R* and 1 ml of *nitric acid R* and dilute to 50 ml with *water R*. Shake and filter. Dilute 10 ml of the filtrate to 15 ml with *water R*. The solution complies with the limit test for chlorides (350 ppm). Prepare the standard using 14 ml of *chloride standard solution (5 ppm Cl) R* to which 1 ml of *water R* has been added.

Sulphates (*2.4.13*). To 25 ml of solution S add 5 ml of *distilled water R* and 10 ml of *hydrochloric acid R* and dilute to 50 ml with *distilled water R*. Shake and filter. Dilute 10 ml of the filtrate to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Heavy metals (*2.4.8*). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.



Water (*2.5.12*). Not more than 5.0 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

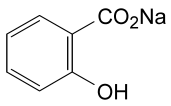
Dissolve 0.150 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 20.22 mg of $C_{10}H_{11}NaO_3$.

IMPURITIES

A. R = H: 4-hydroxybenzoic acid,

B. R = CH_3 : methyl 4-hydroxybenzoate,



C. R = CH_2-CH_3: ethyl 4-hydroxybenzoate,

D. R = CH_2-CH_2-CH_2-CH_3: butyl 4-hydroxybenzoate.

corrected 6.0

SODIUM SALICYLATE

Natrii salicylas

$C_7H_5NaO_3$ M_r 160.1
[54-21-7]

DEFINITION

Sodium 2-hydroxybenzenecarboxylate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or small, colourless crystals or shiny flakes.

Solubility: freely soluble in water, sparingly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *sodium salicylate CRS.*

B. Solution S (see Tests) gives the reactions of salicylates (*2.3.1*).

C. It gives reaction (b) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Acidity. To 20 ml of solution S add 0.1 ml of *phenol red solution R*. The solution is yellow. Not more than 2.0 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to violet-red.

Chlorides (*2.4.4*): maximum 200 ppm.

To 5 ml of solution S add 5 ml of *water R* and 10 ml of *dilute nitric acid R* and filter. Dilute 10 ml of the filtrate to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 600 ppm.

Dilute 2.5 ml of solution S to 15 ml with *distilled water R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

Dissolve 1.6 g in 16 ml of a mixture of 5 volumes of *water R* and 10 volumes of *ethanol (96 per cent) R*. 12 ml of the solution complies with test B. Prepare the reference solution using lead standard solution (2 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 5 volumes of *water R* and 10 volumes of *ethanol (96 per cent) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.00 g by drying in an oven at 105 °C.

ASSAY

Dissolve 0.130 g in 30 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid,* determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 16.01 mg of $C_7H_5NaO_3$.

STORAGE

In an airtight container, protected from light.

01/2008:1677

SODIUM SELENITE PENTAHYDRATE

Natrii selenis pentahydricus

$Na_2SeO_3,5H_2O$ M_r 263.0
[26970-82-1]

DEFINITION

Content: 98.5 per cent to 101.5 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder, hygroscopic.

Solubility: freely soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 50 mg in 5 ml of a mixture of equal volumes of *dilute hydrochloric acid R* and *water R* and heat to boiling. Add 0.05 g of *ascorbic acid R*; a red precipitate is formed which may become black.

B. Dissolve 50 mg in a mixture of 1 ml of *dilute hydrochloric acid R* and 5 ml of *water R*. Add 1 ml of *barium chloride solution R1*; the solution remains clear.

C. It gives reaction (a) of sodium (*2.3.1*).

D. It complies with the limits of the assay.

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 9.8 to 10.8 for solution S.

Chlorides (*2.4.4*): maximum 50 ppm.

To 10 ml of solution S add 2 ml of *nitric acid R* and dilute to 15 ml with *water R*.

Sulphates and selenates (*2.4.13*): maximum 300 ppm (determined as sulphates).

Dissolve 0.5 g in 10 ml of *distilled water R*. Add 0.5 ml of *hydrochloric acid R1* and dilute to 15 ml with *distilled water R*.

Iron: maximum 50 ppm.

To 2 ml of solution S add 2 ml of a 200 g/l solution of *sulphosalicylic acid R*, 5 ml of *concentrated ammonia R* and dilute to 10 ml with *water R*. The solution is not more intensely coloured than a reference solution prepared in the same manner using 1 ml of *iron standard solution (10 ppm Fe) R*.

ASSAY

Dissolve 0.120 g in 50 ml of *water R*, add 7 ml of *glacial acetic acid R*, 25.0 ml of *0.1 M sodium thiosulphate* and 0.5 g of *potassium iodide R*. Titrate immediately with *0.05 M iodine solution* using *starch solution R* as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 6.575 mg of $Na_2SeO_3,5H_2O$.

STORAGE

In an airtight container.

01/2008:0983

SODIUM STARCH GLYCOLATE (TYPE A)

Carboxymethylamylum natricum A

DEFINITION

Sodium salt of a cross-linked partly *O*-carboxymethylated potato starch.

Content: 2.8 per cent to 4.2 per cent of Na (A_r 22.99) (substance washed with ethanol (80 per cent *V/V*) and dried).

CHARACTERS

Appearance: white or almost white, fine, free-flowing powder, very hygroscopic.

Solubility: practically insoluble in methylene chloride. It gives a translucent suspension in water.

Examined under a microscope it is seen to consist of: granules, irregularly shaped, ovoid or pear-shaped, 30-100 µm in size, or rounded, 10-35 µm in size; compound granules consisting of 2-4 components occur occasionally; the granules have an eccentric hilum and clearly visible concentric striations; between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum; small crystals are visible at the surface of the granules. The granules show considerable swelling in contact with water.

IDENTIFICATION

A. pH (see Tests).

B. Prepare with shaking and without heating a mixture of 4.0 g of the substance to be examined and 20 ml of *carbon dioxide-free water R*. The mixture has the appearance of a gel. Add 100 ml of *carbon dioxide-free water R* and shake. A suspension forms that settles after standing.

C. To an acidified solution, add *iodinated potassium iodide solution R1*. The solution becomes blue or violet.

D. Solution S2 (see Tests) gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S1. Centrifuge the suspension obtained in identification test B at 2500 *g* for 10 min. Collect carefully the supernatant liquid.

Solution S2. Place 2.5 g in a silica or platinum crucible and add 2 ml of a 500 g/l solution of *sulphuric acid R*. Heat on a water-bath, then cautiously over a naked flame, raising the temperature progressively, then incinerate in a muffle furnace at 600 ± 25 °C. Continue heating until all black particles have disappeared. Allow to cool, add a few drops of *dilute sulphuric acid R*, heat and incinerate as above. Allow to cool, add a few drops of *ammonium carbonate solution R*, evaporate to dryness and incinerate cautiously. Allow to cool and dissolve the residue in 50 ml of *water R*.

Appearance of solution S1. Solution S1 is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 5.5 to 7.5.

Disperse 1.0 g in 30 ml of *water R*.

Sodium glycolate: maximum 2.0 per cent. *Carry out the test protected from light.*

Test solution. Place 0.20 g in a beaker. Add 5 ml of *acetic acid R* and 5 ml of *water R*. Stir until dissolution is complete (about 10 min). Add 50 ml of *acetone R* and 1 g of *sodium chloride R*. Filter through a fast filter paper impregnated with *acetone R*, rinse the beaker and filter with *acetone R*. Combine the filtrate and washings and dilute to 100.0 ml with *acetone R*. Allow to stand for 24 h without shaking. Use the clear supernatant liquid.

Reference solution. Dissolve 0.310 g of *glycollic acid R*, previously dried *in vacuo* over *diphosphorus pentoxide R* at room temperature overnight, in *water R* and dilute to 500.0 ml with the same solvent. To 5.0 ml of this solution add 5 ml of *acetic acid R* and allow to stand for about 30 min. Add 50 ml of *acetone R* and 1 g of *sodium chloride R*. Filter through a fast filter paper impregnated with *acetone R*, rinse the beaker and filter with *acetone R*. Combine the filtrate and washings and dilute to 100.0 ml with *acetone R*. Allow to stand for 24 h without shaking. Use the clear supernatant liquid.

Heat 2.0 ml of the test solution on a water-bath for 20 min. Cool to room temperature and add 20.0 ml of *2,7-dihydroxynaphthalene solution R*. Shake and heat in a water-bath for 20 min. Cool under running water, transfer to a volumetric flask and dilute to 25.0 ml with *sulphuric acid R*, maintaining the flask under running water. Within 10 min, measure the absorbance at 540 nm (*2.2.25*) using *water R* as the compensation liquid. The absorbance of the solution prepared with the test solution is not greater than that of a solution prepared at the same time and in the same manner with 2.0 ml of the reference solution.

Sodium chloride: maximum 7.0 per cent.

Place 0.500 g in a beaker and suspend in 100 ml of *water R*. Add 1 ml of *nitric acid R*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*), using a silver indicator electrode.

1 ml of *0.1 M silver nitrate* is equivalent to 5.844 mg of NaCl.

Iron (*2.4.9*): maximum 20 ppm determined on 10 ml of solution S2.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test D. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g by drying in an oven at 130 °C for 1.5 h.

Microbial contamination. It complies with the test for *Escherichia coli* and *Salmonella* (*2.6.13*).

ASSAY

Shake 1.000 g with 20 ml of *ethanol (80 per cent V/V) R*, stir for 10 min and filter. Repeat the operation until chloride has been completely extracted and verify the absence of chloride using *silver nitrate solution R2*. Dry the residue at 105 °C to constant mass. To 0.700 g of the dried residue, add 80 ml of *glacial acetic acid R* and heat under a reflux condenser for 2 h. Cool the solution to room temperature. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 2.299 mg of Na.

STORAGE

In an airtight container, protected from light.

01/2008:0984

SODIUM STARCH GLYCOLATE (TYPE B)

Carboxymethylamylum natricum B

DEFINITION

Sodium salt of a cross-linked partly *O*-carboxymethylated potato starch.

Content: 2.0 per cent to 3.4 per cent of Na (A_r 22.99) (substance washed with ethanol (80 per cent *V/V*) and dried).

CHARACTERS

Appearance: white or almost white, fine, free-flowing powder, very hygroscopic.

Solubility: practically insoluble in methylene chloride. It gives a translucent suspension in water.

Examined under a microscope it is seen to consist of: granules, irregularly shaped, ovoid or pear shaped, 30-100 µm in size, or rounded, 10-35 µm in size; compound granules consisting of 2-4 components occur occasionally; the granules have an eccentric hilum and clearly visible concentric striations; between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum; small crystals are visible at the surface of the granules. The granules show considerable swelling in contact with water.

IDENTIFICATION

A. pH (see Tests).

B. Prepare with shaking and without heating a mixture of 4.0 g of the substance to be examined and 20 ml of *carbon dioxide-free water R*. The mixture has the appearance of a gel. Add 100 ml of *carbon dioxide-free water R* and shake. A suspension forms that settles after standing.

C. To an acidified solution, add *iodinated potassium iodide solution R1*. The solution becomes blue or violet.

D. Solution S2 (see Tests) gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S1. Centrifuge the suspension obtained in identification test B at 2500 *g* for 10 min. Collect carefully the supernatant liquid.

Solution S2. Place 2.5 g in a silica or platinum crucible and add 2 ml of a 500 g/l solution of *sulphuric acid R*. Heat on a water-bath, then cautiously over a naked flame, raising the temperature progressively, and then incinerate in a muffle furnace at 600 ± 25 °C. Continue heating until all black particles have disappeared. Allow to cool, add a few drops of *dilute sulphuric acid R* and heat and incinerate as above. Allow to cool, add a few drops of *ammonium carbonate solution R*, evaporate to dryness and incinerate cautiously. Allow to cool and dissolve the residue in 50 ml of *water R*.

Appearance of solution S1. Solution S1 is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 3.0 to 5.0.

Disperse 1.0 g in 30 ml of *water R*.

Sodium glycolate: maximum 2.0 per cent. *Carry out the test protected from light.*

Test solution. Place 0.20 g in a beaker. Add 5 ml of *acetic acid R* and 5 ml of *water R*. Stir until dissolution is complete (about 10 min). Add 50 ml of *acetone R* and 1 g of *sodium chloride R*. Filter through a fast filter paper impregnated with *acetone R*, rinse the beaker and filter with *acetone R*. Combine the filtrate and washings and dilute to 100.0 ml with *acetone R*. Allow to stand for 24 h without shaking. Use the clear supernatant liquid.

Reference solution. Dissolve 0.310 g of *glycollic acid R*, previously dried *in vacuo* over *diphosphorus pentoxide R* at room temperature overnight, in *water R* and dilute to 500.0 ml with the same solvent. To 5.0 ml of this solution add 5 ml of *acetic acid R* and allow to stand for about 30 min. Add 50 ml of *acetone R* and 1 g of *sodium chloride R*. Filter through a fast filter paper impregnated with *acetone R*, rinse the beaker and filter with *acetone R*. Combine the filtrate and washings and dilute to 100.0 ml with *acetone R*. Allow to stand for 24 h without shaking. Use the clear supernatant liquid.

Heat 2.0 ml of the test solution on a water-bath for 20 min. Cool to room temperature and add 20.0 ml of *2,7-dihydroxynaphthalene solution R*. Shake and heat in a water-bath for 20 min. Cool under running water, transfer quantitatively to a volumetric flask and dilute to 25.0 ml with *sulphuric acid R*, maintaining the flasks under running water. Within 10 min, measure the absorbance at 540 nm (*2.2.25*) using *water R* as the compensation liquid. The absorbance of the solution prepared with the test solution is not greater than that of a solution prepared at the same time and in the same manner with 2.0 ml of the reference solution.

Sodium chloride: maximum 7.0 per cent.

Place 0.500 g in a beaker and suspend in 100 ml of *water R*. Add 1 ml of *nitric acid R*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*) using a silver indicator electrode.

1 ml of *0.1 M silver nitrate* is equivalent to 5.844 mg of NaCl.

Iron (*2.4.9*): maximum 20 ppm determined on 10 ml of solution S2.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test D. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g by drying in an oven at 130 °C for 1.5 h.

Microbial contamination. It complies with the test for *Escherichia coli* and *Salmonella* (*2.6.13*).

ASSAY

Shake 1.000 g with 20 ml of *ethanol (80 per cent V/V) R*, stir for 10 min and filter. Repeat the operation until chloride has been completely extracted and verify the absence of chloride using *silver nitrate R2*. Dry the residue at 105 °C to constant mass. To 0.700 g of the dried residue, add 80 ml of *glacial acetic acid R* and heat under a reflux condenser for 2 h. Cool the solution to room temperature. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 2.299 mg of Na.

STORAGE

In an airtight container, protected from light.

corrected 6.0

SODIUM STARCH GLYCOLATE (TYPE C)

Carboxymethylamylum natricum C

DEFINITION

Sodium salt of a partly *O*-carboxymethylated starch, cross-linked by physical dehydration.

Content: 2.8 per cent to 5.0 per cent of Na (A_r 22.99) (substance washed with ethanol (80 per cent *V/V*) and dried).

CHARACTERS

Appearance: white or almost white, fine, free-flowing powder, very hygroscopic.

Microscopic examination: it is seen to consist of granules, irregularly shaped, ovoid or pear-shaped, 30-100 µm in size, or rounded, 10-35 µm in size; compound granules consisting of 2-4 components occur occasionally; the granules have an eccentric hilum and clearly visible concentric striations; between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum; small crystals are visible at the surface of the granules. The granules show considerable swelling in contact with water.

Solubility: soluble in water, practically insoluble in methylene chloride. It gives a translucent gel-like product in water.

IDENTIFICATION

A. pH (see Tests).

B. Prepare with shaking and without heating a mixture of 4.0 g of the substance to be examined and 20 ml of *carbon dioxide-free water R*. The mixture has the appearance of a gel. Add 100 ml of *carbon dioxide-free water R* and shake: the gel remains stable (difference from types A and B). Keep the gel for the tests for appearance of gel and pH.

C. To 5 ml of the gel obtained in identification test B add 0.05 ml of *iodine solution R1*. A dark blue colour is produced.

D. Solution S (see Tests) gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Place 2.5 g in a silica or platinum crucible and add 2 ml of a 500 g/l solution of *sulphuric acid R*. Heat on a water-bath, then cautiously over a naked flame, raising the temperature progressively, and then incinerate in a muffle furnace at 600 ± 25 °C. Continue heating until all black particles have disappeared. Allow to cool, add a few drops of *sulphuric acid R*, heat and incinerate as above. Allow to cool, add a few drops of *ammonium carbonate solution R*, evaporate to dryness and incinerate cautiously. Allow to cool and dissolve the residue in 50 ml of *water R*.

Appearance of gel. The gel obtained in identification test B is colourless (*2.2.2, Method II*).

pH (*2.2.3*): 5.5 to 7.5 for the gel obtained in identification test B.

Sodium glycolate: maximum 2.0 per cent. *Carry out the test protected from light.*

Test solution. Place 0.20 g in a beaker. Add 5 ml of *acetic acid R* and 5 ml of *water R*. Stir until dissolution is complete (about 10 min). Add 50 ml of *acetone R* and 1 g of *sodium chloride R*. Filter through a fast filter paper impregnated with *acetone R*, rinse the beaker and filter with *acetone R*. Combine the filtrate and washings and dilute to 100.0 ml with *acetone R*. Allow to stand for 24 h without shaking. Use the clear supernatant liquid.

Reference solution. Dissolve 0.310 g of *glycollic acid R*, previously dried *in vacuo* over *diphosphorus pentoxide R*, in *water R* and dilute to 500.0 ml with the same solvent. To 5.0 ml of this solution, add 5 ml of *acetic acid R* and allow to stand for about 30 min. Add 50 ml of *acetone R* and 1 g of *sodium chloride R* and dilute to 100.0 ml with *acetone R*.

Heat 2.0 ml of the test solution on a water-bath for 20 min. Cool to room temperature and add 20.0 ml of *2,7-dihydroxynaphthalene solution R*. Shake and heat on a water-bath for 20 min. Cool under running water, transfer to a volumetric flask and dilute to 25.0 ml with *sulphuric acid R*, maintaining the flask under running water. Within 10 min, measure the absorbance (*2.2.25*) at 540 nm using *water R* as the compensation liquid. The absorbance of the solution prepared with the test solution is not greater than that of a solution prepared at the same time and in the same manner with 2.0 ml of the reference solution.

Sodium chloride: maximum 1 per cent.

Shake 1.00 g with 20 ml of *ethanol (80 per cent V/V) R* for 10 min and filter. Repeat the operation 4 times. Dry the residue to constant mass at 100 °C and set aside for the assay. Combine the filtrates. Evaporate to dryness, take up the residue with *water R* and dilute to 25.0 ml with the same solvent. To 10.0 ml of the solution add 30 ml of *water R* and 5 ml of *dilute nitric acid R*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*), using a silver indicator electrode.

1 ml of *0.1 M silver nitrate* is equivalent to 5.844 mg of NaCl.

Iron (*2.4.9*): maximum 20 ppm, determined on solution S.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test D. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 7.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Microbial contamination. It complies with the test for *Escherichia coli* and *Salmonella* (*2.6.13*).

ASSAY

To 0.500 g of the dried and crushed residue obtained in the test for sodium chloride add 80 ml of *anhydrous acetic acid R* and heat under a reflux condenser for 2 h. Cool the solution to room temperature. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank test.

1 ml of *0.1 M perchloric acid* is equivalent to 2.299 mg of Na.

STORAGE

In an airtight container, protected from light.

corrected 6.0

SODIUM STEARATE

Natrii stearas

DEFINITION

Mixture of sodium salts of different fatty acids consisting mainly of stearic (octadecanoic) acid [$C_{17}H_{35}COONa$; M_r 306.5] and palmitic (hexadecanoic) acid [$C_{15}H_{31}COONa$; M_r 278.4].

Content:

– *sodium*: 7.4 per cent to 8.5 per cent (A_r 22.99) (dried substance);

– *stearic acid in the fatty acid fraction*: minimum 40 per cent;

– *sum of stearic acid and palmitic acid in the fatty acid fraction*: minimum 90 per cent.

CHARACTERS

Appearance: white or yellowish, fine powder, greasy to the touch.

Solubility: slightly soluble in water and in ethanol (96 per cent).

IDENTIFICATION

First identification: C, D.

Second identification: A, B, D.

A. Freezing point (*2.2.18*): minimum 53 °C for the residue obtained in the preparation of solution S (see Tests).

B. Acid value (*2.5.1*): 195 to 210, determined on 0.200 g of the residue obtained in the preparation of solution S dissolved in 25 ml of the prescribed mixture of solvents.

C. Examine the chromatograms obtained in the assay of stearic acid and palmitic acid.

Results: the 2 principal peaks in the chromatogram obtained with the test solution are similar in retention time and size to the 2 principal peaks in the chromatogram obtained with the reference solution.

D. Solution S gives reaction (b) of sodium (*2.3.1*).

TESTS

Solution S. To 10.0 g add 100 ml of *peroxide-free ether R* and 80 ml of *acetic acid R*. Boil under a reflux condenser until dissolution is complete. Allow to cool. In a separating funnel, separate the aqueous layer and shake the ether layer with 2 quantities, each of 8 ml, of *acetic acid R*. Combine the aqueous layers, wash with 30 ml of *peroxide-free ether R* and dilute to 100 ml with *distilled water R* (solution S). Evaporate the ether layers to dryness on a water-bath and dry the residue at 100-105 °C.

Acidity or alkalinity. Suspend 2.0 g in 50 ml of previously neutralised *ethanol (96 per cent) R*. Heat under reflux to dissolve and add 3 drops of *phenolphthalein solution R*; the solution is colourless. Not less than 0.60 ml and not more than 0.85 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Chlorides (*2.4.4*): maximum 0.2 per cent.

Dilute 0.25 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 0.3 per cent.

Dilute 0.5 ml of solution S to 15 ml with *distilled water R*.

Nickel: maximum 5.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Place 50.0 mg of the substance to be examined in a polytetrafluoroethylene digestion flask and add 0.5 ml of a mixture of 1 volume of *heavy metal-free hydrochloric acid R* and 5 volumes of *heavy metal-free nitric acid R*. Allow to digest at 170 °C for 5 h. Allow to cool. Dissolve the residue in *water R* and dilute to 5.0 ml with the same solvent.

Reference solutions. Prepare the reference solutions using *nickel standard solution (10 ppm Ni) R*, diluted as necessary with *water R*.

Source: nickel hollow-cathode lamp.

Wavelength: 232.0 nm.

Atomisation device: air-acetylene flame.

Loss on drying (*2.2.32*): maximum 5.0 per cent.

In a weighing glass introduce 1.0 g of previously washed *sand R*, dry at 105 °C and weigh. Add 0.500 g of the substance to be examined and 10 ml of *ethanol (96 per cent) R*. Evaporate at 80 °C and dry the residue at 105 °C for 4 h.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 micro-organisms per gram, determined by plate count. It complies with the test for *Escherichia coli* (*2.6.13*).

ASSAY

Sodium. Dissolve 0.250 g with gentle heating in a mixture of 5 ml of *acetic anhydride R* and 20 ml of *anhydrous acetic acid R*. Cool and add 20 ml of *dioxan R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 2.299 mg of Na.

Stearic acid and palmitic acid. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. In a conical flask fitted with a reflux condenser, dissolve 0.10 g of the substance to be examined in 5 ml of *boron trifluoride-methanol solution R*. Boil under a reflux condenser for 10 min. Add 4 ml of *heptane R* through the condenser and boil again under a reflux condenser for 10 min. Allow to cool. Add 20 ml of *saturated sodium chloride solution R*. Shake and allow the layers to separate. Remove about 2 ml of the organic layer and dry over 0.2 g of *anhydrous sodium sulphate R*. Dilute 1.0 ml of the solution to 100.0 ml with *heptane R*.

Reference solution. Prepare the reference solution in the same manner as the test solution using 50.0 mg of *palmitic acid CRS* and 50.0 mg of *stearic acid CRS* instead of the substance to be examined.

Column:

– *material*: fused silica;

– *size*: *l* = 30 m, Ø = 0.32 mm;

– *stationary phase*: *macrogol 20 000 R* (film thickness 0.5 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 2.4 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	70
	2 - 36	70 → 240
	36 - 41	240
Injection port		220
Detector		260

Detection: flame ionisation.

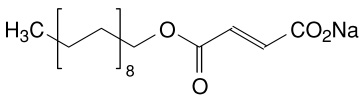
Injection: 1 µl.

Relative retention with reference to methyl stearate (retention time = about 40 min): methyl palmitate = about 0.88.

System suitability: reference solution:

– *resolution*: minimum 5.0 between the peaks due to methyl stearate and methyl palmitate.

Calculate the content of stearic acid and palmitic acid.



STORAGE

In an airtight container, protected from light.

01/2008:1567

SODIUM STEARYL FUMARATE

Natrii stearylis fumaras

$C_{22}H_{39}NaO_4$ M_r 390.5
[4070-80-8]

DEFINITION

Sodium octadecyl (*E*)-butenedioate.

Content: 99.0 per cent to 101.5 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, fine powder with agglomerates of flat, circular particles.

Solubility: practically insoluble in water, slightly soluble in methanol, practically insoluble in acetone and in ethanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *sodium stearyl fumarate CRS*.

TESTS

Related substances. Gas chromatography (*2.2.28*): use the normalisation procedure.

Silylation solution. To 2 ml of *N,O-bis(trimethylsilyl)trifluoroacetamide R* add 0.02 ml of *chlorotrimethylsilane R* and mix.

Test solution. Introduce 15.0 mg of the substance to be examined in a vial with a screw cap and add 1 ml of the silylation solution. Seal the vial and heat at about 70 °C for 1 h. After the reaction a precipitate remains in the vial; filter the solution through a nylon filter (pore size 0.45 µm).

Reference solution. Introduce 1.0 mg of *sodium stearyl maleate CRS* and 1.0 mg of *sodium stearyl fumarate CRS* into a vial with a screw cap and add 1 ml of the silylation solution. Seal the vial and heat at about 70 °C for 1 h.

Column:

– *material*: fused silica,
– *size*: *l* = 15 m, Ø = 0.53 mm,
– *stationary phase*: *poly(dimethyl)siloxane R* (film thickness 0.15 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 2 ml/min.

Split ratio: 1:25.

Temperature:

	Time (min)	Temperature (°C)
	0 - 1	180
Column	1 - 21	180 → 320
	21 - 26	320
Injection port		250
Detector		320

Detection: flame ionisation.

Injection: 2 µl.

Relative retention with reference to stearyl trimethylsilyl fumarate (retention time = about 9 min): stearyl alcohol = 0.30; stearyl trimethylsilyl ether = 0.35; palmityl trimethylsilyl fumarate = 0.80; heptadecyl trimethylsilyl fumarate = 0.85; stearyl trimethylsilyl maleate = 0.90; nonadecyl trimethylsilyl fumarate = 1.05; eicos-11-enyl trimethylsilyl fumarate = 1.15; distearyl fumarate = 2.25.

System suitability:

– *resolution*: minimum 1.5 between the peaks in the chromatogram obtained with the reference solution.

Limits:

– *any impurity*: maximum 0.5 per cent,
– *total*: maximum 5.0 per cent.

Water (*2.5.12*): maximum 5.0 per cent, determined on 0.250 g.

ASSAY

Dissolve 0.250 g, accurately weighed, in 10 ml of *methylene chloride R* and add 30 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 39.05 mg of $C_{22}H_{39}NaO_4$.

01/2008:0099
corrected 6.0

SODIUM SULPHATE, ANHYDROUS

Natrii sulfas anhydricus

Na_2SO_4 M_r 142.0
[7757-82-6]

DEFINITION

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: freely soluble in water.

IDENTIFICATION

A. It gives the reactions of sulphates (*2.3.1*).

B. It gives the reactions of sodium (*2.3.1*).

C. It complies with the test for loss on drying (see Tests).

TESTS

Solution S. Dissolve 2.2 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Chlorides (*2.4.4*): maximum 450 ppm.

5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides.

Calcium (*2.4.3*): maximum 450 ppm, if intended for use in the manufacture of parenteral dosage forms.

10 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for calcium.

Iron (*2.4.9*): maximum 90 ppm, if intended for use in the manufacture of parenteral dosage forms.

5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron.

Magnesium: maximum 200 ppm, if intended for use in the manufacture of parenteral dosage forms.

To 10 ml of solution S add 1 ml of *glycerol (85 per cent) R*, 0.15 ml of *titan yellow solution R*, 0.25 ml of *ammonium oxalate solution R* and 5 ml of *dilute sodium hydroxide solution R* and shake. Any pink colour in the test solution is not more intense than that in a standard prepared at the same time in the same manner using a mixture of 5 ml of *magnesium standard solution (10 ppm Mg) R* and 5 ml of *water R*.

Heavy metals (*2.4.8*): maximum 45 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 130 °C.

ASSAY

Dissolve 0.100 g in 40 ml of *water R*. Add a mixture of 0.2 ml of *0.1 M hydrochloric acid* and 80 ml of *methanol R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M lead nitrate* and as indicator electrode a lead-selective electrode and as reference electrode a silver-silver chloride electrode.

1 ml of *0.1 M lead nitrate* is equivalent to 14.20 mg of Na_2SO_4.

STORAGE

Store in an airtight container.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

01/2008:0100
corrected 6.0

SODIUM SULPHATE DECAHYDRATE

Natrii sulfas decahydricus

$Na_2SO_4,10H_2O$ M_r 322.2
[7727-73-3]

DEFINITION

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless, transparent crystals.

Solubility: freely soluble in water, practically insoluble in alcohol. It partly dissolves in its own water of crystallisation at about 33 °C.

IDENTIFICATION

A. It gives the reactions of sulphates (*2.3.1*).

B. It gives the reactions of sodium (*2.3.1*).

C. It complies with the test for loss on drying (see Tests).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Chlorides (*2.4.4*): maximum 200 ppm.

5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides.

Calcium (*2.4.3*): maximum 200 ppm, if intended for use in the manufacture of parenteral dosage forms.

10 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for calcium.

Iron (*2.4.9*): maximum 40 ppm, if intended for use in the manufacture of parenteral dosage forms.

5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron.

Magnesium: maximum 100 ppm, if intended for use in the manufacture of parenteral dosage forms.

To 10 ml of solution S add 1 ml of *glycerol (85 per cent) R*, 0.15 ml of *titan yellow solution R*, 0.25 ml of *ammonium oxalate solution R* and 5 ml of *dilute sodium hydroxide solution R* and shake. Any pink colour in the test solution is not more intense than that in a standard prepared at the same time in the same manner using a mixture of 5 ml of *magnesium standard solution (10 ppm Mg) R* and 5 ml of *water R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): 52.0 per cent to 57.0 per cent, determined on 1.000 g by drying at 30 °C for 1 h, then at 130 °C.

ASSAY

Dissolve 0.250 g in 40 ml of *water R*. Add a mixture of 0.2 ml of *0.1 M hydrochloric acid* and 80 ml of *methanol R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M lead nitrate* and as indicator electrode a lead-selective electrode and as reference electrode a silver-silver chloride electrode.

1 ml of *0.1 M lead nitrate* is equivalent to 14.20 mg of Na_2SO_4.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

01/2008:0775

SODIUM SULPHITE, ANHYDROUS

Natrii sulfis anhydricus

Na_2SO_3 M_r 126.0
[7757-83-7]

DEFINITION

Content: 95.0 per cent to 100.5 per cent of Na_2SO_3.

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Solution S (see Tests) is slightly alkaline (*2.2.4*).

B. To 5 ml of solution S add 0.5 ml of *0.05 M iodine*. The solution is colourless and gives reaction (a) of sulphates (*2.3.1*).

C. Solution S gives reaction (a) of sodium (*2.3.1*).

D. It complies with the limits of the assay.

TESTS

Solution S. Dissolve 5 g in *water R* and dilute to 100 ml with the same solvent.

Solution S1. To 10.0 g add 25 ml of *water R*. Shake until mostly dissolved, carefully and progressively add 15 ml of *hydrochloric acid R*. Heat to boiling. Cool and dilute to 100.0 ml with *water R*.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method I*).

Thiosulphates: maximum 0.1 per cent.

To 2.00 g add 100 ml of *water R*. Shake, add 10 ml of *formaldehyde solution R* and 10 ml of *acetic acid R*. Allow to stand for 5 min. Add 0.5 ml of *starch solution R* and titrate with *0.05 M iodine*. Carry out a blank titration. The difference between the volumes used in the titrations is not more than 0.15 ml.

Iron (*2.4.9*): maximum 10 ppm, determined on solution S1.

Selenium: maximum 10 ppm.

To 3.0 g add 10 ml of *formaldehyde solution R*, carefully and progressively add 2 ml of *hydrochloric acid R*. Heat on a water-bath for 20 min. Any pink colour in the solution is not more intense than that of a standard prepared at the same time and in the same manner using 1.0 g of the substance to be examined to which 0.2 ml of *selenium standard solution (100 ppm Se) R* has been added.

Zinc: maximum 25.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dilute 2.0 ml of solution S1 to 10.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *zinc standard solution (100 ppm Zn) R*, diluting with *water R*.

Source: zinc hollow-cathode lamp.

Wavelength: 213.9 nm.

Atomisation device: air-acetylene flame.

Heavy metals (*2.4.8*): maximum 10 ppm.

Evaporate 20 ml of solution S1 almost to dryness. Add 10 ml of *water R*, neutralise with *concentrated ammonia R* and dilute to 20 ml with *water R*. 12 ml of this solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

ASSAY

Introduce 0.250 g into a 500 ml conical flask containing 50.0 ml of *0.05 M iodine*. Shake until completely dissolved. Add 1 ml of *starch solution R* and titrate the excess of iodine with *0.1 M sodium thiosulphate*. Carry out a blank titration.

1 ml of *0.05 M iodine* is equivalent to 6.30 mg of Na_2SO_3.

01/2008:0776

SODIUM SULPHITE HEPTAHYDRATE

Natrii sulfis heptahydricus

$Na_2SO_3,7H_2O$ M_r 252.2
[10102-15-5]

DEFINITION

Content: 48.0 per cent to 52.5 per cent of Na_2SO_3.

CHARACTERS

Appearance: colourless crystals.

Solubility: freely soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Solution S (see Tests) is slightly alkaline (*2.2.4*).

B. To 5 ml of solution S add 0.5 ml of *0.05 M iodine*. The solution is colourless and gives reaction (a) of sulphates (*2.3.1*).

C. Solution S gives reaction (a) of sodium (*2.3.1*).

D. It complies with the limits of the assay.

TESTS

Solution S. Dissolve 10 g in *water R* and dilute to 100 ml with the same solvent.

Solution S1. To 20.0 g add 25 ml of *water R*. Shake until mostly dissolved, and carefully and progressively, add 15 ml of *hydrochloric acid R*. Heat to boiling. Cool and dilute to 100.0 ml with *water R*.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method I*).

Thiosulphates: maximum 0.05 per cent.

To 4.00 g add 100 ml of *water R*. Shake to dissolve, add 10 ml of *formaldehyde solution R* and 10 ml of *acetic acid R*. Allow to stand for 5 min, then add 0.5 ml of *starch solution R* and titrate with *0.05 M iodine*. Carry out a blank

titration. The difference between the volumes used in the titrations is not more than 0.15 ml.

Iron (*2.4.9*): maximum 5 ppm, determined on solution S1.

Selenium: maximum 5 ppm.

To 6.0 g add 10 ml of *formaldehyde solution R*, carefully and progressively add 2 ml of *hydrochloric acid R*. Heat on a water-bath for 20 min. Any pink colour in the solution is not more intense than that of a standard prepared at the same time and in the same manner using 2.0 g of the substance to be examined to which 0.2 ml of *selenium standard solution (100 ppm Se) R* has been added.

Zinc: maximum 12.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dilute 2.0 ml of solution S1 to 10.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *zinc standard solution (100 ppm Zn) R*, diluting with *water R*.

Source: zinc hollow-cathode lamp.

Wavelength: 213.9 nm.

Atomisation device: air-acetylene flame.

Heavy metals (*2.4.8*): maximum 5 ppm.

Evaporate 20 ml of solution S1 almost to dryness. Add 10 ml of *water R*, neutralise with *concentrated ammonia R* and dilute to 20 ml with *water R*. 12 ml of this solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

ASSAY

Introduce 0.500 g into a 500 ml conical flask containing 50.0 ml of *0.05 M iodine*. Shake until completely dissolved. Add 1 ml of *starch solution R* and titrate the excess of iodine with *0.1 M sodium thiosulphate*. Carry out a blank titration.

1 ml of *0.05 M iodine* is equivalent to 6.30 mg of Na_2SO_3.

01/2008:0414

SODIUM THIOSULPHATE

Natrii thiosulfas

$Na_2S_2O_3,5H_2O$ M_r 248.2
[10102-17-7]

DEFINITION

Content: 99.0 per cent to 101.0 per cent of $Na_2S_2O_3,5H_2O$.

CHARACTERS

Appearance: transparent, colourless crystals, efflorescent in dry air.

Solubility: very soluble in water, practically insoluble in ethanol 96 per cent. It dissolves in its water of crystallisation at about 49 °C.

IDENTIFICATION

A. It decolourises *iodinated potassium iodide solution R*.

B. To 0.5 ml of solution S (see Tests) add 0.5 ml of *water R* and 2 ml of *silver nitrate solution R2*. A white precipitate is formed which rapidly becomes yellowish and then black.

C. To 2.5 ml of solution S add 2.5 ml of *water R* and 1 ml of *hydrochloric acid R*. A precipitate of sulphur is formed and gas is evolved which gives a blue colour to *starch iodate paper R*.

D. 1 ml of solution S gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. The freshly prepared solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 10.0 g in 50 ml of *distilled water R*, add 1 ml of *0.1 M sodium hydroxide* and dilute to 100 ml with the same solvent.

pH (*2.2.3*): 6.0 to 8.4 for the freshly prepared solution S.

Sulphates and sulphites (*2.4.13*): maximum 0.2 per cent.

Dilute 2.5 ml of freshly prepared solution S to 10 ml with *distilled water R*. To 3 ml of this solution first add 2 ml of *iodinated potassium iodide solution R* and continue the addition dropwise until a very faint persistent yellow colour appears. Dilute to 15 ml with *distilled water R*.

Sulphides. To 10 ml of solution S add 0.05 ml of a freshly prepared 50 g/l solution of *sodium nitroprusside R*. The solution does not become violet.

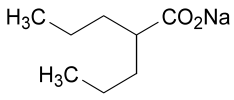
Heavy metals: maximum 10 ppm.

To 10 ml of solution S add 0.05 ml of *sodium sulphide solution R*. After 2 min, any brown colour in the solution is not more intense than that in a reference solution prepared at the same time and in the same manner using 10 ml of *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 0.500 g in 20 ml of *water R* and titrate with *0.05 M iodine*, using 1 ml of *starch solution R*, added towards the end of the titration, as indicator.

1 ml of *0.05 M iodine* is equivalent to 24.82 mg of $Na_2S_2O_3,5H_2O$.



STORAGE

In an airtight container.

01/2008:0678
corrected 6.0

SODIUM VALPROATE

Natrii valproas

$C_8H_{15}NaO_2$ M_r 166.2
[1069-66-5]

DEFINITION

Sodium 2-propylpentanoate.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline, hygroscopic powder.

Solubility: very soluble in water, slightly or freely soluble in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *sodium valproate CRS*.

If the spectra obtained in the solid state show differences, record new spectra using discs prepared by placing 50 µl of a 100 g/l solution in *methanol R* on a disc of *potassium bromide R* and evaporating the solvent *in vacuo*. Examine immediately.

B. Examine the chromatograms obtained in the test for related substances.

Results: the principal peak in the chromatogram obtained with test solution (b) is similar in retention time to the principal peak in the chromatogram obtained with reference solution (b).

C. 2 ml of solution S (see Tests) gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 1.25 g in 20 ml of *distilled water R* in a separating funnel, add 5 ml of *dilute nitric acid R* and shake. Allow the mixture to stand for 12 h. Use the lower layer.

Appearance of solution. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Dissolve 2.0 g in *water R* and dilute to 10 ml with the same solvent.

Acidity or alkalinity. Dissolve 1.0 g in 10 ml of *water R*. Add 0.1 ml of *phenolphthalein solution R*. Not more than 0.75 ml of *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 10 mg of *butyric acid R* in *heptane R* and dilute to 200 ml with the same solvent.

Test solution (a). Dissolve 0.500 g of the substance to be examined in 10 ml of *water R*. Add 5 ml of *dilute sulphuric acid R* and shake with 3 quantities, each of 20 ml, of *heptane R*. Add 10.0 ml of the internal standard solution to the combined upper layers, shake with *anhydrous sodium sulphate R*, filter and evaporate the filtrate, at a temperature not exceeding 30 °C, using a rotary evaporator. Take up the residue with *heptane R* and dilute to 10.0 ml with the same solvent. Dilute 1.0 ml of this solution to 10.0 ml with *heptane R*.

Test solution (b). Dissolve 40 mg of the substance to be examined in 100 ml of *water R*. To 10 ml of this solution add 0.5 ml of *dilute sulphuric acid R* and shake with 3 quantities, each of 5 ml, of *heptane R*. Shake with *anhydrous sodium sulphate R*, filter and evaporate the filtrate, at a temperature not exceeding 30 °C, to a volume of about 10 ml, using a rotary evaporator.

Reference solution (a). Dissolve 20 mg of *2-(1-methylethyl)pentanoic acid CRS* (impurity C) in 5.0 ml of test solution (b) and dilute to 10 ml with *heptane R*. Dilute 1 ml of this solution to 10 ml with *heptane R*.

Reference solution (b). Prepare as prescribed for test solution (b), using *sodium valproate CRS* instead of the substance to be examined.

Column:

– *material*: wide-bore fused silica;
– *size*: *l* = 30 m, Ø = 0.53 mm;
– *stationary phase*: *macrogol 20 000 2-nitroterephthalate R* (film thickness 0.5 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 8 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	130
	10 - 30	130 → 190
Injection port		220
Detector		220

Detection: flame ionisation.

Injection: 1 µl.

System suitability: reference solution (a):

– *resolution*: minimum 3.0 between the peaks due to impurity C and valproic acid.

Limits: test solution (a):

– *any impurity*: for each impurity, not more than the area of the peak due to the internal standard (0.1 per cent);
– *total*: not more than 3 times the area of the peak due to the internal standard (0.3 per cent);
– *disregard limit*: 0.1 times the area of the peak due to the internal standard (0.01 per cent).

Chlorides (*2.4.4*): maximum 200 ppm.

To 5 ml of solution S add 10 ml of *water R*.

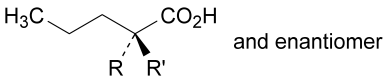
Sulphates (*2.4.13*): maximum 200 ppm, determined on Solution S.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 2.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

ASSAY



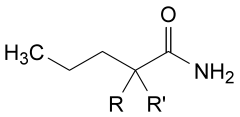
Dissolve 0.1500 g in 25 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 16.62 mg of $C_8H_{15}NaO_2$.

STORAGE

In an airtight container.

IMPURITIES

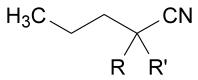


and enantiomer

A. R = R′ = H: pentanoic acid (valeric acid),

B. R = H, R′ = CH_2-CH_3: (2*RS*)-2-ethylpentanoic acid,

C. R = H, R′ = $CH(CH_3)_2$: (2*RS*)-2-(1-methylethyl)pentanoic acid,



D. R = R′ = CH_2-CH_2-CH_3: 2,2-dipropylpentanoic acid,

E. R = R′ = H: pentanamide (valeramide),

F. R = H, R′ = CH_2-CH_2-CH_3: 2-propylpentanamide,

G. R = R′ = CH_2-CH_2-CH_3: 2,2-dipropylpentanamide,

H. R = R′ = H: pentanenitrile (valeronitrile),

I. R = H, R′ = CH_2-CH_2-CH_3: 2-propylpentanenitrile,

J. R = R′ = CH_2-CH_2-CH_3: 2,2-dipropylpentanenitrile.

01/2008:1264

SOLUTIONS FOR ORGAN PRESERVATION

Solutiones ad conservationem partium corporis

DEFINITION

Solutions for organ preservation are sterile, aqueous preparations, intended for storage, protection and/or perfusion of mammalian body organs that are in particular destined for transplantation.

They contain electrolytes that are typically at a concentration close to the intracellular electrolyte composition.

They may contain carbohydrates (such as glucose or mannitol), amino acids, calcium-complexing agents (such as citrate or phosphate), hydrocolloids (such as starch or gelatin derivatives) and other excipients, for example to make the preparation isotonic with blood, to adjust or buffer the pH, to prevent deterioration of the ingredients, but not to adversely affect the intended action of the preparation or, at the concentration used, to cause toxicity or undue local irritation. Solutions for organ preservation may also contain active substances or these may be added immediately before use.

Solutions for organ preservation, examined under suitable conditions of visibility, are clear and practically free from particles.

Solutions for organ preservation may also be presented as concentrated solutions. They are diluted to the prescribed volume with a prescribed liquid immediately before use. After dilution, they comply with the requirements for solutions for organ preservation.

Before use, the solutions for organ preservation are cooled below room temperature, typically to 2 °C to 6 °C, to reduce the temperature of the body organ and its metabolism.

Where applicable, the containers for solutions for organ preservation comply with the requirements for *Materials used for the manufacture of containers* (*3.1* and subsections) and *Containers* (*3.2* and subsections). Solutions for organ preservation are supplied in glass containers (*3.2.1*) or in other containers such as plastic containers (*3.2.2* and *3.2.8*). The tightness of the container is ensured by suitable means. Closures ensure a good seal, prevent the access of micro-organisms and other contaminants and usually permit the withdrawal of a part or the whole of the contents without removal of the closure. The plastic materials or elastomers of which the closure is composed are sufficiently firm and elastic to allow the passage of a needle with the least possible shedding of particles.

PRODUCTION

Solutions for organ preservation are prepared using materials and methods designed to ensure their sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (*5.1.1*).

Unless otherwise justified and authorised, solutions for organ preservation are prepared from *water for injections R* and do not contain antimicrobial preservatives.

TESTS

pH (*2.2.3*). *Carry out the test at room temperature.* The pH of the solution is 5.0 to 8.0.

Osmolality (*2.2.35*). The osmolality of the solution is 250 mosmol/kg to 380 mosmol/kg.

Hydroxymethylfurfural. If the solution contains glucose, it complies with the following test: to a volume of the preparation to be examined containing the equivalent of 25 mg of glucose, add 5.0 ml of a 100 g/l solution of *p-toluidine R* in *2-propanol R* containing 10 per cent *V/V* of *glacial acetic acid R* and 1.0 ml of a 5 g/l solution of *barbituric acid R*. The absorbance (*2.2.25*), determined at 550 nm after allowing the mixture to stand for 2 min to 3 min, is not greater than that of a standard prepared at the same time in the same manner using a solution containing 10 µg of *hydroxymethylfurfural R* in the same volume as the preparation to be examined.

Particulate contamination. Carry out the test for sub-visible particles (*2.9.19*) using 50 ml of preparation to be examined. The solution contains not more than 50 particles per millilitre larger than 10 µm and not more than 5 particles per millilitre larger than 25 µm.

Products for which the label states that the product is to be used with a final filter are exempted from these requirements.

Sterility (*2.6.1*). The solution complies with the test for sterility.

Bacterial endotoxins (*2.6.14*): less than 0.5 IU/ml.

Pyrogens (*2.6.8*). Solutions for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 ml of the solution, unless otherwise justified and authorised.

LABELLING

The label states:

- that the solution is not to be used for injection,
- the formula of the solution for organ preservation expressed in grams per litre and in millimoles per litre,
- the nominal volume of the solution for organ preservation in the container,
- the osmolality, expressed in milliosmoles per kilogram,
- that any unused portion of the ready-to-use solution, of the concentrated solution or of the diluted solution must be discarded,
- the storage conditions,
- if applicable, that the solution is to be used in conjunction with a final filter.

In addition, for concentrated solutions the label states that the solution must be diluted with a suitable liquid immediately before use.

01/2008:0949

SOMATOSTATIN

Somatostatinum

$C_{76}H_{104}N_{18}O_{19}S_2$ M_r 1638
[38916-34-6]

DEFINITION

L-Alanylglycyl-L-cysteinyl-L-lysyl-L-asparaginyl-L-phenylalanyl-L-phenylalanyl-L-tryptophyl-L-lysyl-L-threonyl-L-phenylalanyl-L-threonyl-L-seryl-L-cysteine cyclic (3→14)-disulfide.

Synthetic cyclic tetradecapeptide having the structure of the hypothalamic hormone that inhibits the release of human growth hormone. It contains a variable amount of acetic acid. It is available in the freeze-dried form.

Content: 95.0 per cent to 103.0 per cent (anhydrous and acetic acid-free substance).

CHARACTERS

Appearance: white or almost white, amorphous powder.

Solubility: freely soluble in water and in acetic acid, practically insoluble in methylene chloride.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 1.0 mg of the substance to be examined in 1.0 ml of *water R*.

Reference solution. Dissolve the contents of a vial of *somatostatin CRS* in *water R* and dilute with the same solvent to obtain a final concentration of 1 mg/ml.

Plate: *TLC silica gel plate R*.

Mobile phase: *glacial acetic acid R, pyridine R, water R, butanol R* (10:15:20:45 *V/V/V/V*).

Application: 20 µl.

Development: over a path of 15 cm.

Drying: in a current of warm air.

Detection: spray with a 1 g/l solution of *ninhydrin R* and heat in an oven at 110 °C for about 5 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

C. Amino acid analysis (*2.2.56*). For hydrolysis use Method 1 and for analysis use Method 1.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids taking 1/8 of the sum of the number of moles of aspartic acid, alanine, lysine, glycine and phenylalanine as equal to 1. The values fall within the following limits: aspartic acid: 0.90 to 1.10; glycine: 0.90 to 1.10; alanine: 0.90 to 1.10; phenylalanine: 2.7 to 3.3; serine: 0.7 to 1.05; threonine: 1.4 to 2.1; half-cystine: 1.4 to 2.1; lysine: 1.8 to 2.2. Not more than traces of other amino acids are present.

TESTS

Specific optical rotation (*2.2.7*): – 37 to – 47 (anhydrous and acetic acid-free substance).

Dissolve 2.0 mg in 1.0 ml of a 1 per cent *V/V* solution of *glacial acetic acid R*.

Absorbance (*2.2.25*): maximum 0.20 at 280 nm (calculated with reference to the peptide content as determined in the assay).

Dissolve 5.0 mg in a 9 g/l solution of *sodium chloride R* and dilute to 100.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*): use the normalisation procedure.

Test solution. Dissolve 5.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Column:

– *size*: *l* = 0.05 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: dilute 11 ml of *phosphoric acid R* with *water R*, adjust to pH 2.3 with *triethylamine R* and dilute to 1000 ml with *water R*;
– *mobile phase B*: *acetonitrile for chromatography R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 18	79 → 60	21 → 40
18 - 20	60	40
20 - 21	60 → 79	40 → 21
21 - 26	79	21

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 25 µl.

Limits:

– *any impurity*: maximum 1 per cent;
– *total*: maximum 2 per cent;
– *disregard limit*: 0.03 per cent.

Acetic acid (*2.5.34*): 3.0 per cent to 15.0 per cent.

Test solution. Dissolve 7.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A, then dilute to 10.0 ml with the same mixture of mobile phases.

Water (*2.5.12*): maximum 8.0 per cent, determined on 10.0 mg.

Bacterial endotoxins (*2.6.14*): less than 10 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

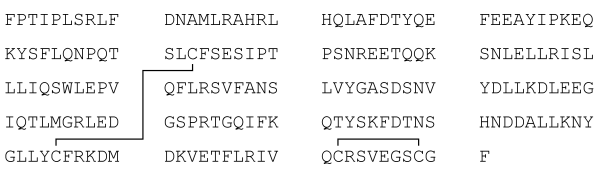
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Reference solution. Dissolve the contents of a vial of *somatostatin CRS* in *water R* and dilute with the same solvent to obtain a final concentration of 0.5 mg/ml.

Mobile phase: mobile phase B, mobile phase A (25:75 *V/V*).

Run time: 15 min.

Calculate the content of somastatin ($C_{76}H_{104}N_{18}O_{19}S_2$) from the declared content of $C_{76}H_{104}N_{18}O_{19}S_2$ in *somatostatin CRS*.



STORAGE

In an airtight container protected from light, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

01/2008:0951

SOMATROPIN

Somatropinum

$C_{990}H_{1528}N_{262}O_{300}S_7$ M_r 22 125

DEFINITION

Protein having the structure (191 amino-acid residues) of the major component of growth hormone produced by the human pituitary.

Content: 91.0 per cent to 105.0 per cent (anhydrous substance).

By convention, for the purpose of labelling somatropin preparations, 1 mg of anhydrous somatropin ($C_{990}H_{1528}N_{262}O_{300}S_7$) is equivalent to 3.0 IU of biological activity.

PRODUCTION

Somatropin is produced by a method based on recombinant DNA (rDNA) technology. During the course of product development, it must be demonstrated that the manufacturing process produces a product having a biological activity of not less than 2.5 IU/mg, using a validated bioassay based on growth promotion and approved by the competent authority.

Somatropin complies with the following additional requirements.

Host-cell-derived proteins. The limit is approved by the competent authority.

Host-cell- and vector-derived DNA. The limit is approved by the competent authority.

CHARACTERS

Appearance: white or almost white powder.

IDENTIFICATION

A. Capillary electrophoresis (*2.2.47*) as described in the test for charged variants with the following modifications.

Injection: test solution (b); under pressure or vacuum, using the following sequence: sample injection for at least 3 s then CZE buffer injection for 1 s.

Results: in the electropherogram obtained, only 1 principal peak, corresponding to somatropin, is detected: no doubling of this peak is observed.

B. Examine the chromatograms obtained in the test for related proteins.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with the reference solution.

C. Peptide mapping (*2.2.55*).

SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS

Test solution. Prepare a solution of the substance to be examined in *0.05 M tris-hydrochloride buffer solution pH 7.5 R* to obtain a solution containing 2.0 mg/ml of somatropin and transfer about 1.0 ml to a tube made from a suitable material such as polypropylene. Prepare a 1 mg/ml solution of *trypsin for peptide mapping R* in *0.05 M tris-hydrochloride buffer solution pH 7.5 R* and add 30 µl to the solution of the substance to be examined. Cap the tube and place in a water-bath at 37 °C for 4 h. Remove from the water-bath and stop the reaction immediately, for example by freezing. If analysed immediately using an automatic injector, maintain at 2-8 °C.

Reference solution. Prepare at the same time and in the same manner as for the test solution, but using *somatropin CRS* instead of the substance to be examined.

CHROMATOGRAPHIC SEPARATION. Liquid chromatography (*2.2.29*).

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octylsilyl silica gel for chromatography R* (5-10 µm) with a pore size of 30 nm;
– *temperature*: 30 °C.

Mobile phase:

– *mobile phase A*: dilute 1 ml of *trifluoroacetic acid R* to 1000 ml with *water R*;
– *mobile phase B*: to 100 ml of *water R*, add 1 ml of *trifluoroacetic acid R* and dilute to 1000 ml with *acetonitrile for chromatography R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 20	100 → 80	0 → 20
20 - 40	80 → 75	20 → 25
40 - 65	75 → 50	25 → 50
65 - 70	50 → 20	50 → 80
70 - 71	20 → 100	80 → 0
71 - 85	100	0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 100 µl.

System suitability: the chromatograms obtained with the test solution and the reference solution are similar to the chromatogram of somatropin digest supplied with *somatropin CRS*.

Results: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

D. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with the reference solution.

TESTS

Related proteins. Liquid chromatography (*2.2.29*): use the normalisation procedure. *Maintain the solutions at 2-8 °C and use within 24 h. If an automatic injector is used, maintain it at 2-8 °C.*

Test solution. Prepare a solution of the substance to be examined in *0.05 M tris-hydrochloride buffer solution pH 7.5 R*, containing 2.0 mg/ml of somatropin.

Reference solution. Prepare a solution of *somatropin CRS* in *0.05 M tris-hydrochloride buffer solution pH 7.5 R*, containing 2.0 mg/ml of somatropin.

Resolution solution. Dissolve the contents of a vial of *somatropin/desamidosomatropin resolution mixture CRS* in *0.05 M tris-hydrochloride buffer solution pH 7.5 R* to obtain a concentration of 2 mg/ml of somatropin.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: a suitable singly end-capped butylsilyl silica gel, with a granulometry of 5 µm and a porosity of 30 nm; a silica saturation column is placed between the pump and the injector valve;
– *temperature*: 45 °C.

Mobile phase: *propanol R, 0.05 M tris-hydrochloride buffer solution pH 7.5 R* (29:71 *V/V*).

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 220 nm.

Preconditioning of the column: rinse with 200-500 ml of a 0.1 per cent *V/V* solution of *trifluoroacetic acid R* in a 50 per cent *V/V* solution of *acetonitrile R*; repeat as necessary, to improve column performance.

Injection: 20 µl.

Relative retention with reference to somatropin (retention time = about 33 min; if necessary adjust the concentration of *propanol R* in the mobile phase): desamidosomatropin = about 0.85.

System suitability: resolution solution:

– *resolution*: minimum 1.0 between the peaks due to desamidosomatropin and somatropin;
– *symmetry factor*: 0.9 to 1.8 for the peak due to somatropin.

Limit:

– *total*: maximum 6.0 per cent.

Dimer and related substances of higher molecular mass. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

Test solution. Prepare a solution of the substance to be examined in *0.025 M phosphate buffer solution pH 7.0 R*, containing 1.0 mg/ml of somatropin.

Reference solution. Dissolve the contents of a vial of *somatropin CRS* in *0.025 M phosphate buffer solution pH 7.0 R* and dilute with the same solution to obtain a concentration of 1.0 mg/ml.

Resolution solution. Place 1 vial of *somatropin CRS* in an oven at 50 °C for a period sufficient to generate 1-2 per cent of dimer (typically 12-24 h). Dissolve its contents in *0.025 M phosphate buffer solution pH 7.0 R* and dilute with the same solution to obtain a concentration of 1.0 mg/ml.

Column:

– *size*: *l* = 0.30 m, Ø = 7.8 mm;
– *stationary phase*: *hydrophilic silica gel for chromatography R* of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 5000 to 150 000.

Mobile phase: *2-propanol R, 0.063 M phosphate buffer solution pH 7.0 R* (3:97 *V/V*); filter and degas.

Flow rate: 0.6 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 20 µl.

Relative retention with reference to somatropin monomer (retention time = 12 min to 17 min): related substances of higher molecular mass = about 0.65; somatropin dimer = about 0.9.

System suitability: resolution solution:

– *peak-to-valley ratio*: minimum 2.5, where H_p = height above the baseline of the peak due to the dimer and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer.

Limit:

– *sum of the peaks with retention times less than that of the principal peak*: maximum 4.0 per cent.

Charged variants. Capillary electrophoresis (*2.2.47*).

Test solution (a). Prepare a solution of the substance to be examined containing 1 mg/ml of somatropin.

Test solution (b). Mix equal volumes of test solution (a) and the reference solution.

Reference solution. Dissolve the contents of a vial of *somatropin CRS* in *water R* and dilute with the same solvent to obtain a concentration of 1 mg/ml.

Capillary:

– *material*: uncoated fused silica;
– *size*: effective length = at least 70 cm, Ø = 50 µm.

Temperature: 30 °C.

CZE buffer: 13.2 g/l solution of *ammonium phosphate R* adjusted to pH 6.0 with *phosphoric acid R* and filtered.

Detection: spectrophotometer at 200 nm.

Set the autosampler to store the samples at 4 °C during analysis.

Preconditioning of the capillary: rinse with *1 M sodium hydroxide* for 20 min, with *water R* for 10 min and with the CZE buffer for 20 min.

Between-run rinsing: rinse with *0.1 M sodium hydroxide* for 2 min and with the CZE buffer for 6 min.

Note: rinsing times may be adapted according to the length of the capillary and the equipment used.

Injection: test solution (a) and the reference solution; under pressure or vacuum, using the following sequence: sample injection for at least 3 s then CZE buffer injection for 1 s.

The injection time and pressure may be adapted in order to meet the system suitability criteria.

Migration: apply a field strength of 217 V/cm (20 kV for capillaries of 92 cm total length) for 80 min, using the CZE buffer as the electrolyte in both buffer reservoirs.

Relative migration with reference to somatropin: deamidated forms = 1.02 to 1.11.

System suitability: reference solution:

– the electropherogram obtained is similar to the electropherogram of somatropin supplied with *somatropin CRS*; 2 peaks (I_1, I_2) eluting prior to the principal peak and at least 2 peaks (I_3, I_4) eluting after the principal peak are clearly visible.

Note: peak I_2 corresponds to the cleaved form and peak I_4 corresponds to the deamidated forms, eluting as a doublet.

Limits:

– *deamidated forms*: maximum 5.0 per cent;

– *any other impurity*: for each impurity, maximum 2.0 per cent;
– *total*: maximum 10.0 per cent.

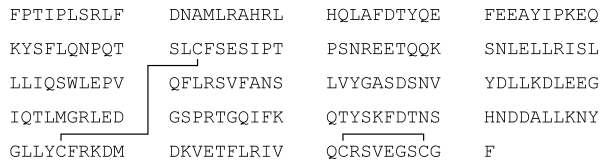
Water (*2.5.32*): maximum 10.0 per cent.

Bacterial endotoxins (*2.6.14*): less than 5 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Size-exclusion chromatography (*2.2.30*) as described in the test for dimer and related substances of higher molecular mass.

Calculate the content of somatropin ($C_{990}H_{1528}N_{262}O_{300}S_7$) from the declared content of $C_{990}H_{1528}N_{262}O_{300}S_7$ in *somatropin CRS*.



STORAGE

In an airtight container, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

01/2008:0950

SOMATROPIN CONCENTRATED SOLUTION

Somatropini solutio concentrata

$C_{990}H_{1528}N_{262}O_{300}S_7$ M_r 22 125

DEFINITION

Solution containing a protein having the structure (191 amino-acid residues) of the major component of growth hormone produced by the human pituitary. It may contain buffer salts and other auxiliary substances.

Content: 91.0 per cent to 105.0 per cent of the amount of somatropin stated on the label.

By convention, for the purpose of labelling somatropin preparations, 1 mg of anhydrous somatropin ($C_{990}H_{1528}N_{262}O_{300}S_7$) is equivalent to 3.0 IU of biological activity.

PRODUCTION

Somatropin concentrated solution is produced by a method based on recombinant DNA (rDNA) technology. During the course of product development, it must be demonstrated that the manufacturing process produces a product having a biological activity of at least 2.5 IU/mg, using a validated bioassay based on growth promotion and approved by the competent authority.

Somatropin concentrated solution complies with the following additional requirements.

Host-cell-derived proteins. The limit is approved by the competent authority.

Host-cell- and vector-derived DNA. The limit is approved by the competent authority.

CHARACTERS

Appearance: clear or slightly turbid, colourless solution.

IDENTIFICATION

A. Capillary electrophoresis (*2.2.47*) as described in the test for charged variants with the following modifications.

Injection: test solution (b); under pressure or vacuum, using the following sequence: sample injection for at least 3 s then CZE buffer injection for 1 s.

Results: in the electropherogram obtained, only 1 principal peak, corresponding to somatropin, is detected: no doubling of this peak is observed.

B. Examine the chromatograms obtained in the test for related proteins.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with the reference solution.

C. Peptide mapping (*2.2.55*).

SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS

Test solution. Dilute the solution to be examined with *0.05 M tris-hydrochloride buffer solution pH 7.5 R* so that it contains 2.0 mg/ml of somatropin and transfer about 1.0 ml to a tube made from a suitable material such as polypropylene. Prepare a 1 mg/ml solution of *trypsin for peptide mapping R* in *0.05 M tris-hydrochloride buffer solution pH 7.5 R* and add 30 µl to the solution of the substance to be examined. Cap the tube and place in a water-bath at 37 °C for 4 h. Remove from the water-bath and stop the reaction immediately, for example by freezing. If analysed immediately using an automatic injector, maintain at 2-8 °C.

Note: If a 2 mg/ml somatropin concentration is not obtainable, a similar digest relationship (micrograms of trypsin per milligram of somatropin) may be used.

Reference solution. Prepare at the same time and in the same manner as for the test solution, but using *somatropin CRS* instead of the substance to be examined.

CHROMATOGRAPHIC SEPARATION. Liquid chromatography (*2.2.29*).

Column:
– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octylsilyl silica gel for chromatography R* (5-10 µm) with a pore size of 30 nm;
– *temperature*: 30 °C.

Mobile phase:
– *mobile phase A*: dilute 1 ml of *trifluoroacetic acid R* to 1000 ml with *water R*;
– *mobile phase B*: to 100 ml of *water R*, add 1 ml of *trifluoroacetic acid R* and dilute to 1000 ml with *acetonitrile for chromatography R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 20	100 → 80	0 → 20
20 - 40	80 → 75	20 → 25
40 - 65	75 → 50	25 → 50
65 - 70	50 → 20	50 → 80
70 - 71	20 → 100	80 → 0
71 - 85	100	0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 100 µl.

System suitability: the chromatograms obtained with the test solution and the reference solution are similar to the chromatogram of somatropin digest supplied with *somatropin CRS*.

Results: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

D. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with the reference solution.

TESTS

Related proteins. Liquid chromatography (*2.2.29*): use the normalisation procedure. *Maintain the solutions at 2-8 °C and use within 24 h. If an automatic injector is used, maintain it at 2-8 °C.*

Test solution. Dilute the solution to be examined in *0.05 M tris-hydrochloride buffer solution pH 7.5 R,* so as to contain 2.0 mg/ml of somatropin. A weaker solution may be prepared, in which case the injection volume is adjusted accordingly.

Reference solution. Prepare a solution of *somatropin CRS* in *0.05 M tris-hydrochloride buffer solution pH 7.5 R,* containing 2.0 mg/ml of somatropin.

Resolution solution. Dissolve the contents of a vial of *somatropin/desamidosomatropin resolution mixture CRS* in *0.05 M tris-hydrochloride buffer solution pH 7.5 R* to obtain a concentration of 2 mg/ml of somatropin.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: a suitable singly end-capped butylsilyl silica gel, with a granulometry of 5 µm and a porosity of 30 nm; a silica saturation column is placed between the pump and the injector valve;
– *temperature*: 45 °C.

Mobile phase: *propanol R, 0.05 M tris-hydrochloride buffer solution pH 7.5 R* (29:71 *V/V*).

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 220 nm.

Preconditioning of the column: rinse with 200-500 ml of a 0.1 per cent *V/V* solution of *trifluoroacetic acid R* in a 50 per cent *V/V* solution of *acetonitrile R*; repeat as necessary, to improve column performance.

Injection: 20 µl.

Relative retention with reference to somatropin (retention time = about 33 min; if necessary adjust the concentration of *propanol R* in the mobile phase): desamidosomatropin = about 0.85.

System suitability: resolution solution:

– *resolution*: minimum 1.0 between the peaks due to desamidosomatropin and somatropin;
– *symmetry factor*: 0.9 to 1.8 for the peak due to somatropin.

Limit:

– *total*: maximum 6.0 per cent.

Dimer and related substances of higher molecular mass. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

Test solution. Dilute the solution to be examined in *0.025 M phosphate buffer solution pH 7.0 R,* so as to contain 1.0 mg/ml of somatropin.

Reference solution. Dissolve the contents of a vial of *somatropin CRS* in *0.025 M phosphate buffer solution pH 7.0 R* and dilute with the same solution to obtain a concentration of 1.0 mg/ml.

Resolution solution. Place 1 vial of *somatropin CRS* in an oven at 50 °C for a period sufficient to generate 1-2 per cent of dimer (typically 12-24 h). Dissolve its contents in *0.025 M phosphate buffer solution pH 7.0 R* and dilute with the same solution to obtain a concentration of 1.0 mg/ml.

Column:

– *size*: *l* = 0.30 m, Ø = 7.8 mm;
– *stationary phase*: *hydrophilic silica gel for chromatography R* of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 5000 to 150 000.

Mobile phase: *2-propanol R, 0.063 M phosphate buffer solution pH 7.0 R* (3:97 *V/V*); filter and degas.

Flow rate: 0.6 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 20 µl.

Relative retention with reference to somatropin monomer (retention time = 12 min to 17 min): related substances of higher molecular mass = about 0.65; somatropin dimer = about 0.9.

System suitability: resolution solution:

– *peak-to-valley ratio*: minimum 2.5, where H_p = height above the baseline of the peak due to the dimer and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer.

Limit:

– *sum of the peaks with retention times less than that of the principal peak*: maximum 4.0 per cent.

Charged variants. Capillary electrophoresis (*2.2.47*).

Test solution (a). Dilute the solution to be examined so as to obtain a concentration of 1 mg/ml of somatropin.

Test solution (b). Mix equal volumes of test solution (a) and the reference solution.

Reference solution. Dissolve the contents of a vial of *somatropin CRS* in *water R* and dilute with the same solvent to obtain a concentration of 1 mg/ml.

Capillary:

– *material*: uncoated fused silica;
– *size*: effective length = at least 70 cm, Ø = 50 µm.

Temperature: 30 °C.

CZE buffer: 13.2 g/l solution of *ammonium phosphate R* adjusted to pH 6.0 with *phosphoric acid R* and filtered.

Detection: spectrophotometer at 200 nm.

Set the autosampler to store the samples at 4 °C during analysis.

Preconditioning of the capillary: rinse with *1 M sodium hydroxide* for 20 min, with *water R* for 10 min and with the CZE buffer for 20 min.

Between-run rinsing: rinse with *0.1 M sodium hydroxide* for 2 min and with the CZE buffer for 6 min.

Note: rinsing times may be adapted according to the length of the capillary and the equipment used.

Injection: test solution (a) and the reference solution; under pressure or vacuum, using the following sequence: sample injection for at least 3 s then CZE buffer injection for 1 s. The injection time and pressure may be adapted in order to meet the system suitability criteria.

Migration: apply a field strength of 217 V/cm (20 kV for capillaries of 92 cm total length) for 80 min, using the CZE buffer as the electrolyte in both buffer reservoirs.

Relative migration with reference to somatropin: deamidated forms = 1.02 to 1.11.

System suitability: reference solution:

– the electropherogram obtained is similar to the electropherogram of somatropin supplied with *somatropin CRS*; 2 peaks (I_1, I_2) eluting prior to the principal peak and at least 2 peaks (I_3, I_4) eluting after the principal peak are clearly visible.

Note: peak I_2 corresponds to the cleaved form and peak I_4 corresponds to the deamidated forms, eluting as a doublet.

Limits:

– *deamidated forms*: maximum 5.0 per cent;
– *any other impurity*: for each impurity, maximum 2.0 per cent;
– *total*: maximum 10.0 per cent.

Bacterial endotoxins (*2.6.14*): less than 5 IU in the volume that contains 1 mg of somatropin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

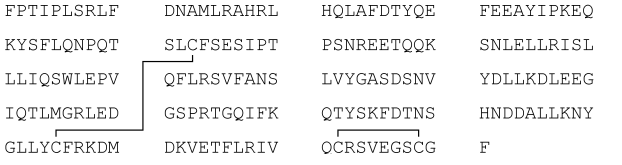
Size-exclusion chromatography (*2.2.30*) as described in the test for dimer and related substances of higher molecular mass.

Calculate the content of somatropin ($C_{990}H_{1528}N_{262}O_{300}S_7$) from the declared content of $C_{990}H_{1528}N_{262}O_{300}S_7$ in *somatropin CRS*.

STORAGE

In an airtight container at a temperature of – 20 °C. Avoid repeated freezing and thawing. If the solution is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING



The label states:

– the content of somatropin in milligrams per millilitre;
– the name and concentration of any auxiliary substance.

01/2008:0952

SOMATROPIN FOR INJECTION

Somatropinum iniectabile

$C_{990}H_{1528}N_{262}O_{300}S_7$ M_r 22 125

DEFINITION

Freeze-dried, sterile preparation of a protein having the structure (191 amino-acid residues) of the major component of growth hormone produced by the human pituitary.

Content: 89.0 per cent to 105.0 per cent of the amount of somatropin stated on the label.

By convention, for the purpose of labelling somatropin preparations, 1 mg of anhydrous somatropin ($C_{990}H_{1528}N_{262}O_{300}S_7$) is equivalent to 3.0 IU of biological activity.

Somatropin for injection complies with the requirements of the monograph *Parenteral preparations (0520)*.

PRODUCTION

Somatropin for injection is prepared either from *Somatropin (0951)* or from *Somatropin concentrated solution (0950)*, or by a method based on recombinant DNA (rDNA) technology in which the injectable preparation is produced without the isolation of an intermediate solid or liquid bulk. In the latter case, during the course of product development, it must be demonstrated that the manufacturing process produces a product having a biological activity of not less than 2.5 IU/mg, using a validated bioassay based on growth promotion and approved by the competent authority. The purified preparation, to which buffers and stabilisers may be added, is filtered through a bacteria-retentive filter, aseptically distributed in sterile containers of glass type I (*3.2.1*) and freeze-dried. The containers are immediately sealed so as to exclude microbial contamination and moisture.

Somatropin for injection complies with the following additional requirements.

Host-cell-derived proteins. The limit is approved by the competent authority.

Host-cell- and vector-derived DNA. The limit is approved by the competent authority.

Where somatropin for injection is prepared from Somatropin (0951) or from Somatropin concentrated solution (0950), compliance with the requirements for host-cell-derived proteins, host-cell- and vector-derived DNA, identification test A, identification test C and charged variants need not be reconfirmed by the manufacturer during subsequent production of somatropin for injection.

CHARACTERS

Appearance: white or almost white powder.

IDENTIFICATION

A. Capillary electrophoresis (*2.2.47*) as described in the test for charged variants with the following modifications.

Injection: test solution (b); under pressure or vacuum, using the following sequence: sample injection for at least 3 s then CZE buffer injection for 1 s.

Results: in the electropherogram obtained, only 1 principal peak, corresponding to somatropin, is detected: no doubling of this peak is observed.

B. Examine the chromatograms obtained in the test for related proteins.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with the reference solution.

C. Peptide mapping (*2.2.55*).

SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS

Test solution. Prepare a solution of the substance to be examined in *0.05 M tris-hydrochloride buffer solution pH 7.5 R* to obtain a solution containing 2.0 mg/ml of somatropin and transfer about 1.0 ml to a tube made from a suitable material such as polypropylene. Prepare a 1 mg/ml solution of *trypsin for peptide mapping R* in *0.05 M tris-hydrochloride buffer solution pH 7.5 R*

and add 30 µl to the solution of the substance to be examined. Cap the tube and place in a water-bath at 37 °C for 4 h. Remove from the water-bath and stop the reaction immediately, for example by freezing. If analysed immediately using an automatic injector, maintain at 2-8 °C.

Reference solution. Prepare at the same time and in the same manner as for the test solution, but using *somatropin CRS* instead of the substance to be examined.

CHROMATOGRAPHIC SEPARATION. Liquid chromatography (*2.2.29*).

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octylsilyl silica gel for chromatography R* (5-10 µm) with a pore size of 30 nm;
– *temperature*: 30 °C.

Mobile phase:

– *mobile phase A*: dilute 1 ml of *trifluoroacetic acid R* to 1000 ml with *water R*;
– *mobile phase B*: to 100 ml of *water R* add 1 ml of *trifluoroacetic acid R* and dilute to 1000 ml with *acetonitrile for chromatography R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 20	100 → 80	0 → 20
20 - 40	80 → 75	20 → 25
40 - 65	75 → 50	25 → 50
65 - 70	50 → 20	50 → 80
70 - 71	20 → 100	80 → 0
71 - 85	100	0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 100 µl.

System suitability: the chromatograms obtained with the test solution and the reference solution are similar to the chromatogram of somatropin digest supplied with *somatropin CRS*.

Results: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

D. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with the reference solution.

TESTS

Related proteins. Liquid chromatography (*2.2.29*): use the normalisation procedure. *Maintain the solutions at 2-8 °C and use within 24 h. If an automatic injector is used, maintain at 2-8 °C.*

Test solution. Prepare a solution of the substance to be examined in *0.05 M tris-hydrochloride buffer solution pH 7.5 R*, containing 2.0 mg/ml of somatropin.

Reference solution. Prepare a solution of *somatropin CRS* in *0.05 M tris-hydrochloride buffer solution pH 7.5 R*, containing 2.0 mg/ml of somatropin.

Resolution solution. Dissolve the contents of a vial of *somatropin/desamidosomatropin resolution mixture CRS* in *0.05 M tris-hydrochloride buffer solution pH 7.5 R* to obtain a concentration of 2 mg/ml of somatropin.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: a suitable singly end-capped butylsilyl silica gel, with a granulometry of 5 µm and a porosity of 30 nm; a silica saturation column is placed between the pump and the injector valve;
– *temperature*: 45 °C.

Mobile phase: *propanol R, 0.05 M tris-hydrochloride buffer solution pH 7.5 R* (29:71 *V/V*).

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 220 nm.

Preconditioning of the column: rinse with 200-500 ml of a 0.1 per cent *V/V* solution of *trifluoroacetic acid R* in a 50 per cent *V/V* solution of *acetonitrile R*; repeat as necessary, to improve column performance.

Injection: 20 µl.

Relative retention with reference to somatropin (retention time = about 33 min; if necessary adjust the concentration of *propanol R* in the mobile phase): desamidosomatropin = about 0.85.

System suitability: resolution solution:

– *resolution*: minimum 1.0 between the peaks due to desamidosomatropin and somatropin;
– *symmetry factor*: 0.9 to 1.8 for the peak due to somatropin.

Limit:

– *total*: maximum 13.0 per cent.

Dimer and related substances of higher molecular mass. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

Test solution. Prepare a solution of the substance to be examined in *0.025 M phosphate buffer solution pH 7.0 R*, containing 1.0 mg/ml of somatropin.

Reference solution. Dissolve the contents of a vial of *somatropin CRS* in *0.025 M phosphate buffer solution pH 7.0 R* and dilute with the same solution to obtain a concentration of 1.0 mg/ml.

Resolution solution. Place 1 vial of *somatropin CRS* in an oven at 50 °C for a period sufficient to generate 1-2 per cent of dimer (typically 12-24 h). Dissolve its contents in *0.025 M phosphate buffer solution pH 7.0 R* and dilute with the same solution to obtain a concentration of 1.0 mg/ml.

Column:

– *size*: *l* = 0.30 m, Ø = 7.8 mm;
– *stationary phase*: *hydrophilic silica gel for chromatography R* of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 5000 to 150 000.

Mobile phase: *2-propanol R, 0.063 M phosphate buffer solution pH 7.0 R* (3:97 *V/V*); filter and degas.

Flow rate: 0.6 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 20 µl.

Relative retention with reference to somatropin monomer (retention time = 12 min to 17 min): related substances of higher molecular mass = about 0.65; somatropin dimer = about 0.9.

System suitability: resolution solution:

– *peak-to-valley ratio*: minimum 2.5, where H_p = height above the baseline of the peak due to the dimer and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer.

Limit:

– *sum of the peaks with retention times less than that of the principal peak*: maximum 6.0 per cent.

Charged variants. Capillary electrophoresis (*2.2.47*).

Test solution (a). Prepare a solution of the substance to be examined containing 1 mg/ml of somatropin.

Test solution (b). Mix equal volumes of test solution (a) and the reference solution.

Reference solution. Dissolve the contents of a vial of *somatropin CRS* in *water R* and dilute with the same solvent to obtain a concentration of 1 mg/ml.

Capillary:

– *material*: uncoated fused silica;

– *size*: effective length = at least 70 cm, Ø = 50 µm.

Temperature: 30 °C.

CZE buffer: 13.2 g/l solution of *ammonium phosphate R* adjusted to pH 6.0 with *phosphoric acid R* and filtered.

Detection: spectrophotometer at 200 nm.

Set the autosampler to store the samples at 4 °C during analysis.

Preconditioning of the capillary: rinse with *1 M sodium hydroxide* for 20 min, with *water R* for 10 min and with the CZE buffer for 20 min.

Between-run rinsing: rinse with *0.1 M sodium hydroxide* for 2 min and with the CZE buffer for 6 min.

Note: rinsing times may be adapted according to the length of the capillary and the equipment used.

Injection: test solution (a) and the reference solution; under pressure or vacuum, using the following sequence: sample injection for at least 3 s then CZE buffer injection for 1 s.

The injection time and pressure may be adapted in order to meet the system suitability criteria.

Migration: apply a field strength of 217 V/cm (20 kV for capillaries of 92 cm total length) for 80 min, using CZE buffer as the electrolyte in both buffer reservoirs.

Relative migration with reference to somatropin: deamidated forms = 1.02 to 1.11.

System suitability: reference solution:

– the electropherogram obtained is similar to the electropherogram of somatropin supplied with *somatropin CRS*; 2 peaks (I_1, I_2) eluting prior to the principal peak and at least 2 peaks (I_3, I_4) eluting after the principal peak are clearly visible.

Note: peak I_2 corresponds to the cleaved form and peak I_4 corresponds to the deamidated forms, eluting as a doublet.

Limits:

– *deamidated forms*: maximum 6.5 per cent;

– *any other impurity*: for each impurity, maximum 2.0 per cent;

– *total*: maximum 11.5 per cent.

Water (*2.5.32*): maximum 3.0 per cent, unless otherwise justified and authorised.

Bacterial endotoxins (*2.6.14*): less than 5 IU/mg.

ASSAY

Size-exclusion chromatography (*2.2.30*) as described in the test for dimer and related substances of higher molecular mass.

Calculate the content of somatropin ($C_{990}H_{1528}N_{262}O_{300}S_7$) from the declared content of $C_{990}H_{1528}N_{262}O_{300}S_7$ in *somatropin CRS*.

STORAGE

In a sterile, airtight, tamper-proof container, at a temperature of 2 °C to 8 °C.

LABELLING

The label states:

– the content of somatropin in the container, in milligrams;

– the composition and volume of the liquid to be added for reconstitution;

– the time within which the reconstituted solution shall be used and the storage conditions during this period;

– the name and quantity of any added substance;

– the storage temperature;

– that the preparation shall not be shaken during reconstitution.

01/2008:0592

SORBIC ACID

Acidum sorbicum

$C_6H_8O_2$ M_r 112.1
[110-44-1]

DEFINITION

(*E,E*)-Hexa-2,4-dienoic acid.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: slightly soluble in water, freely soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. Melting point (*2.2.14*): 132 °C to 136 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50.0 mg in *water R* and dilute to 250.0 ml with the same solvent. Dilute 2.0 ml of this solution to 200.0 ml with *0.1 M hydrochloric acid.*

Spectral range: 230-350 nm.

Absorption maximum: at 264 nm.

Specific absorbance at the absorption maximum: 2150 to 2550.

C. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *sorbic acid CRS.*

D. Dissolve 0.2 g in 2 ml of *ethanol (96 per cent) R* and add 0.2 ml of *bromine water R*. The solution is decolorised.

TESTS

Solution S. Dissolve 1.25 g in *ethanol (96 per cent) R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Aldehydes: maximum 0.15 per cent, calculated as C_2H_4O.

Dissolve 1.0 g in a mixture of 30 ml of *water R* and 50 ml of *2-propanol R*, adjust to pH 4 with *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* and dilute to 100 ml with *water R*. To 10 ml of this solution add 1 ml of *decolorised fuchsin solution R* and allow to stand for 30 min. Any colour in the solution is not more intense than that in a standard prepared at the same time by adding 1 ml of *decolorised fuchsin solution R* to a mixture of 1.5 ml of *acetaldehyde standard solution (100 ppm C_2H_4O) R*, 4 ml of *2-propanol R* and 4.5 ml of *water R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with test B. Prepare the reference solution using 5 ml of *lead standard solution (1 ppm Pb) R* and 5 ml of *ethanol (96 per cent) R*.

Water (*2.5.12*): maximum 1.0 per cent, determined on 2.000 g.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.1000 g in 20 ml of *ethanol (96 per cent) R*. Using 0.2 ml of *phenolphthalein solution R* as indicator, titrate with *0.1 M sodium hydroxide* until a pink colour is obtained.

1 ml of *0.1 M sodium hydroxide* is equivalent to 11.21 mg of $C_6H_8O_2$.

STORAGE

Protected from light.

SORBITAN LAURATE

Sorbitani lauras

DEFINITION

Mixture usually obtained by partial esterification of sorbitol and its mono- and di-anhydrides with lauric (dodecanoic) acid.

CHARACTERS

Appearance: brownish-yellow, viscous liquid.

Solubility: practically insoluble, but dispersible in water, miscible with alcohol.

Relative density: about 0.98.

IDENTIFICATION

A. It complies with the test for hydroxyl value (see Tests).

B. It complies with the test for iodine value (see Tests).

C. It complies with the test for composition of fatty acids (see Tests).

TESTS

Acid value (*2.5.1*): maximum 7.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*): 330 to 358.

Iodine value (*2.5.4*): maximum 10.

Peroxide value (*2.5.5*): maximum 5.0.

Saponification value (*2.5.6*): 158 to 170.

Carry out the saponification for 1 h.

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*).

Prepare reference solution (a) as indicated in tables 2.4.22.-1 and 2.4.22.-2.

Composition of the fatty acid fraction of the substance:

– *caproic acid*: maximum 1.0 per cent,
– *caprylic acid*: maximum 10.0 per cent,
– *capric acid*: maximum 10.0 per cent,
– *lauric acid*: 40.0 per cent to 60.0 per cent,
– *myristic acid*: 14.0 per cent to 25.0 per cent,
– *palmitic acid*: 7.0 per cent to 15.0 per cent,
– *stearic acid*: maximum 7.0 per cent,
– *oleic acid*: maximum 11.0 per cent,
– *linoleic acid*: maximum 3.0 per cent.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 1.5 per cent, determined on 1.00 g.

Total ash (*2.4.16*): maximum 0.5 per cent.

STORAGE

Protected from light.

01/2008:1041

SORBITAN OLEATE

Sorbitani oleas

DEFINITION

Mixture usually obtained by esterification of 1 mole of sorbitol and its mono-and di-anhydrides per mole of oleic (*cis*-9-octadecenoic) acid. A suitable antioxidant may be added.

CHARACTERS

Appearance: brownish-yellow, viscous liquid.

Solubility: practically insoluble but dispersible in water, soluble in fatty oils producing a hazy solution, miscible with alcohol.

Relative density: about 0.99.

IDENTIFICATION

A. It complies with the test for hydroxyl value (see Tests).

B. It complies with the test for iodine value (see Tests).

C. It complies with the test for composition of fatty acids (see Tests).

Margaric acid: maximum 0.2 per cent for oleic acid of vegetable origin and maximum 4.0 per cent for oleic acid of animal origin.

TESTS

Acid value (*2.5.1*): maximum 8.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*): 190 to 210.

Iodine value (*2.5.4*): 62 to 76.

Peroxide value (*2.5.5*): maximum 10.0.

Saponification value (*2.5.6*): 145 to 160.

Carry out the saponification for 1 h.

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*).

Composition of the fatty acid fraction of the substance:
- *myristic acid*: maximum 5.0 per cent,
- *palmitic acid*: maximum 16.0 per cent,
- *palmitoleic acid*: maximum 8.0 per cent,
- *stearic acid*: maximum 6.0 per cent,
- *oleic acid*: 65.0 per cent to 88.0 per cent,
- *linoleic acid*: maximum 18.0 per cent,
- *linolenic acid*: maximum 4.0 per cent,
- *fatty acids with chain length greater than* C_{18}: maximum 4.0 per cent.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 1.5 per cent, determined on 1.000 g.

Total ash (*2.4.16*): maximum 0.5 per cent, determined on 1.5 g.

STORAGE

Protected from light.

LABELLING

The label states the origin of the oleic acid used (animal or vegetable).

01/2008:1042

SORBITAN PALMITATE

Sorbitani palmitas

DEFINITION

Mixture usually obtained by partial esterification of sorbitol and its mono- and di-anhydrides with palmitic (hexadecanoic) acid.

CHARACTERS

Appearance: yellow or yellowish powder, waxy flakes or hard masses.

Solubility: practically insoluble in water, soluble in fatty oils, slightly soluble in alcohol.

IDENTIFICATION

A. Melting point (*2.2.15*): 44 °C to 51 °C.

   Introduce the melted substance into the glass capillary tubes and allow to stand at a temperature below 10 °C for 24 h.

B. It complies with the test for hydroxyl value (see Tests).

C. It complies with the test for composition of fatty acids (see Tests).

TESTS

Acid value (*2.5.1*): maximum 8.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*): 270 to 305.

Peroxide value (*2.5.5*): maximum 5.0.

Saponification value (*2.5.6*): 140 to 155.

Carry out the saponification for 1 h.

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*).

Composition of the fatty acid fraction of the substance:
- *palmitic acid*: minimum 92.0 per cent,
- *stearic acid*: maximum 6.0 per cent.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 1.5 per cent, determined on 1.00 g.

Total ash (*2.4.16*): maximum 0.5 per cent.

STORAGE

Protected from light.

01/2008:1916

SORBITAN SESQUIOLEATE

Sorbitani sesquioleas

DEFINITION

Mixture usually obtained by esterification of 2 moles of sorbitol and its mono- and di-anhydrides per 3 moles of oleic (*cis*-9-octadecenoic) acid. A suitable antioxidant may be added.

CHARACTERS

Appearance: pale yellow or slightly brownish-yellow paste, which becomes a viscous, oily, brownish-yellow liquid at about 25 °C.

Solubility: dispersible in water, soluble in fatty oils, slightly soluble in ethanol.

Relative density: about 0.99.

IDENTIFICATION

A. It complies with the test for hydroxyl value (see Tests).

B. It complies with the test for iodine value (see Tests).

C. It complies with the test for composition of fatty acids (see Tests).

   Margaric acid: maximum 0.2 per cent for oleic acid of vegetable origin and maximum 4.0 per cent for oleic acid of animal origin.

TESTS

Acid value (*2.5.1*): maximum 16.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*): 180 to 215.

Iodine value (*2.5.4*): 70 to 95.

Peroxide value (*2.5.5*): maximum 10.0.

Saponification value (*2.5.6*): 145 to 166.

Carry out the saponification for 1 h.

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*).

Composition of the fatty acid fraction of the substance:
- *myristic acid*: maximum 5.0 per cent,
- *palmitic acid*: maximum 16.0 per cent,
- *palmitoleic acid*: maximum 8.0 per cent,
- *stearic acid*: maximum 6.0 per cent,
- *oleic acid*: 65.0 per cent to 88.0 per cent,
- *linoleic acid*: maximum 18.0 per cent,
- *linolenic acid*: maximum 4.0 per cent,

– *fatty acids with chain length greater than C_{18}*: maximum 4.0 per cent.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 1.5 per cent, determined on 1.000 g.

Total ash (*2.4.16*): maximum 0.5 per cent, determined on 1.5 g.

STORAGE

Protected from light.

LABELLING

The label states the origin of the oleic acid used (animal or vegetable).

01/2008:1043

SORBITAN STEARATE

Sorbitani stearas

DEFINITION

Mixture usually obtained by partial esterification of sorbitol and its mono- and di-anhydrides with *Stearic acid 50 (1474)* or *Stearic acid 70 (1474)*.

CHARACTERS

Appearance: pale yellow, waxy solid.

Solubility: practically insoluble, but dispersible in water, slightly soluble in alcohol.

IDENTIFICATION

A. Melting point (*2.2.15*): 50 °C to 60 °C.
   Introduce the melted substance into the capillary tubes and allow to stand at a temperature below 10 °C for 24 h.
B. It complies with the test for hydroxyl value (see Tests).
C. It complies with the test for composition of fatty acids (see Tests).

TESTS

Acid value (*2.5.1*): maximum 10.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*): 235 to 260.

Peroxide value (*2.5.5*): maximum 5.0.

Saponification value (*2.5.6*): 147 to 157.

Carry out the saponification for 1 h.

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*).

Composition of the fatty acid fraction of the subtance:

	Type of fatty acid used	Composition of fatty acids
Sorbitan stearate (type I)	Stearic acid 50	*Stearic acid*: 40.0 per cent to 60.0 per cent, *Sum of the contents of palmitic and stearic acids*: minimum 90.0 per cent.
Sorbitan stearate (type II)	Stearic acid 70	*Stearic acid*: 60.0 per cent to 80.0 per cent, *Sum of the contents of palmitic and stearic acids*: minimum 90.0 per cent.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 1.5 per cent, determined on 1.00 g.

Total ash (*2.4.16*): maximum 0.5 per cent.

STORAGE

Protected from light.

LABELLING

The label states the type of sorbitan stearate.

01/2008:1044

SORBITAN TRIOLEATE

Sorbitani trioleas

DEFINITION

Mixture usually obtained by esterification of 1 mole of sorbitol and its mono-anhydride per 3 moles of oleic (*cis*-9-octadecenoic) acid. A suitable antioxidant may be added.

CHARACTERS

Appearance: pale yellow, light yellowish or brown solid, which becomes a viscous, oily, brownish-yellow liquid at about 25 °C.

Solubility: practically insoluble but dispersible in water, soluble in fatty oils, slightly soluble in alcohol.

Relative density: about 0.98.

IDENTIFICATION

A. It complies with the test for hydroxyl value (see Tests).
B. It complies with the test for iodine value (see Tests).
C. It complies with the test for composition of fatty acids (see Tests).
   Margaric acid: maximum 0.2 per cent for oleic acid of vegetable origin and maximum 4.0 per cent for oleic acid of animal origin.

TESTS

Acid value (*2.5.1*): maximum 16.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*): 55 to 75.

Iodine value (*2.5.4*): 76 to 90.

Peroxide value (*2.5.5*): maximum 10.0.

Saponification value (*2.5.6*): 170 to 190.

Carry out the saponification for 1 h.

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*).

Composition of the fatty acid fraction of the substance:

– *myristic acid*: maximum 5.0 per cent,
– *palmitic acid*: maximum 16.0 per cent,
– *palmitoleic acid*: maximum 8.0 per cent,
– *stearic acid*: maximum 6.0 per cent,
– *oleic acid*: 65.0 per cent to 88.0 per cent,
– *linoleic acid*: maximum 18.0 per cent,
– *linolenic acid*: maximum 4.0 per cent,
– *fatty acids with chain length greater than C_{18}*: maximum 4.0 per cent.

Heavy metals (*2.4.8*): maximum 10 ppm.

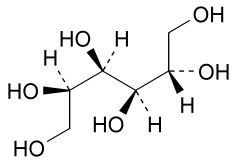
2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 1.5 per cent, determined on 1.000 g.

Total ash (*2.4.16*): maximum 0.5 per cent, determined on 1.5 g.

STORAGE

Protected from light.



LABELLING

The label states the origin of the oleic acid used (animal or vegetable).

01/2008:0435

SORBITOL

Sorbitolum

$C_6H_{14}O_6$ M_r 182.2

DEFINITION

D-Glucitol (D-sorbitol).

Content: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very soluble in water, practically insoluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

B. Dissolve 0.5 g with heating in a mixture of 0.5 ml of *pyridine R* and 5 ml of *acetic anhydride R*. After 10 min, pour the solution into 25 ml of *water R* and allow to stand in iced water for 2 h. The precipitate, recrystallised from a small volume of *ethanol (96 per cent) R* and dried *in vacuo*, melts (*2.2.14*) at 98 °C to 104 °C.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *sorbitol CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 25 mg of *mannitol CRS* and 25 mg of *sorbitol CRS* in *water R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: *water R, ethyl acetate R, propanol R* (10:20:70 *V/V/V*).

Application: 2 µl.

Development: over a path of 17 cm.

Drying: in air.

Detection: spray with *4-aminobenzoic acid solution R*; dry in a current of cold air until the acetone is removed; heat at 100 °C for 15 min; allow to cool and spray with a 2 g/l solution of *sodium periodate R*; dry in a current of cold air; heat at 100 °C for 15 min.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Specific optical rotation (*2.2.7*): + 4.0 to + 7.0 (anhydrous substance).

Dissolve 5.00 g of the substance to be examined and 6.4 g of *disodium tetraborate R* in 40 ml of *water R*. Allow to stand for 1 h, shaking occasionally, and dilute to 50.0 ml with *water R*. Filter if necessary.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 5 g in *water R* and dilute to 50 ml with the same solvent.

Conductivity (*2.2.38*): maximum 20 µS·cm^{-1}.

Dissolve 20.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent. Measure the conductivity of the solution while gently stirring with a magnetic stirrer.

Reducing sugars: maximum 0.2 per cent, expressed as glucose equivalent.

Dissolve 5.0 g in 6 ml of *water R* with the aid of gentle heat. Cool and add 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R* and, when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Related products. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 5.0 g of the substance to be examined in 20 ml of *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 0.50 g of *sorbitol CRS* in 2 ml of *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with *water R*.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 100.0 ml with *water R*.

Reference solution (d). Dissolve 0.5 g of *sorbitol R* and 0.5 g of *mannitol R* (impurity A) in 5 ml of *water R* and dilute to 10.0 ml with the same solvent.

Column:

– *size*: *l* = 0.3 m, Ø = 7.8 mm;

– *stationary phase*: *strong cation exchange resin (calcium form) R* (9 µm);

– *temperature*: 85 ± 1 °C.

Mobile phase: degassed *water R*.

Flow rate: 0.5 ml/min.

Detection: refractometer maintained at a constant temperature.

Injection: 20 µl of the test solution and reference solutions (b), (c) and (d).

Run time: 3 times the retention time of sorbitol.

Relative retention with reference to sorbitol (retention time = about 27 min): impurity C = about 0.6; impurity A = about 0.8; impurity B = about 1.1.

System suitability: reference solution (d):

– *resolution*: minimum 2 between the peaks due to impurity A and sorbitol.

Limits:

– *any impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent);
– *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent);
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Lead (*2.4.10*): maximum 0.5 ppm.

Nickel (*2.4.15*): maximum 1 ppm.

Dissolve the substance to be examined in 150.0 ml of the prescribed mixture of solvents.

Water (*2.5.12*): maximum 1.5 per cent, determined on 1.00 g.

Microbial contamination. If intended for use in the manufacture of parenteral dosage forms, the total viable aerobic count (*2.6.12*) is not more than 10^2 bacteria and 10^2 fungi per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (*2.6.13*).

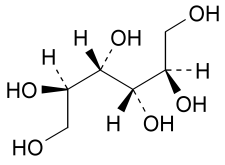
Bacterial endotoxins (*2.6.14*): less than 4 IU/g for parenteral dosage forms having a concentration of less than 100 g/l of sorbitol, and less than 2.5 IU/g for parenteral dosage forms having a concentration of 100 g/l or more of sorbitol, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related products with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of D-sorbitol from the declared content of *sorbitol CRS*.



LABELLING

The label states:

– where applicable, the maximum concentration of bacterial endotoxins;
– where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

IMPURITIES

A. mannitol,

B. iditol,

C. maltitol.

01/2008:0436

SORBITOL, LIQUID (CRYSTALLISING)

Sorbitolum liquidum cristallisabile

DEFINITION

Aqueous solution of a hydrogenated, partly hydrolysed starch.

Content:

– anhydrous substance: 68.0 per cent *m/m* to 72.0 per cent *m/m*,
– D-glucitol (D-sorbitol, $C_6H_{14}O_6$): 92.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: clear, colourless, syrupy liquid, miscible with water.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

B. To 7.0 g add 40 ml of *water R* and 6.4 g of *disodium tetraborate R*, allow to stand for 1 h, shaking occasionally, and dilute to 50.0 ml with *water R*. Filter if necessary. The angle of rotation (*2.2.7*) is 0° to + 1.5°.

C. It is a clear, syrupy liquid at a temperature of 25 °C.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dilute 7.0 g to 50 ml with *water R*.

Conductivity (*2.2.38*): maximum 10 $\mu S \cdot cm^{-1}$ measured on the undiluted liquid sorbitol (crystallising) while gently stirring with a magnetic stirrer.

Reducing sugars: maximum 0.2 per cent calculated as glucose equivalent.

To 5.0 g add 6 ml of *water R*, 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R* and, when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Lead (*2.4.10*): maximum 0.5 ppm.

Nickel (*2.4.15*): maximum 1 ppm.

Water (*2.5.12*): 28.0 per cent to 32.0 per cent *m/m*, determined on 0.1 g.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Mix 1.00 g of the substance to be examined with 20 ml of *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 65.0 mg of *sorbitol CRS* in 2 ml of *water R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dissolve 65 mg of *mannitol R* and 65 mg of *sorbitol R* in 2 ml of *water R* and dilute to 5.0 ml with the same solvent.

Column:

– *size*: *l* = 0.3 m, Ø = 7.8 mm,
– *stationary phase*: *strong cation exchange resin (calcium form) R* (9 µm),
– *temperature*: 85 ± 1 °C.

Mobile phase: degassed *water R*.

Flow rate: 0.5 ml/min.

Detection: refractometer maintained at a constant temperature.

Injection: 20 µl.

Run time: 3 times the retention time of sorbitol.

Relative retention with reference to sorbitol (retention time = about 27 min): mannitol = about 0.8.

System suitability: reference solution (b):

– *resolution*: minimum 2 between the peaks due to mannitol and to sorbitol.

Calculate the percentage content of D-sorbitol from the areas of the peaks and the declared content of *sorbitol CRS*.

01/2008:0437

SORBITOL, LIQUID (NON-CRYSTALLISING)

Sorbitolum liquidum non cristallisabile

DEFINITION

Aqueous solution of a hydrogenated, partly hydrolysed starch.

Content:

– anhydrous substance: 68.0 per cent *m/m* to 72.0 per cent *m/m*,
– D-glucitol (D-sorbitol, $C_6H_{14}O_6$): 72.0 per cent to 92.0 per cent (anhydrous substance).

CHARACTERS

Appearance: clear, colourless, syrupy liquid, miscible with water.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

B. To 7.0 g add 40 ml of *water R* and 6.4 g of *disodium tetraborate R*. Allow to stand for 1 h, shaking occasionally, and dilute to 50.0 ml with *water R*. Filter if necessary. The angle of rotation (*2.2.7*) is + 1.5° to + 3.5°.

C. It is a clear, syrupy liquid at 25 °C.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dilute 7.0 g to 50 ml with *water R*.

Conductivity (*2.2.38*): maximum 10 µS·cm^{-1} measured on the undiluted liquid sorbitol (non crystallising) while gently stirring with a magnetic stirrer.

Reducing sugars: maximum 0.2 per cent calculated as glucose equivalent.

To 5.0 g add 6 ml of *water R*, 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R* and, when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Reducing sugars after hydrolysis: maximum 9.3 per cent calculated as glucose equivalent.

To 6.0 g add 35 ml of *water R*, 40 ml of *1 M hydrochloric acid* and a few glass beads. Boil under a reflux condenser for 4 h. Cool and neutralise with *dilute sodium hydroxide solution R* using 0.2 ml of *bromothymol blue solution R1* as indicator. Cool and dilute to 100.0 ml with *water R*. To 3.0 ml of the solution add 5 ml of *water R*, 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R*. When the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 8.0 ml of *0.05 M sodium thiosulphate* is required.

Lead (*2.4.10*): maximum 0.5 ppm.

Nickel (*2.4.15*): maximum 1 ppm.

Water (*2.5.12*): 28.0 per cent to 32.0 per cent *m/m*, determined on 0.1 g.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Mix 1.00 g of the substance to be examined with 20 ml of *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 55.0 mg of *sorbitol CRS* in 2 ml of *water R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dissolve 55 mg of *mannitol R* and 55 mg of *sorbitol R* in 2 ml of *water R* and dilute to 5.0 ml with the same solvent.

Column:

– *size*: *l* = 0.3 m, Ø = 7.8 mm,
– *stationary phase*: *strong cation exchange resin (calcium form) R* (9 µm),
– *temperature*: 85 ± 1 °C.

Mobile phase: degassed *water R*.

Flow rate: 0.5 ml/min.

Detection: refractometer maintained at a constant temperature.

Injection: 20 µl.

Run time: 3 times the retention time of sorbitol.

Relative retention with reference to sorbitol (retention time = about 27 min): mannitol = about 0.8.

System suitability: reference solution (b):

– *resolution*: minimum 2 between the peaks due to mannitol and to sorbitol.

Calculate the percentage content of D-sorbitol from the areas of the peaks and the declared content of *sorbitol CRS*.

01/2008:2048

SORBITOL, LIQUID, PARTIALLY DEHYDRATED

Sorbitolum liquidum partim deshydricum

DEFINITION

Liquid sorbitol, partially dehydrated is obtained by acid-catalysed partial internal dehydration of liquid sorbitol. It contains not less than 68.0 per cent *m/m* and not more than 85.0 per cent *m/m* of anhydrous substances, composed of a mixture of mainly D-sorbitol and 1,4-sorbitan with mannitol, hydrogenated oligo- and disaccharides, and sorbitans.

Content (nominal value):

– 1,4-sorbitan ($C_6H_{12}O_5$): minimum 15.0 per cent (anhydrous substance),

– D-sorbitol ($C_6H_{14}O_6$): minimum 25.0 per cent (anhydrous substance).

The contents of 1,4-sorbitan and D-sorbitol are within 95.0 per cent to 105.0 per cent of the nominal values.

CHARACTERS

Appearance: clear, colourless, syrupy liquid.

Solubility: miscible with water, practically insoluble in mineral oils and vegetable oils.

IDENTIFICATION

Examine the chromatograms obtained in the assay.

Results: the 2 principal peaks in the chromatogram obtained with the test solution are similar in retention time and size to the peaks in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dilute the substance to be examined with *carbon dioxide-free water R* prepared from *distilled water R* to obtain a solution containing 50.0 per cent *m/m* of anhydrous substance.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Conductivity (*2.2.38*): maximum 20 $\mu S \cdot cm^{-1}$.

Measure the conductivity of solution S, while gently stirring with a magnetic stirrer.

Reducing sugars: maximum 0.3 per cent, calculated as glucose (anhydrous substance).

To an amount of the substance to be examined equivalent to 3.3 g of anhydrous substance, add 3 ml of *water R*, 20.0 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min. Maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25 ml of a mixture of 6 ml of *hydrochloric acid R* and 94 ml of *water R*. When the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 2 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Nickel (*2.4.15*): maximum 1 ppm (anhydrous substance).

Water (*2.5.12*): 15.0 per cent to 32.0 per cent, determined on 0.10 g.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 micro-organisms per gram and not more than 10^2 fungi per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (*2.6.13*).

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.400 g of the substance to be examined in *water R* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dissolve 50.0 mg of *sorbitol CRS* and 20.0 mg of *1,4-sorbitan CRS* in *water R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dissolve 0.100 g of *mannitol R* and 0.100 g of *sorbitol R* in *water R* and dilute to 10.0 ml with the same solvent.

Column:

– *size*: *l* = 0.3 m, Ø = 7.8 mm,

– *stationary phase*: *strong cation exchange resin (calcium form) R* (9 µm),

– *temperature*: 80 ± 5 °C.

Mobile phase: degassed *water R*.

Flow rate: 0.5 ml/min.

Detection: refractometer maintained at a constant temperature of about 30-35 °C.

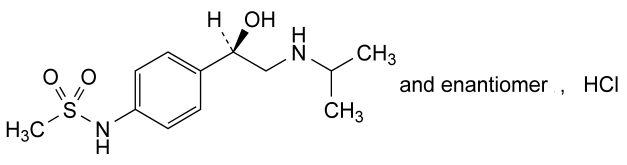
Injection: 40 µl.

Relative retention with reference to D-sorbitol (retention time = about 25 min): 1,4-sorbitan = about 0.5; mannitol = about 0.8.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to mannitol and D-sorbitol.

Calculate the percentage contents of 1,4-sorbitan and D-sorbitol using the chromatogram obtained with reference solution (a) and the declared contents of *1,4-sorbitan CRS* and of *sorbitol CRS*.



LABELLING

The label states the content of D-sorbitol and the content of 1,4-sorbitan (= nominal values).

corrected 6.0

SOTALOL HYDROCHLORIDE

Sotaloli hydrochloridum

$C_{12}H_{21}ClN_2O_3S$ M_r 308.8
[959-24-0]

DEFINITION

N-[4-[(1*RS*)-1-hydroxy-2-[(1-methylethyl)amino]ethyl]phenyl]methanesulphonamide hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *sotalol hydrochloride CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension III (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

pH (*2.2.3*): 4.0 to 5.0.

Dilute 5.0 ml of solution S to 10.0 ml with *carbon dioxide-free water R*.

Optical rotation (*2.2.7*): – 0.10° to + 0.10°.

Dilute 25.0 ml of solution S to 50.0 ml with *water R*.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 3.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 8.0 mg of *sotalol impurity B CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 1.5 ml of reference solution (b) to 100 ml with the mobile phase. To 1 ml of this solution add 1 ml of reference solution (a).

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dissolve 2 g of *sodium octanesulphonate R* in 790 ml of *water R*. Adjust to pH 3.0 with *phosphoric acid R* and add 210 ml of *acetonitrile R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 228 nm.

Injection: 10 µl; inject the test solution and reference solutions (a), (c) and (d).

Run time: 2.5 times the retention time of sotalol.

System suitability: reference solution (d):

– *resolution*: minimum 4.0 between the peaks due to sotalol and to impurity B.

Limits:

– *impurity B*: not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
– *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), and not more than 1 such peak has an area greater than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
– *total of other impurities*: not more than 1.65 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
– *disregard limit*: 0.17 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Palladium: maximum 0.5 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 1.00 g in a mixture of 0.25 volumes of *nitric acid R*, 0.75 volumes of *hydrochloric acid R* and 99.0 volumes of *water R* and dilute to 20.0 ml with the same mixture of solvents.

Reference solutions. Use solutions containing 0.02 µg, 0.03 µg and 0.05 µg of palladium per millilitre, freshly prepared by dilution of *palladium standard solution (0.5 ppm Pd) R* with a mixture of 0.25 volumes of *nitric acid R*, 0.75 volumes of *hydrochloric acid R* and 99.0 volumes of *water R*.

Source: palladium hollow-cathode lamp.

Wavelength: 247.6 nm.

Use a graphite tube.

Heavy metals (*2.4.8*): maximum 20 ppm.

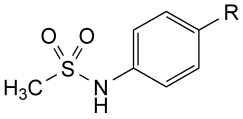
To 10 ml of solution S add 10 ml of *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating during the titration, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

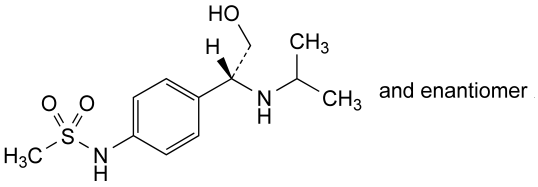


Dissolve 0.250 g in 10 ml of *anhydrous formic acid R*, if necessary with the aid of ultrasound. Add 40 ml of *acetic anhydride R* and titrate immediately with *0.1 M perchloric acid*. Determine the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 30.88 mg of $C_{12}H_{21}ClN_2O_3S$.

STORAGE

Protected from light.



IMPURITIES

A. R = CH_2-CH_2-NH-$CH(CH_3)_2$: *N*-[4-[2-[(1-methylethyl)amino]ethyl]phenyl]methanesulphonamide,

B. R = CO-CH_2-NH-$CH(CH_3)_2$: *N*-[4-[[(1-methylethyl)amino]acetyl]phenyl]methanesulphonamide,

C. R = CHO: *N*-(4-formylphenyl)methanesulphonamide,

D. *N*-[4-[(1*RS*)-2-hydroxy-1-[(1-methylethyl)amino]ethyl]phenyl]methanesulphonamide.

01/2008:1265

SOYA-BEAN OIL, HYDROGENATED

Soiae oleum hydrogenatum

DEFINITION

Hydrogenated soya-bean oil is the product obtained by refining, bleaching, hydrogenation and deodorisation of oil obtained from seeds of *Glycine soja* Sieb. and Zucc. and *Glycine max* (L.) Merr. (*G. hispida* (Moench) Maxim.). The product consists mainly of triglycerides of palmitic (hexadecanoic) and stearic (octadecanoic) acids.

CHARACTERS

A white or almost white mass or powder which melts to a clear, pale yellow liquid when heated, practically insoluble in water, freely soluble in methylene chloride, in light petroleum (bp: 65 °C to 70 °C) after heating and in toluene, very slightly soluble in alcohol.

IDENTIFICATION

A. It complies with the test for melting point (see Tests).

B. It complies with the test for composition of fatty acids (see Tests).

TESTS

Melting point (*2.2.15*): 66 °C to 72 °C.

Acid value (*2.5.1*). Not more than 0.5, determined on 10.0 g. Dissolve the substance to be examined in 50 ml of a hot mixture of equal volumes of *alcohol R* and *toluene R*, previously neutralised with *0.1 M potassium hydroxide* using 0.5 ml of *phenolphthalein solution R1* as indicator. Titrate the solution immediately while still hot.

Peroxide value (*2.5.5*). Not more than 5.0.

Unsaponifiable matter (*2.5.7*). Not more than 1.0 per cent, determined on 5.0 g.

Alkaline impurities in fatty oils (*2.4.19*). Dissolve 2.0 g with gentle heating in a mixture of 1.5 ml of *alcohol R* and 3 ml of *toluene R*. Add 0.05 ml of a 0.4 g/l solution of *bromophenol blue R* in *alcohol R*. Not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour to yellow.

Composition of fatty acids (*2.4.22, Method A*).

The chromatographic procedure may be carried out using:

– a fused-silica column 25 m long and 0.25 mm in internal diameter coated with *poly(cyanopropyl)siloxane R* (film thickness 0.2 µm),
– *helium for chromatography R* as the carrier gas at a flow rate of 0.65 ml/min,
– a flame-ionisation detector,
– a split injector (1:100),

maintaining the temperature of the column at 180 °C for 20 min and that of the injection port and the detector at 250 °C.

The fatty acid fraction of the oil has the following composition:

– *saturated fatty acids of chain length less than C_{14}*: not more than 0.1 per cent,
– *myristic acid*: not more than 0.5 per cent,
– *palmitic acid*: 9.0 per cent to 16.0 per cent,
– *stearic acid*: 79.0 per cent to 89.0 per cent,
– *oleic acid and isomers ($C_{18:1}$ equivalent chain length on poly(cyanopropyl)siloxane 18.5 to 18.8)*: not more than 4.0 per cent,
– *linoleic acid and isomers ($C_{18:2}$ equivalent chain length on poly(cyanopropyl)siloxane 19.4 to 19.8)*: not more than 1.0 per cent,
– *linolenic acid and isomers ($C_{18:3}$ equivalent chain length on poly(cyanopropyl)siloxane 20.3 to 20.7)*: not more than 0.2 per cent,
– *arachidic acid*: not more than 1.0 per cent,
– *behenic acid*: not more than 1.0 per cent.

Nickel. Not more than 1.0 ppm of Ni, determined by atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Introduce 5.0 g into a platinum or silica crucible, previously tared after ignition. Cautiously heat and introduce into the substance a wick formed from twisted ashless filter paper. Light the wick. When the substance is alight stop heating. After combustion, ignite in a muffle furnace at about 600 ± 50 °C. Continue the ignition until white ash is obtained. After cooling, take up the residue with two quantities, each of 2 ml, of *dilute hydrochloric acid R* and transfer into a 25 ml graduated flask. Add 0.3 ml of *nitric acid R* and dilute to 25.0 ml with *water R*.

Reference solutions. Prepare three reference solutions by adding 1.0 ml, 2.0 ml and 4.0 ml of *nickel standard solution (0.2 ppm Ni) R* to 2.0 ml of the test solution and diluting to 10.0 ml with *water R*.

Measure the absorbance at 232 nm using a nickel hollow-cathode lamp as a source of radiation, a graphite furnace as an atomic generator and *argon R* as the carrier gas.

Water (*2.5.12*). Not more than 0.3 per cent, determined on 1.000 g by the semi-micro determination of water.

STORAGE

Store protected from light.

01/2008:1473

SOYA-BEAN OIL, REFINED

Soiae oleum raffinatum

DEFINITION

Refined soya-bean oil is the fatty oil obtained from seeds of *Glycine soja* Sieb. and Zucc. and *Glycine max* (L.) Merr. (*G. hispida* (Moench) Maxim.) by extraction and subsequent refining. It may contain a suitable antioxidant.

CHARACTERS

A clear, pale yellow, liquid, miscible with light petroleum (50 °C to 70 °C), practically insoluble in alcohol.

It has a relative density of about 0.922 and a refractive index of about 1.475.

IDENTIFICATION

Carry out the identification of fatty oils by thin-layer chromatography (*2.3.2*). The chromatogram obtained is similar to the typical chromatogram for soya-bean oil.

TESTS

Acid value (*2.5.1*). Not more than 0.5, determined on 10.0 g.

Peroxide value (*2.5.5, Method A*). Not more than 10.0. If intended for use in the manufacture of parenteral dosage forms, the peroxide value is not more than 5.0.

Unsaponifiable matter (*2.5.7*). Not more than 1.5 per cent, determined on 5.0 g.

Alkaline impurities (*2.4.19*). It complies with the test for alkaline impurities in fatty oils.

Composition of fatty acids (*2.4.22, Method A*). The fatty acid fraction of the oil has the following composition:

– *saturated fatty acids of chain length less than* C_{14}: not more than 0.1 per cent,

– *myristic acid*: not more than 0.2 per cent,

– *palmitic acid*: 9.0 per cent to 13.0 per cent,

– *palmitoleic acid* (equivalent chain length on polyethyleneglycol adipate 16.3): not more than 0.3 per cent,

– *stearic acid*: 3.0 per cent to 5.0 per cent,

– *oleic acid* (equivalent chain length on polyethyleneglycol adipate 18.3): 17.0 per cent to 30.0 per cent,

– *linoleic acid* (equivalent chain length on polyethyleneglycol adipate 18.9): 48.0 per cent to 58.0 per cent,

– *linolenic acid* (equivalent chain length on polyethyleneglycol adipate 19.7): 5.0 per cent to 11.0 per cent,

– *arachidic acid*: not more than 1.0 per cent,

– *eicosenoic acid* (equivalent chain length on polyethyleneglycol adipate 20.3): not more than 1.0 per cent,

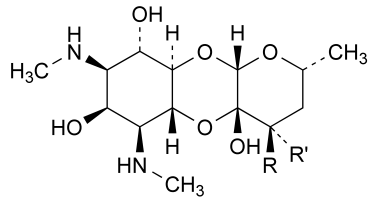
– *behenic acid*: not more than 1.0 per cent.

Brassicasterol (*2.4.23*). The sterol fraction of the oil contains not more than 0.3 per cent of brassicasterol.

Water (*2.5.32*). If intended for use in the manufacture of parenteral dosage forms, not more than 0.1 per cent, determined on 5.00 g by the coulometric determination of water. Use a mixture of equal volumes of *decanol R* and *anhydrous methanol R* as the solvent.

STORAGE

Store in a well-filled container, protected from light, at a temperature not exceeding 25 °C.



LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

01/2008:1152

SPECTINOMYCIN DIHYDROCHLORIDE PENTAHYDRATE

Spectinomycini dihydrochloridum pentahydricum

Compound	R	R'	Molec. Formula	M_r
spectinomycin	R + R' = O		$C_{14}H_{26}Cl_2N_2O_7,5H_2O$	495.4
(4*R*)-dihydro-spectinomycin	OH	H	$C_{14}H_{28}Cl_2N_2O_7,5H_2O$	497.4

DEFINITION

Mixture of (2*R*,4a*R*,5a*R*,6*S*,7*S*,8*R*,9*S*,9a*R*,10a*S*)-4a,7,9-trihydroxy-2-methyl-6,8-bis(methylamino)decahydro-4*H*-pyrano[2,3-*b*][1,4]benzodioxin-4-one dihydrochloride pentahydrate (spectinomycin dihydrochloride pentahydrate) and of (2*R*,4*R*,4a*S*,5a*R*,6*S*,7*S*,8*R*,9*S*,9a*R*,10a*S*)-2-methyl-6,8-bis(methylamino)decahydro-2*H*-pyrano[2,3-*b*][1,4]-benzodioxine-4,4a,7,9-tetrol dihydrochloride pentahydrate ((4*R*)-dihydrospectinomycin dihydrochloride pentahydrate).

It is produced by *Streptomyces spectabilis* or by any other means.

Content:

– *(4R)-dihydrospectinomycin dihydrochloride*: maximum 9.0 per cent (anhydrous substance);

– *sum of the contents of spectinomycin dihydrochloride and (4R)-dihydrospectinomycin dihydrochloride*: 93.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, slightly hygroscopic powder.

Solubility: freely soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *spectinomycin hydrochloride CRS*.

B. Dilute 1.0 ml of solution S (see Tests) to 10 ml with *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dilute 2.0 ml of solution S to 20.0 ml with *water R*.

pH (*2.2.3*): 3.8 to 5.6 for solution S.

Specific optical rotation (*2.2.7*): + 15.0 to + 21.0 (anhydrous substance), determined on solution S within 20 min of preparation.

Related substances. Liquid chromatography (*2.2.29*). *In order to avoid formation of anomers, prepare the solutions immediately before use.*

Test solution. Dissolve 15.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 3 mg of *spectinomycin for system suitability CRS* in the mobile phase and dilute to 20 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 3.0 ml of reference solution (b) to 10.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: ambient and constant.

Mobile phase: dissolve 4.2 g of *oxalic acid R* and 2.0 ml of *heptafluorobutyric acid R* in *water R* and dilute to 1000 ml with *water R*; adjust to pH 3.2 with *sodium hydroxide solution R*, add 105 ml of *acetonitrile R* and mix; filter through a 0.45 µm filter and degas with *helium for chromatography R* for 10 min.

Flow rate: 1.0 ml/min.

Post-column solution: *carbonate-free sodium hydroxide solution R* diluted with *carbon dioxide-free water R* to obtain a final concentration of NaOH of 21 g/l. Degas the solution with *helium for chromatography R* for 10 min before use. Add it pulse-less to the column effluent using a 375 µl polymeric mixing coil.

Post-column flow rate: 0.5 ml/min.

Detection: pulsed amperometric detection or equivalent with a gold indicator electrode having preferably a diameter of 1.4 mm or greater, a suitable reference electrode and a stainless steel counter electrode, held at + 0.12 V detection, + 0.70 V oxidation and – 0.60 V reduction potentials respectively, with pulse durations according to the instrument used. Keep the detection cell at ambient and constant temperature. Clean the gold indicator electrode with an eraser and damp precision wipe prior to start-up of the system to enhance the detector sensitivity and increase the signal-to-noise ratio.

Injection: 20 µl.

Run time: 1.5 times the retention time of spectinomycin.

Identification of impurities: use the chromatogram supplied with *spectinomycin for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A, D and E.

Relative retention with reference to spectinomycin (retention time = 11 min to 20 min): impurity A = about 0.5; impurity F = about 0.53; impurity G = about 0.6; impurity D = about 0.7; impurity E = about 0.9; (4*R*)-dihydrospectinomycin = about 1.3; impurity C = about 1.4.

System suitability: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to impurity E and spectinomycin.

Limits:

– *correction factor*: for the calculation of content, multiply the peak area of impurity A by 0.4;
– *impurities A, C, F, G*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
– *impurities D, E*: for each impurity, not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (4.0 per cent);
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
– *total*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (6.0 per cent);
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent); disregard the peak due to (4*R*)-dihydrospectinomycin.

Water (*2.5.12*): 16.0 per cent to 20.0 per cent, determined on 0.100 g.

Sulphated ash (*2.4.14*): maximum 1.0 per cent, determined on 1.0 g.

Bacterial endotoxins (*2.6.14*): less than 0.09 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins. Prepare the solutions using a 0.42 per cent *m/m* solution of *sodium hydrogen carbonate R*.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

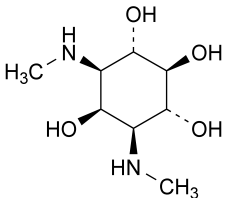
Test solution. Dissolve 40.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent. Allow to stand for not less than 15 h and not more than 72 h (formation of anomers). Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve 40.0 mg of *spectinomycin hydrochloride CRS* (containing (4*R*)-dihydrospectinomycin) in *water R* and dilute to 50.0 ml with the same solvent. Allow to stand for the same period of time as the test solution (formation of anomers). Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

System suitability:

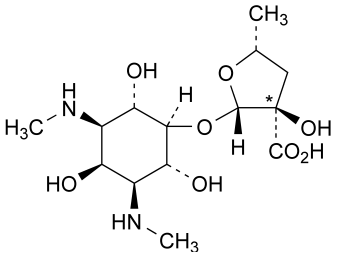
– *repeatability*: maximum relative standard deviation of 3.0 per cent for the principal peak after 6 injections of the reference solution.

Calculate the sum of the percentage contents of spectinomycin dihydrochloride and (4*R*)-dihydrospectinomycin dihydrochloride from the declared contents of $C_{14}H_{26}Cl_2N_2O_7$ and $C_{14}H_{28}Cl_2N_2O_7$ in *spectinomycin hydrochloride CRS*.



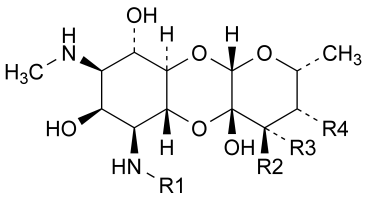
STORAGE

In an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.



IMPURITIES

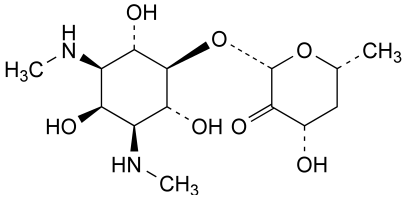
Specified impurities: *A, C, D, E, F, G.*



Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B.*

A. 1,3-dideoxy-1,3-bis(methylamino)-*myo*-inositol (actinamine),

B. (2*S*,3*RS*,5*R*)-3-hydroxy-5-methyl-2-[[(1*r*,2*R*,3*S*,4*r*,5*R*,6*S*)-2,4,6-trihydroxy-3,5-bis(methylamino)cyclohexyl]oxy]-tetrahydrofuran-3-carboxylic acid (actinospectinoic acid),

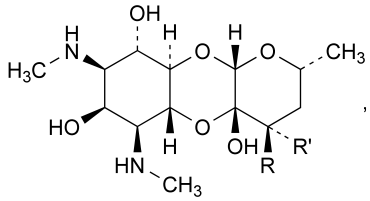


C. R1 = CH_3, R2 = R4 = H, R3 = OH: (2*R*,4*S*,4a*S*,5a*R*,6*S*,7*S*,8*R*,9*S*,9a*R*,10a*S*)-2-methyl-6,8-bis(methylamino)decahydro-2*H*-pyrano[2,3-*b*][1,4]benzodioxine-4,4a,7,9-tetrol ((4*S*)-dihydrospectinomycin),

D. R1 = CH_3, R2 = H, R3 = R4 = OH: (2*R*,3*R*,4*S*,4a*S*,5a*R*,6*S*,7*S*,8*R*,9*S*,9a*R*,10a*S*)-2-methyl-6,8-bis(methylamino)decahydro-2*H*-pyrano[2,3-*b*][1,4]benzodioxine-3,4,4a,7,9-pentol (dihydroxyspectinomycin),

E. R1 = R4 = H, R2 + R3 = O: (2*R*,4a*R*,5a*R*,6*S*,7*R*,8R,9*S*,9a*R*,10a*S*)-6-amino-4a,7,9-trihydroxy-2-methyl-8-(methylamino)decahydro-4*H*-pyrano[2,3-*b*][1,4]-benzodioxin-4-one (*N*-desmethylspectinomycin),

G. R1 = CH_3, R2 + R3 = O, R4 = OH: (2*R*,3*S*,4a*R*,5a*R*,6*S*,7*S*,8*R*,9*S*,9a*R*,10a*S*)-3,4a,7,9-tetrahydroxy-2-methyl-6,8-bis(methylamino)decahydro-4*H*-pyrano[2,3-*b*][1,4]-benzodioxin-4-one (tetrahydroxyspectinomycin),



F. (2*S*,4*S*,6*R*)-4-hydroxy-6-methyl-2-[[(1*r*,2*R*,3*S*,4*r*,5*R*,6*S*)-2,4,6-trihydroxy-3,5-bis(methylamino)cyclohexyl]oxy]dihydro-2*H*-pyran-3(4*H*)-one (triol spectinomycin).

01/2008:1658

SPECTINOMYCIN SULPHATE TETRAHYDRATE FOR VETERINARY USE

Spectinomycini sulfas tetrahydricus ad usum veterinarium

Compound	R	R'	Molec. Formula	M_r
spectinomycin	R + R' = O		$C_{14}H_{26}N_2O_{11}S,4H_2O$	502.5
(4*R*)-dihydro-spectinomycin	OH	H	$C_{14}H_{28}N_2O_{11}S,4H_2O$	504.5

DEFINITION

Mixture of (2*R*,4a*R*,5a*R*,6*S*,7*S*,8*R*,9*S*,9a*R*,10a*S*)-4a,7,9-trihydroxy-2-methyl-6,8-bis(methylamino)decahydro-4*H*-pyrano[2,3-*b*][1,4]benzodioxin-4-one sulphate tetrahydrate (spectinomycin sulphate tetrahydrate) and (2*R*,4*R*,4a*S*,5a*R*,6*S*,7*S*,8*R*,9*S*,9a*R*,10a*S*)-2-methyl-6,8-bis(methylamino)decahydro-2*H*-pyrano[2,3-*b*][1,4]benzodioxine-4,4a,7,9-tetrol sulphate tetrahydrate ((4*R*)-dihydrospectinomycin sulphate tetrahydrate).

It is produced by *Streptomyces spectabilis* or by any other means.

Content:

– *(4R)-dihydrospectinomycin sulphate*: maximum 2.0 per cent (anhydrous substance);
– *sum of the contents of spectinomycin sulphate and (4R)-dihydrospectinomycin sulphate*: 93.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *spectinomycin sulphate tetrahydrate CRS*.

B. Dilute 1.0 ml of solution S (see Tests) to 10 ml with *water R*. The solution gives reaction (a) of sulphates (*2.3.1*).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 3.8 to 5.6 for solution S.

Specific optical rotation (*2.2.7*): + 10.0 to + 14.0 (anhydrous substance).

Dissolve 2.50 g in an 8 ml/l solution of *concentrated ammonia R1* and dilute to 25.0 ml with the same solvent.

Allow the solution to stand at room temperature for not less than 30 min and not more than 2 h prior to determination.

Related substances. Liquid chromatography (*2.2.29*). *In order to avoid the formation of anomers, prepare the solutions immediately before use.*

Test solution. Dissolve 15.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 3 mg of *spectinomycin for system suitability CRS* in the mobile phase and dilute to 20 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 3.0 ml of reference solution (b) to 10.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: ambient and constant.

Mobile phase: dissolve 4.2 g of *oxalic acid R* and 2.0 ml of *heptafluorobutyric acid R* in *water R* and dilute to 1000 ml with *water R*; adjust to pH 3.2 with *sodium hydroxide solution R*; add 105 ml of *acetonitrile R* and mix; filter through a 0.45 µm filter and degas with *helium for chromatography R* for 10 min.

Flow rate: 1.0 ml/min.

Post-column solution: *carbonate-free sodium hydroxide solution R* diluted with *carbon dioxide-free water R* to obtain a final concentration of NaOH of 21 g/l. Degas the solution with *helium for chromatography R* for 10 min before use. Add it pulse-less to the column effluent using a 375 µl polymeric mixing coil.

Post-column flow rate: 0.5 ml/min.

Detection: pulsed amperometric detection or equivalent with a gold indicator electrode having preferably a diameter of 1.4 mm or greater, a suitable reference electrode and a stainless steel counter electrode, held at + 0.12 V detection, + 0.70 V oxidation and – 0.60 V reduction potentials respectively, with pulse durations according to the instrument used. Keep the detection cell at ambient and constant temperature. Clean the gold indicator electrode with an eraser and damp precision wipe prior to start-up of the system to enhance the detector sensitivity and increase the signal-to-noise ratio.

Injection: 20 µl.

Run time: 1.5 times the retention time of spectinomycin.

Identification of impurities: use the chromatogram supplied with *spectinomycin for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A, D and E.

Relative retention with reference to spectinomycin (retention time = 11 min to 20 min): impurity A = about 0.5; impurity D = about 0.7; impurity E = about 0.9; (4*R*)-dihydrospectinomycin = about 1.3.

System suitability: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to impurity E and spectinomycin.

Limits:

– *correction factor*: for the calculation of content, multiply the peak area of impurity A by 0.4;

– *impurities A, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);

– *impurity D*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (4.0 per cent);

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);

– *total*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (6.0 per cent);

– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent); disregard the peak due to (4*R*)-dihydrospectinomycin.

Water (*2.5.12*): 12.0 per cent to 16.5 per cent, determined on 0.100 g.

Sulphated ash (*2.4.14*): maximum 1.0 per cent, determined on 1.0 g.

Bacterial endotoxins (*2.6.14*): less than 0.17 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins. Prepare the solutions using a 0.42 per cent *m/m* solution of *sodium hydrogen carbonate R*.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Test solution. Dissolve 40.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent. Allow to stand for not less than 15 h and not more than 72 h (formation of anomers). Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

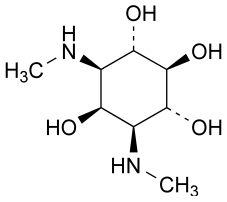
Reference solution. Dissolve 40.0 mg of *spectinomycin hydrochloride CRS* (containing (4*R*)-dihydrospectinomycin) in *water R* and dilute to 50.0 ml with the same solvent. Allow to stand for the same period of time as the test solution (formation of anomers). Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

System suitability:

– *repeatability*: maximum relative standard deviation of 3.0 per cent for the principal peak after 6 injections of the reference solution.

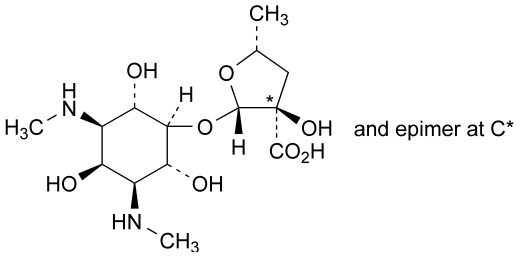
Calculate the sum of the percentage contents of spectinomycin sulphate and (4*R*)-dihydrospectinomycin sulphate from the declared contents of $C_{14}H_{26}Cl_2N_2O_7$ and $C_{14}H_{28}Cl_2N_2O_7$ in *spectinomycin hydrochloride CRS*, applying a correction factor of 1.062.

STORAGE



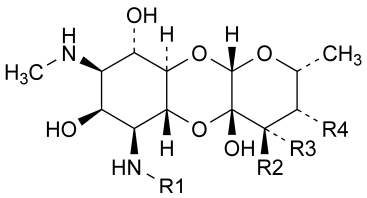
In an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

IMPURITIES



Specified impurities: *A, D, E*.

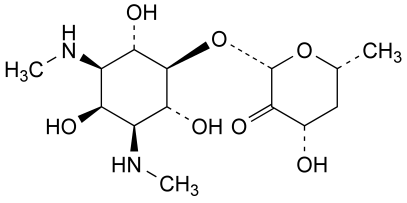
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to



identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, F, G.*

A. 1,3-dideoxy-1,3-bis(methylamino)-*myo*-inositol (actinamine),

B. (2*S*,3*RS*,5*R*)-3-hydroxy-5-methyl-2-[[(1*r*,2*R*,3*S*,4*r*,5*R*,6*S*)-2,4,6-trihydroxy-3,5-bis(methylamino)cyclohexyl]oxy]tetrahydrofuran-3-carboxylic acid (actinospectinoic acid),

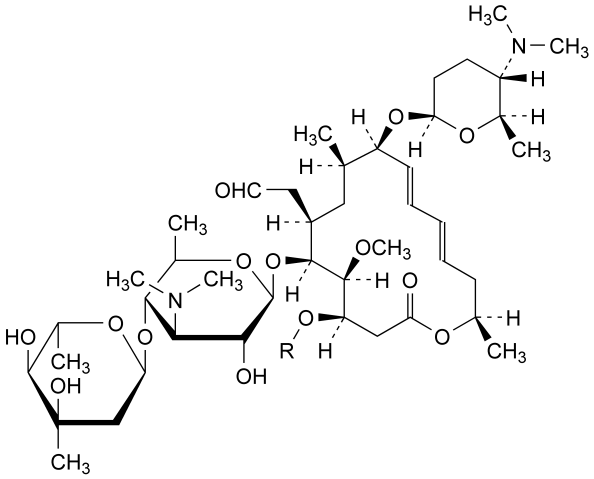


C. R1 = CH_3, R2 = R4 = H, R3 = OH: (2*R*,4*S*,4a*S*,5a*R*,6*S*,7*S*,8*R*,9*S*,9a*R*,10a*S*)-2-methyl-6,8-bis(methylamino)decahydro-2*H*-pyrano[2,3-*b*][1,4]benzodioxine-4,4a,7,9-tetrol ((4*S*)-dihydrospectinomycin),

D. R1 = CH_3, R2 = H, R3 = R4 = OH: (2*R*,3*R*,4*S*,4a*S*,5a*R*,6*S*,7*S*,8*R*,9*S*,9a*R*,10a*S*)-2-methyl-6,8-bis(methylamino)decahydro-2*H*-pyrano[2,3-*b*][1,4]benzodioxine-3,4,4a,7,9-pentol (dihydroxyspectinomycin),

E. R1 = R4 = H, R2 + R3 = O: (2*R*,4a*R*,5a*R*,6*S*,7*R*,8*R*,9*S*,9a*R*,10a*S*)-6-amino-4a,7,9-trihydroxy-2-methyl-8-(methylamino)decahydro-4*H*-pyrano[2,3-*b*][1,4]benzodioxin-4-one (*N*-desmethylspectinomycin),

G. R1 = CH_3, R2 + R3 = O, R4 = OH: (2*R*,3*S*,4a*R*,5a*R*,6*S*,7*S*,8*R*,9*S*,9a*R*,10a*S*)-3,4a,7,9-tetrahydroxy-2-methyl-6,8-bis(methylamino)decahydro-4*H*-pyrano[2,3-*b*][1,4]benzodioxin-4-one (tetrahydroxyspectinomycin),



F. (2*S*,4*S*,6*R*)-4-hydroxy-6-methyl-2-[[(1*r*,2*R*,3*S*,4*r*,5*R*,6*S*)-2,4,6-trihydroxy-3,5-bis(methylamino)cyclohexyl]oxy]dihydro-2*H*-pyran-3(4*H*)-one (triol spectinomycin).

Compound	R	Molec Formula	M_r
Spiramycin I	H	$C_{43}H_{74}N_2O_{14}$	843.1
Spiramycin II	CO-CH_3	$C_{45}H_{76}N_2O_{15}$	885.1
Spiramycin III	CO-CH_2-CH_3	$C_{46}H_{78}N_2O_{15}$	899.1

[8025-81-8]

DEFINITION

Macrolide antibiotic produced by the growth of certain strains of *Streptomyces ambofaciens* or obtained by any other means. The main component is (4*R*,5*S*,6*S*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-6-[[3,6-dideoxy-4-*O*-(2,6-dideoxy-3-*C*-methyl-α-L-*ribo*-hexopyranosyl)-3-(dimethylamino)-β-D-glucopyranosyl]oxy]-4-hydroxy-5-methoxy-9,16-dimethyl-7-(2-oxoethyl)-10-[[2,3,4,6-tetradeoxy-4-(dimethylamino)-D-*erythro*-hexopyranosyl]oxy]oxacyclohexadeca-11,13-dien-2-one (spiramycin I; M_r 843). Spiramycin II (4-*O*-acetylspiramycin I) and spiramycin III (4-*O*-propanoylspiramycin I) are also present.

Potency: minimum 4100 IU/mg (dried substance).

CHARACTERS

Appearance: white or slightly yellowish powder, slightly hygroscopic.

Solubility: slightly soluble in water, freely soluble in acetone, in ethanol (96 per cent) and in methanol.

IDENTIFICATION

A. Dissolve 0.10 g in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *methanol R*. Examined between 220 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 232 nm. The specific absorbance at the absorption maximum is about 340.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 40 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 40 mg of *spiramycin CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 40 mg of *erythromycin A CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: the upper layer of a mixture of 4 volumes of *2-propanol R*, 8 volumes of a 150 g/l solution of *ammonium acetate R* previously adjusted to pH 9.6 with *strong sodium hydroxide solution R*, and 9 volumes of *ethyl acetate R*.

Application: 5 µl.

Development: over 3/4 of the plate.

Drying: in air.

Detection: spray with *anisaldehyde solution R1* and heat at 110 °C for 5 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). If in the chromatogram obtained with the test solution 1 or 2 spots occur with R_F values slightly higher than that of the principal spot, these spots are similar in position and colour to the secondary spots in the chromatogram obtained with reference solution (a) and differ from the spots in the chromatogram obtained with reference solution (b).

C. Dissolve 0.5 g in 10 ml of *0.05 M sulphuric acid* and add 25 ml of *water R*. Adjust to about pH 8 with *0.1 M sodium hydroxide* and dilute to 50 ml with *water R*. To 5 ml of this solution add 2 ml of a mixture of 1 volume of *water R* and 2 volumes of *sulphuric acid R*. A brown colour develops.

TESTS

pH (*2.2.3*): 8.5 to 10.5.

Dissolve 0.5 g in 5 ml of *methanol R* and dilute to 100 ml with *carbon dioxide-free water R*.

Specific optical rotation (*2.2.7*): – 80 to – 85 (dried substance).

Dissolve 1.00 g in a 10 per cent *V/V* solution of *dilute acetic acid R* and dilute to 50.0 ml with the same acid solution.

Composition. Liquid chromatography (*2.2.29*) as described in the test for related substances.

Injection: test solution and reference solution (a).

Calculate the percentage content using the declared content of spiramycins I, II and III in *spiramycin CRS*.

Composition of spiramycins (dried substance):

– *spiramycin I*: minimum 80.0 per cent,
– *spiramycin II*: maximum 5.0 per cent,
– *spiramycin III*: maximum 10.0 per cent,
– *sum of spiramycins I, II and III*: minimum 90.0 per cent.

Related substances. Liquid chromatography (*2.2.29*).

Prepare the solutions immediately before use.

Test solution. Dissolve 25.0 mg of the substance to be examined in a mixture of 3 volumes of *methanol R* and 7 volumes of *water R* and dilute to 25.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 25.0 mg of *spiramycin CRS* in a mixture of 3 volumes of *methanol R* and 7 volumes of *water R* and dilute to 25.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 100.0 ml with a mixture of 3 volumes of *methanol R* and 7 volumes of *water R*.

Reference solution (c). Dissolve 5 mg of *spiramycin CRS* in 15.0 ml of *buffer solution pH 2.2 R* and dilute to 25.0 ml with *water R*, then heat in a water-bath at 60 °C for 30 min.

Blank solution: *methanol R, water R* (3:7 *V/V*).

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm) (polar embedded octadecylsilyl methylsilica gel), with a pore size of 12.5 nm and a carbon loading of 15 per cent,
– *temperature*: 70 °C.

Mobile phase: mix 5 volumes of a 34.8 g/l solution of *dipotassium hydrogen phosphate R* previously adjusted to pH 6.5 with a 27.2 g/l solution of *potassium dihydrogen phosphate R*, 40 volumes of *acetonitrile R* and 55 volumes of *water R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 232 nm.

Injection: 20 µl of the blank solution, the test solution and reference solutions (b) and (c).

Run time: 3 times the retention time of spiramycin I.

Identification of spiramycins: use the chromatogram supplied with *spiramycin CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to spiramycins I, II and III.

Relative retention with reference to spiramycin I (retention time = 20 min to 30 min): spiramycin II = about 1.4; spiramycin III = about 2.0; impurity F = about 0.41; impurity A = about 0.45; impurity D = about 0.50; impurity G = 0.66; impurity B = about 0.73; impurity H = about 0.87; impurity E = about 2.5.

If necessary adjust the composition of the mobile phase by changing the amount of acetonitrile.

System suitability: reference solution (c):

– *resolution*: minimum 10.0 between the peaks due to impurity A and spiramycin I.

Limits:

– *impurities A, B, C, D, E, F, G, H*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (10.0 per cent),
– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent); disregard any peak due to the blank and the peaks due to spiramycins I, II and III.

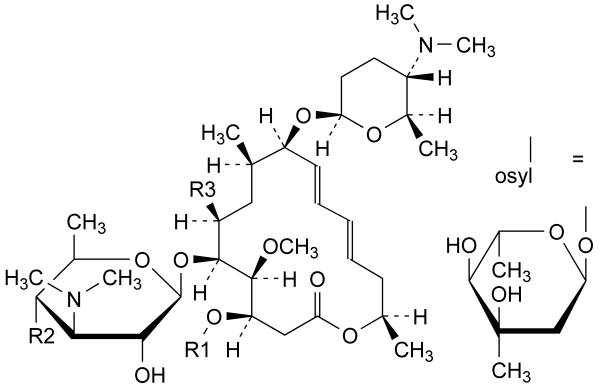
Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with limit test F. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 3.5 per cent, determined on 0.500 g by drying at 80 °C over *diphosphorus pentoxide R* at a pressure not exceeding 670 Pa for 6 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Carry out the microbiological assay of antibiotics (*2.7.2*).

STORAGE

In an airtight container.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H.

A. R1 = H, R2 = OH, R3 = CH_2-CHO: (4*R*,5*S*,6*S*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-6-[[3,6-dideoxy-3-(dimethylamino)-β-D-glucopyranosyl]oxy]-4-hydroxy-5-methoxy-9,16-dimethyl-7-(2-oxoethyl)-10-[[2,3,4,6-tetradeoxy-4-(dimethylamino)-β-D-*erythro*-hexopyranosyl]oxy]oxacyclohexadeca-11,13-dien-2-one (neospiramycin I),

B. F. spiramycin dimer.

01/2008:1766

SPIRAPRIL HYDROCHLORIDE MONOHYDRATE

Spiraprili hydrochloridum monohydricum

$C_{22}H_{31}ClN_2O_5S_2,H_2O$ M_r 521.1

DEFINITION

(8*S*)-7-[(2*S*)-2-[[(1*S*)-1-(Ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]-1,4-dithia-7-azaspiro[4.4]nonane-8-carboxylic acid hydrochloride monohydrate.

Content: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, fine crystalline powder.

Solubility: very slightly soluble in water, soluble in methanol, slightly soluble in acetonitrile, practically insoluble in methylene chloride.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs of *potassium bromide R*.

Comparison: *spirapril hydrochloride monohydrate CRS*.

C. It gives the reactions of chlorides (*2.3.1*).

TESTS

Specific optical rotation (*2.2.7*): – 11.0 to – 13.0 (anhydrous substance).

Dissolve 0.200 g in *dimethylformamide R* and dilute to 20.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Solvent mixture: *acetonitrile R1, water R* (2:8 *V/V*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 20.0 ml with the solvent mixture.

Reference solution (a). Dissolve 6.0 mg of *spirapril for system suitability CRS* (spirapril spiked with impurity B and impurity D) in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 5.0 ml of this solution to 50.0 ml with the solvent mixture.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.125 m, Ø = 4.6 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),

– *temperature*: 70 °C.

Mobile phase:

– *mobile phase A*: dissolve 4.5 g of *tetramethylammonium hydroxide R* in 900 ml of *water R*, add 100 ml of *acetonitrile R1* and adjust to pH 2.2 with *phosphoric acid R*,

– *mobile phase B*: dissolve 4.5 g of *tetramethylammonium hydroxide R* in 400 ml of *water R*, add 600 ml of *acetonitrile R1* and adjust to pH 2.2 with *phosphoric acid R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 4	90	10
4 - 14	90 → 10	10 → 90
14 - 20	10	90
20 - 23	10 → 90	90 → 10
23 - 33	90	10

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Relative retention with reference to spirapril (retention time = about 10 min): impurity C = about 0.6; impurity B = about 0.7; impurity A = about 1.26; impurity D = about 1.38.

System suitability: reference solution (a):

– *resolution*: minimum 3.5 between the peaks due to impurity B and spirapril, and minimum 5.5 between the peaks due to spirapril and impurity D.

Limits:

– *impurities A, C*: for each impurity, not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),

– *impurity B*: not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),

– *impurity D*: not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent),

– *any other impurity*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),

– *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent); disregard any peak due to the blank (solvent mixture).

Water (*2.5.12*): 3.0 per cent to 4.0 per cent, determined on 0.200 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*).

Solvent mixture. Mix equal volumes of *acetonitrile R1* and *water R*.

Test solution. Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). Dissolve 20.0 mg of *spirapril hydrochloride monohydrate CRS* in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (b). Dissolve 6.0 mg of *spirapril for system suitability CRS* (spirapril spiked with impurity B and impurity D) in a mixture of 2 volumes of *acetonitrile R* and 8 volumes of *water R* and dilute to 20 ml with the same mixture of solvents.

Solution A. Dissolve 4.5 g of *tetramethylammonium hydroxide R* in 900 ml of *water R*, adjust to pH 1.75 with *phosphoric acid R* and add 100 ml of *acetonitrile R1*.

Solution B. Dissolve 4.5 g of *tetramethylammonium hydroxide R* in 400 ml of *water R*, adjust to pH 1.75 with *phosphoric acid R* and add 600 ml of *acetonitrile R1*.

Column:

– *size*: *l* = 0.125 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
– *temperature*: 70 °C.

Mobile phase: solution A, solution B (45:55 *V/V*).

Flow rate: 2.0 ml/min.

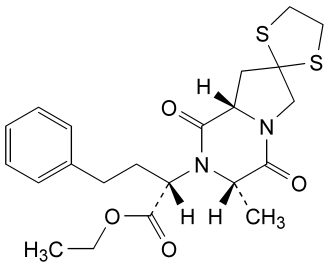
Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Retention time: spirapril = 1.6 min to 2.9 min; impurity D = about 13 min. Adjust the proportion of solution B in the mobile phase if necessary.

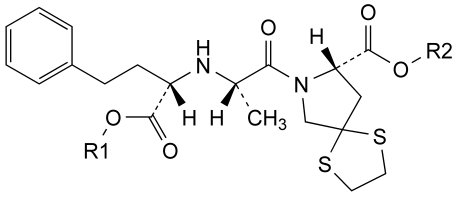
System suitability: reference solution (b):

– *resolution*: minimum 15 between the peaks due to spirapril and impurity D.



Calculate the percentage content of $C_{22}H_{31}ClN_2O_5S_2$ from the chromatograms obtained with the test solution and reference solution (a) and the declared content of *spirapril hydrochloride monohydrate CRS*.

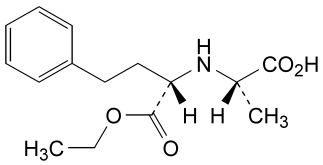
STORAGE



In an airtight container, protected from light.

IMPURITIES

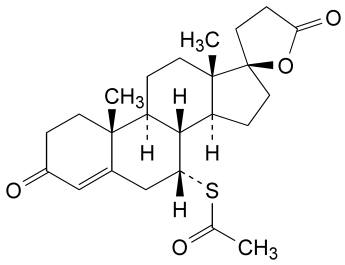
Specified impurities: A, B, C, D.



A. ethyl (2*S*)-2-[(3′*S*,8′a*S*)-3′-methyl-1′,4′-dioxohexahydrospiro[1,3-dithiolane-2,7′(6′*H*)-pyrrolo[1,2-*a*]pyrazin]-2′-yl]-4-phenylbutanoate,

B. R1 = R2 = H: (8*S*)-7-[(2*S*)-2-[[(1*S*)-1-carboxy-3-phenylpropyl]amino]propanoyl]-1,4-dithia-7-azaspiro[4.4]nonane-8-carboxylic acid (spiraprilat),

D. R1 = C_2H_5, R2 = $CH(CH_3)_2$: 1-methylethyl (8*S*)-7-[(2*S*)-2-[[(1*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]-1,4-dithia-7-azaspiro[4.4]nonane-8-carboxylate,



C. (2*S*)-2-[[(1*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoic acid.

SPIRONOLACTONE

Spironolactonum

$C_{24}H_{32}O_4S$ M_r 416.6
[52-01-7]

DEFINITION

Spironolactone contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of 7α-(acetylsulfanyl)-3′,4′-dihydrospiro[androst-4-ene-17,2′(5′*H*)-furan]-3,5′-dione, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white powder, practically insoluble in water, soluble in alcohol.

It shows polymorphism (*5.9*).

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *spironolactone CRS*. Examine the substances as 50 g/l solutions in *chloroform R*.

B. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution. Dissolve 20 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20 mg of *spironolactone CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *water R*, 24 volumes of *cyclohexane R* and 75 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot

in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. To about 10 mg add 2 ml of a 50 per cent *V/V* solution of *sulphuric acid R* and shake. An orange solution with an intense yellowish-green fluorescence is produced. Heat the solution gently; the colour becomes deep red and hydrogen sulphide, which blackens *lead acetate paper R*, is evolved. Add the solution to 10 ml of *water R*; a greenish-yellow solution is produced which shows opalescence or a precipitate.

TESTS

Specific optical rotation (*2.2.7*). Dissolve 0.100 g in *chloroform R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is – 33 to – 37, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (*2.2.29*).

Test solution. Dissolve 62.5 mg of the substance to be examined in 2.5 ml of *tetrahydrofuran R* and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 25.0 mg of *canrenone CRS* in 1 ml of *tetrahydrofuran R* and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (d). Mix 1 ml of the test solution with 1 ml of reference solution (b) and dilute to 100 ml with the mobile phase.

Reference solution (e). Dilute 0.50 ml of reference solution (a) to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),

– a mixture of 8 volumes of *acetonitrile R*, 18 volumes of *tetrahydrofuran R* and 74 volumes of *water R* as the mobile phase at a flow rate of 1.8 ml/min,

– a variable wavelength spectrophotometer capable of operating at 254 nm and at 283 nm as detector.

Inject separately 20 µl of the test solution and 20 µl of reference solution (a), 20 µl of reference solution (d) and 20 µl of reference solution (e) and record the chromatograms with the detector set for recording at 254 nm. Continue the chromatography for twice the retention time of spironolactone. In the chromatogram obtained with the test solution, the sum of the areas of the peaks, except those corresponding to spironolactone and canrenone, is not greater than the area of the peak corresponding to spironolactone in the chromatogram obtained with reference solution (a) (1.0 per cent). Disregard any peak whose area is less than that of the principal peak in the chromatogram obtained with reference solution (e) (0.05 per cent). Inject 20 µl of the test solution and 20 µl of reference solution (c) and record the chromatogram with the detector set for recording at 283 nm. In the chromatogram obtained with the test solution, the area of any peak corresponding to canrenone is not greater than the area of the peak corresponding to canrenone in the chromatogram obtained with reference solution (c) (1.0 per cent). Calculate the percentage content of canrenone found when recording at 283 nm and the percentage content of the other related substances found when recording at 254 nm. Add together these percentages. The sum is not greater than 1.0 per cent. The test is not valid unless: the chromatogram obtained with reference solution (d) shows peaks, corresponding to canrenone and spironolactone, with a resolution greater than 1.4; the principal peak in the chromatogram obtained with reference solution (e) has a signal-to-noise ratio of at least 6.

Free mercapto compounds. To 2.0 g add 20 ml of *water R*, shake for 1 min and filter. To 10 ml of the filtrate add 0.05 ml of *0.01 M iodine* and 0.1 ml of *starch solution R* and mix. A blue colour develops.

Chromium. To 0.20 g in a platinum crucible add 1 g of *potassium carbonate R* and 0.3 g of *potassium nitrate R*. Heat gently until fused, and ignite at 600 °C to 650 °C until carbon is removed. Cool, dissolve the residue as completely as possible in 10 ml of *water R* with the aid of gentle heat, filter, and dilute to 20 ml with *water R*. To 10 ml of this solution add 0.5 g of *urea R*, and add a 14 per cent *V/V* solution of *sulphuric acid R* until the solution is just acid. When effervescence ceases, add a further 1 ml of the sulphuric acid, dilute to 20 ml with *water R* and add 0.5 ml of *diphenylcarbazide solution R*. The solution is not more intensely coloured than a standard prepared by adding 1 ml of a 14 per cent *V/V* solution of *sulphuric acid R* to 0.50 ml of a freshly prepared 28.3 mg/l solution of *potassium dichromate R*, diluting to 20 ml with *water R* and adding 0.5 ml of *diphenylcarbazide solution R* (50 ppm).

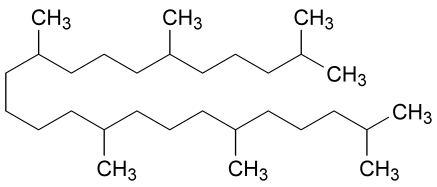
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 50.0 mg in *methanol R* and dilute to 250.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *methanol R*. Measure the absorbance (*2.2.25*) of the solution at the maximum at 238 nm.

Calculate the content of $C_{24}H_{32}O_4S$, taking the specific absorbance to be 470.



STORAGE

Store protected from light.

01/2008:1630

SQUALANE

Squalanum

$C_{30}H_{62}$ M_r 422.8

[111-01-3]

DEFINITION

2,6,10,15,19,23-Hexamethyltetracosane (perhydrosqualene). It may be of vegetable (unsaponifiable matter of olive oil) or animal (shark liver oil) origin.

Content: 96.0 per cent to 103.0 per cent.

CHARACTERS

Appearance: clear, colourless, oily liquid.

Solubility: practically insoluble in water, miscible with most fats and oils, freely soluble in acetone and in cyclohexane, practically insoluble in ethanol (96 per cent).

Relative density: about 0.815.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *squalane CRS*.

B. Refractive index (see Tests).

C. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

The chromatogram obtained with squalane of vegetable origin shows a peak corresponding to cyclosqualane (Figure 1630.-1 and Figure 1630.-2).

TESTS

Appearance. The substance to be examined is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Refractive index (*2.2.6*): 1.450 to 1.454.

Acid value (*2.5.1*): maximum 0.2.

Iodine value (*2.5.4, Method A*): maximum 4.0.

Saponification value (*2.5.6*): maximum 3.0.

Nickel (*2.4.31*): maximum 1 ppm.

Total ash (*2.4.16*): maximum 0.5 per cent, determined on 1.000 g.

ASSAY

Gas chromatography (*2.2.28*).

Internal standard solution. To 1.0 ml of *dimethylacetamide R*, add 100.0 ml of *heptane R*.

Test solution. Dissolve 0.100 g in the internal standard solution and dilute to 25.0 ml with the same solution.

Reference solution (a). Dissolve 0.100 g of *squalane CRS* in the internal standard solution and dilute to 25.0 ml with the same solution.

Reference solution (b). To 0.1 ml of *methyl erucate R* add 0.100 g of the substance to be examined, dissolve in the internal standard solution and dilute to 25.0 ml with the same solution.

Column:

– *material*: fused silica;
– *size*: *l* = 30 m, Ø = 0.32 mm;
– *stationary phase*: *poly(dimethyl)siloxane R* (film thickness 1 µm).

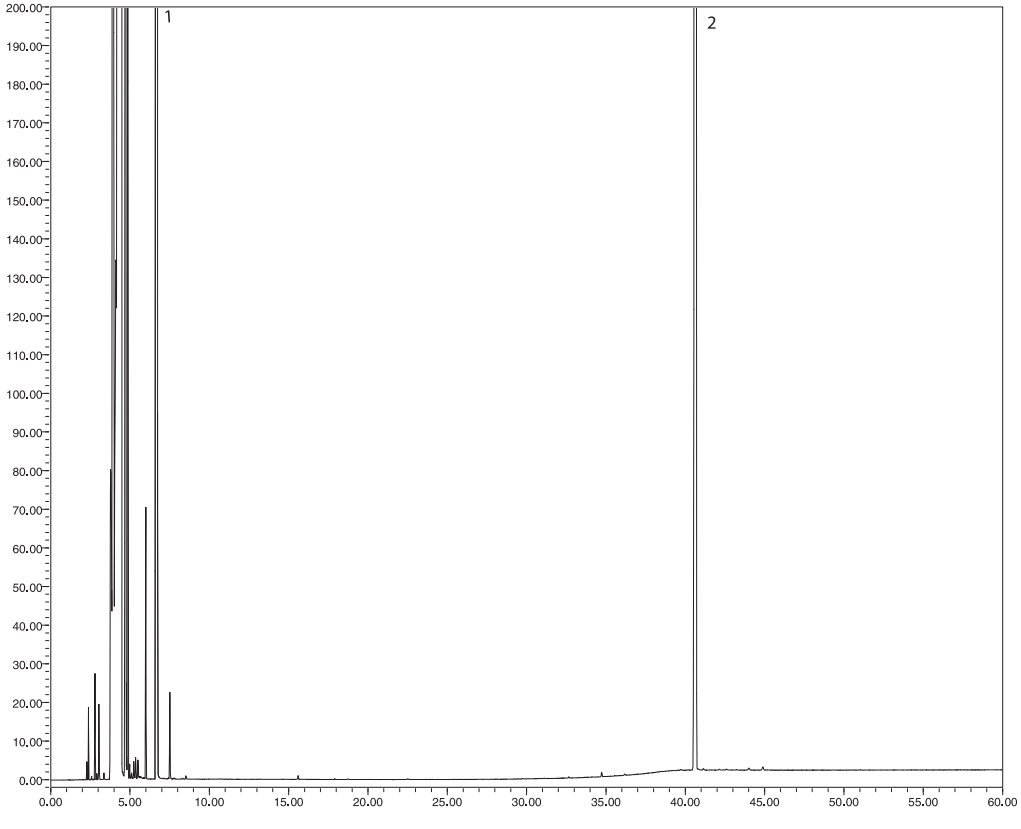
Carrier gas: *helium for chromatography R*.

Flow rate: 1.7 ml/min.

Split ratio: 1:12.

Temperature:

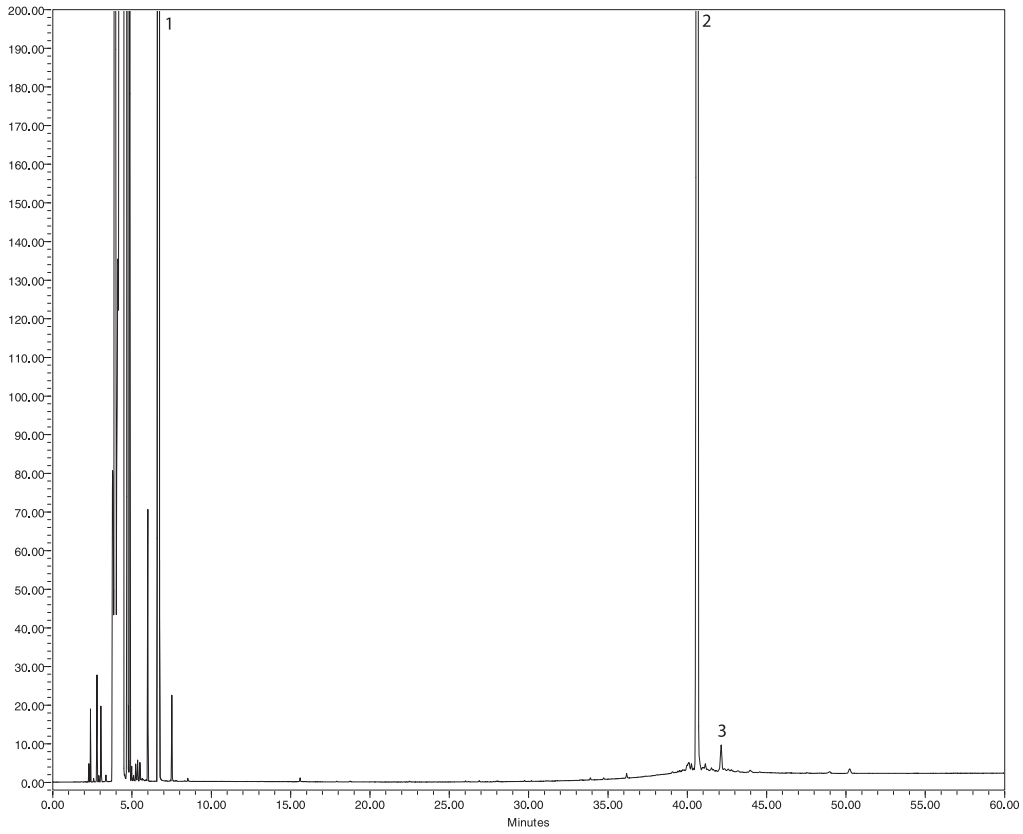
	Time (min)	Temperature (°C)
Column	0 - 39	60 - 290
	39 - 50	290
Injection port		275
Detector		300



Detection: flame ionisation.

Injection: 1 µl.

Relative retentions with reference to squalane (retention time = about 41 min): internal standard = about 0.2; methyl erucate = about 0.9; cyclosqualane = 1.05.



System suitability: reference solution (b):

– *resolution*: minimum 5 between the peaks due to methyl erucate and squalane.

1. DMA 2. squalane

Figure 1630.-1. – *Chromatogram of squalane of animal origin*

1. DMA 2. squalane 3. cyclosqualane

Figure 1630.-2. – *Chromatogram of squalane of vegetable origin*

Calculate the percentage content of squalane from the declared content of *squalane CRS*.

LABELLING

The label states the origin of squalane (vegetable or animal).

01/2008:1438
corrected 6.0

St. JOHN'S WORT

Hyperici herba

DEFINITION

Whole or cut, dried flowering tops of *Hypericum perforatum* L., harvested during flowering time.

Content: minimum 0.08 per cent of total hypericins, expressed as hypericin ($C_{30}H_{16}O_8$; M_r 504.4) (dried drug).

IDENTIFICATION

A. The branched and bare stem shows 2 more-or-less prominent longitudinal ridges. The leaves are opposite, sessile, exstipulate, oblong-oval and 15-30 mm long; present on the leaf margins are glands which appear as black dots and over all the surface of the leaves many small, strongly translucent excretory glands which are visible in transmitted light. The flowers are regular and form corymbose clusters at the apex of the stem. They have 5 green, acute sepals, with black secretory glands on the margins; 5 orange-yellow petals, also with black secretory glands on the margins; 3 staminal blades, each divided into many orange-yellow stamens and 3 carpels surmounted by red styles.

B. Reduce to a powder (355) (*2.9.12*). The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of polygonal cells of the epidermis with thickened and beaded walls and paracytic or anomocytic stomata (*2.8.3*); fragments of the leaf and sepal with large oil glands and red pigment cells; thin-walled, elongated cells of the petal epidermis with straight or wavy anticlinal walls; tracheids and tracheidal vessels with pitted walls and groups of thick-walled fibres; fragments of rectangular, lignified and pitted parenchyma; fibrous layer of the anther and elongated, thin-walled cells of the filament with a striated cuticle; numerous pollen grains with 3 pores and a smooth exine, occur singly or in dense groups, and calcium oxalate cluster crystals.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Stir 0.5 g of the powdered drug (500) (*2.9.12*) in 10 ml of *methanol R* in a water-bath at 60 °C for 10 min and filter.

Reference solution. Dissolve 5 mg of *rutin R* and 5 mg of *hyperoside R* in *methanol R*, then dilute to 5 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, water R, ethyl acetate R* (6:9:90 *V/V/V*).

Application: 10 µl of the test solution and 5 µl of the reference solution, as bands of 10 mm.

Development: over a path of 10 cm.

Drying: at 100-105 °C for 10 min.

Detection: spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. After about 30 min, examine in ultraviolet light at 365 nm.

Results: the chromatogram obtained with the reference solution shows in the lower third the zone due to rutin and above it the zone due to hyperoside, both with

yellow-orange fluorescence. The chromatogram obtained with the test solution shows in the lower third the reddish-orange fluorescent zones of rutin and hyperoside and in the lower part of the upper third the zone of pseudohypericin and above it the zone of hypericin, both with red fluorescence. Other yellow or blue fluorescent zones are visible.

TESTS

Foreign matter (*2.8.2*): maximum 3 per cent of stems with a diameter greater than 5 mm and maximum 2 per cent of other foreign matter.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (500) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 7.0 per cent.

ASSAY

Test solution. In a 100 ml round-bottomed flask, introduce 0.800 g of the powdered drug (500) (*2.9.12*), 60 ml of a mixture of 20 volumes of *water R* and 80 volumes of *tetrahydrofuran R* and a magnetic stirrer. Boil the mixture in a water-bath at 70 °C under a reflux condenser for 30 min. Centrifuge (2 min at 700 *g*) and decant the supernatant into a 250 ml flask. Take up the residue with 60 ml of a mixture of 20 volumes of *water R* and 80 volumes of *tetrahydrofuran R*. Heat again under a reflux condenser for 30 min. Centrifuge (2 min at 700 *g*) and decant the supernatant. Combine the extracts and evaporate to dryness. Take up the residue with 15 ml of *methanol R* with the help of ultrasound and transfer to a 25 ml measuring flask. Rinse the 250 ml flask with *methanol R* and dilute to 25.0 ml with the same solvent. Centrifuge again, filter 10 ml through a syringe filter (0.2 µm). Discard the first 2 millilitres of the filtrate. Introduce 5.0 ml of the filtrate into a measuring flask and dilute to 25.0 ml with *methanol R*.

Compensation liquid. Methanol R.

Measure the absorbance (*2.2.25*) at 590 nm of the test solution, by comparison with the compensation liquid.

Calculate the percentage content of total hypericins, expressed as hypericin, using the following expression:

$$\frac{A \times 125}{m \times 870}$$

i.e. taking the specific absorbance of hypericin to be 870.

A = absorbance at 590 nm,

m = mass of the drug to be examined, in grams.

corrected 6.0

STANNOUS CHLORIDE DIHYDRATE

Stannosi chloridum dihydricum

$SnCl_2,2H_2O$ M_r 225.6
[10025-69-1]

DEFINITION

Content: 98.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals, efflorescent in air.

Solubility: freely soluble in water (the solution becomes cloudy after standing or on dilution), freely soluble in ethanol (96 per cent). It dissolves in dilute hydrochloric acid.

IDENTIFICATION

A. To 1 ml of solution S1 (see Tests) add 5 ml of *water R* and 0.05 ml of *mercuric chloride solution R*. A blackish-grey precipitate is formed.

B. Dissolve 1.0 g in 3.0 ml of *water R*. Add 0.5 ml of *dilute sodium hydroxide solution R* to the cloudy solution; a yellowish flocculent precipitate is formed. Add 6.5 ml of *water R*. To 1.0 ml of the previously shaken suspension add 1.0 ml of *strong sodium hydroxide solution R*; the precipitate dissolves and the resulting solution is clear and colourless.

C. Dissolve 10 mg in 2 ml of *dilute nitric acid R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S1. To 0.40 g add 1 ml of *dilute hydrochloric acid R* and dilute to 20 ml with *distilled water R*.

Solution S2. Dissolve 1.0 g in *dilute hydrochloric acid R* and dilute to 30 ml with the same acid. Heat to boiling. Add 30 ml of *thioacetamide solution R* and boil for 15 min (solution A). Take 5 ml, filter and heat the filtrate to boiling. Add 5 ml of *thioacetamide solution R* and boil for 15 min. If a precipitate is formed, add the remainder of solution A (solution A′) to the mixture. Add 10 ml of *thioacetamide solution R* and boil. Repeat the series of operations from "Take 5 ml" until a precipitate is no longer formed on addition of *thioacetamide solution R* to the filtrate obtained from the 5 ml of solution A (solution A′, solution A″, etc. respectively). If no precipitate is formed or if no more precipitate is formed combine the solution obtained with the remainder of solution A (solution A′, solution A″, etc. respectively), filter and wash the precipitate with 10 ml of *water R*. Heat the filtrate until the resulting vapour no longer turns a moistened piece of *lead acetate paper R* blackish-grey. Allow to cool and dilute to 50 ml with *water R*.

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 10.0 g in *dilute hydrochloric acid R* and dilute to 20 ml with the same acid.

Substances not precipitated by thioacetamide: maximum 0.2 per cent.

Evaporate 25 ml of solution S2 to dryness and ignite at 600 ± 50 °C. The residue weighs a maximum of 1 mg.

Sulphates (*2.4.13*): maximum 500 ppm, determined on solution S1.

Iron (*2.4.9*): maximum 100 ppm.

Dilute 5 ml of solution S2 to 10 ml with *water R*.

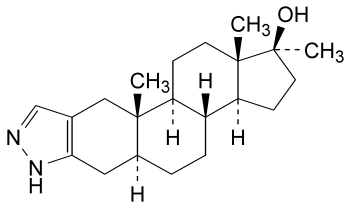
Heavy metals: maximum 50 ppm.

Dissolve 1.0 g in 2 ml of a mixture of 1 volume of *nitric acid R* and 3 volumes of *hydrochloric acid R*. Heat on a water-bath until nitrous vapour is no longer evolved. Dissolve the residue in *water R* and dilute to 25 ml with the same solvent. To 5 ml of this solution add 3 ml of *strong sodium hydroxide solution R* and 2 ml of *water R*. Heat until a clear solution is obtained, then cool and add 0.5 ml of *thioacetamide reagent R*. After 2 min, any colour in the solution is not more intense than that of a mixture of 1.0 ml of *lead standard solution (10 ppm Pb) R*, 6 ml of *water R*, 3 ml of *strong sodium hydroxide solution R* and 0.5 ml of *thioacetamide reagent R*.

ASSAY

Dissolve 0.100 g in 50 ml of *water R*, freed from oxygen by purging with carbon dioxide or nitrogen for 15 min. Add 1.5 ml of *hydrochloric acid R1*, 5 g of *sodium potassium tartrate R*, 10 g of *sodium hydrogen carbonate R* and 1 ml of *starch solution R*. Titrate immediately with *0.05 M iodine*. Carry out a blank titration.

1 ml of *0.05 M iodine* is equivalent to 11.28 mg of $SnCl_2,2H_2O$.



STORAGE

In an airtight container.

01/2008:1568

STANOZOLOL

Stanozololum

$C_{21}H_{32}N_2O$ M_r 328.5

[10418-03-8]

DEFINITION

Stanozolol contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 17-methyl-2′*H*-5α-androst-2-eno[3,2-*c*]pyrazol-17β-ol, calculated with reference to the dried substance.

CHARACTERS

A white or almost white crystalline powder, hygroscopic, practically insoluble in water, soluble in dimethylformamide, slightly soluble in alcohol, very slightly soluble in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Examine by infrared spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *stanozolol CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of methylene chloride, evaporate to dryness at room temperature under an air-stream and record new spectra using the residues.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (c).

TESTS

Specific optical rotation (*2.2.7*). Dissolve 0.10 g in *chloroform R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is + 34 to + 40, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel F_{254} plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 200 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

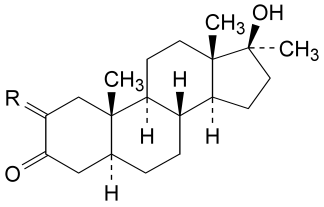
Reference solution (b). Dissolve 5 mg of *stanozolol impurity A CRS* in reference solution (a) and dilute to 50 ml with the same solution.

Reference solution (c). Dissolve 10 mg of *stanozolol CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Apply to the plate 5 µl of each solution. Develop over a path corresponding to two thirds of the plate height using a mixture of 10 volumes of *methanol R* and 90 volumes of *methylene chloride R*. Allow the plate to dry in air, spray with *alcoholic solution of sulphuric acid R*, heat at 105 °C for 15 min and examine under ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Loss on drying (*2.2.32*). Not more than 1.0 per cent, determined on 1.000 g by drying at 100 °C at a pressure not exceeding 0.7 kPa.

ASSAY



Dissolve 0.250 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 32.85 mg of $C_{21}H_{32}N_2O$.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

A. R = H_2: 17β-hydroxy-17-methyl-5α-androstan-3-one (mestanolone),

B. R = CH-OH: 17β-hydroxy-2-(hydroxymethylene)-17-methyl-5α-androstan-3-one (oxymetholone).

01/2008:1153

STAR ANISE

Anisi stellati fructus

DEFINITION

Dried composite fruit of *Illicium verum* Hooker fil.

Content:

– minimum 70 ml/kg of essential oil (anhydrous drug),

– minimum 86.0 per cent of *trans*-anethole in the essential oil.

CHARACTERS

The fruit carpels are brown.

Odour of anethole.

IDENTIFICATION

A. The fruit generally consists of 8 developed, one-seeded follicles, each 12-22 mm long and 6-12 mm high, radially arranged around a short, central, blunt-ending columella. In some fruits 1 or 2 follicles may be missing, but their position is clearly visible. Each follicle is boat-shaped or boot-shaped, with a greyish-brown dorsal surface showing rough markings and lateral surfaces bearing scars from the neighbouring follicles. One or more follicles are split open along the ventral suture, exposing a single, lenticular, shiny, reddish-brown seed about 8 mm in diameter. The markings on the dorsal surface are not visible from the ventral surface. Some of the follicles (1-3) may be imperfectly developed. Isolated follicles, pedicels and seeds may be present.

B. Reduce to a powder (355) (*2.9.12*). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: brown epicarpal cells, polygonal in surface view, with a strongly striated cuticle and occasional anomocytic stomata (*2.8.3*); fragments of the endocarp with long palisade-like cells; fragments of the mesocarp with large parenchymatous cells, vessels, oil-containing cells and groups of stone cells; fragments of the seed testa with palisade-like, sclerified, strongly pitted, yellow cells up to 200 µm long; fragments of the columella and the fruit stalk with strongly and irregularly thickened, star-shaped stone cells about 400 µm long and 150 µm wide; rhomboidal or rectangular crystals of calcium oxalate.

C. Examine the chromatograms obtained in test B for *Illicium anisatum* (= *I. religiosum*) and certain other *Illicium* spp.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weaker zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
———	———
Caffeic acid: a light blue fluorescent zone	
Quercitrin: a brownish-yellow fluorescent zone	
	A brownish-yellow fluorescent zone
———	———
	A greenish fluorescent zone
Hyperoside: a brownish-yellow fluorescent zone	A brownish-yellow fluorescent zone
Chlorogenic acid: a light blue fluorescent zone	
	A green fluorescent zone
Rutin: a brownish-yellow fluorescent zone	A brownish-yellow fluorescent zone
Reference solution	**Test solution**

TESTS

***Illicium anisatum* (= *I. religiosum*) and certain other *Illicium* spp.**

A. Adulteration with *Illicium anisatum* or certain other *Illicium* spp. is indicated by the presence of fruits mainly consisting of more than 8 follicles; fruits either smaller than 2.5 cm or greater than 3.5 cm; follicles with the suture edged with a thickening extending to the neighbouring follicle, or with dorsal markings visible from the ventral surface; follicles somewhat undulate and ending in a fine beak or a small, ventrally turned hook; follicles with a profile fitting into a rectangle; pedicels more than 5 cm long; seedless fruits; seeds either very flat or almost spherical.

B. Thin-layer chromatography (*2.2.27*).

Test solution. To 2.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methanol R* and heat under a reflux condenser in a water-bath at 60 °C for 5 min. Allow to cool and filter.

Reference solution. Dissolve 1 mg of *caffeic acid R*, 1 mg of *chlorogenic acid R*, 2.5 mg of *quercitrin R*, 2.5 mg of *rutin R* and 2.5 mg of *hyperoside R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R* (2-10 µm).

Mobile phase: *anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R* (11:11:26:100 *V/V/V/V*).

Application: 5 µl as bands.

Development: over a path of 6 cm.

Drying: in a current of warm air.

Detection: spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*; after 30 min, examine in ultraviolet light at 365 nm.

Results: the chromatogram obtained with the test solution shows no brownish-yellow fluorescent zone at or above the position of the zone due to quercitrin in the chromatogram obtained with the reference solution. No yellow fluorescent zone is seen at or above the position of the zone due to caffeic acid in the chromatogram obtained with the reference solution. No brownish-yellow fluorescent zone is seen directly above the zone due to hyperoside in the chromatogram obtained with the reference solution.

Water (*2.2.13*): maximum 100 ml/kg, determined by distillation on 20.0 g of the powdered drug (355) (*2.9.12*).

Total ash (*2.4.16*): maximum 4.0 per cent.

ASSAY

Essential oil. Carry out the determination of essential oils in herbal drugs (*2.8.12*). Use a 250 ml round-bottomed flask and 100 ml of *water R* as the distillation liquid. Immediately before the determination, reduce 50.0 g of the drug to a coarse powder (1400) (*2.9.12*) and mix. Further reduce about 10.0 g of this mixture to a finer powder (710) (*2.9.12*). Use 2.50 g of the powder for the determination. Introduce 0.50 ml of *xylene R* into the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

***trans*-Anethole**. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Dilute the mixture of essential oil and *xylene R* obtained in the assay of essential oil to 5.0 ml with *xylene R* by rinsing the apparatus.

Reference solution. To 1.0 ml of *xylene R* add 20 µl of *estragole R*, 20 mg of *α-terpineol R* and 60 µl of *anethole R*.

Column:

– *material*: fused silica;
– *size*: *l* = 30 m, Ø = 0.25 mm;
– *stationary phase*: *macrogol 20 000 R*.

Carrier gas: *helium for chromatography R*.

Flow rate: 1.0 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	60
	5 - 80	60 → 210
	80 - 95	210
Injection port		200
Detector		220

Detection: flame ionisation.

Injection: 1 µl.

Elution order: order indicated in the preparation of the reference solution.

System suitability: reference solution:

– *resolution*: minimum 5 between the peaks due to estragole and α-terpineol.

Use the retention times from the chromatogram obtained with the reference solution locate the components of the reference solution in the chromatogram obtained with the test solution.

Calculate the percentage content of *trans*-anethole. Disregard any peak due to the solvent or with an area less than 0.05 per cent of the area of the principal peak in the chromatogram obtained with the test solution.

01/2008:2108

STAR ANISE OIL

Anisi stellati aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the dry ripe fruits of *Illicium verum* Hook. fil.

CHARACTERS

Appearance: clear, colourless or pale yellow liquid.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 1 g of the substance to be examined in *toluene R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 µl of *linalol R*, 30 µl of *anisaldehyde R* and 200 µl of *anethole R* and in *toluene R* and dilute to 15 ml with the same solvent. Dilute 1 ml of this solution to 5 ml with *toluene R*.

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *ethyl acetate R, toluene R* (7:93 *V/V*).

Application: 5 µl as bands of 10 mm (for normal TLC plates) or 2 µl as bands of 10 mm (for fine particle TLC plates).

Development: over a path of 15 cm (for normal TLC plates) or over a path of 6 cm (for fine particle size plates).

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A quenching zone, partly separated
Anethole: a quenching zone	A very strong quenching zone (anethole)
_____	_____
Anisaldehyde: a quenching zone	A quenching zone (anisaldehyde)
_____	_____
Reference solution	**Test solution**

Detection B: spray with *methyl 4-acetylbenzoate reagent R* and heat at 100-105 °C for 10 min; examine the still hot plate in daylight within 10 min.

Results B: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A violet-brown zone, not fully separated
Anethole: a brown zone	A very strong brown zone (anethole)
_____	_____
Anisaldehyde: a yellow zone	A yellow zone (anisaldehyde)
_____	_____
Linalol: a grey zone	A grey zone (linalol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*): 0.979 to 0.985.

Refractive index (*2.2.6*): 1.553 to 1.556.

Freezing point (*2.2.18*): 15 °C to 19 °C.

Fenchone. Gas chromatography (*2.2.28*) as described in the test for chromatographic profile with the following modifications.

Test solution. Dissolve 400 µl of the substance to be examined in 2.0 ml of *hexane R*.

Reference solution (a). Dilute 10 µl of *fenchone R* to 1.2 g with *hexane R*.

Reference solution (b). Dilute 100 µl of reference solution (a) to 100 ml with *hexane R*.

System suitability: reference solution (b):

– *signal-to-noise ratio*: minimum 10 for the principal peak.

Limit:

– *fenchone*: maximum 0.01 per cent.

Pseudoisoeugenyl 2-methylbutyrate. Gas chromatography (*2.2.28*) as described in the test for chromatographic profile with the following modifications.

Test solution. The substance to be examined.

Reference solution (a). Dilute 10 mg of the test solution to 1.000 g with *hexane R*. Dilute 0.5 ml of this solution to 100 ml with *hexane R*.

Reference solution (b). Pseudoisoeugenyl 2-methylbutyrate for peak identification CRS.

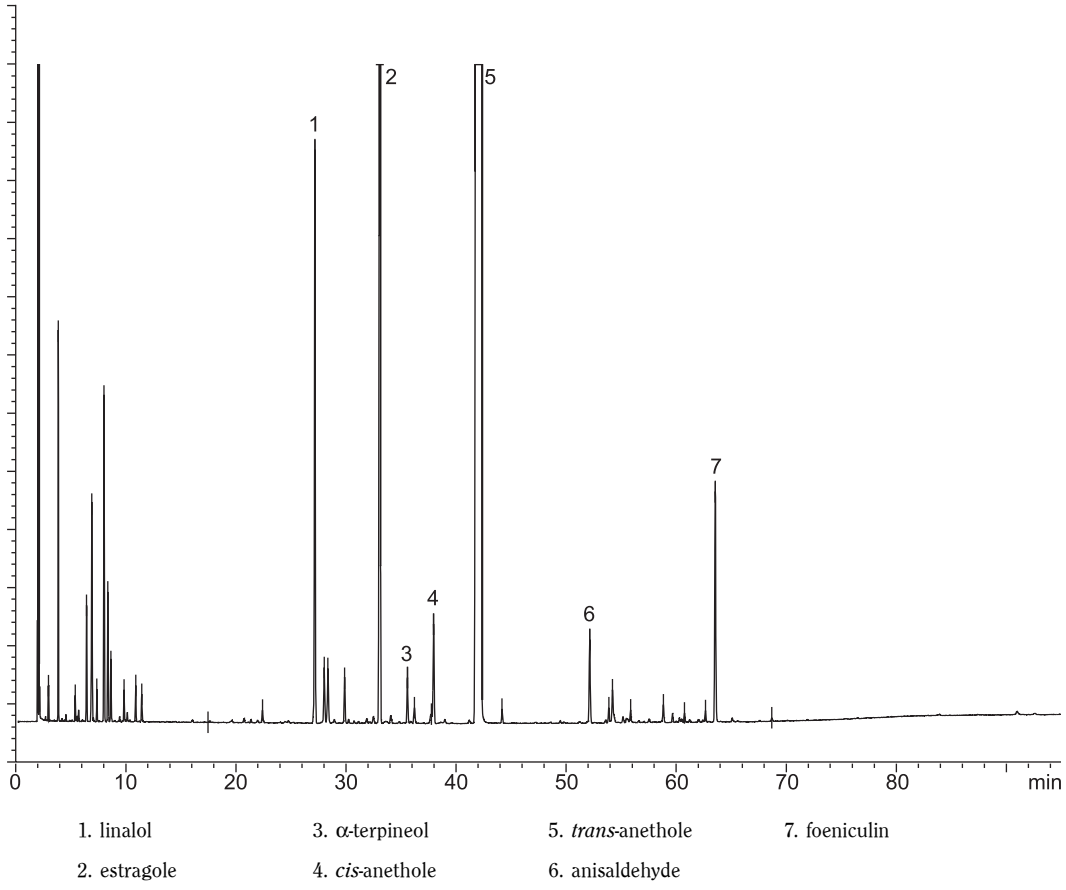


Figure 2108.-1. – *Chromatogram for the test for chromatographic profile of star anise oil*

System suitability:

– the chromatogram obtained with reference solution (b) is similar to the chromatogram provided with *pseudoisoeugenyl 2-methylbutyrate for peak identification CRS*.

– *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (a).

Limit: locate the peak due to pseudoisoeugenyl 2-methylbutyrate by comparison with the chromatogram provided with *pseudoisoeugenyl 2-methylbutyrate for peak identification CRS*.

– *pseudoisoeugenyl 2-methylbutyrate*: maximum 0.01 per cent.

Fatty oils and resinified essential oils (*2.8.7*). It complies with the test for fatty oils and resinified essential oils.

Chromatographic profile. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Dissolve 200 µl of the substance to be examined in 1.0 ml of *hexane R*.

Reference solution. To 1.0 ml of *hexane R*, add 20 µl of *linalol R*, 20 µl of *estragole R*, 20 µl of *α-terpineol R*, 60 µl of *anethole R* and 30 µl of *anisaldehyde R*.

Column:

– *material*: fused silica,

– *size*: *l* = 30 m, Ø = 0.25 mm,

– *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.0 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	60
	5 - 80	60 → 210
	80 - 95	210
Injection port		200
Detector		220

Detection: flame ionisation.

Injection: 0.2 µl.

Elution order: order indicated in the composition of the reference solution; record the retention times of these substances.

System suitability: reference solution:

– *resolution*: minimum 1.5 between the peaks due to estragole and α-terpineol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution and locate *cis*-anethole and foeniculin using the chromatogram shown in Figure 2108.-1 (disregard any peak due to hexane).

Determine the percentage content of these components. The percentages are within the following ranges:

– *linalol*: 0.2 per cent to 2.5 per cent,

– *estragole*: 0.5 per cent to 6.0 per cent,

– *α-terpineol*: less than 0.3 per cent,

– *cis-anethole*: 0.1 per cent to 0.5 per cent,

– *trans-anethole*: 86 per cent to 93 per cent,

– *anisaldehyde*: 0.1 per cent to 0.5 per cent,

– *foeniculin*: 0.1 per cent to 3.0 per cent.

STORAGE

In a well-filled, airtight container, protected from light and at a temperature not exceeding 25 °C.

01/2008:1267

STARCH, PREGELATINISED

Amylum pregelificatum

DEFINITION

Pregelatinised starch is prepared from *Maize starch (0344)*, *Potato starch (0355)* or *Rice starch (0349)* by mechanical processing in the presence of water, with or without heat, to rupture all or part of the starch granules and subsequent drying. It contains no added substances but it may be modified to render it compressible and to improve its flow characteristics.

CHARACTERS

Appearance: white or yellowish-white powder.

It swells in cold water.

IDENTIFICATION

A. Examined under a microscope using a mixture of equal volumes of *glycerol R* and *water R* it presents irregular, translucent, white or yellowish-white flakes or pieces with an uneven surface. Under polarised light (between crossed nicol prisms), starch granules with a distinct black cross intersecting at the hilum may be seen.

B. Disperse 0.5 g in 2 ml of *water R* without heating and add 0.05 ml of *iodine solution R1*. A reddish-violet to blue colour is produced.

TESTS

pH (*2.2.3*): 4.5 to 7.0.

Progressively add 3.0 g to 100.0 ml of *carbon dioxide-free water R*, stirring continuously. Determine the pH when a homogeneous solution is obtained.

Oxidising substances (*2.5.30*). It complies with the test for oxidising substances. Use a mixture of equal volumes of *water R* and *methanol R* as solvent.

Sulphur dioxide (*2.5.29*): maximum 50 ppm.

Iron (*2.4.9*): maximum 20 ppm.

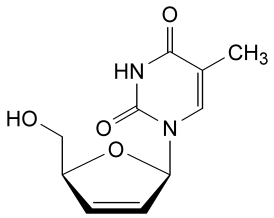
Dissolve the residue obtained in the test for sulphated ash in 20 ml of *dilute hydrochloric acid R*. Filter. 10 ml of the filtrate complies with the limit test for iron

Foreign matter. Examined under a microscope using a mixture of equal volumes of *glycerol R* and *water R*, not more than traces of matter other than starch granules are present.

Loss on drying (*2.2.32*): maximum 15.0 per cent, determined on 1.000 g by drying in an oven at 130 °C for 90 min.

Sulphated ash (*2.4.14*): maximum 0.6 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 bacteria and not more than 10^2 fungi per gram, determined by plate-count. It complies with the test for *Escherichia coli* (*2.6.13*).



LABELLING

The type of starch used as starting material is stated.

01/2008:2130

STAVUDINE

Stavudinum

$C_{10}H_{12}N_2O_4$ M_r 224.2

[3056-17-5]

DEFINITION

1-(2,3-Dideoxy-β-D-*glycero*-pent-2-enofuranosyl)-5-methylpyrimidine-2,4(1*H*,3*H*)-dione.

Content: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: soluble in water, sparingly soluble in ethanol (96 per cent), slightly soluble in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Specific optical rotation (*2.2.7*): – 39.5 to – 45.9 (anhydrous substance).

Dissolve 0.100 g in *water R* and dilute to 10.0 ml with the same solvent.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *stavudine CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *anhydrous ethanol R*, evaporate to dryness and record new spectra using the residues.

TESTS

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use or maintain at 2-8 °C until use.*

Test solution. Dissolve 25.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dilute 0.5 ml of the test solution to 100.0 ml with *water R*.

Reference solution (b). Dilute 20 ml of reference solution (a) to 100.0 ml with *water R*.

Reference solution (c). Dissolve 5.0 mg of *stavudine for system suitability CRS* (stavudine containing impurities A to H) in *water R* and dilute to 10.0 ml with the same solvent.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: mix 35 volumes of *acetonitrile for chromatography R* and 965 volumes of a 0.77 g/l solution of *ammonium acetate R*,

– *mobile phase B*: mix 250 volumes of *acetonitrile for chromatography R* and 750 volumes of a 0.77 g/l solution of *ammonium acetate R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 10	100	0
10 - 20	100 → 0	0 → 100
20 - 30	0	100
30 - 35	0 → 100	100 → 0
35 - 40	100	0

Flow rate: 2 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 10 µl.

Identification of impurities: use the chromatogram supplied with *stavudine for system suitability CRS* to identify the peaks due to impurities A to H.

Relative retention with reference to stavudine (retention time = 9.5-12.5 min): impurity A = about 0.3; impurity B = about 0.50; impurity C = about 0.53; impurity D = about 0.8; impurity E = about 1.1; impurity F = about 1.4; impurity G = about 1.8; impurity H = about 2.0.

System suitability: reference solution (c):

– *peak-to-valley ratio*: minimum 1.5, where H_p = height above the baseline of the peak due to impurity C and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity B; minimum 1.5, where H_p = height above the baseline of the peak due to impurity E and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to stavudine.

Limits:

– *correction factor*: for the calculation of content, multiply the peak area of impurity A by 0.7,

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (*2.5.12*): maximum 0.5 per cent, determined on 0.500 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use or maintain at 2-8 °C until use.*

Test solution. Dissolve 10.0 mg of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 50.0 ml with *water R*.

Reference solution (a). Dissolve 10.0 mg of *stavudine CRS* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 50.0 ml with *water R*.

Reference solution (b). Dissolve 5 mg of *thymine R* and 7.5 mg of *thymidine R* in *water R* and dilute to 100 ml with the same solvent. Dilute 10 ml of the solution to 50 ml with *water R*.

Column:

– *size*: *l* = 0.033 m, Ø = 4.0 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase: mix 5 volumes of *acetonitrile for chromatography R* and 95 volumes of a 0.77 g/l solution of *ammonium acetate R*.

Flow rate: 0.7 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 25 µl.

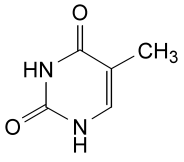
Retention time: stavudine = 2.8 min to 5.0 min.

System suitability:

– *symmetry factor*: maximum 1.6 for the peak due to stavudine in the chromatogram obtained with reference solution (a),

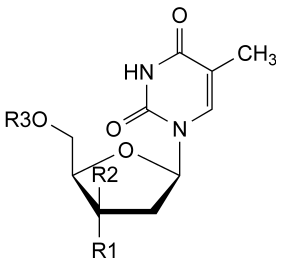
– *resolution*: minimum 3.5 between the peaks due to impurity A and impurity C in the chromatogram obtained with reference solution (b).

Calculate the percentage content of $C_{10}H_{12}N_2O_4$ using the chromatograms obtained with the test solution and reference solution (a) and the declared content of *stavudine CRS*.



STORAGE

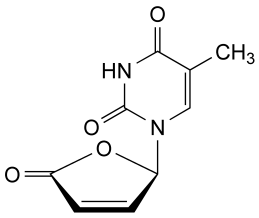
Protected from light and humidity.



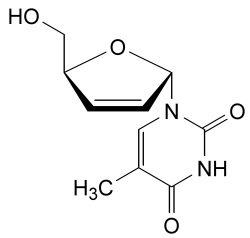
IMPURITIES

Specified impurities: A.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, E, F, G, H.*

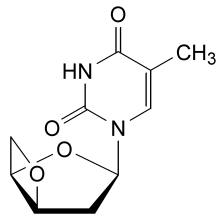


A. 5-methylpyrimidine-2,4(1*H*,3*H*)-dione (thymine),

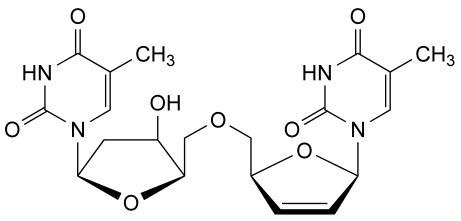


B. R1 = R3 = H, R2 = OH: 1-(2-deoxy-β-D-*threo*-pentofuranosyl)-5-methylpyrimidine-2,4(1*H*,3*H*)-dione (3′-epithymidine),

C. R1 = OH, R2 = R3 = H: 1-(2-deoxy-β-D-*erythro*-pentofuranosyl)-5-methylpyrimidine-2,4(1*H*,3*H*)-dione (thymidine),



H. R1 = H, R2 = OH, R3 = $CH(CH_3)_2$: 1-[2-deoxy-5-*O*-(1-methylethyl)-β-D-*erythro*-pentofuranosyl]-5-methylpyrimidine-2,4(1*H*,3*H*)-dione,



D. 1-[(2*R*)-5-oxo-2,5-dihydrofuran-2-yl]-5-methylpyrimidine-2,4(1*H*,3*H*)-dione,

E. 1-(2,3-dideoxy-α-D-*glycero*-pent-2-enofuranosyl)-5-methylpyrimidine-2,4(1*H*,3*H*)-dione (stavudine anomer α),

F. 1-(3,5-anhydro-2-deoxy-β-D-*threo*-pentofuranosyl)-5-methylpyrimidine-2,4(1*H*,3*H*)-dione,

G. 5′-*O*-[[(2*S*,5*R*)-5-(5-methyl-2,4-dioxo-3,4-dihydropyrimidine-1(2*H*)-yl)-2,5-dihydrofuran-2-yl]methyl]-3′-epithymidine.

STEARIC ACID

Acidum stearicum

DEFINITION

Mixture consisting mainly of stearic (octadecanoic) acid ($C_{18}H_{36}O_2$; M_r 284.5) and palmitic (hexadecanoic) acid ($C_{16}H_{32}O_2$; M_r 256.4) obtained from fats or oils of vegetable or animal origin.

Content:

Stearic acid 50	*Stearic acid*: 40.0 per cent to 60.0 per cent. *Sum of the contents of stearic and palmitic acids*: minimum 90.0 per cent.
Stearic acid 70	*Stearic acid*: 60.0 per cent to 80.0 per cent. *Sum of the contents of stearic and palmitic acids*: minimum 90.0 per cent.
Stearic acid 95	*Stearic acid*: minimum 90.0 per cent. *Sum of the contents of stearic and palmitic acids*: minimum 96.0 per cent.

CHARACTERS

Appearance: white or almost white, waxy, flaky crystals, white or almost white hard masses, or white or yellowish-white powder.

Solubility: practically insoluble in water, soluble in ethanol (96 per cent) and in light petroleum (50-70 °C).

IDENTIFICATION

A. It complies with the test for freezing point (see Tests).

B. Acid value (*2.5.1*): 194 to 212, determined on 0.5 g.

C. Examine the chromatograms obtained in the assay.

Results: the retention times of the principal peaks in the chromatogram obtained with the test solution are approximately the same as those of the principal peaks in the chromatogram obtained with the reference solution.

TESTS

Appearance. Heat the substance to be examined to about 75 °C. The resulting liquid is not more intensely coloured than reference solution Y_7 or BY_7 (*2.2.2, Method I*).

Acidity. Melt 5.0 g, shake for 2 min with 10 ml of hot *carbon dioxide-free water R*, cool slowly and filter. To the filtrate add 0.05 ml of *methyl orange solution R*. No red colour develops.

Iodine value (*2.5.4*). See Table 1474.-1.

Freezing point (*2.2.18*). See Table 1474.-1.

Table 1474.-1.

Type	Iodine value	Freezing point (°C)
Stearic acid 50	maximum 4.0	53 - 59
Stearic acid 70	maximum 4.0	57 - 64
Stearic acid 95	maximum 1.5	64 - 69

Nickel (*2.4.27*): maximum 1 ppm.

ASSAY

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. In a conical flask fitted with a reflux condenser, dissolve 0.100 g of the substance to be examined in 5 ml of *boron trifluoride-methanol solution R*. Boil under reflux for 10 min. Add 4.0 ml of *heptane R* through the condenser and boil again under reflux for 10 min. Allow to cool. Add 20 ml of a saturated solution of *sodium chloride R*. Shake and allow the layers to separate. Remove about 2 ml of the organic layer and dry it over 0.2 g of *anhydrous sodium sulphate R*. Dilute 1.0 ml of this solution to 10.0 ml with *heptane R*.

Reference solution. Prepare the reference solution in the same manner as the test solution using 50 mg of *palmitic acid CRS* and 50 mg of *stearic acid CRS* instead of the substance to be examined.

Column:

– *material*: fused silica;
– *size*: *l* = 30 m, Ø = 0.32 mm;
– *stationary phase*: *macrogol 20 000 R* (film thickness 0.5 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 2.4 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	70
	2 - 36	70 → 240
	36 - 41	240
Injection port		220
Detector		260

Detection: flame ionisation.

Injection: 1 µl.

Relative retention with reference to methyl stearate: methyl palmitate = about 0.88.

System suitability: reference solution:

– *resolution*: minimum 5.0 between the peaks due to methyl stearate and methyl palmitate.

LABELLING

The label states the type of stearic acid (50, 70, 95).

01/2008:1268
corrected 6.0

STEAROYL MACROGOLGLYCERIDES

Macrogolglyceridorum stearates

DEFINITION

Mixtures of monoesters, diesters and triesters of glycerol and monoesters and diesters of macrogols with a mean relative molecular mass between 300 and 4000.

They are obtained by partial alcoholysis of saturated oils containing mainly triglycerides of stearic (octadecanoic) acid, using macrogol, or by esterification of glycerol and macrogol with saturated fatty acids, or by mixture of glycerol esters and condensates of ethylene oxide with the fatty acids of these hydrogenated oils.

The hydroxyl value is within 15 units of the nominal value. The saponification value is within 10 units of the nominal value.

CHARACTERS

Appearance: pale yellow waxy solid.

Solubility: dispersible in warm water and in warm liquid paraffin, freely soluble in methylene chloride, soluble in warm anhydrous ethanol.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 20 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *hexane R, ether R* (30:70 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 0.1 g/l solution of *rhodamine B R* in *ethanol (96 per cent) R* and examine in ultraviolet light at 365 nm.

Results: the chromatogram shows a spot due to triglycerides with an R_F value of about 0.9 (R_{st} 1) and spots due to 1,3-diglycerides (R_{st} 0.7), to 1,2-diglycerides (R_{st} 0.6), to monoglycerides (R_{st} 0.1) and to esters of macrogol (R_{st} 0).

B. Hydroxyl value (see Tests).

C. Saponification value (see Tests).

D. Fatty acid composition (see Tests).

TESTS

Acid value (*2.5.1*): maximum 2.0, determined on 2.0 g.

Hydroxyl value (*2.5.3, Method A*): within 15 units of the nominal value, determined on 1.0 g.

Peroxide value (*2.5.5, Method A*): maximum 6.0, determined on 2.0 g.

Saponification value (*2.5.6*): within 10 units of the nominal value, determined on 2.0 g.

Alkaline impurities. Into a test-tube introduce 5.0 g and carefully add a mixture, neutralised if necessary with *0.01 M hydrochloric acid* or with *0.01 M sodium hydroxide,* of 0.05 ml of a 0.4 g/l solution of *bromophenol blue R* in *ethanol (96 per cent) R*, 0.3 ml of *water R* and 10 ml of *ethanol (96 per cent) R*. Shake and allow to stand. Not more than 1.0 ml of *0.01 M hydrochloric acid* is required to change the colour of the upper layer to yellow.

Free glycerol: maximum 3.0 per cent.

Dissolve 1.20 g in 25.0 ml of *methylene chloride R*. Heat if necessary. After cooling, add 100 ml of *water R*. Shake and add 25.0 ml of *periodic acetic acid solution R*. Shake and allow to stand for 30 min. Add 40 ml of a 75 g/l solution of *potassium iodide R*. Allow to stand for 1 min. Add 1 ml of *starch solution R*. Titrate the iodine with *0.1 M sodium thiosulphate*. Carry out a blank titration.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 2.3 mg of glycerol.

Composition of fatty acids. Gas chromatography (*2.4.22, Method A*).

Composition of the fatty-acid fraction of the substance:

– *lauric acid*: maximum 5.0 per cent;
– *myristic acid*: maximum 5.0 per cent;
– *stearic acid and palmitic acid*: different nominal amounts and minimum 90.0 per cent for the sum of $C_{18}H_{36}O_2$ and $C_{16}H_{32}O_2$.

Ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.0 g. Use a mixture of 30 volumes of *anhydrous methanol R* and 70 volumes of *methylene chloride R* as solvent.

Total ash (*2.4.16*): maximum 0.2 per cent.

LABELLING

The label states:

- the nominal hydroxyl value;
- the nominal saponification value;
- the type of the macrogol used (mean relative molecular mass) or the number of moles of ethylene oxide reacted per mole of substance (nominal value).

01/2008:0753

STEARYL ALCOHOL

Alcohol stearylicus

DEFINITION

Mixture of solid alcohols, mainly octadecan-1-ol ($C_{18}H_{38}O$; M_r 270.5), of animal or vegetable origin.

Content: minimum 95.0 per cent of $C_{18}H_{38}O$.

CHARACTERS

Appearance: white or almost white, unctuous flakes, granules or mass.

Solubility: practically insoluble in water, soluble in ethanol (96 per cent). When melted, it is miscible with fatty oils, with liquid paraffin and with melted wool fat.

IDENTIFICATION

Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (b).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution B_6 (*2.2.2, Method II*).

Dissolve 0.50 g in 20 ml of boiling *ethanol (96 per cent) R*. Allow to cool.

Melting point (*2.2.14*): 57 °C to 60 °C.

Acid value (*2.5.1*): maximum 1.0.

Hydroxyl value (*2.5.3, Method A*): 197 to 217.

Iodine value (*2.5.4, Method A*): maximum 2.0.

Dissolve 2.00 g in *methylene chloride R*, warming if necessary and dilute to 25 ml with the same solvent.

Saponification value (*2.5.6*): maximum 2.0.

ASSAY

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Dissolve 0.100 g of the substance to be examined in *ethanol (96 per cent) R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of *cetyl alcohol R* in *ethanol (96 per cent) R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 50 mg of *stearyl alcohol CRS* in *ethanol (96 per cent) R* and dilute to 5 ml with the same solvent.

Reference solution (c). Mix 1 ml of reference solution (a) and 1 ml of reference solution (b) and dilute to 10 ml with *ethanol (96 per cent) R*.

Column:

- *size*: *l* = 30 m, Ø = 0.32 mm,
- *stationary phase*: *poly(dimethyl)siloxane R* (1 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 20	150 → 250
	20 - 40	250
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 1 µl of the test solution and reference solutions (b) and (c).

System suitability: reference solution (c):

- *resolution*: minimum 5.0 between the peaks due to cetyl alcohol and stearyl alcohol.

Calculate the percentage content of $C_{18}H_{38}O$.

corrected 6.0

STRAMONIUM LEAF

Stramonii folium

DEFINITION

Dried leaf or dried leaf and flowering, and occasionally fruit-bearing, tops of *Datura stramonium* L. and its varieties.

Content: minimum 0.25 per cent of total alkaloids, expressed as hyoscyamine ($C_{17}H_{23}NO_3$; M_r 289.4) (dried drug). The alkaloids consist mainly of hyoscyamine with varying proportions of hyoscine (scopolamine).

CHARACTERS

Unpleasant odour.

IDENTIFICATION

A. The leaves are dark brownish-green or dark greyish-green, often much twisted and shrunken during drying, thin and brittle, ovate or triangular-ovate, dentately lobed with an acuminate apex and often unequal at the base. Young leaves are pubescent on the veins, older leaves are nearly glabrous. Stems are green or purplish-green, slender, curved and twisted, wrinkled longitudinally and sometimes wrinkled transversely, branched dichasially, with a single flower or an immature fruit in the fork. Flowers, on short pedicels, have a gamosepalous calyx with 5 lobes and trumpet-shaped brownish-white or

purplish corolla. The fruit is a capsule, usually covered with numerous short, stiff emergences; seeds are brown or black with a minutely pitted testa.

B. Reduce to a powder (355) (*2.9.12*). The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of leaf lamina showing epidermal cells with slightly wavy anticlinal walls and smooth cuticle; stomata are more frequent on the lower epidermis (anisocytic and anomocytic) (*2.8.3*); covering trichomes are conical, uniseriate with 3-5 cells and warty walls; glandular trichomes are short and clavate with heads formed by 2-7 cells; dorsiventral mesophyll, with a single layer of palisade cells and a spongy parenchyma containing cluster crystals of calcium oxalate; annularly and spirally thickened vessels. The powdered drug may also show: fibres and reticulately thickened vessels from the stems; subspherical pollen grains about 60-80 µm in diameter with 3 germinal pores and nearly smooth exine; fragments of the corolla with a papillose epidermis; seed fragments containing yellowish-brown, sinuous, thick-walled sclereids of testa; occasional prisms and microsphenoidal crystals of calcium oxalate.

C. Examine the chromatograms obtained in the Chromatography test.

Results: the principal zones in the chromatograms obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.

D. Shake 1 g of the powdered drug (180) (*2.9.12*) with 10 ml of *0.05 M sulphuric acid* for 2 min. Filter and add to the filtrate 1 ml of *concentrated ammonia R* and 5 ml of *water R*. Shake cautiously with 15 ml of *peroxide-free ether R*, avoiding the formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulphate R*. Filter and evaporate the ether in a porcelain dish. Add 0.5 ml of *nitric acid R* and evaporate to dryness on a water-bath. Add 10 ml of *acetone R* and, dropwise, a 30 g/l solution of *potassium hydroxide R* in *ethanol (96 per cent) R*. A deep violet colour develops.

TESTS

Chromatography. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (180) (*2.9.12*) add 10 ml of *0.05 M sulphuric acid*, shake for 15 min and filter. Wash the filter with *0.05 M sulphuric acid* until 25 ml of filtrate is obtained. To the filtrate add 1 ml of *concentrated ammonia R* and shake with 2 quantities, each of 10 ml, of *peroxide-free ether R*. If necessary, separate by centrifugation. Dry the combined ether layers over *anhydrous sodium sulphate R*, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *methanol R*.

Reference solution. Dissolve 50 mg of *hyoscyamine sulphate R* in 9 ml of *methanol R*. Dissolve 15 mg of *hyoscine hydrobromide R* in 10 ml of *methanol R*. Mix 3.8 ml of the hyoscyamine sulphate solution and 4.2 ml of the hyoscine hydrobromide solution and dilute to 10 ml with *methanol R*.

Plate: *TLC silica gel G plate R*.

Mobile phase: *concentrated ammonia R, water R, acetone R* (3:7:90 *V/V/V*).

Application: 10 µl and 20 µl, as bands of 20 mm by 3 mm, leaving 1 cm between the bands.

Development: over a path of 10 cm.

Drying: at 100-105 °C for 15 min and allow to cool.

Detection A: spray with *potassium iodobismuthate solution R2*, using about 10 ml for a plate 200 mm square, until the orange or brown zones become visible against a yellow background.

Results A: the zones in the chromatograms obtained with the test solution are similar in position (hyoscyamine in the lower third, hyoscine in the upper third of the chromatogram) and colour to those in the chromatograms obtained with the reference solution. The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µl of the test solution or near the starting point in the chromatogram obtained with 10 µl of the test solution.

Detection B: spray with *sodium nitrite solution R* until the coating is transparent; examine after 15 min.

Results B: the zones due to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

Foreign matter (*2.8.2*): maximum 3 per cent stems with a diameter greater than 5 mm.

Total ash (*2.4.16*): maximum 20.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 4.0 per cent.

ASSAY

a) Determine the loss on drying (*2.2.32*) on 2.000 g of the powdered drug (180) (*2.9.12*) by drying in an oven at 105 °C.

b) Moisten 10.0 g of the powdered drug (180) (*2.9.12*) with a mixture of 5 ml of *ammonia R*, 10 ml of *ethanol (96 per cent) R* and 30 ml of *peroxide-free ether R* and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of *chloroform R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator, dissolve the residue in *0.25 M sulphuric acid* and verify the absence of alkaloids using *potassium tetraiodomercurate solution R*. Concentrate the percolate to about 50 ml by distilling on a water-bath and transfer it to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than 3 quantities, each of 20 ml, of *0.25 M sulphuric acid*, separate the 2 layers by centrifugation if necessary and transfer the acid layers to a second separating funnel. Make the acid layer alkaline with *ammonia R* and shake with 3 quantities, each of 30 ml, of *chloroform R*. Combine the chloroform layers, add 4 g of *anhydrous sodium sulphate R* and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the anhydrous sodium sulphate with 3 quantities, each of 10 ml, of *chloroform R*. Add the washings to the chloroform extract, evaporate to dryness on a water-bath and heat in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *chloroform R*, add 20.0 ml of *0.01 M sulphuric acid* and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with *0.02 M sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, using the following expression:

$$\frac{57.88\,(20 - n)}{(100 - d)\,m}$$

d = loss on drying, as a percentage;

n = volume of *0.02 M sodium hydroxide*, in millilitres;

m = mass of drug, in grams.

STORAGE

Protected from moisture.

corrected 6.0

STRAMONIUM, PREPARED

Stramonii pulvis normatus

DEFINITION

Prepared stramonium is stramonium leaf powder (180) (*2.9.12*) adjusted, if necessary, by the addition of powdered lactose or stramonium leaf of lower alkaloidal content to contain 0.23 per cent to 0.27 per cent of total alkaloids, calculated as hyoscyamine ($C_{17}H_{23}NO_3$; M_r 289.4) with reference to the dried drug.

CHARACTERS

Greyish-green powder with an unpleasant odour.

IDENTIFICATION

A. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of leaf lamina showing epidermal cells with slightly wavy anticlinal walls and smooth cuticle; stomata are more frequent on the lower epidermis (anisocytic and anomocytic) (*2.8.3*); covering trichomes are conical, uniseriate with three to five cells and warty walls; glandular trichomes are short and clavate with heads formed by 2 to 7 cells; dorsiventral mesophyll, with a single layer of palisade cells and a spongy parenchyma containing cluster crystals of calcium oxalate; annularly and spirally thickened vessels. The powdered drug may also show the following: fibres and reticulately thickened vessels from the stem; subspherical pollen grains usually about 60 µm to 80 µm in diameter with three germinal pores and nearly smooth exine; fragments of the corolla with papillose epidermis; seed fragments containing yellowish-brown, sinuous, thick-walled sclereids of testa; occasional prisms and microsphenoidal crystals of calcium oxalate. Examined in *glycerol (85 per cent) R*, it may be seen to contain lactose crystals.

B. Examine the chromatograms obtained in the chromatography test. The principal zones in the chromatogram obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.

C. Shake 1 g with 10 ml of *0.05 M sulphuric acid* for 2 min. Filter and add to the filtrate 1 ml of *concentrated ammonia R* and 5 ml of *water R*. Shake cautiously with 15 ml of *peroxide-free ether R* to avoid the formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulphate R*. Filter and evaporate the ether in a porcelain dish. Add 0.5 ml of *nitric acid R* and evaporate to dryness on a water-bath. Add 10 ml of *acetone R* and, dropwise, a 30 g/l solution of *potassium hydroxide R* in *alcohol R*. A deep violet colour develops.

TESTS

Chromatography. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution. To 1.0 g add 10 ml of *0.05 M sulphuric acid*, shake for 15 min and filter. Wash the filter with *0.05 M sulphuric acid* until 25 ml of filtrate is obtained. To the filtrate add 1 ml of *concentrated ammonia R* and shake with two quantities, each of 10 ml, of *peroxide-free ether R*. If necessary, separate by centrifugation. Dry the combined ether layers over *anhydrous sodium sulphate R*, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *methanol R*.

Reference solution. Dissolve 50 mg of *hyoscyamine sulphate R* in 9 ml of *methanol R*. Dissolve 15 mg of *hyoscine hydrobromide R* in 10 ml of *methanol R*. Mix 3.8 ml of the hyoscyamine sulphate solution and 4.2 ml of the hyoscine hydrobromide solution and dilute to 10 ml with *methanol R*.

Apply separately to the plate as bands 20 mm by 3 mm 10 µl and 20 µl of each solution, leaving 1 cm between the bands. Develop over a path of 10 cm using a mixture of 3 volumes of *concentrated ammonia R*, 7 volumes of *water R* and 90 volumes of *acetone R*. Dry the plate at 100 °C to 105 °C for 15 min, allow to cool and spray with *potassium iodobismuthate solution R2*, using about 10 ml for a plate 200 mm square, until the orange or brown zones become visible against a yellow background. The zones in the chromatograms obtained with the test solution are similar to those in the chromatograms obtained with the reference solution with respect to their position (hyoscyamine in the lower third, hyoscine in the upper third of the chromatogram) and their colour. The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µl of the test solution or near the starting point in the chromatogram obtained with 10 µl of the test solution. Spray the plate with *sodium nitrite solution R* until the coating is transparent. Examine after 15 min. The zones corresponding to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

Loss on drying (*2.2.32*). Not more than 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Total ash (*2.4.16*). Not more than 20.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*). Not more than 4.0 per cent.

ASSAY

a) Determine the loss on drying (*2.2.32*) on 2.000 g by drying in an oven at 105 °C.

b) Moisten 10.0 g with a mixture of 5 ml of *ammonia R*, 10 ml of *alcohol R* and 30 ml of *peroxide-free ether R* and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of *chloroform R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator, dissolve the residue in *0.25 M sulphuric acid* and verify the absence of alkaloids using *potassium tetraiodomercurate solution R*. Concentrate the percolate to about 50 ml by distilling on a water-bath and transfer it to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than three quantities, each of 20 ml, of *0.25 M sulphuric acid*, separate the two layers by centrifugation if necessary and transfer the acid layers to a second separating funnel. Make the acid layer alkaline with *ammonia R* and shake with three quantities, each of 30 ml, of *chloroform R*. STREPTOKINASE BULK SOLUTION

Streptokinasi solutio ad praeparationem

DEFINITION

Streptokinase bulk solution is a preparation of a protein obtained from culture filtrates of certain strains of haemolytic *Streptococcus* group C; it has the property of combining with human plasminogen to form plasminogen activator. It may contain buffer salts and other auxiliary substances. The potency is not less than 510 IU per microgram of nitrogen.

PRODUCTION

If intended for use in the manufacture of parenteral dosage forms, the method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test.

Abnormal toxicity (*2.6.9*). Inject into each mouse a quantity of the preparation to be examined (if necessary, dilute with *water for injections R*) equivalent to 50 000 IU of streptokinase activity in 0.5 ml, the injection lasting 15-20 s.

CHARACTERS

Appearance: clear, colourless liquid.

IDENTIFICATION

A. Place 0.5 ml of citrated human plasma in a haemolysis tube maintained in a water-bath at 37 °C. Add 0.1 ml of a dilution of the preparation to be examined containing 10 000 IU of streptokinase activity per millilitre in *phosphate buffer solution pH 7.2 R* and 0.1 ml of a solution of *human thrombin R* containing 20 IU/ml in *phosphate buffer solution pH 7.2 R*. Mix immediately. A clot forms and lyses within 30 min. Repeat the procedure using citrated bovine plasma. The clot does not lyse within 60 min.

B. Dissolve 0.6 g of agar in 50.0 ml of *barbital buffer solution pH 8.6 R1*, heating until a clear solution is obtained. Use glass plates 50 mm square (transparency mounts) free from traces of grease. Using a pipette, apply to each plate 4 ml of the agar solution. Maintain the plates horizontal. Allow to cool. Pierce a cavity 6 mm in diameter in the centre of the agar and an appropriate number of cavities (not exceeding 6) at distances of 11 mm from the central cavity. Remove the residual agar from the cavities using a cannula connected to a vacuum pump. Using pipettes graduated in microlitres, place in the central cavity about 80 µl of goat or rabbit antistreptokinase serum containing 10 000 units of antistreptokinase activity per millilitre; place in each of the surrounding cavities about 80 µl of a dilution of the preparation to be examined containing 125 000 IU of streptokinase activity per millilitre. Allow the plates to stand in a humidified tank for 24 h. Only one precipitation arc appears and it is well defined and localised between the application point of the serum and each cavity containing the solution of the preparation to be examined.

TESTS

pH (*2.2.3*): 6.8 to 7.5.

Dilute the preparation to be examined in *carbon dioxide-free water R* to obtain a solution containing 5000 IU of streptokinase activity per millilitre.

Streptodornase: maximum 10 IU of streptodornase activity per 100 000 IU of streptokinase activity.

Test solution. Dilute the preparation to be examined in *imidazole buffer solution pH 6.5 R* to obtain a solution containing 150 000 IU of streptokinase activity per millilitre.

Reference solution. Dissolve in *imidazole buffer solution pH 6.5 R* a reference preparation of streptodornase, calibrated in International Units against the International Standard of streptodornase, to obtain a solution containing 20 IU of streptodornase activity per millilitre. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

To each of 8 numbered centrifuge tubes, add 0.5 ml of a 1 g/l solution of *sodium deoxyribonucleate R* in *imidazole buffer solution pH 6.5 R*. To tube number 1 and tube number 2 add 0.25 ml of *imidazole buffer solution pH 6.5 R*, 0.25 ml of the test solution and, immediately, 3.0 ml of perchloric acid (25 g/l $HClO_4$). Mix, centrifuge at about 3000 *g* for 5 min and measure the absorbances (*2.2.25*) of the supernatant liquids at 260 nm, using as the compensation liquid a mixture of 1.0 ml of *imidazole buffer solution pH 6.5 R* and 3.0 ml of perchloric acid (25 g/l $HClO_4$) (absorbances A_1 and A_2). To

the other 6 tubes (numbers 3 to 8) add 0.25 ml, 0.25 ml, 0.125 ml, 0.125 ml, 0 ml and 0 ml respectively of *imidazole buffer solution pH 6.5 R*; add to each tube 0.25 ml of the test solution and 0 ml, 0 ml, 0.125 ml, 0.125 ml, 0.25 ml and 0.25 ml respectively of the reference solution. Mix the contents of each tube and heat at 37 °C for 15 min. To each tube add 3.0 ml of perchloric acid (25 g/l $HClO_4$), mix and centrifuge. Measure the absorbances (*2.2.25*) of the supernatant liquids at 260 nm using the compensation liquid described above (absorbances A_3 to A_8). The absorbances comply with the following requirement:

$$(A_3 + A_4) - (A_1 + A_2) < \frac{(A_5 + A_6 + A_7 + A_8)}{2} - (A_3 + A_4)$$

Streptolysin. In a haemolysis tube, use a quantity of the preparation to be examined equivalent to 500 000 IU of streptokinase activity and dilute to 0.5 ml with a mixture of 1 volume of *phosphate buffer solution pH 7.2 R* and 9 volumes of a 9 g/l solution of *sodium chloride R*. Add 0.4 ml of a 23 g/l solution of *sodium thioglycollate R*. Heat in a water-bath at 37 °C for 10 min. Add 0.1 ml of a solution of a reference preparation of human antistreptolysin O containing 5 IU/ml. Heat at 37 °C for 5 min. Add 1 ml of *rabbit erythrocyte suspension R*. Heat at 37 °C for 30 min. Centrifuge at about 1000 *g*. In the same manner, prepare a haemolysis tube in which the solution of the preparation to be examined has been replaced by 0.5 ml of a mixture of 1 volume of *phosphate buffer solution pH 7.2 R* and 9 volumes of a 9 g/l solution of *sodium chloride R*. Measure the absorbances (*2.2.25*) of the supernatant liquids at 550 nm. The absorbance of the test solution is not more than 50 per cent greater than that of the reference solution.

Bacterial endotoxins (*2.6.14*): less than 0.02 IU per 100 IU of streptokinase activity, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Nitrogen (*2.5.9*).

Potency

The potency of streptokinase is determined by comparing its capacity to activate plasminogen to form plasmin with the same capacity of a reference preparation of streptokinase calibrated in International Units; the formation of plasmin is determined using a suitable chromogenic substrate.

The International Unit is the activity of a stated amount of the International Standard for streptokinase. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Reference and test solutions

Prepare 2 independent series of 4 dilutions of each of the substance to be examined and of the reference preparation of streptokinase in *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R1*, in the range of 0.5-4.0 IU/ml. Prepare and maintain all solutions at 37 °C.

Substrate solution

Mix 1.0 ml of *tris(hydroxymethyl)aminomethane buffer solution pH 7.4 R* with 1.0 ml of *chromogenic substrate R3*.

Add 5 µl of a 100 g/l solution of *polysorbate 20 R*. Keep at 37 °C in a water-bath. Immediately before commencing the activation assay, add 45 µl of a 1 mg/ml solution of *human plasminogen R*.

Method

Analyse each streptokinase dilution, maintained at 37 °C, in duplicate. Initiate the activation reaction by adding 60 µl of each dilution to 40 µl of substrate solution. For blank wells, use 60 µl of *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R1* instead of the reference and test solutions. Allow the reaction to proceed at 37 °C for 20 min and read the absorbance (*2.2.25*) at 405 nm. If a suitable thermostatted plate reader is available, this may be used to monitor the reaction. Alternatively, it may be necessary to stop the reaction after 20 min using 50 µl of a 50 per cent *V/V* solution of *glacial acetic acid R*. Best results are obtained when the absorbance for the highest streptokinase concentration is between 0.1 and 0.2 (after blank subtraction). If necessary, adjust the time of incubation in order to reach this range of absorbances.

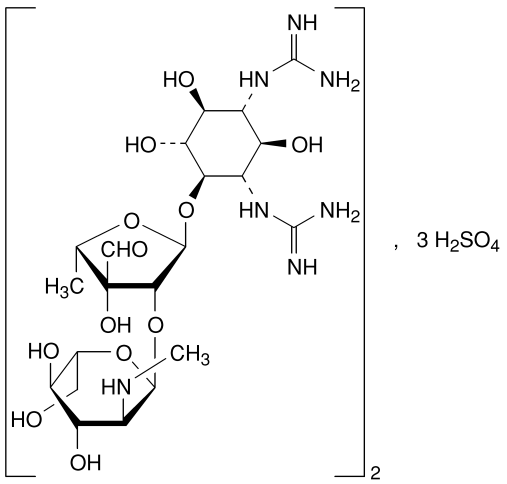
Calculate the regression of the absorbance on log concentrations of the solutions of the substance to be examined and of the reference preparation of streptokinase and calculate the potency of the substance to be examined using the usual statistical methods for parallel-line assays.

The estimated potency is not less than 90 per cent and not more than 111 per cent of the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent of the stated potency.

STORAGE

In a sealed container, protected from light and at a temperature of – 20 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING



The label states:

- the number of International Units of streptokinase activity per milligram, calculated with reference to the dried preparation,
- the name and quantity of any added substance,
- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

01/2008:0053

STREPTOMYCIN SULPHATE

Streptomycini sulfas

$C_{42}H_{84}N_{14}O_{36}S_3$ M_r 1457

[3810-74-0]

DEFINITION

Streptomycin sulphate is bis[*N,N'*-bis(aminoiminomethyl)-4-*O*-[5-deoxy-2-*O*-[2-deoxy-2-(methylamino)-α-L-glucopyranosyl]-3-*C*-formyl-α-L-lyxofuranosyl]-D-streptamine] trisulphate,

a substance produced by the growth of certain strains of *Streptomyces griseus* or obtained by any other means. Stabilisers may be added. The potency is not less than 720 IU/mg, calculated with reference to the dried substance.

PRODUCTION

It is produced by methods of manufacture designed to eliminate or minimise substances lowering blood pressure.

The method of manufacture is validated to demonstrate that the product if tested would comply with the following test:

Abnormal toxicity (*2.6.9*). Inject into each mouse 1 mg of the substance to be examined dissolved in 0.5 ml of *water for injections R*.

CHARACTERS

A white or almost white powder, hygroscopic, very soluble in water, practically insoluble in ethanol.

IDENTIFICATION

A. Examine by thin-layer chromatography (*2.2.27*), using a plate coated with a 0.75 mm layer of the following mixture: mix 0.3 g of *carbomer R* with 240 ml of *water R* and allow to stand, with moderate shaking, for 1 h; adjust to pH 7 by the gradual addition, with continuous shaking, of *dilute sodium hydroxide solution R* and add 30 g of *silica gel H R*.

   Heat the plate at 110 °C for 1 h, allow to cool and use immediately.

   Test solution. Dissolve 10 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

   Reference solution (a). Dissolve 10 mg of *streptomycin sulphate CRS* in *water R* and dilute to 10 ml with the same solvent.

   Reference solution (b). Dissolve 10 mg of *kanamycin monosulphate CRS*, 10 mg of *neomycin sulphate CRS* and 10 mg of *streptomycin sulphate CRS* in *water R* and dilute to 10 ml with the same solvent.

   Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm using a 70 g/l solution of *potassium dihydrogen phosphate R*. Dry the plate in a current of warm air, and spray with a mixture of equal volumes of a 2 g/l solution of *1,3-dihydroxynaphthalene R* in *alcohol R* and a 460 g/l solution of *sulphuric acid R*. Heat at 150 °C for 5 min to 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. Dissolve 5 mg to 10 mg in 4 ml of *water R* and add 1 ml of *1 M sodium hydroxide*. Heat in a water-bath for 4 min. Add a slight excess of *dilute hydrochloric acid R* and 0.1 ml of *ferric chloride solution R1*. A violet colour develops.

C. Dissolve 0.1 g in 2 ml of *water R*, add 1 ml of *α-naphthol solution R* and 2 ml of a mixture of equal volumes of *strong sodium hypochlorite solution R* and *water R*. A red colour develops.

D. Dissolve about 10 mg in 5 ml of *water R* and add 1 ml of *1 M hydrochloric acid*. Heat in a water-bath for 2 min. Add 2 ml of a 5 g/l solution of *α-naphthol R* in *1 M sodium hydroxide* and heat in a water-bath for 1 min. A faint yellow colour develops.

E. It gives the reactions of sulphates (*2.3.1*).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is not more intensely coloured than intensity 3 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*). Allow to stand protected from light, at a temperature of about 20 °C for 24 h. Solution S is not more opalescent than reference suspension II (*2.2.1*).

pH (*2.2.3*). The pH of solution S is 4.5 to 7.0.

Methanol. Examine by gas chromatography (*2.2.28*).

Test solution. Dissolve 1.00 g of the substance to be examined in *water R* and dilute to 25.0 ml with the same solvent.

Reference solution. Dilute 12.0 mg of *methanol R* to 100 ml with *water R*.

The chromatographic procedure may be carried out using:

– a column 1.5 m to 2.0 m long and 2 mm to 4 mm in internal diameter, packed with *ethylvinylbenzene-divinylbenzene copolymer R* (150 µm to 180 µm),
– *nitrogen for chromatography R* as the carrier gas at a constant flow rate of 30 ml to 40 ml per minute,
– a flame-ionisation detector.

Maintain the column at a constant temperature between 120 °C and 140 °C and the injection port and the detector at a temperature at least 50 °C higher than that of the column. Inject the test solution and the reference solution. The area of the peak corresponding to methanol in the chromatogram obtained with the test solution is not greater than the area of the peak in the chromatogram obtained with the reference solution (0.3 per cent).

Streptomycin B. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in a freshly prepared mixture of 3 volumes of *sulphuric acid R* and 97 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents. Heat under a reflux condenser for 1 h, cool, rinse the condenser with *methanol R* and dilute to 20 ml with the same solvent (10 g/l solution).

Reference solution. Dissolve 36 mg of *mannose R* in a freshly prepared mixture of 3 volumes of *sulphuric acid R* and 97 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents. Heat under a reflux condenser for 1 h, cool, rinse the condenser with *methanol R* and dilute to 50 ml with the same solvent. Dilute 5 ml of the solution to 50 ml with *methanol R* (0.3 g/l solution expressed as strepto-mycin B; 1 mg of *mannose R* is equivalent to 4.13 mg of streptomycin B).

Apply separately to the plate 10 µl of each solution. Develop over a path of 13 cm to 15 cm using a mixture of 25 volumes of *glacial acetic acid R*, 25 volumes of *methanol R* and 50 volumes of *toluene R*. Allow the plate to dry in air and spray with a freshly prepared mixture of equal volumes of a 2 g/l solution of *1,3-dihydroxynaphthalene R* in *alcohol R* and a 20 per cent *V/V* solution of *sulphuric acid R* and heat at 110 °C for 5 min. Any spot corresponding to streptomycin B in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (3.0 per cent).

Loss on drying (*2.2.32*). Not more than 7.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.1 kPa for 24 h.

Sulphated ash (*2.4.14*). Not more than 1.0 per cent, determined on 1.000 g.

Sulphate. 18.0 per cent to 21.5 per cent of sulphate (SO_4), calculated with reference to the dried substance. Dissolve 0.250 g in 100 ml of *water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 ml of *0.1 M barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with *0.1 M sodium edetate* adding 50 ml of *alcohol R* when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears.

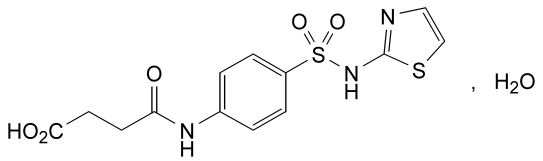
1 ml of *0.1 M barium chloride* is equivalent to 9.606 mg of sulphate (SO_4).

Colorimetric test. Dry the substance to be examined and *streptomycin sulphate CRS* at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.1 kPa for 24 h. Dissolve 0.100 g of the dried substance to be examined in *water R* and dilute to 100.0 ml with the same solvent. Prepare a reference solution in the same manner using 0.100 g of the dried *streptomycin sulphate CRS*. Place 5.0 ml of each solution separately in two volumetric flasks and in a third flask place 5 ml of *water R*. To each flask add 5.0 ml of *0.2 M sodium hydroxide* and heat for exactly 10 min in a water-bath. Cool in ice for exactly 5 min, add 3 ml of a 15 g/l solution of *ferric ammonium sulphate R* in *0.5 M sulphuric acid*, dilute to 25.0 ml with *water R* and mix. Exactly 20 min after the addition of the ferric ammonium sulphate solution measure the absorbance (*2.2.25*) of the test solution and the reference solution in a 2 cm cell at the maximum at 525 nm, using as compensation liquid the solution prepared from 5 ml of *water R*. The absorbance of the test solution is not less than 90.0 per cent of that of the reference solution.

Bacterial endotoxins (*2.6.14*): less than 0.25 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*).



STORAGE

Store in an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

01/2008:0357
corrected 6.0

SUCCINYLSULFATHIAZOLE

Succinylsulfathiazolum

$C_{13}H_{13}N_3O_5S_2,H_2O$ M_r 373.4
[116-43-8]

DEFINITION

4-Oxo-4-[[4-(thiazol-2-ylsulphamoyl)phenyl]amino]butanoic acid monohydrate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish-white, crystalline powder.

Solubility: very slightly soluble in water, slightly soluble in acetone and in ethanol (96 per cent). It dissolves in solutions of alkali hydroxides and carbonates.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *succinylsulfathiazole CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in hot *water R*, allow to crystallise, dry the crystals carefully between 2 sheets of filter paper and prepare new discs.

B. To 2 g add 10 ml of *water R* and 10 ml of *strong sodium hydroxide solution R* and boil for 10 min. Cool and adjust to pH 3.0 with *hydrochloric acid R1*. Cool, adjust to pH 7.0 with *sodium hydrogen carbonate solution R* and filter. The precipitate, washed with *water R* and dried at 100-105 °C, melts (*2.2.14*) at 196 °C to 204 °C. Introduce the capillary containing the precipitate into the bath at a temperature of 190 °C.

C. Heat 0.1 g in a test-tube over a small flame. Fumes are evolved which blacken *lead acetate paper R*.

D. Place 0.1 g in a borosilicate-glass tube of about 30 ml, add 0.5 g of *hydroquinone R* and 1 ml of *sulphuric acid R*. Heat in a glycerin bath at 135 °C for 10 min, mixing at the beginning of heating to obtain a homogeneous liquid phase. Allow to cool and place in iced water. Add carefully and with shaking 15 ml of *water R*. Add 5 ml of *toluene R*, shake for 5-10 s and allow to stand for 2 min; promote separation of the 2 layers using a stirrer. The upper layer (toluene) is intense pink.

E. Dissolve about 10 mg of the precipitate obtained in identification test B in 200 ml of *0.1 M hydrochloric acid*. 2 ml of this solution gives the reaction of primary aromatic amines (*2.3.1*) with formation of an orange precipitate.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_4 or BY_4 (*2.2.2, Method II*).

Dissolve 1.0 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 15 ml of *water R*.

Acidity. To 2.0 g add 20 ml of *water R*, shake continuously for 30 min and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R*. Not more than 2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Sulfathiazole and other primary aromatic amines: maximum 0.75 per cent.

Dissolve 20 mg in a mixture of 3.5 ml of *water R*, 6 ml of *dilute hydrochloric acid R* and 25 ml of *ethanol (96 per cent) R*, previously cooled to 15 °C. Place immediately in iced water and add 1 ml of a 2.5 g/l solution of *sodium nitrite R*. Allow to stand for 3 min, add 2.5 ml of a 40 g/l solution of *sulphamic acid R* and allow to stand for 5 min. Add 1 ml of a 4 g/l solution of *naphthylethylenediamine dihydrochloride R* and dilute to 50 ml with *water R*. The absorbance (*2.2.25*) measured at 550 nm is not greater than that of a standard prepared at the same time and in the same manner using a mixture of 1.5 ml of a 100 ml aqueous solution containing 10 mg of *sulfathiazole R* and 0.5 ml of *hydrochloric acid R*; 2 ml of *water R*; 6 ml of *dilute hydrochloric acid R*; and 25 ml of *ethanol (96 per cent) R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test D. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

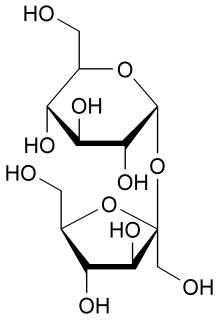
Loss on drying (*2.2.32*): 4.0 per cent to 5.5 per cent, determined on 1.00 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 100 ml of a mixture of 1 volume of *hydrochloric acid R* and 2 volumes of *water R*. Heat under a reflux condenser for 1 h. Carry out the determination of primary aromatic amino-nitrogen (*2.5.8*), determining the end-point electrometrically.

1 ml of *0.1 M sodium nitrite* is equivalent to 35.54 mg of $C_{13}H_{13}N_3O_5S_2$.



STORAGE

Protected from light.

01/2008:0204
corrected 6.0

SUCROSE

Saccharum

$C_{12}H_{22}O_{11}$ M_r 342.3
[57-50-1]

DEFINITION

β-D-Fructofuranosyl α-D-glucopyranoside.

It contains no additives.

CHARACTERS

Appearance: white or almost white, crystalline powder, or lustrous, colourless or white or almost white crystals.

Solubility: very soluble in water, slightly soluble in ethanol (96 per cent), practically insoluble in anhydrous ethanol.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *sucrose CRS*.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *sucrose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg each of *fructose CRS, glucose CRS, lactose CRS* and *sucrose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Plate: *TLC silica gel G plate R*.

Mobile phase: *cold saturated boric acid solution R*, 60 per cent *V/V* solution of *glacial acetic acid R, ethanol R, acetone R, ethyl acetate R* (10:15:20:60:60 *V/V/V/V/V*).

Application: 2 µl.

Development: in an unsaturated tank over a path of 15 cm.

Drying: in a current of warm air.

Detection: spray with a solution of 0.5 g of *thymol R* in a mixture of 5 ml of *sulphuric acid R* and 95 ml of *alcohol R*. Heat the plate at 130 °C for 10 min.

System suitability: the chromatogram obtained with reference solution (b) shows 4 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dilute 1 ml of solution S (see Tests) to 100 ml with *water R*. To 5 ml of the solution add 0.15 ml of freshly prepared *copper sulphate solution R* and 2 ml of freshly prepared *dilute sodium hydroxide solution R*. The solution is blue and clear and remains so after boiling. To the hot solution add 4 ml of *dilute hydrochloric acid R* and boil for 1 min. Add 4 ml of *dilute sodium hydroxide solution R*. An orange precipitate is formed immediately.

TESTS

Solution S. Dissolve 50.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*).

Conductivity (*2.2.38*): maximum 35 µS·cm^{-1}.

Dissolve 31.3 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent. Measure the conductivity of the solution (C_1), while gently stirring with a magnetic stirrer, and that of the water used for preparing the solution (C_2). The readings must be stable within 1 per cent over a period of 30 s. Calculate the conductivity of the solution of the substance to be examined from the following expression:

$$C_1 - 0.35\,C_2$$

Specific optical rotation (*2.2.7*): + 66.3 to + 67.0.

Dissolve 26.0 g in *water R* and dilute to 100.0 ml with the same solvent.

Colour value: maximum 45.

Dissolve 50.0 g in 50.0 ml of *water R*. Mix, filter (diameter of pores 0.45 µm) and degas. Measure the absorbance (*2.2.25*) at 420 nm, using a cell of minimum 4 cm (a cell length of 10 cm or more is preferred).

Calculate the colour value using the following expression:

$$\frac{A \times 1000}{b \times c}$$

A = absorbance measured at 420 nm;

b = path length in centimetres;

c = concentration of the solution, in grams per millilitre, calculated from the refractive index (*2.2.6*) of the solution; use Table 0204.-1 and interpolate the values if necessary.

Table 0204.-1

n_D^{20}	c (g/ml)
1.4138	0.570
1.4159	0.585
1.4179	0.600
1.4200	0.615
1.4221	0.630
1.4243	0.645
1.4264	0.661

System suitability:

– *repeatability*: the absolute difference between 2 results is not greater than 3.

Dextrins. If intended for use in the preparation of large-volume infusions, it complies with the test for dextrins. To 2 ml of solution S add 8 ml of *water R*, 0.05 ml of *dilute hydrochloric acid R* and 0.05 ml of *0.05 M iodine*. The solution remains yellow.

Reducing sugars. To 5 ml of solution S in a test-tube about 150 mm long and 16 mm in diameter add 5 ml of *water R*, 1.0 ml of *1 M sodium hydroxide* and 1.0 ml of a 1 g/l solution of *methylene blue R*. Mix and place in a water-bath. After exactly 2 min, take the tube out of the bath and examine the solution immediately. The blue colour does not disappear completely. Ignore any blue colour at the air/solution interface.

Sulphites: maximum 10 ppm, calculated as SO_2.

Determine the sulphites content by a suitable enzymatic method based on the following reactions. Sulphite is oxidised by sulphite oxidase to sulphate and hydrogen peroxide which in turn is reduced by nicotinamide-adenine dinucleotide-peroxidase in the presence of reduced nicotinamide-adenine dinucleotide (NADH). The amount of NADH oxidised is proportional to the amount of sulphite.

Test solution. Dissolve 4.0 g of the substance to be examined in freshly prepared *distilled water R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dissolve 4.0 g of the substance to be examined in freshly prepared *distilled water R*, add 0.5 ml of *sulphite standard solution (80 ppm SO_2) R* and dilute to 10.0 ml with freshly prepared *distilled water R*.

Blank solution. Freshly prepared *distilled water R*.

Separately introduce 2.0 ml each of the test solution, the reference solution and the blank in 10 mm cuvettes and add the reagents as described in the instructions in the kit for sulphite determination. Measure the absorbance (*2.2.25*) at the absorption maximum at about 340 nm before and at the end of the reaction time and subtract the value obtained with the blank.

The absorbance difference of the test solution is not greater than half the absorbance difference of the reference solution.

Lead: maximum 0.5 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Dissolve 1.5 g of the substance to be examined in 1.5 ml of *deionised distilled water R* in a digestion tube. Add 0.75 ml of *lead-free nitric acid R1* and slowly warm to 90-95 °C, avoiding spattering. Heat for about 60 min, add again 0.75 ml of *lead-free nitric acid R1*. Heat until all brown vapours have dissipated and any reddish tint is gone (about 60 min). Cool. Add 0.5 ml of *strong hydrogen peroxide solution R* dropwise and heat at 90-95 °C for 15 min. Cool. Add again 0.5 ml of *strong hydrogen peroxide solution R* dropwise, heat at 90-95 °C for 60 min and cool. Repeat these operations until a clear, light yellow solution is obtained. Dilute to 10.0 ml with *deionised distilled water R*. Store in capped plastic vials.

Reference solutions. Prepare 3 reference solutions in the same manner as the test solution but adding 0.5 ml, 1.0 ml and 1.5 ml respectively of *lead standard solution (0.5 ppm Pb) R* in addition to the 1.5 g of the substance to be examined.

Blank solution. Prepare a blank in the same manner as for the test solution but without the substance to be examined.

Zero-setting solution. *Deionised distilled water R*.

Apparatus. Suitable graphite furnace atomic absorption spectrometer equipped with a background compensation system, an autosampler and pyrolytically-coated tubes or with pyrolytic graphite platforms.

Source: hollow-cathode lamp or electrodeless discharge lamp.

Gas:

– *argon R* as the purge gas;

– air as alternate gas during the charring step.

Flow rate: to be adapted according to the apparatus; usually between 200 ml/min and 300 ml/min.

Wavelength: 283.3 nm.

Method. Separately inject 20 µl each of the zero-setting solution, the blank solution, the test solution, the reference solutions, and add immediately 5 µl of *magnesium nitrate solution R1*, which is used as matrix modifier, to each of the solutions. Inject each solution in triplicate.

The ashing and atomisation temperatures and times vary according to the apparatus, the background compensation system, and the graphite tube etc. The following parameters are given for guidance and have to be adjusted.

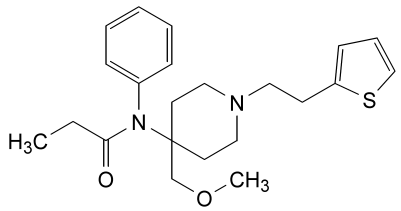
Heat the furnace progressively to 200 °C and maintain the drying temperature at 200 °C for 30 s, the ashing temperature at 750 ± 50 °C for 40 s after a 40 s temperature rise, and the atomisation temperature at 1800 °C for 10 s (0 s temperature rise). Clean out at 2600 °C for 7 s after a 1 s temperature rise. Use the zero-setting solution to set the instrument zero. Calculate the mean readings of the test solution and of the reference solutions subtracting the mean blank. If necessary, dilute with the zero-setting solution to obtain a reading within the linear range.

System suitability:

– the relative standard deviation of the 3 readings obtained for the triplicate injections of the reference solutions from which the mean blank has been subtracted is not greater than 15 per cent.

Loss on drying (*2.2.32*): maximum 0.1 per cent, determined on 2.000 g by drying in an oven at 105 °C for 3 h.

Bacterial endotoxins (*2.6.14*): less than 0.25 IU/mg, if intended for use in the preparation of large-volume infusions.



LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of large-volume parenteral dosage forms.

01/2008:1569

SUFENTANIL

Sufentanilum

$C_{22}H_{30}N_2O_2S$ M_r 386.6
[56030-54-7]

DEFINITION

N-[4-(Methoxymethyl)-1-[2-(thiophen-2-yl)ethyl]piperidin-4-yl]-*N*-phenylpropanamide.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in ethanol (96 per cent) and in methanol.

mp: about 98 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of sufentanil.*

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 0.10 g in *methanol R* and dilute to 20 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). In order to produce impurity E *in situ,* dissolve 10 mg of the substance to be examined in 10.0 ml of *dilute hydrochloric acid R*. Heat on a water-bath under a reflux condenser for 4 h. Add 10.0 ml of *dilute sodium hydroxide solution R*. Evaporate to dryness on a water-bath. Cool and take up the residue in 10 ml of *methanol R*. Filter.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 20.0 ml with *methanol R*.

Column:

– *size*: *l* = 0.1 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:

– *mobile phase A*: 5 g/l solution of *ammonium carbonate R* in a mixture of 10 volumes of *tetrahydrofuran R* and 90 volumes of *water R*;
– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	90 → 40	10 → 60
15 - 20	40	60

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 220 nm.

Equilibration: with *acetonitrile R* for at least 30 min and then with the mobile phase at the initial composition for at least 5 min.

Injection: 10 µl; inject *methanol R* as a blank.

Retention time: impurity E = about 12 min; sufentanil = about 13 min.

System suitability: reference solution (a):

– *resolution*: minimum 4.0 between the peaks due to impurity E and sufentanil; if necessary, adjust the concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient elution.

Limits:

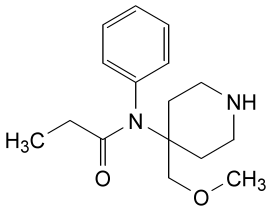
– *impurities D, F, H*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent);
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 2 h.

ASSAY

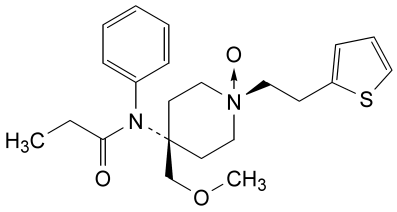
Dissolve 0.300 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R* and titrate with *0.1 M perchloric acid,* using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of *0.1 M perchloric acid* is equivalent to 38.66 mg of $C_{22}H_{30}N_2O_2S$.



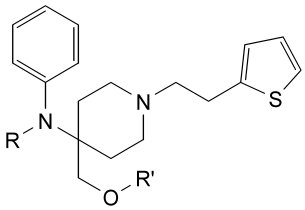
STORAGE

Protected from light.



IMPURITIES

Specified impurities: *D, F, H.*



Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034).* It is therefore not necessary to identify these impurities for demonstration of compliance. SUFENTANIL CITRATE

Sufentanili citras

$C_{28}H_{38}N_2O_9S$ M_r 578.7
[60561-17-3]

DEFINITION

N-[4-(Methoxymethyl)-1-[2-(thiophen-2-yl)ethyl]piperidin-4-yl]-*N*-phenylpropanamide citrate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: soluble in water and in ethanol (96 per cent), freely soluble in methanol.

mp: about 140 °C, with decomposition.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of sufentanil citrate*.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 0.2 g in *water R* and dilute to 20 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). In order to produce impurity E *in situ*, dissolve 10 mg of the substance to be examined in 10.0 ml of *dilute hydrochloric acid R*. Heat on a water-bath under a reflux condenser for 4 h. Add 10.0 ml of *dilute sodium hydroxide solution R*. Evaporate to dryness on a water-bath. Cool and take up the residue in 10 ml of *methanol R*. Filter.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

Column:

– *size*: *l* = 0.1 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:

– *mobile phase A*: 5 g/l solution of *ammonium carbonate R* in a mixture of 10 volumes of *tetrahydrofuran R* and 90 volumes of *water R*;
– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	90 → 40	10 → 60
15 - 20	40	60

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 220 nm.

Equilibration: with *acetonitrile R* for at least 30 min and then with the mobile phase at the initial composition for at least 5 min.

Injection: 10 µl; inject *methanol R* as a blank.

Retention time: impurity E = about 12 min; sufentanil = about 13 min.

System suitability: reference solution (a):

– *resolution*: minimum 4.0 between the peaks due to impurity E and sufentanil; if necessary, adjust the concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient elution.

Limits:

– *impurities A, B, C, D, E, F, G, H, I*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

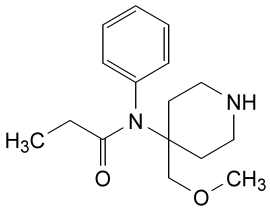
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard any peak with a retention time relative to sufentanil of 0.05 or less.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C.

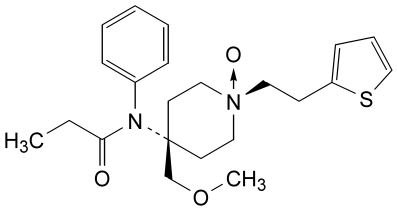
ASSAY

Dissolve 0.400 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R* and titrate with *0.1 M perchloric acid*, using 0.2 ml of *naphtholbenzein solution R* as indicator.



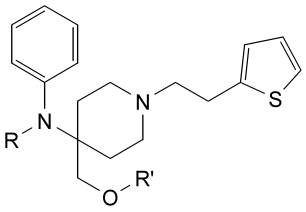
1 ml of *0.1 M perchloric acid* is equivalent to 57.87 mg of $C_{28}H_{38}N_2O_9S$.

STORAGE



Protected from light.

IMPURITIES



Specified impurities: *A, B, C, D, E, F, G, H, I.*

A. *N*-[4-(methoxymethyl)piperidin-4-yl]-*N*-phenylpropanamide,

B. *cis*-4-(methoxymethyl)-4-(phenylpropanoylamino)-1-[2-(thiophen-2-yl)ethyl]piperidine 1-oxide,

corrected 6.0

SUGAR SPHERES

Sacchari sphaerae

DEFINITION

Sugar spheres contain not more than 92 per cent of sucrose, calculated on the dried basis. The remainder consists of maize starch and may also contain starch hydrolysates and

colour additives. The diameter of sugar spheres varies usually from 200 µm to 2000 µm and the upper and lower limits of the size of the sugar spheres are stated on the label.

IDENTIFICATION

A. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel G plate R*.

Test solution. Mix 2 ml of solution S (see Tests) with 3 ml of *methanol R*. Dilute to 20 ml with a mixture of 2 volumes of *water R* and 3 volumes of *methanol R*.

Reference solution (a). Dissolve 10 mg of *sucrose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *fructose CRS*, 10 mg of *glucose CRS*, 10 mg of *lactose CRS* and 10 mg of *sucrose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Apply to the plate 2 µl of each solution and thoroughly dry the starting points. Develop over a path of 15 cm using a mixture of 10 volumes of *water R*, 15 volumes of *methanol R*, 25 volumes of *anhydrous acetic acid R* and 50 volumes of *ethylene chloride R*, measured accurately as a slight excess of water causes cloudiness of the solution. Dry the plate in a current of warm air. Repeat the development immediately after renewing the mobile phase. Dry the plate in a current of warm air and spray evenly with a 5 g/l solution of *thymol R* in a mixture of 5 volumes of *sulphuric acid R* and 95 volumes of *alcohol R*. Heat at 130 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 4 clearly separated spots.

B. To water slurry of the insoluble portion obtained (see Assay), add 0.05 ml of *iodine solution R1*. A dark-blue is produced which disappears on heating.

C. To 5 ml of solution S add 0.15 ml of freshly prepared *copper sulphate solution R* and 2 ml of freshly prepared *dilute sodium hydroxide solution R*. The solution is blue and clear and remains so after boiling. To the hot solution add 4 ml of *dilute hydrochloric acid R* and boil for 1 min. Add 4 ml of *dilute sodium hydroxide solution R*. An orange precipitate is formed immediately.

TESTS

Solution S. To 0.5 g in a 100 ml volumetric flask add 80 ml of *water R* and shake until the sucrose is dissolved. Dilute to 100.0 ml with *water R*. Filter under vacuum to obtain a clear solution.

Fineness (*2.9.12*). Minimum of 90 per cent (*m/m*) of the sugar spheres are between the lower and the upper limits of the size of the sugar spheres stated on the label.

Heavy metals (*2.4.8*). 2.0 g complies with limit test C for heavy metals (5 ppm). Prepare the standard using 1.0 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*). Not more than 0.2 per cent, determined on 2 g.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 bacteria and 10^2 fungi per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (*2.6.13*).

ASSAY

Sucrose content

Weigh 10.000 g of ground sugar spheres in a 100 ml graduated flask and complete to 100.0 ml with *water R*. Stir and decant. Filter under vacuum to obtain a clear solution (the insoluble portion is used for the identification test B). Measure the angle of optical rotation (*2.2.7*) and calculate the sucrose percentage content as follows:

$$\frac{10^6 \times \alpha}{66.5 \times l \times m \times (100 - H)}$$

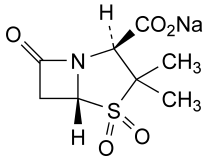
α = angle of rotation,

l = length of the polarimeter tube, in decimetres,

m = exact weight of the granules sample, in grams,

H = loss on drying.

LABELLING



The label states:

- the upper and the lower limits of the size of the sugar spheres,
- any added colour additives,
- any added starch hydrolysates.

01/2008:2209

SULBACTAM SODIUM

Sulbactamum natricum

$C_8H_{10}NNaO_5S$ M_r 255.2

[69388-84-7]

DEFINITION

Sodium (2*S*,5*R*)-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate 4,4-dioxide.

Semi-synthetic product derived from a fermentation product.

Content: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, hygroscopic, crystalline powder.

Solubility: freely soluble in water, sparingly soluble in ethyl acetate, very slightly soluble in ethanol (96 per cent). It is freely soluble in dilute acids.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *sulbactam sodium CRS*.

B. It gives reaction (a) of sodium (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*).

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent.

Absorbance (*2.2.25*): maximum 0.10 at 430 nm.

Dissolve 1.0 g in *water R* and dilute to 100.0 ml with the same solvent.

pH (*2.2.3*): 4.5 to 7.2; if the substance is sterile: 5.2 to 7.2.

Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Specific optical rotation (*2.2.7*): + 219 to + 233 (anhydrous substance).

Dissolve 0.500 g in *water R* and dilute to 50.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Solution A. 2.72 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 4.0 with *dilute phosphoric acid R*.

Solution B. Dilute 2 ml of *acetonitrile R1* to 100.0 ml with solution A.

Test solution. Suspend 77.0 mg of the substance to be examined in 2 ml of *acetonitrile R1* and sonicate for about 5 min. Dilute to 100.0 ml with solution A.

Reference solution (a). Suspend 70.0 mg of *sulbactam CRS* in 2 ml of *acetonitrile R1* and sonicate for about 5 min. Dilute to 100.0 ml with solution A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with solution B. Dilute 1.0 ml of this solution to 10.0 ml with solution B.

Reference solution (c). Dissolve 15.0 mg of *6-aminopenicillanic acid R* in solution A and dilute to 50.0 ml with solution A.

Reference solution (d). Mix 1 ml of reference solution (a) and 1 ml of reference solution (c) and dilute to 25.0 ml with solution B.

Reference solution (e). Dissolve 8 mg of *sulbactam for peak identification CRS* (containing impurities A, C, D, E and F) in 1 ml of *acetonitrile R1*, sonicate for about 5 min and dilute to 10 ml with solution B.

Column:

- *size*: *l* = 0.10 m, Ø = 4.0 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3.0 µm);
- *temperature*: 40 °C.

Mobile phase:

- *mobile phase A*: 5.44 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 4.0 with *dilute phosphoric acid R*;
- *mobile phase B*: *acetonitrile R1*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 7.5	98 → 50	2 → 50
7.5 - 8.5	50	50
8.5 - 9.0	50 → 98	50 → 2
9.0 - 12.5	98	2

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 20 µl of the test solution, solution B and reference solutions (b), (d) and (e).

Relative retention with reference to sulbactam (retention time = about 2.5 min): impurity A = about 0.4; impurity B = about 0.6; impurity C = about 1.6; impurity D = about 2.0; impurity E = about 2.1; impurity F = about 2.5.

Identification of impurities: use the chromatogram supplied with *sulbactam for peak identification CRS* and the chromatogram obtained with reference solution (e) to identify the peaks due to impurities A, C, D, E and F.

System suitability: reference solution (d):

- *resolution*: minimum 7.0 between the peaks due to impurity B and sulbactam.

Limits:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.6; impurity B = 0.5; impurity D = 0.5; impurity F = 0.6;
- *impurity A*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *impurities B, D, F*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *impurities C, E*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

2-Ethylhexanoic acid (*2.4.28*): maximum 0.5 per cent *m/m*.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test A. Prepare the reference solution using 10.0 ml of *lead standard solution (2 ppm Pb) R*.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g.

Bacterial endotoxins (*2.6.14, Method A*): less than 0.17 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

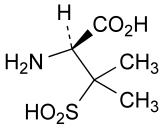
ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

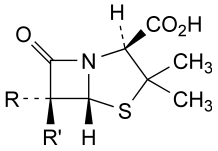
Calculate the percentage content of sulbactam sodium by multiplying the percentage content of sulbactam by 1.094 and using the declared content of *sulbactam CRS*.

STORAGE



In an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

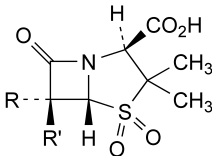
IMPURITIES



Specified impurities: A, B, C, D, E, F.

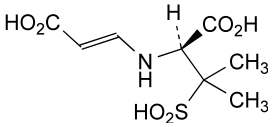
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to

identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): G.



A. (2*S*)-2-amino-3-methyl-3-sulphinobutanoic acid,

B. R = NH_2, R′ = H: (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

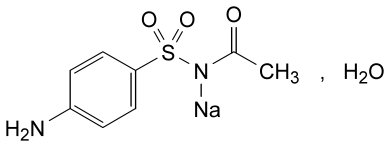


D. R = Br, R′ = H: (2*S*,5*R*,6*R*)-6-bromo-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-bromopenicillanic acid),

F. R = R′ = Br: (2*S*,5*R*)-6,6-dibromo-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6,6-dibromopenicillanic acid),

C. R = Br, R′ = H: (2*S*,5*R*,6*R*)-6-bromo-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid 4,4-dioxide (6-bromopenicillanic acid sulphone),

E. R = R′ = Br: (2*S*,5*R*)-6,6-dibromo-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid 4,4-dioxide (6,6-dibromopenicillanic acid sulphone),



G. (2*E*)-3-[[(1*S*)-1-carboxy-2-methyl-2-sulphinopropyl]amino]prop-2-enoic acid.

SULFACETAMIDE SODIUM

Sulfacetamidum natricum

$C_8H_9N_2NaO_3S,H_2O$ M_r 254.2

DEFINITION

Sulfacetamide sodium contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of the sodium derivative of *N*-[(4-aminophenyl)sulphonyl]acetamide, calculated with reference to the anhydrous substance.

CHARACTERS

A white or yellowish-white, crystalline powder, freely soluble in water, slightly soluble in ethanol.

IDENTIFICATION

First identification: B, F.

Second identification: A, C, D, E, F.

A. Dissolve 0.1 g in *phosphate buffer solution pH 7.0 R* and dilute to 100.0 ml with the same buffer solution. Dilute 1.0 ml of the solution to 100.0 ml with *phosphate buffer solution pH 7.0 R*. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 255 nm. The specific absorbance at the maximum is 660 to 720, calculated with reference to the anhydrous substance.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sulfacetamide sodium CRS*.

C. Dissolve 1 g in 10 ml of *water R*, add 6 ml of *dilute acetic acid R* and filter. The precipitate, washed with a small quantity of *water R* and dried at 100 °C to 105 °C for 4 h, melts (*2.2.14*) at 181 °C to 185 °C.

D. Dissolve 0.1 g of the precipitate obtained in identification test C in 5 ml of *alcohol R*. Add 0.2 ml of *sulphuric acid R* and heat. The odour of ethyl acetate is perceptible.

E. Dissolve about 1 mg of the precipitate obtained in identification test C, with heating, in 1 ml of *water R*. The solution gives the reaction of primary aromatic amines (*2.3.1*) with formation of an orange-red precipitate.

F. Solution S (see Tests) gives the reactions of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 1.25 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution GY_4 (*2.2.2, Method II*).

pH (*2.2.3*). The pH of solution S is 8.0 to 9.5.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* HF_{254} *R* as the coating substance.

Test solution. Dissolve 1.5 g of the substance to be examined in *water R* and dilute to 15 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *sulfanilamide R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *water R*.

Reference solution (c). Dissolve 5 mg of *sulfanilamide R* in 10 ml of the test solution.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 25 volumes of *ethanol R*, 25 volumes of *water R* and 50 volumes of *butanol R*. Allow the plate to dry in air and spray with *dimethylaminobenzaldehyde solution R2*. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent), and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Sulphates (*2.4.13*). Dissolve 2.5 g in *distilled water R* and dilute to 25 ml with the same solvent. Add 25 ml of *dilute acetic acid R*, shake for 30 min and filter. 15 ml of the filtrate complies with the limit test for sulphates (200 ppm).

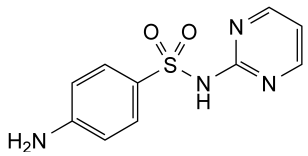
Heavy metals (*2.4.8*). 12 ml of the filtrate obtained in the test for sulphates complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*). 6.0 per cent to 8.0 per cent, determined on 0.200 g by the semi-micro determination of water.

ASSAY

Dissolve 0.500 g in a mixture of 50 ml of *water R* and 20 ml of *dilute hydrochloric acid R*. Cool the solution in iced water and carry out the determination of primary aromatic amino-nitrogen (*2.5.8*), determining the end-point electrometrically.

1 ml of *0.1 M sodium nitrite* is equivalent to 23.62 mg of $C_8H_9N_2NaO_3S$.



STORAGE

Store protected from light.

corrected 6.0

SULFADIAZINE

Sulfadiazinum

$C_{10}H_{10}N_4O_2S$ M_r 250.3
[68-35-9]

DEFINITION

Sulfadiazine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-pyrimidin-2-ylbenzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White, yellowish-white or pinkish-white, crystalline powder or crystals, practically insoluble in water, slightly soluble in acetone, very slightly soluble in alcohol. It dissolves in solutions of alkali hydroxides and in dilute mineral acids.

It melts at about 255 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sulfadiazine CRS*. Examine the substances prepared as discs.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (a) corresponds in position and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Place 3 g in a dry tube. Immerse the lower part of the tube, inclined at 45°, in a silicone oil bath and heat to about 270 °C. The substance to be examined decomposes and a white or yellowish-white sublimate is formed which, after recrystallisation from *toluene R* and drying at 100 °C, melts (*2.2.14*) at 123 °C to 127 °C.

D. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (*2.3.1*).

TESTS

Appearance of solution. Dissolve 0.8 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*. The solution is not more intensely coloured than reference solution Y_5, BY_5 or GY_5 (*2.2.2, Method II*).

Acidity. To 1.25 g, finely powdered, add 25 ml of *carbon dioxide-free water R*. Heat at about 70 °C for 5 min. Cool in iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution (a). Dissolve 20 mg of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5.0 ml with the same mixture of solvents.

Test solution (b). Dissolve 0.10 g of the substance to be examined in 0.5 ml of *concentrated ammonia R* and dilute to 5.0 ml with *methanol R*. If the solution is not clear, heat gently until dissolution is complete.

Reference solution (a). Dissolve 20 mg of *sulfadiazine CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.25 ml of test solution (a) to 50 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 3 volumes of *dilute ammonia R1*, 5 volumes of *water R*, 40 volumes of *nitromethane R* and 50 volumes of *dioxan R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (b), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

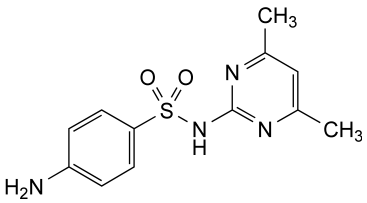
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in a mixture of 20 ml of *dilute hydrochloric acid R* and 50 ml of *water R*. Cool the solution in iced water. Carry out the determination of primary aromatic amino-nitrogen (*2.5.8*), determining the end-point electrometrically.

1 ml of *0.1 M sodium nitrite* is equivalent to 25.03 mg of $C_{10}H_{10}N_4O_2S$.



STORAGE

Store protected from light.

corrected 6.0

SULFADIMIDINE

Sulfadimidinum

$C_{12}H_{14}N_4O_2S$ M_r 278.3
[57-68-1]

DEFINITION

Sulfadimidine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(4, 6-dimethylpyrimidin-2-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White or almost white powder or crystals, very slightly soluble in water, soluble in acetone, slightly soluble in alcohol. It dissolves in solutions of alkali hydroxides and in dilute mineral acids.

It melts at about 197 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sulfadimidine CRS*. Examine the substances prepared as discs.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (a) corresponds in position and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Place 3 g in a dry tube. Immerse the lower part of the tube, inclined at 45°, in a silicone oil bath and heat to about 270 °C. The substance to be examined decomposes and a white or yellowish-white sublimate is formed which, after recrystallisation from *toluene R* and drying at 100 °C, melts (*2.2.14*) at 150 °C to 154 °C.

D. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (*2.3.1*).

TESTS

Appearance of solution. Dissolve 0.5 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*. The solution is not more intensely coloured than reference solution Y_5, BY_5 or GY_5 (*2.2.2, Method II*).

Acidity. To 1.25 g, finely powdered, add 25 ml of *carbon dioxide-free water R*. Heat at about 70 °C for 5 min. Cool in iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution (a). Dissolve 20 mg of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5.0 ml with the same mixture of solvents.

Test solution (b). Dissolve 0.10 g of the substance to be examined in 0.5 ml of *concentrated ammonia R* and dilute to 5.0 ml with *methanol R*. If the solution is not clear, heat gently until dissolution is complete.

Reference solution (a). Dissolve 20 mg of *sulfadimidine CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.25 ml of test solution (a) to 50 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 3 volumes of *dilute ammonia R1*, 5 volumes of *water R*, 40 volumes of *nitromethane R* and 50 volumes of *dioxan R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (b), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

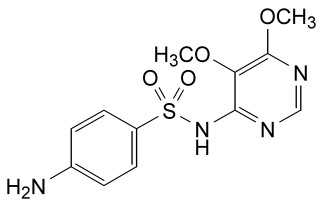
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 20 ml of *dilute hydrochloric acid R* and 50 ml of *water R*. Cool the solution in iced water. Carry out the determination of primary aromatic amino-nitrogen (*2.5.8*), determining the end-point electrometrically.

1 ml of *0.1 M sodium nitrite* is equivalent to 27.83 mg of $C_{12}H_{14}N_4O_2S$.



STORAGE

SULFADOXINE

Sulfadoxinum

$C_{12}H_{14}N_4O_4S$ M_r 310.3
[2447-57-6]

DEFINITION

Sulfadoxine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(5,6-dimethoxypyrimidin-4-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White or yellowish-white crystalline powder or crystals, very slightly soluble in water, slightly soluble in alcohol and in methanol. It dissolves in solutions of alkali hydroxides and in dilute mineral acids.

It melts at about 198 °C, with decomposition.

IDENTIFICATION

First identification: A, C.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sulfadoxine CRS*. Examine the substances prepared as discs.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.5 g in 1 ml of a 40 per cent *V/V* solution of *sulphuric acid R*, heating gently. Continue heating until a crystalline precipitate appears (about 2 min). Allow to cool and add 10 ml of *dilute sodium hydroxide solution R*. Cool again. Add 25 ml of *ether R* and shake for 5 min. Separate the ether layer, dry over *anhydrous sodium sulphate R* and filter. Evaporate the solvent by heating in a water-bath. The residue melts (*2.2.14*) at 80 °C to 82 °C or at 90 °C to 92 °C.

D. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (*2.3.1*).

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*. The solution is not more intensely coloured than reference solution Y_5, BY_5 or GY_5 (*2.2.2, Method II*).

Acidity. To 1.25 g, finely powdered, add 25 ml of *carbon dioxide-free water R*. Heat at 70 °C for 5 min. Cool in a bath of iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 5 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Reference solution (a). Dissolve 20 mg of *sulfadoxine CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (b). Dilute 2.5 ml of test solution (b) to 100 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 3 volumes of *dilute ammonia R1*, 5 volumes of *water R*, 40 volumes of *nitromethane R* and 50 volumes of *dioxan R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the determination of primary aromatic amino-nitrogen (*2.5.8*), using 0.250 g and determining the end-point electrometrically.

1 ml of *0.1 M sodium nitrite* is equivalent to 31.03 mg of $C_{12}H_{14}N_4O_4S$.

SULFAFURAZOLE

Sulfafurazolum

$C_{11}H_{13}N_3O_3S$ M_r 267.3
[127-69-5]

DEFINITION

Sulfafurazole contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(3,4-dimethylisoxazol-5-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White or yellowish-white, crystalline powder or crystals, practically insoluble in water, sparingly soluble in alcohol, slightly soluble in methylene chloride. It dissolves in solutions of alkali hydroxides and in dilute mineral acids.

It melts at about 197 °C, with decomposition.

IDENTIFICATION

First identification: A, C.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sulfafurazole CRS*. Examine the substances prepared as discs.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

C. To 0.5 g add 1 ml of a 40 per cent *V/V* solution of *sulphuric acid R* and heat over a low flame to dissolve. Continue heating until a crystalline precipitate appears (about 2 min). Allow to cool and add 10 ml of *dilute sodium hydroxide solution R*. Cool. Shake the solution for 5 min with 25 ml of *ether R*. Separate the ether layer, dry over *anhydrous sodium sulphate R* and filter. Evaporate the solvent by heating on a water-bath. The residue melts (*2.2.14*) at 119 °C to 123 °C.

D. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (*2.3.1*).

TESTS

Appearance of solution. Dissolve 0.4 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*, with gently warming if necessary. The solution is not more intensely coloured than reference solution Y_6, BY_6 or GY_6 (*2.2.2, Method II*).

Acidity. To 1.25 g, finely powdered, add 25 ml of *carbon dioxide-free water R*. Heat at 70 °C for 5 min. Cool in iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 5 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Reference solution (a). Dissolve 20 mg of *sulfafurazole CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.25 ml of test solution (b) to 50 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 25 volumes of *methanol R* and 75 volumes of *methylene chloride R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

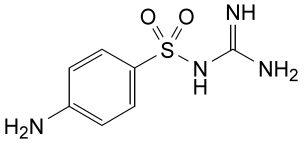
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of *acetone R*. Titrate with *0.1 M tetrabutylammonium hydroxide* using a 4 g/l solution of *thymol blue R* in *methanol R* as indicator.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 26.73 mg of $C_{11}H_{13}N_3O_3S$.



STORAGE

Store protected from light.

SULFAGUANIDINE

Sulfaguanidinum

$C_7H_{10}N_4O_2S$ M_r 214.3
[56-67-0]

DEFINITION

Sulfaguanidine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (4-aminophenylsulphonyl)guanidine, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, fine crystalline powder, very slightly soluble in water, slightly soluble in acetone, very slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride. It dissolves in dilute solutions of mineral acids.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D, E.

A. Melting point (*2.2.14*): 189 °C to 193 °C, determined on the dried substance.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sulfaguanidine CRS*.

C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (*2.3.1*).

E. Suspend 0.1 g in 2 ml of *water R*, add 1 ml of *α-naphthol solution R* and 2 ml of a mixture of equal volumes of *water R* and *strong sodium hypochlorite solution R*. A red colour develops.

TESTS

Solution S. To 2.5 g, add 40 ml of *carbon dioxide-free water R*. Heat at about 70 °C for 5 min. Cool while stirring in iced water for about 15 min, filter and dilute to 50 ml with *carbon dioxide-free water R*.

Acidity. To 20 ml of solution S, add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin layer chromatography (*2.2.27*), using a *TLC silica gel* GF_{254} *plate R*.

Test solution (a). Dissolve 50 mg of the substance to be examined in *acetone R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 2 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dissolve 10 mg of *sulfaguanidine CRS* in *acetone R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 5 ml of test solution (b) to 200 ml with *acetone R*.

Reference solution (c). Dilute 5 ml of reference solution (b) to 10 ml with *acetone R*.

Reference solution (d). Dissolve 10 mg of *sulfanilamide R* in test solution (b) and dilute to 5 ml with the same solution.

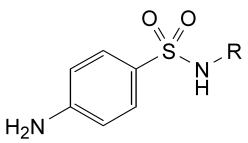
Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *anhydrous formic acid R*, 20 volumes of *methanol R* and 70 volumes of *methylene chloride R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and at most one such spot is more intense that the spot in the chromatogram obtained with reference solution (c) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated principal spots.

Heavy metals (*2.4.8*). 1.0 g complies with test F (20 ppm). Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): not more than 8.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): not more than 0.1 per cent, determined on 1.0 g.

ASSAY



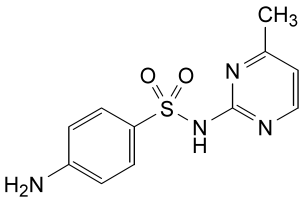
Dissolve 0.175 g in 50 ml of *dilute hydrochloric acid R*. Cool the solution in iced water. Carry out the determination of primary aromatic amino-nitrogen (*2.5.8*), determining the end-point electrometrically.

1 ml of *0.1 M sodium nitrite* is equivalent to 21.42 mg of $C_7H_{10}N_4O_2S$.

STORAGE

Store protected from light.

IMPURITIES



A. R = H: 4-aminobenzenesulphonamide (sulphanilamide),

B. R = CO-NH_2: *N*-[(4-aminophenyl)sulphonyl]urea (sulphacarbamide).

corrected 6.0

SULFAMERAZINE

Sulfamerazinum

$C_{11}H_{12}N_4O_2S$ M_r 264.3
[127-79-7]

DEFINITION

Sulfamerazine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(4-methyl-2-pyrimidinyl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White, yellowish-white or pinkish-white, crystalline powder or crystals, very slightly soluble in water, sparingly soluble in acetone, slightly soluble in alcohol, very slightly soluble in methylene chloride. It dissolves in solutions of alkali hydroxides and in dilute mineral acids.

It melts at about 235 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sulfamerazine CRS*. Examine the substances as discs.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Place 3 g in a dry tube. Incline the tube by about 45°, immerse the bottom of the tube in a silicone-oil bath and heat to about 270 °C. The substance decomposes, producing a white or yellowish-white sublimate which, after recrystallisation from *toluene R* and drying at 100 °C, melts (*2.2.14*) at 157 °C to 161 °C.

D. Dissolve about 20 mg in 0.5 ml of *dilute hydrochloric acid R* and add 1 ml of *water R*. The solution gives, without further addition of acid, the identification reaction of primary aromatic amines (*2.3.1*).

TESTS

Appearance of solution. Dissolve 0.8 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*. The solution is not more intensely coloured than reference solution Y_4, BY_4 or GY_4 (*2.2.2, Method II*).

Acidity. To 1.25 g, finely powdered, add 40 ml of *carbon dioxide-free water R* and heat at about 70 °C for 5 min. Cool for about 15 min in iced water and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (*2.2.27*) using *silica gel GF_{254} R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Reference solution (a). Dissolve 10 mg of *sulfamerazine CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (b). Dilute 2.5 ml of test solution (b) to 50 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm with a mixture of 3 volumes of *dilute ammonia R1*, 5 volumes of *water R*, 40 volumes of *nitromethane R* and 50 volumes of *dioxan R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense that the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

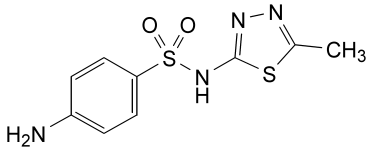
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.2500 g in a mixture of 20 ml of *dilute hydrochloric acid R* and 50 ml of *water R*. Cool the solution in iced water. Carry out the determination of primary aromatic amino-nitrogen (*2.5.8*), determining the end-point electrometrically.

1 ml of *0.1 M sodium nitrite* is equivalent to 26.43 mg of $C_{11}H_{12}N_4O_2S$.



STORAGE

Store protected from light.

01/2008:0637
corrected 6.0

SULFAMETHIZOLE

Sulfamethizolum

$C_9H_{10}N_4O_2S_2$ M_r 270.3
[144-82-1]

DEFINITION

Sulfamethizole contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(5-methyl-1,3,4-thiadiazol-2-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White or yellowish-white crystalline powder or crystals, very slightly soluble in water, soluble in acetone, sparingly soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides and in dilute mineral acids.

It melts at about 210 °C.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sulfamethizole CRS*. Examine the substances prepared as discs.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 50 mg in 4 ml of *methanol R* and add 0.2 ml of a 40 g/l solution of *copper acetate R*. A flocculent, yellowish-green precipitate is formed, changing to dark green.

D. Dissolve about 5 mg in *1 M hydrochloric acid* and dilute to 10 ml with the same solvent. Dilute 1 ml of this solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (*2.3.1*).

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*. The solution is not more intensely coloured than reference solution Y_5, BY_5 or GY_5 (*2.2.2, Method II*).

Acidity. To 1.25 g add 25 ml of *carbon dioxide-free water R* and heat at 70 °C for 5 min. Cool for about 15 min in iced water and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel GF_{254} R* as the coating substance.

Test solution (a). Dissolve 0.30 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dissolve 30 mg of *sulfamethizole CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 20 ml with *acetone R*.

Apply to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 15 volumes of *methanol R* and 80 volumes of *chloroform R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

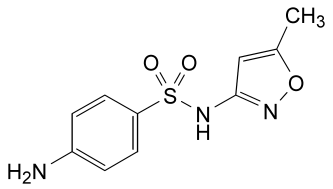
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the determination of primary aromatic amino-nitrogen (*2.5.8*), using 0.2500 g and determining the end-point electrometrically.

1 ml of *0.1 M sodium nitrite* is equivalent to 27.03 mg of $C_9H_{10}N_4O_2S_2$.



STORAGE

Store protected from light.

SULFAMETHOXAZOLE

Sulfamethoxazolum

$C_{10}H_{11}N_3O_3S$ M_r 253.3
[723-46-6]

DEFINITION

4-Amino-*N*-(5-methylisoxazol-3-yl)benzenesulphonamide.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in acetone, sparingly soluble in ethanol (96 per cent). It dissolves in dilute solutions of sodium hydroxide and in dilute acids.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 169 °C to 172 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *sulfamethoxazole CRS.*

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 20 mg of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution. Dissolve 20 mg of *sulfamethoxazole CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *dilute ammonia R1, water R, nitromethane R, dioxan R* (3:5:41:51 *V/V/V/V*).

Application: 5 µl.

Development: over 3/4 of the plate.

Drying: at 100-105 °C.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid.* Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_5, BY_5 or GY_5 (*2.2.2, Method II*).

Dissolve 1.0 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*.

Acidity. To 1.25 g, finely powdered, add 25 ml of *water R*. Heat at 70 °C for 5 min. Cool in iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.3 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in 45 ml of the mobile phase, sonicate at about 45 °C for 10 min, cool and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 1 mg of the substance to be examined and 1 mg of *sulfamethoxazole impurity A CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 1.0 mg of *sulfamethoxazole impurity F CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm,
– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm),
– *temperature*: 30 °C.

Mobile phase: mix 35 volumes of *methanol R2* and 65 volumes of a 13.6 g/l solution of *potassium dihydrogen phosphate R* previously adjusted to pH 5.3 with a 20 g/l solution of *potassium hydroxide R.*

Flow rate: 0.9 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Run time: 3 times the retention time of sulfamethoxazole.

Relative retention with reference to sulfamethoxazole (retention time = about 10 min): impurity D = about 0.3; impurity E = about 0.35; impurity F = about 0.45; impurity C = about 0.5; impurity A = about 1.2; impurity B = about 2.0.

System suitability: reference solution (b):

– *resolution*: minimum 3.5 between the peaks due to sulfamethoxazole and impurity A.

Limits:

– *impurities A, B, C, D, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *impurity F*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.025 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

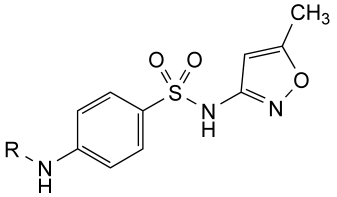
1.0 g complies with test D. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

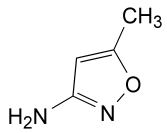
Carry out the assay of primary aromatic amino-nitrogen (*2.5.8*), using 0.200 g and determining the end-point electrometrically.



1 ml of *0.1 M sodium nitrite* is equivalent to 25.33 mg of $C_{10}H_{11}N_3O_3S$.

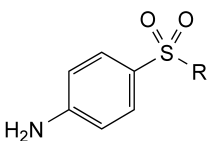
STORAGE

Protected from light.



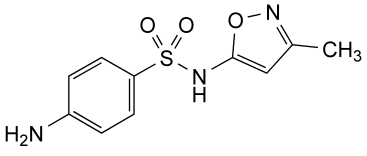
IMPURITIES

Specified impurities: A, B, C, D, E, F.



A. R = CO-CH_3: *N*-[4-[(5-methylisoxazol-3-yl)sulphamoyl]phenyl]acetamide,

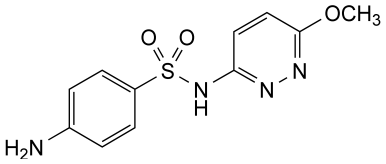
B. R = SO_2-C_6H_4-*p*NH_2: 4-[[(4-aminophenyl)sulphonyl]amino]-*N*-(5-methylisoxazol-3-yl)benzenesulphonamide,



C. 5-methylisoxazol-3-amine,

D. R = OH: 4-aminobenzenesulphonic acid (sulphanilic acid),

E. R = NH_2: 4-aminobenzenesulphonamide (sulphanilamide),



F. 4-amino-*N*-(3-methylisoxazol-5-yl)benzenesulphonamide.

SULFAMETHOXYPYRIDAZINE FOR VETERINARY USE

Sulfamethoxypyridazinum ad usum veterinarium

$C_{11}H_{12}N_4O_3S$ M_r 280.3
[80-35-3]

DEFINITION

Sulfamethoxypyridazine for veterinary use contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(6-methoxypyridazin-3-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, colouring slowly on exposure to light, practically insoluble in water, sparingly soluble in acetone, slightly soluble in alcohol, very slightly soluble in methylene chloride. It dissolves in solutions of alkali hydroxides and in dilute mineral acids.

It melts at about 180 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sulfamethoxypyridazine CRS*. Examine the substances prepared as discs.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.5 g in 1 ml of a 40 per cent *V/V* solution of *sulphuric acid R*, heating gently. Continue heating until a crystalline precipitate appears (about 2 min). Cool and add 10 ml of *dilute sodium hydroxide solution R*. Cool again, add 25 ml of *ether R* and shake the solution for 5 min. Separate the ether layer, dry over *anhydrous sodium sulphate R* and filter. Evaporate the ether by heating in a water-bath. An oily residue is obtained which becomes crystalline on cooling; if necessary, scratch the wall of the container with a glass rod. The residue melts (*2.2.14*) at 102 °Cto 106 °C.

D. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (*2.3.1*).

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 10 ml of *1 M sodium hydroxide* and 15 ml of *water R*. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_4 or BY_4 (*2.2.2, Method II*).

Acidity. To 1.25 g, finely powdered, add 25 ml of *carbon dioxide-free water R*. Heat at 70 °C for 5 min. Cool in iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin layer chromatography (*2.2.27*), using *TLC silica gel GF_{254} plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *acetone R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dissolve 20 mg of *sulfamethoxypyridazine CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 2.5 ml of test solution (b) to 50 ml with *acetone R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *dilute ammonia R1*, 9 volumes of *water R*, 30 volumes of *2-propanol R* and 50 volumes of *ethyl acetate R*. Dry the plate at 100-105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

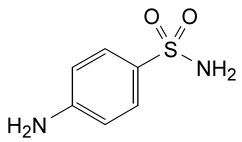
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the assay of primary aromatic amino-nitrogen (*2.5.8*), using 0.2500 g, determining the end-point electrometrically.

1 ml of *0.1 M sodium nitrite* is equivalent to 28.03 mg of $C_{11}H_{12}N_4O_3S$.



STORAGE

Protected from light.

corrected 6.0

SULFANILAMIDE

Sulfanilamidum

$C_6H_8N_2O_2S$ M_r 172.2
[63-74-1]

DEFINITION

Sulfanilamide contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-aminobenzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White or yellowish-white crystals or fine powder, slightly soluble in water, freely soluble in acetone, sparingly soluble in alcohol, practically insoluble in methylene chloride. It dissolves in solutions of alkali hydroxides and in dilute mineral acids.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 164.5 °C to 166.0 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sulfanilamide CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (a) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (*2.3.1*).

TESTS

Solution S. To 2.5 g add 50 ml of *carbon dioxide-free water R*. Heat at about 70 °C for about 5 min. Cool in iced water for about 15 min and filter.

Acidity. To 20 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel F_{254} plate R*.

Test solution (a). Dissolve 20 mg of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dissolve 0.10 g of the substance to be examined in 0.5 ml of *concentrated ammonia R* and dilute to 5 ml with *methanol R*. If the solution is not clear, heat gently until dissolution is complete.

Reference solution (a). Dissolve 20 mg of *sulfanilamide CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.25 ml of test solution (a) to 50 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Reference solution (c). Dissolve 20 mg of the substance to be examined and 20 mg of *sulfamerazine CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Apply to the plate 5 µl of each solution. Develop over a path corresponding to two-thirds of the plate height using a mixture of 3 volumes of *dilute ammonia R1*, 5 volumes of *water R*, 40 volumes of *nitromethane R* and 50 volumes of *dioxan R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (b), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Heavy metals (*2.4.8*). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

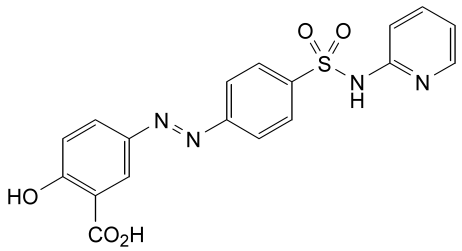
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the determination of primary aromatic amino-nitrogen (*2.5.8*), using 0.140 g and determining the end-point electrometrically.

1 ml of *0.1 M sodium nitrite* is equivalent to 17.22 mg of $C_6H_8N_2O_2S$.



STORAGE

Store protected from light.

SULFASALAZINE

Sulfasalazinum

$C_{18}H_{14}N_4O_5S$ M_r 398.4
[599-79-1]

DEFINITION

2-Hydroxy-5-[2-[4-(pyridin-2-ylsulphamoyl)phenyl]diazenyl]-benzoic acid.

Content: 97.0 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: bright yellow or brownish-yellow, fine powder.

Solubility: practically insoluble in water, very slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *sulfasalazine CRS*.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in *dilute ammonia R3* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *dilute ammonia R3*.

Reference solution (b). Dissolve 1.0 mg of *sulfasalazine derivative for resolution CRS* in 10.0 ml of reference solution (a). Dilute 1.0 ml of this solution to 10.0 ml with reference solution (a).

Column:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:
- *mobile phase A*: in a 1000 ml volumetric flask dissolve 1.13 g of *sodium dihydrogen phosphate R* and 2.5 g of *sodium acetate R* in 900 ml of *water R*; adjust to pH 4.8 with *glacial acetic acid R* and dilute to 1000 ml with *water R*;
- *mobile phase B*: mobile phase A, *methanol R* (10:40 *V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	60 → 45	40 → 55
15 - 25	45	55
25 - 60	45 → 0	55 → 100
60 - 65	0	100
65 - 67	0 → 60	100 → 40
67 - 77	60	40

Flow rate: 1 ml/min.

Detection: spectrophotometer at 320 nm.

Injection: 20 µl.

Relative retention with reference to sulfasalazine: impurity H = about 0.16; impurity I = about 0.28; impurity C = about 0.80; impurity F = about 0.85; impurity G = about 1.39; impurity E = about 1.63; impurity B = about 1.85; impurity D = about 1.90; impurity A = about 2.00.

System suitability: reference solution (b):
- *resolution*: minimum 3.0 between the peaks due to sulfasalazine and sulfasalazine derivative for resolution.

Limits:
- *impurities A, B, C, D, E, F, G, I*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent);
- *total*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (4 per cent);
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent); disregard any peak with a retention time less than 6 min (due to impurities H and J).

Impurities H and J. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in *dilute ammonia R3* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *salicylic acid R* (impurity H) and 5.0 mg of *sulfapyridine CRS* (impurity J) in *dilute ammonia R3* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 100.0 ml with *dilute ammonia R3*.

Column:
- *size*: *l* = 0.25, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mobile phase B (described in the test for related substances), mobile phase A (described in the test for related substances) (30:70 *V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 300 nm.

Injection: 20 µl of the test solution and reference solution (b).

Run time: 10 min.

Retention time: impurity H = about 6 min; impurity J = about 7 min.

System suitability: reference solution (b):

– *resolution*: minimum 2 between the peaks due to impurities H and J.

Limits:

– *impurities H, J*: for each impurity, not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chlorides (*2.4.4.*): maximum 140 ppm.

To 1.25 g add 50 ml of *distilled water R*. Heat at about 70 °C for 5 min. Cool and filter. To 20 ml of the filtrate add 1 ml of *nitric acid R*, allow to stand for 5 min and filter to obtain a clear solution.

Sulphates (*2.4.13*): maximum 400 ppm.

To 20 ml of the filtrate prepared for the test for chlorides add 1 ml of *dilute hydrochloric acid R*, allow to stand for 5 min and filter.

Heavy metals (*2.4.8*): maximum 10 ppm.

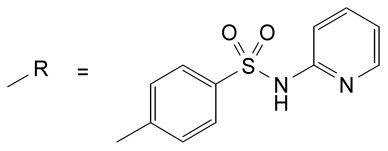
2.0 g complies with test D. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

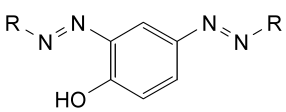
Sulphated ash (*2.4.14*): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in *0.1 M sodium hydroxide* and dilute to 100.0 ml with the same solvent. Transfer 5.0 ml of this solution to a 1000 ml volumetric flask containing about 750 ml of *water R*. Add 20.0 ml of *0.1 M acetic acid* and dilute to 1000.0 ml with *water R*. Prepare a standard solution at the same time and in the same manner using 0.150 g of *sulfasalazine CRS*. Measure the absorbance (*2.2.25*) of the 2 solutions at the absorption maximum at 359 nm.

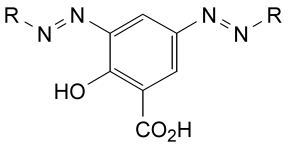


Calculate the content of $C_{18}H_{14}N_4O_5S$ from the absorbances measured and the concentration of the solutions.



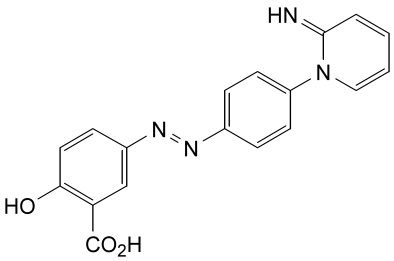
STORAGE

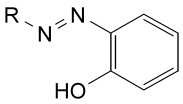
Protected from light.



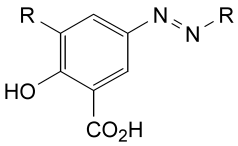
IMPURITIES

Specified impurities: *A, B, C, D, E, F, G, H, I, J.*

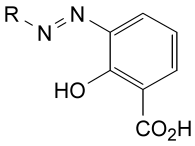




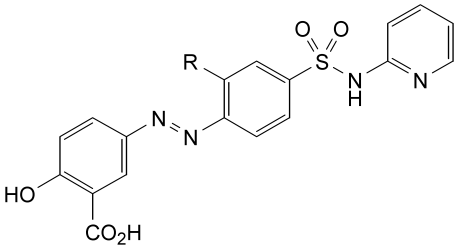
A. 4,4′-[(4-hydroxy-1,3-phenylene)bis(diazenediyl)]bis[*N*-(pyridin-2-yl)benzenesulphonamide],



B. 2-hydroxy-3,5-bis[2-[4-(pyridin-2-ylsulphamoyl)phenyl]-diazenyl]benzoic acid,

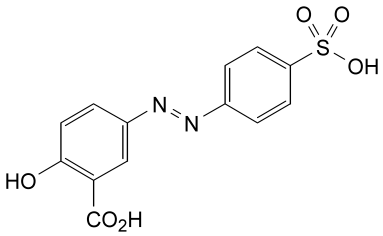


C. 2-hydroxy-5-[2-[4-(2-iminopyridin-1(2*H*)-yl)phenyl]-diazenyl]benzoic acid,



D. 4-[2-(2-hydroxyphenyl)diazenyl]-*N*-(pyridin-2-yl)benzenesulphonamide,

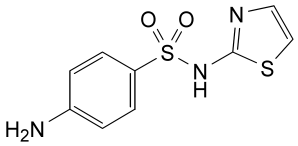
E. 2-hydroxy-4′-(pyridin-2-ylsulphamoyl)-5-[2-[4-(pyridin-2-ylsulphamoyl)phenyl]diazenyl]biphenyl-3-carboxylic acid,



F. 2-hydroxy-3-[2-[4-(pyridin-2-ylsulphamoyl)phenyl]-diazenyl]benzoic acid,

G. 5-[2-[4′,5-bis(pyridin-2-ylsulphamoyl)biphenyl-2-yl]diazenyl]-2-hydroxybenzoic acid,

H. salicylic acid,



I. 2-hydroxy-5-[2-(4-sulphophenyl)diazenyl]benzoic acid,

J. H_2N-R: 4-amino-*N*-(pyridin-2-yl)benzenesulphonamide (sulfapyridine).

corrected 6.0

SULFATHIAZOLE

Sulfathiazolum

$C_9H_9N_3O_2S_2$ M_r 255.3
[72-14-0]

DEFINITION

Sulfathiazole contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(thiazol-2-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, practically insoluble in water, slightly soluble in alcohol, practically insoluble in methylene chloride. It dissolves in dilute solutions of alkali hydroxides and in dilute mineral acids.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D, E.

A. Melting point (*2.2.14*): 200 °C to 203 °C. Melting may occur at about 175 °C, followed by solidification and a second melting between 200 °C and 203 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sulfathiazole CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *alcohol R*, evaporate to dryness *in vacuo* and record the spectra again using the residues.

C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 10 mg in a mixture of 10 ml of *water R* and 2 ml of *0.1 M sodium hydroxide* and add 0.5 ml of *copper sulphate solution R*. A greyish-blue or purple precipitate is formed.

E. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further addition of acid, gives the reaction of primary aromatic amines (*2.3.1*).

TESTS

Appearance of solution. Dissolve 1.0 g in 10 ml of *1 M sodium hydroxide*. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution GY_4 (*2.2.2, Method II*).

Acidity. To 1.0 g add 50 ml of *carbon dioxide-free water R*. Heat to 70 °C for 5 min. Cool rapidly to 20 °C and filter. To 25 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel H R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *alcohol R* and dilute to 10 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 5 ml with a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *alcohol R*.

Reference solution (a). Dissolve 20 mg of *sulfathiazole CRS* in a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *alcohol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 50 mg of *sulfanilamide R* in a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *alcohol R* and dilute to 100 ml with the same mixture of solvents. Dilute 1 ml of this solution to 10 ml with the same mixture of solvents.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 18 volumes of *ammonia R* and 90 volumes of *butanol R*. Dry the plate at 100 °C to 105 °C for 10 min and spray with a 1 g/l solution of *dimethylaminobenzaldehyde R* in *alcohol R* containing 1 per cent *V/V* of *hydrochloric acid R*. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

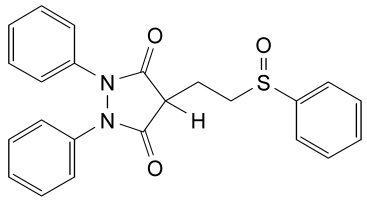
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the determination of primary aromatic amino-nitrogen (*2.5.8*), using 0.200 g, determining the end-point electrometrically.

1 ml of *0.1 M sodium nitrite* is equivalent to 25.53 mg of $C_9H_9N_3O_2S_2$.



STORAGE

Store protected from light.

corrected 6.0

SULFINPYRAZONE

Sulfinpyrazonum

$C_{23}H_{20}N_2O_3S$ M_r 404.5
[57-96-5]

DEFINITION

Sulfinpyrazone contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1,2-diphenyl-4-[2-(phenylsulphinyl)ethyl]pyrazolidine-3,5-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, very slightly soluble in water, sparingly soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. Melting point (*2.2.16*): 131 °C to 135 °C.

B. Dissolve 30.0 mg in *0.01 M sodium hydroxide* and dilute to 100.0 ml with the same alkaline solution. Dilute 1.0 ml of this solution to 20.0 ml with *0.01 M sodium hydroxide*. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 260 nm. The specific absorbance at the maximum is 530 to 580.

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sulfinpyrazone CRS*. Examine the substances prepared as discs.

D. Dissolve about 10 mg in 3 ml of *acetone R* and add a mixture of 0.2 ml of *ferric chloride solution R2* and 3 ml of *water R*. A red to violet colour develops.

TESTS

Appearance of solution in acetone. Dissolve 1.25 g in *acetone R* and dilute to 25 ml with the same solvent. The solution is clear (*2.2.1*). The absorbance (*2.2.25*) of the solution, measured at 420 nm with a path-length of 4 cm, is not greater than 0.10.

Appearance of solution in 1 M sodium hydroxide. Dissolve 1.25 g, heating gently if necessary, in 25 ml of *1 M sodium hydroxide*. The solution is clear (*2.2.1*). The absorbance (*2.2.25*) of the solution, measured at 420 nm with a path-length of 4 cm, is not greater than 0.15.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm. Expose the plate, in a tank, to the vapour from *glacial acetic acid R*. After 10 min, remove the plate and heat at 60 °C for 40 min. Cool and pass a current of nitrogen over the plate for 10 min.

Prepare the solutions immediately before use.

Test solution. Dissolve 0.25 g of the substance to be examined in *acetone R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dilute 2 ml of the test solution to 100 ml with *acetone R*. Dilute 1 ml of this solution to 10 ml with *acetone R*.

Reference solution (b). Dissolve 10 mg of *sulfinpyrazone impurity A CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dilute 5 ml of reference solution (b) to 10 ml with *acetone R*.

Reference solution (d). Dissolve 10 mg of *sulfinpyrazone impurity B CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (e). Dilute 5 ml of reference solution (d) to 10 ml with *acetone R*.

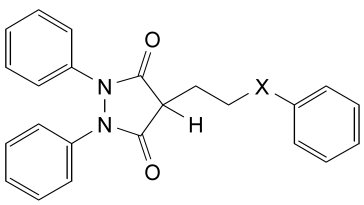
Apply to the plate, under an atmosphere of nitrogen, 2 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R* and 80 volumes of *chloroform R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution: any spots corresponding to sulfinpyrazone impurity A and sulfinpyrazone impurity B are not more intense than the spots in the chromatograms obtained with reference solutions (b) (2.0 per cent) and (d) (2.0 per cent), respectively, and at most one of the spots is more intense than the corresponding spot in the chromatogram obtained with reference solution (c) (1.0 per cent) or (e) (1.0 per cent); any spot apart from the principal spot and the two spots previously cited is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



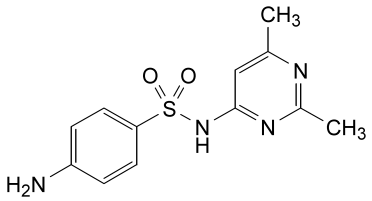
Dissolve 0.300 g in 25 ml of *acetone R*. Add 0.5 ml of *bromothymol blue solution R1*. Titrate with *0.1 M sodium hydroxide* until the colour changes from yellow to blue.

1 ml of *0.1 M sodium hydroxide* is equivalent to 40.45 mg of $C_{23}H_{20}N_2O_3S$.

STORAGE

Store protected from light.

IMPURITIES



A. X = SO_2: 1,2-diphenyl-4-[2-(phenylsulphonyl)ethyl]pyrazolidine-3,5-dione,

B. X = S: 1,2-diphenyl-4-[2-(phenylsulphanyl)ethyl]pyrazolidine-3,5-dione.

SULFISOMIDINE

Sulfisomidinum

$C_{12}H_{14}N_4O_2S$ M_r 278.3
[515-64-0]

DEFINITION

Sulfisomidine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(2, 6-dimethylpyrimidin-4-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White or yellowish-white powder or crystals, very slightly soluble in water, slightly soluble in acetone and in alcohol. It dissolves in dilute solutions of the alkali hydroxides and in dilute mineral acids.

It melts at about 240 °C with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *sulfisomidine CRS*. Examine the substances prepared as discs.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 50 mg with heating in 4 ml of *methanol R*. Cool and filter. Add to the filtrate 0.2 ml of a 40 g/l solution of *copper acetate R*. The solution becomes yellowish-green.

D. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (*2.3.1*).

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*. The solution is not more intensely coloured than reference solution Y_5, BY_5 or GY_5 (*2.2.2, Method II*).

Acidity. To 1.25 g, finely powdered, add 25 ml of *carbon dioxide-free water R*. Heat at 70 °C for 5 min. Cool in a bath of iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 5 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Reference solution (a). Dissolve 20 mg of *sulfisomidine CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.25 ml of test solution (b) to 50 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 3 volumes of *dilute ammonia R1*, 5 volumes of *water R*, 40 volumes of *nitromethane R* and 50 volumes of *dioxan R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

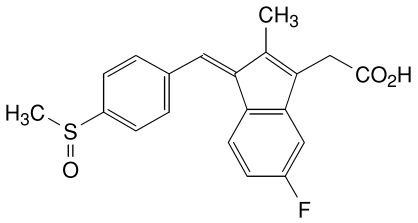
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the determination of primary aromatic amino-nitrogen (*2.5.8*), using 0.2500 g and determining the end-point electrometrically.

1 ml of *0.1 M sodium nitrite* is equivalent to 27.83 mg of $C_{12}H_{14}N_4O_2S$.



STORAGE

Store protected from light.

corrected 6.0

SULINDAC

Sulindacum

$C_{20}H_{17}FO_3S$ M_r 356.4
[38194-50-2]

DEFINITION

(*Z*)-[5-Fluoro-2-methyl-1-[4-(methylsulphinyl)benzylidene]-1*H*-inden-3-yl]acetic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: yellow, crystalline powder.

Solubility: very slightly soluble in water, soluble in methylene chloride, sparingly soluble in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

It shows polymorphism (*5.9*).

IDENTIFICATION

First identification: C.

Second identification: A, B, D, E.

A. Melting point (*2.2.14*): 182 °C to 186 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50 mg in a 0.3 per cent *V/V* solution of *hydrochloric acid R* in *methanol R* and dilute to 100 ml with the same acid solution. Dilute 2 ml of this solution to 50 ml with a 0.3 per cent *V/V* solution of *hydrochloric acid R* in *methanol R*.

Spectral range: 230-350 nm.

Absorption maxima: at 284 nm and 327 nm.

Shoulder: at about 258 nm.

Absorbance ratio: A_{284}/A_{327} = 1.10 to 1.20.

C. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *sulindac CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of hot *methanol R*, evaporate to dryness and record new spectra using the residues.

D. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *sulindac CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *diflunisal CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent. Dilute 1 ml of this solution to 2 ml with reference solution (a).

Plate: *TLC silica gel GF_{254} plate R*.

Mobile phase: *glacial acetic acid R, methylene chloride R, acetone R* (1:49:50 *V/V/V*).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in a current of warm air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

E. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. Add 1.0 ml of the filtrate to a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.10 g of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 20.0 mg of *sulindac CRS* (which has an assigned content of *E*-isomer) in the mobile phase and dilute to 10.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *silica gel for chromatography R* (10 µm).

Mobile phase: *glacial acetic acid R, ethanol (96 per cent) R, ethyl acetate R, ethanol-free chloroform R* (1:4:100:400 *V/V/V/V*).

Flow rate: 2 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl.

Run time: twice the retention time of sulindac.

Identification of peaks: the chromatogram obtained with reference solution (b) shows a principal peak due to sulindac and a peak due to the *E*-isomer.

Relative retention with reference to sulindac:
E-isomer = about 1.75.

From the chromatograms obtained with the test solution and reference solution (b), determine the percentage content of *E*-isomer, taking into account the assigned content of this isomer in *sulindac CRS*.

Limits:

– *E*-isomer: maximum 0.5 per cent;

– *impurities A, B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

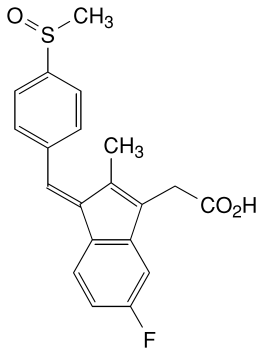
2.0 g complies with test D. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C at a pressure not exceeding 0.7 kPa.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

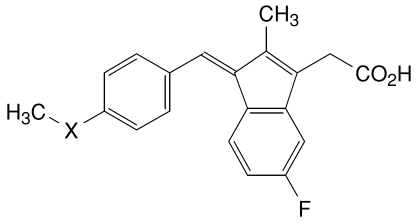
ASSAY

Dissolve 0.300 g in 50 ml of *methanol R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).



1 ml of *0.1 M sodium hydroxide* is equivalent to 35.64 mg of $C_{20}H_{17}FO_3S$.

STORAGE



Protected from light.

IMPURITIES

Specified impurities: *A, B, C*.

A. (*E*)-[5-fluoro-2-methyl-1-[4-(methylsulphinyl)benzylidene]-1*H*-inden-3-yl]acetic acid,

B. X = SO_2: (*Z*)-[5-fluoro-2-methyl-1-[4-(methylsulphonyl)-benzylidene]-1*H*-inden-3-yl]acetic acid,

C. X = S: (*Z*)-[5-fluoro-2-methyl-1-[4-methylsulphanyl)-benzylidene]-1*H*-inden-3-yl]acetic acid.

01/2008:0953

SULPHUR FOR EXTERNAL USE

Sulfur ad usum externum

S A_r 32.07
[7704-34-9]

DEFINITION

Content: 99.0 per cent to 101.0 per cent.

CHARACTERS

Appearance: yellow powder.

Solubility: practically insoluble in water, soluble in carbon disulphide, slightly soluble in vegetable oils.

mp: about 120 °C.

The size of most of the particles is not greater than 20 µm and that of almost all the particles is not greater than 40 µm.

IDENTIFICATION

A. Heated in the presence of air, it burns with a blue flame, emitting sulphur dioxide which changes the colour of moistened *blue litmus paper R* to red.

B. Heat 0.1 g with 0.5 ml of *bromine water R* until decolourised. Add 5 ml of *water R* and filter. The solution gives reaction (a) of sulphates (*2.3.1*).

TESTS

Solution S. To 5 g add 50 ml of *carbon dioxide-free water R* prepared from *distilled water R*. Allow to stand for 30 min with frequent shaking and filter.

Appearance of solution. Solution S is colourless (*2.2.2, Method II*).

Odour (*2.3.4*). It has no perceptible odour of hydrogen sulphide.

Acidity or alkalinity. To 5 ml of solution S add 0.1 ml of *phenolphthalein solution R1*. The solution is colourless. Add 0.2 ml of *0.01 M sodium hydroxide*. The solution is red. Add 0.3 ml of *0.01 M hydrochloric acid*. The solution is colourless. Add 0.15 ml of *methyl red solution R*. The solution is orange-red.

Chlorides (*2.4.4*): maximum 100 ppm.

Dilute 5 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 100 ppm, determined on solution S.

Sulphides. To 10 ml of solution S add 2 ml of *buffer solution pH 3.5 R* and 1 ml of a freshly prepared 1.6 g/l solution of *lead nitrate R* in *carbon dioxide-free water R*. Shake. After 1 min any colour in the solution is not more intense than that in a reference solution prepared at the same time using 1 ml of *lead standard solution (10 ppm Pb) R*, 9 ml of *carbon dioxide-free water R*, 2 ml of *buffer solution pH 3.5 R* and 1.2 ml of *thioacetamide reagent R*.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Carry out the oxygen-flask method (*2.5.10*), using 60.0 mg in a 1000 ml combustion flask. Absorb the combustion products in a mixture of 5 ml of *dilute hydrogen peroxide solution R* and 10 ml of *water R*. Heat to boiling, boil gently for 2 min and cool. Using 0.2 ml of *phenolphthalein solution R* as indicator, titrate with *0.1 M sodium hydroxide* until the colour changes from colourless to red. Carry out a blank titration under the same conditions.

1 ml of *0.1 M sodium hydroxide* is equivalent to 1.603 mg of S.

STORAGE

Protected from light.

01/2008:1572

SULPHURIC ACID

Acidum sulfuricum

H_2SO_4 M_r 98.1
[7664-93-9]

DEFINITION

Content: 95.0 per cent *m/m* to 100.5 per cent *m/m*.

CHARACTERS

Appearance: colourless, oily liquid, very hygroscopic.

Solubility: miscible with water and with ethanol (96 per cent) producing intense heat.

Relative density: about 1.84.

IDENTIFICATION

A. Carefully add 1 ml to 100 ml of *water R*. The solution is strongly acid (*2.2.4*).

B. The solution obtained in identification test A gives reaction (a) of sulphates (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Carefully pour, while cooling, 5 ml into 30 ml of *water R* and dilute to 50 ml with the same solvent.

Chlorides (*2.4.4*): maximum 50 ppm.

Mix carefully, while cooling, 3.3 g with 30 ml of *water R*. Neutralise with *ammonia R* and dilute to 50 ml with *water R*.

Nitrates. Add 5 ml to 5 ml of *water R*. Cool to room temperature and add 0.5 ml of *indigo carmine solution R*. The blue colour persists for at least 1 min.

Arsenic (*2.4.2, Method A*): maximum 1 ppm.

Mix, while cooling, 1 g with 20 ml of *water R* and dilute to 25 ml with the same solvent.

Iron (*2.4.9*): maximum 25 ppm.

Cautiously evaporate 10.0 g and ignite to dull redness. Dissolve the ignition residue in 1 ml of *dilute hydrochloric acid R* with gentle heating and dilute to 25 ml with *water R*. Dilute 1 ml of this solution to 10 ml with *water R*.

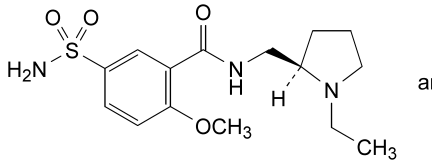
Heavy metals (*2.4.8*): maximum 5 ppm.

4.0 g complies with test F. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

ASSAY

Weigh accurately a ground-glass-stoppered flask containing 30 ml of *water R*. Introduce 0.2 ml, cool and weigh again. Titrate with *1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *1 M sodium hydroxide* is equivalent to 49.04 mg of H_2SO_4.



STORAGE

In an airtight container.

01/2008:1045
corrected 6.0

SULPIRIDE

Sulpiridum

and enantiomer

$C_{15}H_{23}N_3O_4S$ M_r 341.4
[15676-16-1]

DEFINITION

(*RS*)-*N*-[(1-Ethylpyrrolidin-2-yl)methyl]-2-methoxy-5-sulphamoylbenzamide.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, sparingly soluble in methanol, slightly soluble in ethanol (96 per cent) and in methylene chloride. It dissolves in dilute solutions of mineral acids and alkali hydroxides.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 177 °C to 181 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *sulpiride CRS*.

C. Examine the chromatograms obtained in test A for related substances.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To about 1 mg in a porcelain dish, add 0.5 ml of *sulphuric acid R* and 0.05 ml of *formaldehyde solution R*. Examined in ultraviolet light at 365 nm, the solution shows blue fluorescence.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method I*).

Dissolve 1.0 g in *dilute acetic acid R* and dilute to 10 ml with the same acid.

Related substances

A. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent. Sonicate until complete dissolution.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *sulpiride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *sulpiride impurity A CRS* in *methanol R* and dilute to 25 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10 ml with *methanol R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *concentrated ammonia R, dioxan R, methanol R, methylene chloride R* (2:10:14:90 *V/V/V/V*).

Application: 10 µl.

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm for identification test C and then spray with *ninhydrin solution R*; heat at 100-105 °C for 15 min and examine in daylight.

Limit: test solution (a):

– *impurity A*: any spot due to impurity A is not more intense than the corresponding spot in the chromatogram obtained with reference solution (c) (0.1 per cent).

B. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 3.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *sulpiride CRS* and 10 mg of *sulpiride impurity B CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm) in spherical micro-particles.

Mobile phase: mix 10 volumes of *acetonitrile R*, 10 volumes of *methanol R* and 80 volumes of a solution containing 6.8 g/l of *potassium dihydrogen phosphate R* and 1 g/l of *sodium octanesulphonate R*, adjusted to pH 3.3 using *phosphoric acid R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 10 µl.

Run time: 2.5 times the retention time of sulpiride.

System suitability: reference solution (b):

– *resolution*: minimum 2.5 between the peaks due to impurity B and sulpiride.

Limit:

– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent).

Chlorides (*2.4.4*): maximum 100 ppm.

Shake 1.0 g with 20 ml of *water R*. Filter through a sintered-glass filter (40) (*2.1.2*). To 10 ml of the filtrate add 5 ml of *water R*.

Iron (*2.4.9*): maximum 10 ppm.

Ignite 1.0 g in a silica crucible. To the residue add 1 ml of *1 M hydrochloric acid*, 3 ml of *water R* and 0.1 ml of *nitric acid R*. Heat on a water-bath for a few minutes. Place the solution in a test-tube. Rinse the crucible with 4 ml of *water R*. Collect the rinsings in the test-tube and dilute to 10 ml with *water R*.

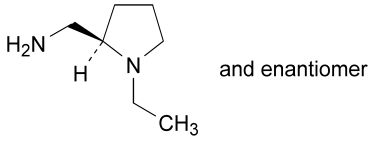
Heavy metals (*2.4.8*): maximum 10 ppm.

1.0 g complies with test C. Prepare the reference solution using 1 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

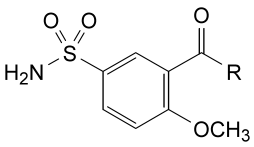
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.250 g in 80 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 34.14 mg of $C_{15}H_{23}N_3O_4S$.

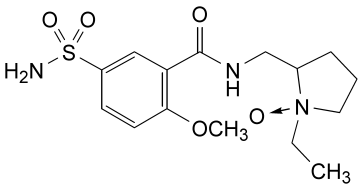


IMPURITIES

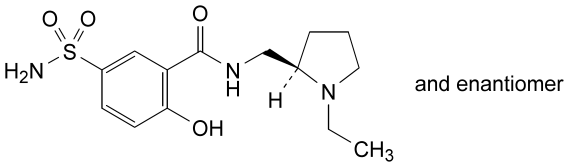
Specified impurities: A.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, E, F, G.*

A. [(2*RS*)-1-ethylpyrrolidin-2-yl]methanamine,



B. R = O-CH_3: methyl 2-methoxy-5-sulphamoylbenzoate,

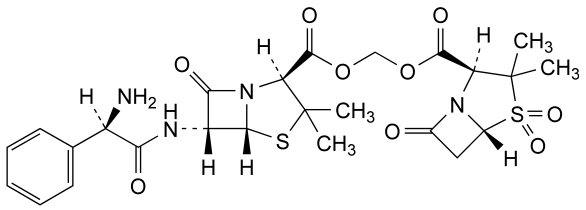


C. R = O-C_2H_5: ethyl 2-methoxy-5-sulphamoylbenzoate,

D. R = OH: 2-methoxy-5-sulphamoylbenzoic acid,

E. R = NH_2: 2-methoxy-5-sulphamoylbenzamide,

F. 1-ethyl-2-[[(2-methoxy-5-sulphamoylbenzoyl)amino]-methyl]pyrrolidine 1-oxide,



G. (*RS*)-*N*-[(1-ethylpyrrolidin-2-yl)methyl]-2-hydroxy-5-sulphamoylbenzamide.

01/2008:2211

SULTAMICILLIN

Sultamicillinum

$C_{25}H_{30}N_4O_9S_2$ M_r 594.7

[76497-13-7]

DEFINITION

Methylene (2*S*,5*R*,6*R*)-6-[[(2*R*)-aminophenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate (2*S*,5*R*)-3,3-dimethyl-4,4,7-trioxo-4λ^6-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate.

Semi-synthetic product derived from a fermentation product.

Content: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, slightly hygroscopic, crystalline powder.

Solubility: practically insoluble in water, very slightly soluble in methanol, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *sultamicillin CRS*.

TESTS

Specific optical rotation (*2.2.7*): + 190 to + 210 (anhydrous substance).

Dissolve 0.500 g in *dimethylformamide R* and dilute to 50.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use or keep at 2-8 °C for not more than 6 h.*

Solution A: *methanol R1, acetonitrile R1* (20:80 *V/V*).

Solution B. Dissolve 1.56 g of *sodium dihydrogen phosphate R* in 900 ml of *water R*. Add 7.0 ml of *phosphoric acid R* and dilute to 1000 ml with *water R*.

Blank solution: solution B, solution A (30:70 *V/V*).

Test solution. Dissolve 50.0 mg of the substance to be examined in 35 ml of solution A and sonicate for about 1 min. Add 13 ml of solution B, mix and sonicate for about 1 min. Dilute to 50.0 ml with solution B and mix.

Reference solution (a). Dissolve 70.0 mg of *sultamicillin tosilate CRS* in 35 ml of solution A and sonicate for about 1 min. Add 13 ml of solution B, mix and sonicate for about 1 min. Dilute to 50.0 ml with solution B and mix.

Reference solution (b). Suspend 15 mg of *sultamicillin tosilate CRS* in 20 ml of a 0.4 g/l solution of *sodium hydroxide R* and sonicate in an ultrasonic bath for about 5 min. Add 20 ml of a 0.36 g/l solution of *hydrochloric acid R* and dilute to 100 ml with *water R*.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the blank solution.

Reference solution (d). Dissolve 17.3 mg of *ampicillin trihydrate CRS* (impurity C) and 15.0 mg of *sulbactam CRS* (impurity A) in *water R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with *water R*.

Reference solution (e). Dissolve 5 mg of *sultamicillin for peak identification CRS* (containing impurity G) in 7.0 ml of solution A and sonicate for about 1 min. Dilute to 10.0 ml with solution B, mix and sonicate for about 1 min.

Column:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3.5 µm);
- *temperature*: 25 °C.

Mobile phase:

- *mobile phase A*: 4.68 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 3.0 with *phosphoric acid R*;
- *mobile phase B*: *acetonitrile R1*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	95 → 30	5 → 70
15 - 16	30	70
16 - 16.5	30 → 95	70 → 5
16.5 - 20	95	5

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 5 µl of the blank solution, the test solution and reference solutions (b), (c), (d) and (e).

Identification of impurities: use the chromatogram supplied with *sultamicillin for peak identification CRS* and the chromatogram obtained with reference solution (e) to identify the peak due to impurity G.

Relative retention with reference to sultamicillin (retention time = about 9.3 min): impurity A = about 0.41; ampicillin penicilloic acid = about 0.47; impurity B = about 0.50; impurity C = about 0.55; impurity D = about 0.94; impurity E = about 1.09; impurity F = about 1.26; impurity G = about 1.42.

System suitability: reference solution (b):

- *resolution*: minimum 2.5 between the peaks due to ampicillin penicilloic acid and impurity B and minimum 2.5 between the peaks due to impurities B and C.

Limits:

- *impurity G*: not more than the area of the peak due to sultamicillin in the chromatogram obtained with reference solution (c) (1.0 per cent);
- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.3 per cent);
- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.3 per cent);
- *impurity C*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.3 per cent);
- *impurities D, E, F*: for each impurity, not more than 0.3 times the area of the peak due to sultamicillin in the chromatogram obtained with reference solution (c) (0.3 per cent);
- *any other impurity*: for each impurity, not more than 0.3 times the area of the peak due to sultamicillin in the chromatogram obtained with reference solution (c) (0.3 per cent);
- *total*: not more than 3 times the area of the peak due to sultamicillin in the chromatogram obtained with reference solution (c) (3.0 per cent);
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Ethyl acetate. Head-space gas chromatography (*2.2.28*).

Test solution. Dissolve 0.200 g in 7.0 ml of a mixture of 1 volume of *water R* and 99 volumes of *dimethylformamide R*.

Reference solution. Dissolve 0.200 g of *ethyl acetate R* in 240 ml of a mixture of 1 volume of *water R* and 99 volumes of *dimethylformamide R* and dilute to 250.0 ml with the same mixture of solvents. Dilute 5.0 ml of this solution to 7.0 ml with a mixture of 1 volume of *water R* and 99 volumes of *dimethylformamide R*.

Close the vials immediately with a tight rubber membrane stopper coated with polytetrafluoroethylene and secure with an aluminium crimped cap. Shake to obtain a homogeneous solution.

Column:

- *material*: fused silica;
- *size*: *l* = 50 m, Ø = 0.32 mm;
- *stationary phase*: *poly(dimethyl)siloxane R* (film thickness: 1.8 µm or 3 µm).

Carrier gas: *helium for chromatography R*.

Linear velocity: 35 cm/s.

Split ratio: 1:5.

Static head-space conditions that may be used:

- *equilibration temperature*: 105 °C;
- *equilibration time*: 45 min;
- *transfer-line temperature*: 110 °C;
- *pressurisation time*: 30 s.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 6	70
	6 - 16	70 → 220
	16 - 18	220
Injection port		140
Detector		250

Detection: flame ionisation.

Injection: 1 ml.

Relative retention with reference to dimethylformamide (retention time = about 14 min): ethyl acetate = about 0.7.

Limit:

– *ethyl acetate*: maximum 2.5 per cent.

Heavy metals (*2.4.8*): maximum 20 ppm.

Dissolve 2.0 g in a mixture of 40 volumes of *methanol R* and 60 volumes of *acetonitrile R* and dilute to 20.0 ml with the same mixture of solvents. 12 ml of the solution complies with test B. Prepare the reference solution using lead standard solution (2 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 40 volumes of *methanol R* and 60 volumes of *acetonitrile R*.

Water (*2.5.12*): maximum 1.0 per cent, determined on 0.500 g.

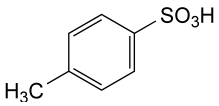
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Injection: test solution and reference solution (a).

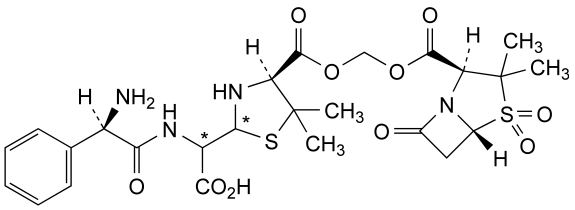
Calculate the percentage content of sultamicillin ($C_{25}H_{30}N_4O_9S_2$) from the declared content of $C_{25}H_{30}N_4O_9S_2$ in *sultamicillin tosilate CRS*.



STORAGE

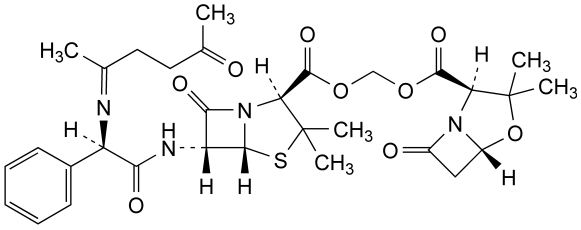
In an airtight container, at a temperature of 2 °C to 8 °C.

IMPURITIES

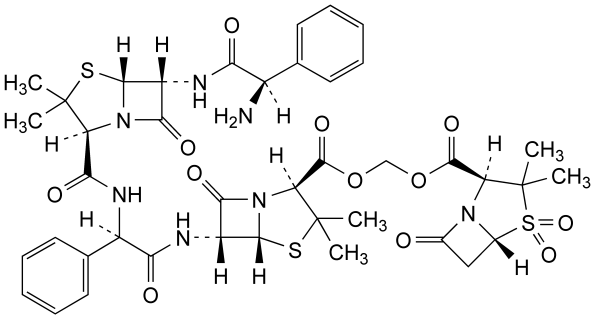


Specified impurities: A, B, C, D, E, F, G.

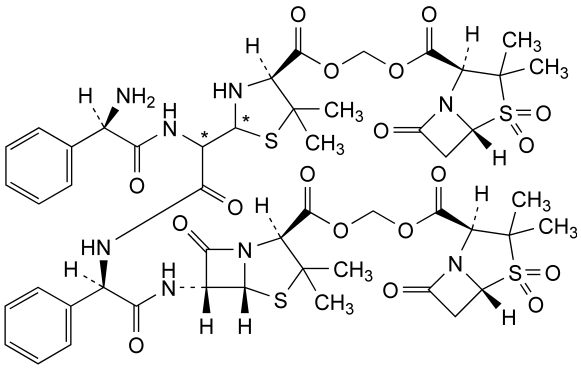
A. sulbactam,



B. 4-methylbenzenesulphonic acid (*p*-toluenesulphonic acid),



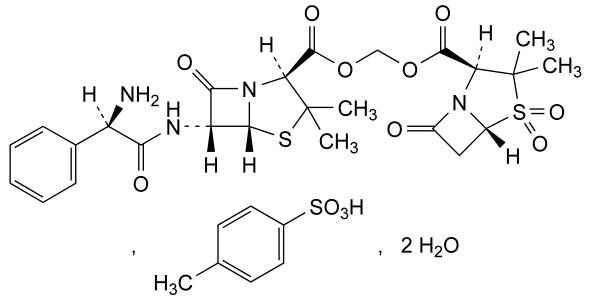
C. ampicillin,



D. [[(2*R*)-aminophenylacetyl]amino][(4*S*)-4-[[[[[(2*S*,5*R*)-3,3-dimethyl-4,4,7-trioxo-4λ⁶-thia-1-azabicyclo[3.2.0]hept-2-yl]carbonyl]oxy]methoxy]carbonyl]-5,5-dimethylthiazolidin-2-yl]acetic acid (penicilloic acids of sultamicillin),

E. methylene (2*S*,5*R*,6*R*)-3,3-dimethyl-6-[[(2*R*)-[(1-methyl-4-oxopentylidene)amino]phenylacetyl]amino]-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate (2*S*,5*R*)-3,3-dimethyl-7-oxo-4-oxa-1-azabicyclo[3.2.0]heptane-2-carboxylate,

F. methylene (2*S*,5*R*,6*R*)-6-[[(2*R*)-[[[(2*S*,5*R*,6*R*)-6-[[(2*R*)-aminophenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]hept-2-yl]carbonyl]amino]phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate (2*S*,5*R*)-3,3-dimethyl-4,4,7-trioxo-4λ⁶-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate (ampicillin sultamicillin amide),



G. methylene (2*S*,5*R*,6*R*)-6-[[(2*R*)-[[[[(2*R*)-aminophenylacetyl]amino][(4*S*)-4-[[[[[(2*S*,5*R*)-3,3-dimethyl-4,4,7-trioxo-4λ⁶-thia-1-azabicyclo[3.2.0]hept-2-yl]carbonyl]oxy]methoxy]carbonyl]-5,5-dimethylthiazolidin-2-yl]acetyl]amino]phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate (2*S*,5*R*)-3,3-dimethyl-4,4,7-trioxo-4λ⁶-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate (sultamicillin dimer).

01/2008:2212

SULTAMICILLIN TOSILATE DIHYDRATE

Sultamicillini tosilas dihydricus

$C_{32}H_{38}N_4O_{12}S_3,2H_2O$ M_r 803

DEFINITION

4-Methylbenzenesulphonate of methylene (2*S*,5*R*,6*R*)-6-[[(2*R*)-aminophenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate (2*S*,5*R*)-3,3-dimethyl-4,4,7-trioxo-4λ⁶-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate dihydrate.

Semi-synthetic product derived from a fermentation product.

Content: 95.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, sparingly soluble in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *sultamicillin tosilate CRS*.

TESTS

Specific optical rotation (*2.2.7*): + 178 to + 195 (anhydrous substance).

Dissolve 1.000 g in *dimethylformamide R* and dilute to 50.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use or keep at 2-8 °C for not more than 6 h.*

Solution A: *methanol R1, acetonitrile R1* (20:80 *V/V*).

Solution B. Dissolve 1.56 g of *sodium dihydrogen phosphate R* in 900 ml of *water R*. Add 7.0 ml of *phosphoric acid R* and dilute to 1000 ml with *water R*.

Blank solution: solution B, solution A (30:70 *V/V*).

Test solution. Dissolve 70.0 mg of the substance to be examined in 35 ml of solution A and sonicate for about 1 min. Add 13 ml of solution B, mix and sonicate for about 1 min. Dilute to 50.0 ml with solution B and mix.

Reference solution (a). Dissolve 70.0 mg of *sultamicillin tosilate CRS* in 35 ml of solution A and sonicate for about 1 min. Add 13 ml of solution B, mix and sonicate for about 1 min. Dilute to 50.0 ml with solution B and mix.

Reference solution (b). Suspend 15 mg of the substance to be examined in 20 ml of a 0.4 g/l solution of *sodium hydroxide R* and sonicate in an ultrasonic bath for about 5 min. Add 20 ml of a 0.36 g/l solution of *hydrochloric acid R* and dilute to 100.0 ml with *water R*.

Reference solution (c). Dissolve 0.200 g of the substance to be examined in 70.0 ml of solution A and sonicate for about 1 min. Add 25.0 ml of solution B, mix and sonicate for about 1 min. Dilute to 100.0 ml with solution B and mix. Dilute 1.0 ml of this solution to 100.0 ml with the blank solution.

Reference solution (d). Dissolve 32.3 mg of *ampicillin trihydrate CRS* (impurity B) and 7.0 mg of *sulbactam CRS* (impurity A) in *water R* and dilute to 1000 ml with the same solvent.

Column:

- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3.5 µm);
- *temperature*: 25 °C.

Mobile phase:

- *mobile phase A*: 4.68 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 3.0 with *phosphoric acid R*;
- *mobile phase B*: *acetonitrile R1*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	95 → 30	5 → 70
15 - 16	30	70
16 - 16.5	30 → 95	70 → 5
16.5 - 20	95	5

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 5 µl of the blank solution, the test solution and reference solutions (b), (c) and (d).

Relative retention with reference to sultamicillin (retention time = about 9.3 min): impurity A = about 0.41; ampicillin penicilloic acid = about 0.47; tosilate = about 0.50; impurity B = about 0.55; impurity C = about 0.94; impurity D = about 1.09; impurity E = about 1.23; impurity F = about 1.26; impurity G = about 1.42.

System suitability: reference solution (b):

- *resolution*: minimum 2.5 between the peaks due to ampicillin penicilloic acid and tosilate and minimum 2.5 between the peaks due to tosilate and impurity B.

Limits:

- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (2.0 per cent);
- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.5 per cent);
- *impurities C, D, E, F, G*: for each impurity, not more than 0.5 times the area of the peak due to sultamicillin in the chromatogram obtained with reference solution (c) (0.5 per cent);
- *any other impurity*: for each impurity, not more than 0.5 times the area of the peak due to sultamicillin in the chromatogram obtained with reference solution (c) (0.5 per cent);
- *total*: not more than 4 times the area of the peak due to sultamicillin in the chromatogram obtained with reference solution (c) (4.0 per cent);
- *disregard limit*: 0.1 times the area of the peak due to sultamicillin in the chromatogram obtained with reference solution (c) (0.1 per cent).

Ethyl acetate. Head space gas chromatography (*2.2.28*).

Test solution. Dissolve 0.200 g in 7.0 ml of a mixture of 1 volume of *water R* and 99 volumes of *dimethylformamide R*.

Reference solution. Dissolve 0.200 g of *ethyl acetate R* in 240 ml of a mixture of 1 volume of *water R* and 99 volumes of *dimethylformamide R* and dilute to 250.0 ml with the same mixture of solvents. Dilute 5.0 ml of this solution to 7.0 ml with a mixture of 1 volume of *water R* and 99 volumes of *dimethylformamide R*.

Immediately close the vials with a tight rubber membrane stopper coated with polytetrafluoroethylene and secure with an aluminium crimped cap. Shake to obtain a homogeneous solution.

Column:

– *material*: fused silica;
– *size*: *l* = 50 m, Ø = 0.32 mm;
– *stationary phase*: *poly(dimethyl)siloxane R* (film thickness: 1.8 µm or 3 µm).

Carrier gas: *helium for chromatography R.*

Linear velocity: 35 cm/s.

Split ratio: 1:5.

Static head-space conditions that may be used:

– *equilibration temperature*: 105 °C;
– *equilibration time*: 45 min;
– *transfer-line temperature*: 110 °C;
– *pressurisation time*: 30 s.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 6	70
	6 - 16	70 → 220
	16 - 18	220
Injection port		140
Detector		250

Detection: flame ionisation.

Injection: 1 ml.

Relative retention with reference to dimethylformamide (retention time = about 14 min): ethyl acetate = about 0.7.

Limit:

– *ethyl acetate*: maximum 2.0 per cent.

Heavy metals (*2.4.8*): maximum 20 ppm.

Dissolve 2.0 g in a mixture of 40 volumes of *methanol R* and 60 volumes of *acetonitrile R* and dilute to 20.0 ml with the same mixture of solvents. 12 ml of the solution complies with test B. Prepare the reference solution using lead standard solution (2 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 40 volumes of *methanol R* and 60 volumes of *acetonitrile R*.

Water (*2.5.12*): 4.0 per cent to 6.0 per cent, determined on 0.200 g.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

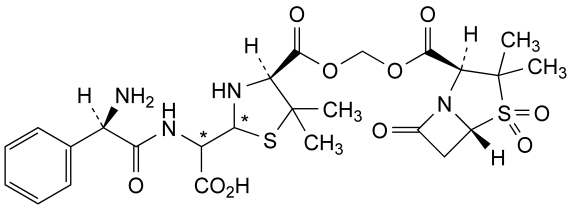
ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

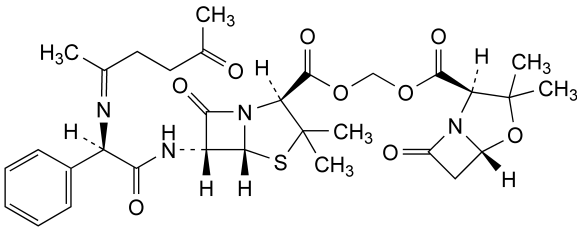
Calculate the percentage content of sultamicillin tosilate ($C_{32}H_{38}N_4O_{12}S_3$) from the declared content of sultamicillin ($C_{25}H_{30}N_4O_9S_2$) in *sultamicillin tosilate CRS* and by multiplying the sultamicillin content by 1.3502.

STORAGE



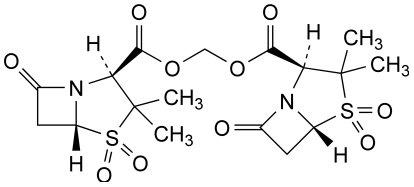
In an airtight container.

IMPURITIES

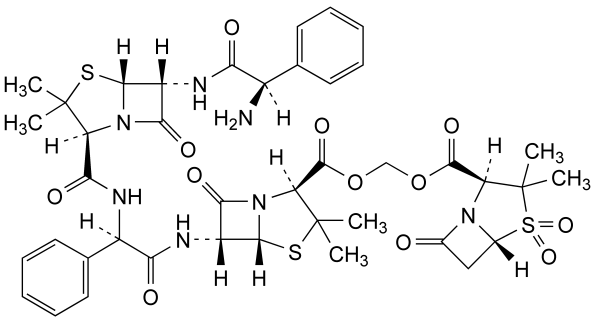


Specified impurities: A, B, C, D, E, F, G.

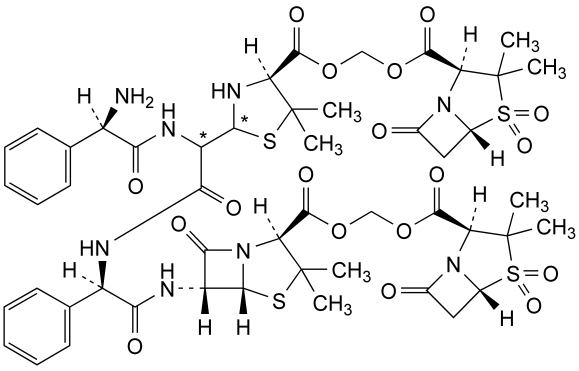
A. sulbactam,



B. ampicillin,



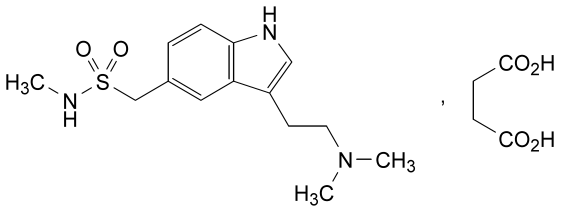
C. [[(2*R*)-aminophenylacetyl]amino][(4*S*)-4-[[[[[(2*S*,5*R*)-3,3-dimethyl-4,4,7-trioxo-4λ⁶-thia-1-azabicyclo[3.2.0]hept-2-yl]carbonyl]oxy]methoxy]carbonyl]-5,5-dimethylthiazolidin-2-yl]acetic acid (penicilloic acids of sultamicillin),



D. methylene (2*S*,5*R*,6*R*)-3,3-dimethyl-6-[[(2*R*)-[(1-methyl-4-oxopentylidene)amino]phenylacetyl]amino]-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate (2*S*,5*R*)-3,3-dimethyl-7-oxo-4-oxa-1-azabicyclo[3.2.0]heptane-2-carboxylate,

E. methylene bis[(2*S*,5*R*)-3,3-dimethyl-4,4,7-trioxo-4λ⁶-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate] (sulbactam methylene ester),

F. methylene (2*S*,5*R*,6*R*)-6-[[(2*R*)-[[[(2*S*,5*R*,6*R*)-6-[[(2*R*)-aminophenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]hept-2-yl]carbonyl]amino]phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate (2*S*,5*R*)-3,3-dimethyl-4,4,7-trioxo-4λ⁶-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate (ampicillin sultamicillin amide),



G. methylene (2*S*,5*R*,6*R*)-6-[[(2*R*)-[[[[(2*R*)-amino-phenylacetyl]amino][(4*S*)-4-[[[[[(2*S*,5*R*)-3,3-dimethyl-4,4,7-trioxo-4λ⁶-thia-1-azabicyclo[3.2.0]hept-2-yl] carbonyl]oxy]methoxy]carbonyl]-5,5-dimethylthiazolidin-2-yl]acetyl]amino]phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate (2*S*,5*R*)-3,3-dimethyl-4,4,7-trioxo-4λ⁶-thia-1-aza-bicyclo[3.2.0]heptane-2-carboxylate (sultamicillin dimer).

01/2008:1573

SUMATRIPTAN SUCCINATE

Sumatriptani succinas

$C_{18}H_{27}N_3O_6S$ M_r 413.5
[103628-48-4]

DEFINITION

[3-[2-(Dimethylamino)ethyl]-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide hydrogen butanedioate.

Content: 97.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, sparingly soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *sumatriptan succinate CRS*.

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

pH (*2.2.3*): 4.5 to 5.3.

Dilute 2.5 ml of solution S to 10 ml with *carbon dioxide-free water R*.

Absorbance (*2.2.25*): maximum 0.10, measured at 440 nm on solution S.

Impurities A and H. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 30.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve the contents of a vial of *sumatriptan for system suitability CRS* (containing impurities A and H) in the mobile phase and dilute to 1 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *silica gel for chromatography R* (5 µm).

Mobile phase: mix 10 volumes of a 771 g/l solution of *ammonium acetate R* and 90 volumes of *methanol R*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 282 nm.

Injection: 20 µl.

Run time: 5 times the retention time of sumatriptan.

System suitability: reference solution (b):

– *resolution*: minimum 1.5 between the peaks due to sumatriptan and impurity A;
– the chromatogram is similar to the chromatogram supplied with *sumatriptan for system suitability CRS*.

Limits:

– *impurity A*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent);
– *impurity H*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Solution A. Dissolve 2.925 g of *sodium dihydrogen phosphate R* in 600 ml of *water R*, adjust to pH 6.5 with *strong sodium hydroxide solution R*, dilute to 750 ml with *water R*, add 250 ml of *acetonitrile R* and mix.

Test solution (a). Dissolve 30.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Test solution (b). Dissolve 15.0 mg of the substance to be examined in solution A and dilute to 100.0 ml with solution A.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve the contents of a vial of *sumatriptan impurity mixture CRS* (containing impurities B, C, D and E) in the mobile phase and dilute to 1 ml with the mobile phase.

Reference solution (c). Dissolve 15.0 mg of *sumatriptan succinate CRS* in solution A and dilute to 100.0 ml with solution A.

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 25 volumes of *acetonitrile R* with 75 volumes of a solution prepared as follows: dissolve 0.970 g of *dibutylamine R*, 0.735 g of *phosphoric acid R*

and 2.93 g of *sodium dihydrogen phosphate R* in 750 ml of *water R*, adjust to pH 6.5 with *strong sodium hydroxide solution R* and dilute to 1000 ml with *water R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 282 nm.

Injection: 10 µl of test solution (a) and reference solutions (a) and (b).

Run time: 4 times the retention time of sumatriptan.

Identification of impurities: use the chromatogram obtained with reference solution (b) and the chromatogram supplied with *sumatriptan impurity mixture CRS* to identify the peaks due to impurities B, C, D and E.

System suitability: reference solution (b):

– *resolution*: minimum 1.5 between the peaks due to sumatriptan and impurity C;

– the chromatogram shows 5 clearly separated peaks.

Limits:

– *impurities B, C, D*: for each impurity, not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);

– *impurity E*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *total*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (*2.5.12*): maximum 1.0 per cent, determined on 0.500 g.

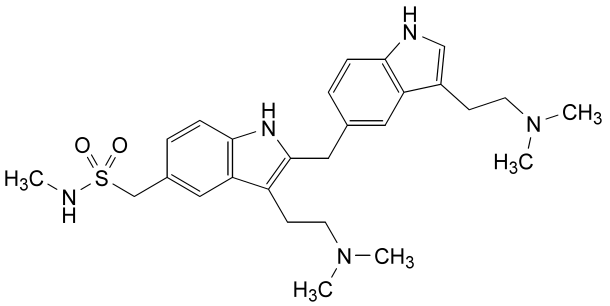
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

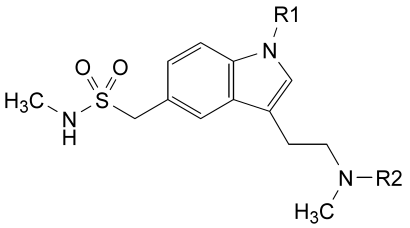
Injection: test solution (b) and reference solution (c).

Calculate the percentage content of $C_{18}H_{27}N_3O_6S$ from the declared content of *sumatriptan succinate CRS*.



STORAGE

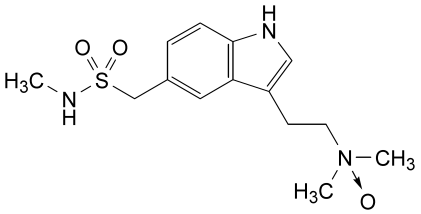
Protected from light.



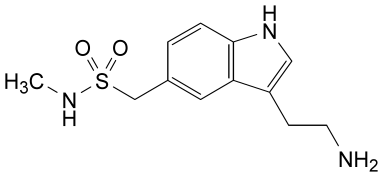
IMPURITIES

Specified impurities: *A, B, C, D, E, H.*

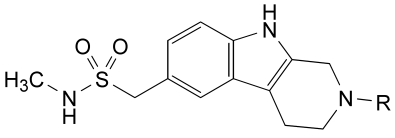
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F, G.*



A. [3-[2-(dimethylamino)ethyl]-2-[[3-[2-(dimethylamino)ethyl]-1*H*-indol-5-yl]methyl]-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide,

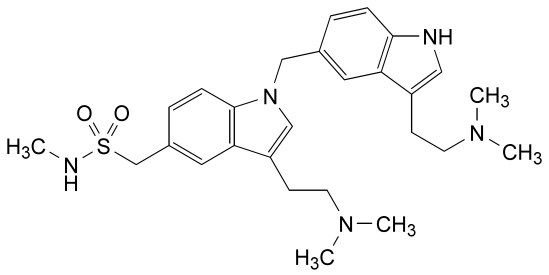


B. R1 = R2 = H: *N*-methyl[3-[2-(methylamino)ethyl]-1*H*-indol-5-yl]methanesulphonamide,



C. R1 = CH_2-OH, R2 = CH_3: [3-[2-(dimethylamino)ethyl]-1-(hydroxymethyl)-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide,

D. *N*,*N*-dimethyl-2-[5-[(methylsulphamoyl)methyl]-1*H*-indol-3-yl]ethanamine *N*-oxide,



E. [3-(2-aminoethyl)-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide,

F. R = H: *N*-methyl(2,3,4,9-tetrahydro-1*H*-pyrido[3,4-*b*]indol-6-yl)methanesulphonamide,

G. R = CH_3: *N*-methyl(2-methyl-2,3,4,9-tetrahydro-1*H*-pyrido[3,4-*b*]indol-6-yl)methanesulphonamide,

H. [3-[2-(dimethylamino)ethyl]-1-[[3-[2-(dimethylamino)ethyl]-1*H*-indol-5-yl]methyl]-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide.

01/2008:1371

SUNFLOWER OIL, REFINED

Helianthi annui oleum raffinatum

DEFINITION

Sunflower oil is the fatty oil obtained from the seeds of *Helianthus annuus* L. by mechanical expression or by extraction. It is then refined. A suitable antioxidant may be added.

CHARACTERS

A clear, light yellow liquid, practically insoluble in water and in alcohol, miscible with light petroleum (bp: 40 °C to 60 °C).

It has a relative density of about 0.921 and a refractive index of about 1.474.

IDENTIFICATION

Carry out the identification of fatty oils by thin-layer chromatography (*2.3.2*). The chromatogram obtained is similar to the typical chromatogram for sunflower oil.

TESTS

Acid value (*2.5.1*). Not more than 0.5, determined on 10.0 g.

Peroxide value (*2.5.5*). Not more than 10.0.

Unsaponifiable matter (*2.5.7*). Not more than 1.5 per cent, determined on 5.0 g.

Alkaline impurities (*2.4.19*). It complies with the test for alkaline impurities in fatty oils.

Composition of fatty acids (*2.4.22, Method A*). The fatty-acid fraction of the oil has the following composition:

– *palmitic acid*: 4.0 per cent to 9.0 per cent,

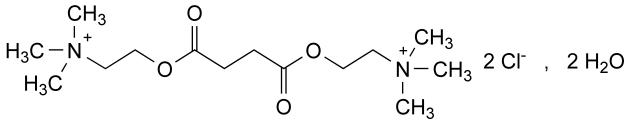
– *stearic acid*: 1.0 per cent to 7.0 per cent,

– *oleic acid*: 14.0 per cent to 40.0 per cent,

– *linoleic acid*: 48.0 per cent to 74.0 per cent.

STORAGE

Store in an airtight, well-filled container, protected from light.



LABELLING

The label states whether the oil is obtained by mechanical expression or by extraction.

01/2008:0248

SUXAMETHONIUM CHLORIDE

Suxamethonii chloridum

$C_{14}H_{30}Cl_2N_2O_4,2H_2O$ M_r 397.3
[6101-15-1]

DEFINITION

Suxamethonium chloride contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 2,2′-[butanedioylbis(oxy)]bis(*N,N,N*-trimethylethanaminium) dichloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, freely soluble in water, slightly soluble in alcohol.

It melts at about 160 °C, determined without previous drying.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *suxamethonium chloride CRS*. Examine the substances prepared as discs.

B. To 1 ml of solution S (see Tests) add 9 ml of *water R*, 10 ml of *dilute sulphuric acid R* and 30 ml of *ammonium reineckate solution R*. A pink precipitate is formed. Allow to stand for 30 min, filter, wash with *water R*, with *alcohol R* and then with *ether R* and dry at 80 °C. The melting point (*2.2.14*) of the precipitate is 180 °C to 185 °C.

C. Dissolve about 25 mg in 1 ml of *water R* and add 0.1 ml of a 10 g/l solution of *cobalt chloride R* and 0.1 ml of *potassium ferrocyanide solution R*. A green colour is produced.

D. About 20 mg gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*). Dilute 4 ml of solution S to 10 ml with *water R*. The solution is colourless (*2.2.2, Method II*).

pH (*2.2.3*). Dilute 1 ml of solution S to 10 ml with *carbon dioxide-free water R*. The pH of the solution is 4.0 to 5.0.

Choline chloride. Examine by thin-layer chromatography (*2.2.27*), using *cellulose for chromatography R1* as the coating substance.

Test solution. Dissolve 0.4 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.4 g of *suxamethonium chloride CRS* and 2 mg of *choline chloride R* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate 5 µl of each solution. Prepare the mobile phase as follows: shake together for 10 min, 10 volumes of *anhydrous formic acid R*, 40 volumes of *water R* and 50 volumes of *butanol R*; allow to stand and use the upper layer. Develop over a path of 15 cm. Dry the plate in a current of air and spray with *potassium iodobismuthate solution R*. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot corresponding to choline chloride in the chromatogram obtained with the reference solution (0.5 per cent). The test is not valid unless the chromatogram obtained with the reference solution shows two clearly separated spots.

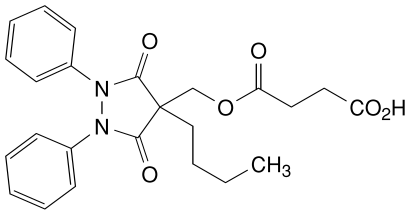
Water (*2.5.12*). 8.0 per cent to 10.0 per cent, determined on 0.30 g by the semi-micro determination of water.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 50 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 18.07 mg of $C_{14}H_{30}Cl_2N_2O_4$.



STORAGE

Store in an airtight container, protected from light.

01/2008:1574
corrected 6.0

SUXIBUZONE

Suxibuzonum

$C_{24}H_{26}N_2O_6$ M_r 438.5
[27470-51-5]

DEFINITION

4-[(4-Butyl-3,5-dioxo-1,2-diphenylpyrazolidin-4-yl)methoxy]-4-oxobutanoic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in acetone, soluble in alcohol, practically insoluble in cyclohexane.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *suxibuzone CRS*.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 1 g in *ethanol R* and dilute to 20 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.10 g of the substance to be examined in *acetonitrile R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 2.8 mg of *phenylbutazone CRS* (impurity A of suxibuzone), 2.8 mg of *suxibuzone impurity B CRS* and 2.8 mg of *suxibuzone impurity C CRS* in *acetonitrile R* and dilute to 10.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *acetonitrile R*.

Reference solution (b). Dissolve 4 mg of *phenylbutazone CRS* (impurity A of suxibuzone) in *acetonitrile R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *acetonitrile R*.

Reference solution (c). Dissolve 10 mg of *phenylbutazone CRS* (impurity A of suxibuzone) in *acetonitrile R* and dilute to 25.0 ml with the same solvent. Mix 10.0 ml of this solution with 1.0 ml of the test solution and dilute the mixture to 25.0 ml with *acetonitrile R*.

Column:

- *size*: *l* = 0.125 m, Ø = 4.0 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 44 volumes of *acetonitrile R* and 56 volumes of a solution prepared as follows: dissolve 6.7 g of *citric acid R* and 2.4 g of *tris(hydroxymethyl)aminomethane R* in 950 ml of *water R*, adjust to pH 3.0 with *citric acid R* and dilute to 1000 ml with *water R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 250 nm.

Injection: 10 µl.

Relative retention with reference to suxibuzone (retention time = about 7 min): impurity C = 0.7; impurity A = 1.4; impurity B = 3.3.

System suitability: reference solution (c):

- *resolution*: minimum of 2.0 between the peaks due to suxibuzone and to impurity A.

Limits:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.7 per cent),
- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.7 per cent),
- *impurity C*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.7 per cent),
- *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *disregard limit*: 0.1 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (a) (0.07 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

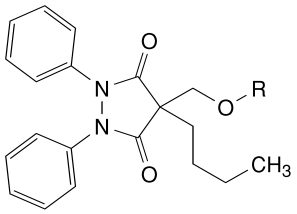
2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven *in vacuo* at 60 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in previously neutralised *ethanol R* and dilute to 10 ml with the same solvent. Carry out a potentiometric titration (*2.2.20*) using *0.1 M sodium hydroxide*.



1 ml of *0.1 M sodium hydroxide* is equivalent to 43.85 mg of $C_{24}H_{26}N_2O_6$.

STORAGE

Protected from light.

IMPURITIES

A. phenylbutazone,

B. R = CO-CH_2-CH_2-CO-O-CH_2-CH_3: (4-butyl-3,5-dioxo-1,2-diphenylpyrazolidin-4-yl)methyl ethyl butanedioate,

C. R = H: 4-butyl-4-(hydroxymethyl)-1,2-diphenyl-1,2-dihydro-4*H*-pyrazole-3,5-dione.

01/2008:1811

SWEET ORANGE OIL

Aurantii dulcis aetheroleum

DEFINITION

Essential oil obtained without heating, by suitable mechanical treatment from the fresh peel of the fruit of *Citrus sinensis* (L.) Osbeck (*Citrus aurantium* L. var. *dulcis* L.). A suitable antioxidant may be added.

CHARACTERS

Appearance: clear, pale yellow to orange, mobile liquid, which may become cloudy when chilled.

It has a characteristic odour of fresh orange peel.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (*2.2.27*).

Examine the chromatograms obtained in the test for bergapten.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
———	———
Bergaptene: a greenish-yellow fluorescent zone	
———	———
	Many blue fluorescent zones
Reference solution	**Test solution**

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
	A brown fluorescent zone
Linalyl acetate: a brownish-orange fluorescent zone	A faint brownish-orange fluorescent zone (linalyl acetate)
———	———
	Many orange fluorescent zones
Linalol: a brownish-orange fluorescent zone	A brownish-orange fluorescent zone (linalol)
Bergaptene: a faint greenish-yellow fluorescent zone	
	Many brownish-orange fluorescent zones
———	———
	Many blue fluorescent zones
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*): 0.842 to 0.850.

Refractive index (*2.2.6*): 1.470 to 1.476.

Optical rotation (*2.2.7*): + 94° to + 99°.

Peroxide value (*2.5.5, Method B*): maximum 20.

Fatty oils and resinified essential oils (*2.8.7*). It complies with the test for fatty oils and resinified essential oils.

Bergaptene. Thin-layer chromatography (*2.2.27*).

Test solution. Dilute 0.2 ml of the substance to be examined in 1 ml of *alcohol R*.

Reference solution. Dissolve 2 mg of *bergaptene R*, 10 µl of *linalol R* and 20 µl of *linalyl acetate R* in 10 ml of *alcohol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, toluene R* (15:85 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 365 nm.

Results A: the chromatogram obtained with the test solution shows no greenish-yellow fluorescent zone present in the chromatogram obtained with the reference solution.

Detection B: spray with *anisaldehyde solution R* and heat at 100-105 °C for 10 min; examine the plate in ultraviolet light at 365 nm.

Chromatographic profile. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Dilute 300 µl of the substance to be examined to 1 ml with *acetone R*.

Reference solution (a). Dilute 10 µl of *α-pinene R*, 10 µl of *β-pinene R*, 10 µl of *sabinene R*, 20 µl of *β-myrcene R*, 800 µl of *limonene R*, 10 µl of *octanal*, 10 µl of *decanal R*, 10 µl of *linalol R*, 10 µl of *citral R* (composed of neral and geranial) and 10 µl of *valencene R* in 1 ml of *acetone R*.

Reference solution (b). Dissolve 5 µl of *β-pinene R* in 10 ml of *acetone R*. Dilute 0.5 ml to 10 ml with *acetone R*.

Column:

- *material*: fused silica,
- *size*: *l* = 30 m, Ø = 0.53 mm,
- *stationary phase*: *macrogol 20 000 R* (film thickness 1 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 6	50
	6 - 31	50 → 150
	31 - 41	150 → 180
	41 - 55	180
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 0.5 µl.

Elution order: order indicated in the composition of reference solution (a). Record the retention times of these substances.

System suitability: reference solution (a)

- *resolution*: minimum 3.9 between the peaks due to β-pinene and sabinene and minimum 1.5 between the peaks due to valencene and geranial.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Determine the percentage content of these components. The limits are within the following ranges:

- *α-pinene*: 0.4 per cent to 0.6 per cent,
- *β-pinene*: 0.02 per cent to 0.3 per cent,
- *sabinene*: 0.2 per cent to 1.1 per cent,
- *β-myrcene*: 1.7 per cent to 2.5 per cent,
- *limonene*: 92.0 per cent to 97.0 per cent,
- *octanal*: 0.1 per cent to 0.4 per cent,
- *decanal*: 0.1 per cent to 0.4 per cent,
- *linalol*: 0.2 per cent to 0.7 per cent,
- *neral*: 0.02 per cent to 0.10 per cent,
- *valencene*: 0.02 per cent to 0.5 per cent,
- *geranial*: 0.03 per cent to 0.20 per cent.

Disregard limit: area of the peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Residue on evaporation: 1.0 per cent to 5.0 per cent.

Evaporate 5.0 g to dryness on a water-bath and dry at 100-105 °C for 4 h.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

TALC

Talcum

[14807-96-6]

DEFINITION

Powdered, selected, natural, hydrated magnesium silicate. Pure talc has the formula $Mg_3Si_4O_{10}(OH)_2$ (M_r 379.3). It may contain variable amounts of associated minerals among which chlorites (hydrated aluminium and magnesium silicates), magnesite (magnesium carbonate), calcite (calcium carbonate) and dolomite (calcium and magnesium carbonate) are predominant.

PRODUCTION

Talc derived from deposits that are known to contain associated asbestos is not suitable for pharmaceutical use. The manufacturer is responsible for demonstrating by the test for amphiboles and serpentines that the product is free from asbestos. The presence of amphiboles and of serpentines is revealed by X-ray diffraction or by infrared spectrophotometry (see A and B). If detected, the specific morphological criteria of asbestos are investigated by a suitable method of optical microscopy to determine whether tremolite asbestos or chrysotile is present, as described below.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs of *potassium bromide R*.

In the range 740 cm^{-1} to 760 cm^{-1} using scale expansion, any absorption band at 758 ± 1 cm^{-1} may indicate the presence of tremolite or of chlorite. If the absorption band remains after ignition of the substance to be examined at 850 ± 50 °C for at least 30 min, it indicates the presence of the tremolite. In the range 600 cm^{-1} to 650 cm^{-1} using scale expansion, any absorption band or shoulder may indicate the presence of serpentines.

B. X-ray diffraction.

Preparation: place the sample on the sample holder; pack and smooth its surface with a polished glass microscope slide.

Radiation: Cu Kα monochromatic, 40 kV, 24-30 mA.

Incident slit: 1°.

Detection slit: 0.2°.

Goniometer speed: 1/10° 2θ/min.

Scanning range: 10-13° 2θ and 24-26° 2θ.

Sample: not oriented.

Results: the presence of amphiboles is detected by a diffraction peak at 10.5 ± 0.1° 2θ, the presence of serpentines is detected by diffraction peaks at 24.3 ± 0.1° 2θ and at 12.1 ± 0.1° 2θ.

If, by one of the 2 methods, amphiboles and/or serpentine are detected, examine by a suitable method of optical microscopy to determine the asbestos character.

The presence of asbestos is shown if the following 2 criteria are met:

– a range of length to width ratios of 20:1 to 100:1, or higher for fibres longer than 5 µm,
– capability of splitting into very thin fibrils,

and if at least 2 of the following 4 criteria are met:

– parallel fibres occurring in bundles,
– fibre bundles displaying frayed ends,
– fibres in the form of thin needles,
– matted masses of individual fibres and/or fibres showing curvature.

CHARACTERS

Appearance: light, homogeneous, white or almost white powder, greasy to the touch (non abrasive).

Solubility: practically insoluble in water, in ethanol (96 per cent) and in dilute solutions of acids and alkali hydroxides.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs of *potassium bromide R*.

Absorption bands: at 3677 ± 2 cm^{-1}, 1018 ± 2 cm^{-1} and 669 ± 2 cm^{-1}.

B. In a platinum crucible, melt a mixture of 0.2 g of *anhydrous sodium carbonate R* and 2.0 g of *potassium carbonate R*. To the melted mass add 0.1 g of the substance to be examined and heat until the mixture is completely melted. Allow to cool and transfer the melted mass into an evaporating dish with 50 ml of hot *water R*. Add *hydrochloric acid R* until effervescence ceases. Add 10 ml of *hydrochloric acid R* and evaporate to dryness on a water-bath. Allow to cool. Add 20 ml of *water R*, heat to boiling and filter (the residue is used for identification test C). To 5 ml of the filtrate add 1 ml of *ammonia R* and 1 ml of *ammonium chloride solution R* and filter. To the filtrate add 1 ml of *disodium hydrogen phosphate solution R*. A white, crystalline precipitate is formed.

C. The residue obtained in identification test B gives the reaction of silicates (*2.3.1*).

TESTS

Solution S1. Weigh 10.0 g into a conical flask fitted with a reflux condenser, add 50 ml of *0.5 M hydrochloric acid* gradually while stirring and heat on a water-bath for 30 min. Allow to cool. Transfer the mixture to a beaker and allow the undissolved material to settle. Filter the supernatant through medium-speed filter paper into a 100 ml volumetric flask, retaining as much as possible of the insoluble material in the beaker. Wash the residue and the beaker with 3 quantities, each of 10 ml, of hot *water R*. Wash the filter with 15 ml of hot *water R*, allow the filtrate to cool and dilute to 100.0 ml with the same solvent.

Solution S2. *Perchlorates mixed with heavy metals are known to be explosive. Take proper precautions while performing this procedure.* Weigh 0.5 g in a 100 ml polytetrafluoroethylene dish, add 5 ml of *hydrochloric acid R*, 5 ml of *lead-free nitric acid R* and 5 ml of *perchloric acid R*. Stir gently then add 35 ml of *hydrofluoric acid R* and evaporate slowly to dryness on a hot plate. To the residue, add 5 ml of *hydrochloric acid R*, cover with a watch-glass, heat to boiling and allow to cool. Rinse the watch-glass and the dish with *water R*. Transfer into a volumetric flask, rinse the dish with *water R* and dilute to 50.0 ml with the same solvent.

Acidity or alkalinity. Boil 2.5 g with 50 ml of *carbon dioxide-free water R* under reflux. Filter *in vacuo*. To 10 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*; not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to green. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R1*; not more than 0.3 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink.

Water-soluble substances: maximum 0.2 per cent.

To 10.0 g add 50 ml of *carbon dioxide-free water R*, heat to boiling and maintain boiling under a reflux condenser for 30 min. Allow to cool, filter through a medium-speed filter paper and dilute to 50.0 ml with *carbon dioxide-free water R*. Take 25.0 ml of the filtrate, evaporate to dryness and heat at 105 °C for 1 h. The residue weighs a maximum of 10 mg.

Aluminium: maximum 2.0 per cent.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. To 5.0 ml of solution S2 add 10 ml of a 25.34 g/l solution of *caesium chloride R*, 10.0 ml of *hydrochloric acid R* and dilute to 100.0 ml with *water R*.

Reference solutions. Into 4 identical volumetric flasks, each containing 10.0 ml of *hydrochloric acid R* and 10 ml of a 25.34 g/l solution of *caesium chloride R*, introduce respectively 5.0 ml, 10.0 ml, 15.0 ml and 20.0 ml of *aluminium standard solution (100 ppm Al) R* and dilute to 100.0 ml with *water R*.

Source: aluminium hollow-cathode lamp.

Wavelength: 309.3 nm.

Atomisation device: nitrous oxide-acetylene flame.

Calcium: maximum 0.90 per cent.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. To 5.0 ml of solution S2 add 10.0 ml of *hydrochloric acid R*, 10 ml of *lanthanum chloride solution R* and dilute to 100.0 ml with *water R*.

Reference solutions. Into 4 identical volumetric flasks, each containing 10.0 ml of *hydrochloric acid R* and 10 ml of *lanthanum chloride solution R*, introduce respectively 1.0 ml, 2.0 ml, 3.0 ml and 4.0 ml of *calcium standard solution (100 ppm Ca) R1* and dilute to 100.0 ml with *water R*.

Source: calcium hollow-cathode lamp.

Wavelength: 422.7 nm.

Atomisation device: nitrous oxide-acetylene flame.

Iron: maximum 0.25 per cent.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. To 2.5 ml of solution S1, add 50.0 ml of *0.5 M hydrochloric acid* and dilute to 100.0 ml with *water R*.

Reference solutions. Into 4 identical volumetric flasks, each containing 50.0 ml of *0.5 M hydrochloric acid*, introduce respectively 2.0 ml, 2.5 ml, 3.0 ml and 4.0 ml of *iron standard solution (250 ppm Fe) R* and dilute to 100.0 ml with *water R*.

Source: iron hollow-cathode lamp.

Wavelength: 248.3 nm.

Atomisation device: air-acetylene flame.

Correction: deuterium lamp.

Lead: maximum 10.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Use solution S1.

Reference solutions. Into 4 identical volumetric flasks, each containing 50.0 ml of *0.5 M hydrochloric acid*, introduce respectively 5.0 ml, 7.5 ml, 10.0 ml and 12.5 ml of *lead standard solution (10 ppm Pb) R1* and dilute to 100.0 ml with *water R*.

Source: lead hollow-cathode lamp.

Wavelength: 217.0 nm.

Atomisation device: air-acetylene flame.

Magnesium: 17.0 per cent to 19.5 per cent.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dilute 0.5 ml of solution S2 to 100.0 ml with *water R*. To 4.0 ml of the solution, add 10.0 ml of *hydrochloric acid R*, 10 ml of *lanthanum chloride solution R* and dilute to 100.0 ml with *water R*.

Reference solutions. Into 4 identical volumetric flasks, each containing 10.0 ml of *hydrochloric acid R* and 10 ml of *lanthanum chloride solution R*, introduce respectively 2.5 ml, 3.0 ml, 4.0 ml and 5.0 ml of *magnesium standard solution (10 ppm Mg) R1* and dilute to 100.0 ml with *water R*.

Source: magnesium hollow-cathode lamp.

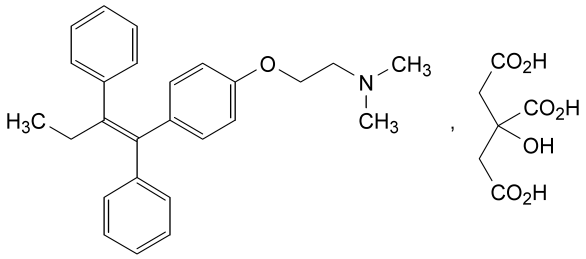
Wavelength: 285.2 nm.

Atomisation device: air-acetylene flame.

Loss on ignition: maximum 7.0 per cent, determined on 1.00 g by ignition to constant weight at 1050-1100 °C.

Microbial contamination. If intended for topical administration, the total viable aerobic count (*2.6.12*) is not more than a total of 10^2 bacteria and fungi per gram.

If intended for oral administration, the total viable aerobic count (*2.6.12*) is not more than 10^3 bacteria and not more than 10^2 fungi per gram.



LABELLING

The label states, where applicable, that the substance is suitable for oral or topical administration.

01/2008:1046

TAMOXIFEN CITRATE

Tamoxifeni citras

$C_{32}H_{37}NO_8$ M_r 563.6

[54965-24-1]

DEFINITION

2-[4-[(*Z*)-1,2-Diphenylbut-1-enyl]phenoxy]-*N*,*N*-dimethylethanamine dihydrogen 2-hydroxypropane-1,2,3-tricarboxylate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: slightly soluble in water, soluble in methanol, slightly soluble in acetone.

It shows polymorphism (*5.9*).

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 20 mg in *methanol R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *methanol R*.

Spectral range: 220-350 nm.

Absorption maxima: at 237 nm and 275 nm.

Absorption ratio: A_{237}/A_{275} = 1.45 to 1.65.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *tamoxifen citrate CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *tamoxifen citrate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *tamoxifen citrate CRS* and 10 mg of *clomifene citrate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *triethylamine R, toluene R* (10:90 *V/V*).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 10 mg in 4 ml of *pyridine R* with shaking and add 2 ml of *acetic anhydride R*; a yellow colour is produced. Heat on a water-bath for 2 min; a pink or red colour is produced.

TESTS

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use and protect from light.*

Test solution. Dissolve 15.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 15.0 mg of *tamoxifen citrate for performance test CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 40 volumes of *acetonitrile R* and 60 volumes of *water R* containing 0.9 g/l of *sodium dihydrogen phosphate R* and 4.8 g/l of *N,N-dimethyloctylamine R*; adjust to pH 3.0 with *phosphoric acid R*.

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 240 nm.

Equilibration: with the mobile phase for about 30 min.

Injection: 10 µl.

Run time: twice the retention time of tamoxifen.

System suitability: reference solution (a):

– the chromatogram obtained is similar to the chromatogram supplied with *tamoxifen citrate for performance test CRS*; there is baseline separation of the peak due to impurity F from the following peak of the principal component;

– *resolution*: minimum 3 between the peaks due to impurities A and F.

Limits:

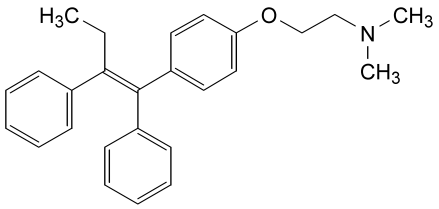
– *impurities A, B, C, D, E, F, G, H*: for each impurity, not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);

– *sum of impurities other than A*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard any peak due to the citrate (retention time = about 2.5 min).

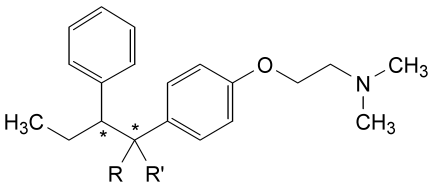
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 65 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.



ASSAY

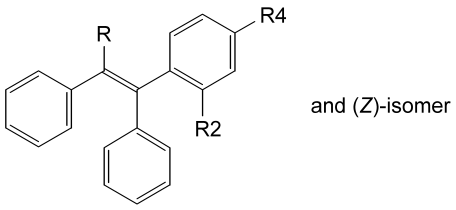
Dissolve 0.400 g in 75 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid* using 0.1 ml of *naphtholbenzein solution R* as indicator.



1 ml of *0.1 M perchloric acid* is equivalent to 56.36 mg of $C_{32}H_{37}NO_8$.

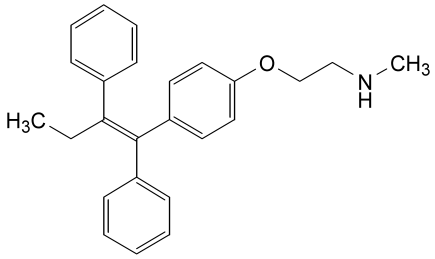
IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H.

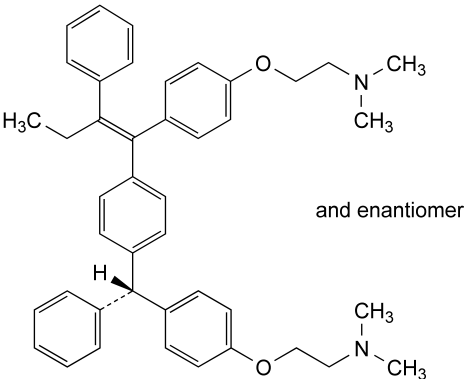


A. 2-[4-[(*E*)-1,2-diphenylbut-1-enyl]phenoxy]-*N*,*N*-dimethylethanamine ((*E*)-isomer),

B. R = OH, R′ = C_6H_5: 1-[4-[2-(dimethylamino)ethoxy]phenyl]-1,2-diphenylbutan-1-ol,



G. R + R′ = O: (2*RS*)-1-[4-[2-(dimethylamino)ethoxy]phenyl]-2-phenylbutan-1-one,

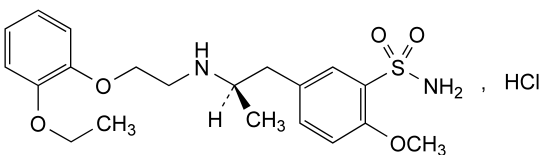


C. R = R2 = H, R4 = O-CH_2-CH_2-N(CH_3)$_2$: 2-[4-[(*EZ*)-1,2-diphenylethenyl]phenoxy]-*N*,*N*-dimethylethanamine,

D. R = CH_3, R2 = H, R4 = O-CH_2-CH_2-N(CH_3)$_2$: 2-[4-[(*EZ*)-1,2-diphenylprop-1-enyl]phenoxy]-*N*,*N*-dimethylethanamine,

E. R = C_2H_5, R2 = O-CH_2-CH_2-N(CH_3)$_2$, R4 = H: 2-[2-[(*EZ*)-1,2-diphenylbut-1-enyl]phenoxy]-*N*,*N*-dimethylethanamine,

F. 2-[4-[(*Z*)-1,2-diphenylbut-1-enyl]phenoxy]-*N*-methylethanamine,



H. 2-[4-[(*Z*)-1-[4-[(*RS*)-[4-[2-(dimethylamino)ethoxy]-phenyl]phenylmethyl]phenyl]-2-phenylbut-1-enyl]-phenoxy]-*N*,*N*-dimethylethanamine.

01/2008:2131

TAMSULOSIN HYDROCHLORIDE

Tamsulosini hydrochloridum

$C_{20}H_{29}ClN_2O_5S$ M_r 445.0

DEFINITION

5-[(2*R*)-2-[[2-(2-Ethoxyphenoxy)ethyl]amino]propyl]-2-methoxybenzenesulfonamide hydrochloride.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: slightly soluble in water, freely soluble in formic acid, slightly soluble in anhydrous ethanol.

mp: about 230 °C.

IDENTIFICATION

Carry out either tests A, C, D or tests A, B, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *tamsulosin hydrochloride CRS*.

B. Specific optical rotation (*2.2.7*): – 17.5 to – 20.5 (dried substance).

Dissolve with heating 0.15 g in *water R* and dilute to 20.0 ml with the same solvent.

C. Enantiomeric purity (see Tests).

D. Dissolve with heating 0.75 g in *water R* and dilute to 100.0 ml with the same solvent. Take 5 ml of the solution and cool in an ice-bath. Add 3 ml of *dilute nitric acid R* and shake. Allow to stand at room temperature for 30 min and filter. The filtrate gives reaction (a) of chlorides (*2.3.1*).

TESTS

Related substances.

A. Impurities eluting before tamsulosin. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 4 mg of *tamsulosin impurity D CRS* and 4 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (c). Dissolve 4 mg of *tamsulosin impurity H CRS* and 4 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 20.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 40 °C.

Mobile phase: dissolve 3.0 g of *sodium hydroxide R* in a mixture of 8.7 ml of *perchloric acid R* and 1.9 litres of *water R*; adjust to pH 2.0 with *0.5 M sodium hydroxide* and dilute to 2 litres with *water R*; to 1.4 litres of this solution, add 600 ml of *acetonitrile R*.

Flow rate: 1.3 ml/min.

Detection: spectrophotometer at 225 nm.

Injection: 10 µl of the test solution and reference solutions (a) and (b).

Run time: 1.5 times the retention time of tamsulosin (retention time = about 6 min).

System suitability: reference solution (b):

– *resolution*: minimum 6 between the peaks due to impurity D and tamsulosin.

Limits:

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

B. Impurities eluting after tamsulosin. Liquid chromatography (*2.2.29*) as described in test A with the following modifications.

Mobile phase: dissolve 3.0 g of *sodium hydroxide R* in a mixture of 8.7 ml of *perchloric acid R* and 1.9 litres of *water R*; adjust to pH 2.0 with *0.5 M sodium hydroxide* and dilute to 2 litres with *water R*; add 2 litres of *acetonitrile R*.

Flow rate: 1.0 ml/min.

Injection: 10 µl of the test solution and reference solutions (a) and (c).

Run time: 5 times the retention time of tamsulosin (retention time = about 2.5 min).

System suitability: reference solution (c):

– *resolution*: minimum 2 between the peaks due to tamsulosin and impurity H.

Limits:

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *sum of impurities eluting before tamsulosin in test A and after tamsulosin in test B*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Enantiomeric purity. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in *methanol R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

Reference solution (b). Dissolve 5.0 mg of *tamsulosin racemate CRS* in *methanol R* and dilute to 25.0 ml with the same solvent. Dilute 2.0 ml of this solution to 10.0 ml with *methanol R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *silica gel OD for chiral separations R*;

– *temperature*: 40 °C.

Mobile phase: *diethylamine R, methanol R, anhydrous ethanol R, hexane R* (1:150:200:650 *V/V/V/V*).

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 225 nm.

Injection: 10 µl.

Relative retention with reference to tamsulosin (retention time = about 14 min): impurity G = about 0.8.

System suitability: reference solution (b):

– *resolution*: minimum 2 between the peaks due to impurity G and tamsulosin.

Limit:

– *impurity G*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

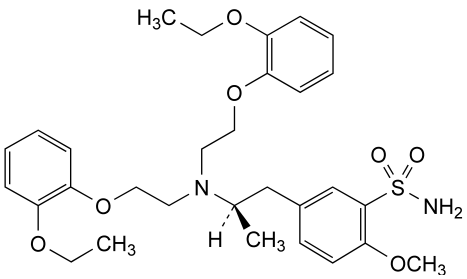
Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

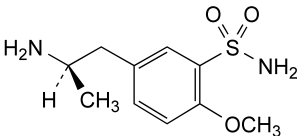
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



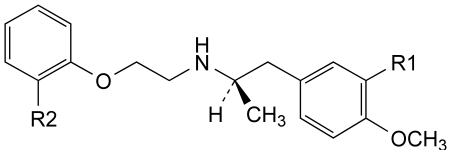
Dissolve 0.350 g in 5.0 ml of *anhydrous formic acid R*, add 75 ml of a mixture of 2 volumes of *acetic anhydride R* and 3 volumes of *glacial acetic acid R*. Titrate immediately with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 44.50 mg of $C_{20}H_{29}ClN_2O_5S$.



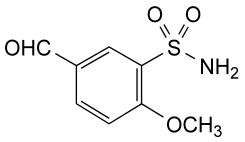
IMPURITIES

Specified impurities: G.

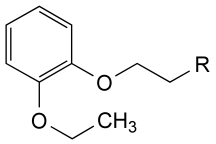


Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034).* It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, D, E, F, H, I.*

A. 5-[(2*R*)-2-[bis[2-(2-ethoxyphenoxy)ethyl]amino]propyl]-2-methoxybenzenesulfonamide,



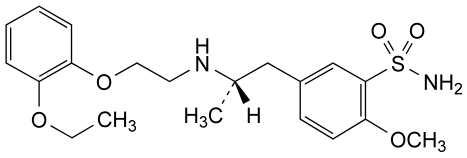
B. 5-[(2*R*)-2-aminopropyl]-2-methoxybenzenesulfonamide,



C. R1 = SO_2-NH_2, R2 = H: 2-methoxy-5-[(2*R*)-2-[(2-phenoxyethyl)amino]propyl]benzenesulfonamide,

D. R1 = SO_2-NH_2, R2 = OCH_3: 2-methoxy-5-[(2*R*)-2-[[2-(2-methoxyphenoxy)ethyl]amino]propyl]benzenesulfonamide,

H. R1 = H, R2 = OC_2H_5: (2*R*)-*N*-[2-(2-ethoxyphenoxy)ethyl]-1-(4-methoxyphenyl)propan-2-amine,



E. 5-formyl-2-methoxybenzenesulfonamide,

F. R = NH_2: 2-(2-ethoxyphenoxy)ethanamine,

I. R = Br: 1-(2-bromoethoxy)-2-ethoxybenzene,

G. 5-[(2*S*)-2-[[2-(2-ethoxyphenoxy)ethyl]amino]propyl]-2-methoxybenzenesulfonamide.

corrected 6.0

TANNIC ACID

Tanninum

DEFINITION

Mixture of esters of glucose with gallic acid and 3-galloylgallic acid.

CHARACTERS

Appearance: yellowish-white or slightly brown amorphous light powder or shiny plates.

Solubility: very soluble in water, freely soluble in acetone, in ethanol (96 per cent) and in glycerol (85 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

A. Dilute 0.1 ml of solution S (see Tests) to 5 ml with *water R*. Add 0.1 ml of *ferric chloride solution R1*. A blackish-blue colour is produced which becomes green on the addition of 1 ml of *dilute sulphuric acid R*.

B. To 1 ml of solution S, add 3 ml of a 1 g/l solution of *gelatin R*. The mixture becomes turbid and a flocculent precipitate is formed.

C. Dilute 0.1 ml of solution S to 5 ml with *water R*. Add 0.3 ml of *barium hydroxide solution R*. A greenish-blue precipitate is formed.

TESTS

Solution S. Dissolve 4.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

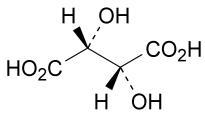
Appearance of solution. Solution S is not more opalescent than reference suspension II (*2.2.1*).

Dextrins, gum, salts, sugars. To 2 ml of solution S, add 2 ml of *ethanol (96 per cent) R*. The solution is clear. Add 1 ml of *ether R*. The solution remains clear for at least 10 min.

Resins. To 5 ml of solution S, add 5 ml of *water R*. The mixture remains clear (*2.2.1*) for at least 15 min.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 0.200 g by drying at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.



STORAGE

Protected from light.

corrected 6.0

TARTARIC ACID

Acidum tartaricum

$C_4H_6O_6$ M_r 150.1
[87-69-4]

DEFINITION

(2*R*,3*R*)-2,3-Dihydroxybutanedioic acid.

Content: 99.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: very soluble in water, freely soluble in ethanol (96 per cent).

IDENTIFICATION

A. Solution S (see Tests) is strongly acid (*2.2.4*).

B. It gives the reactions of tartrates (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*): + 12.0 to + 12.8 (dried substance).

Dissolve 5.00 g in *water R* and dilute to 25.0 ml with the same solvent.

Oxalic acid: maximum 350 ppm, calculated as anhydrous oxalic acid.

Dissolve 0.80 g in 4 ml of *water R*. Add 3 ml of *hydrochloric acid R* and 1 g of *zinc R* in granules and boil for 1 min. Allow to stand for 2 min. Collect the liquid in a test-tube containing 0.25 ml of a 10 g/l solution of *phenylhydrazine hydrochloride R* and heat to boiling. Cool rapidly, transfer to a graduated cylinder and add an equal volume of *hydrochloric acid R* and 0.25 ml of a 50 g/l solution of *potassium ferricyanide R*. Shake and allow to stand for 30 min. Any pink colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using 4 ml of a 0.1 g/l solution of *oxalic acid R*.

Chlorides (*2.4.4*): maximum 100 ppm.

Dilute 5 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 150 ppm.

Dilute 10 ml of solution S to 15 ml with *distilled water R*.

Calcium (*2.4.3*): maximum 200 ppm.

To 5 ml of solution S add 10 ml of a 50 g/l solution of *sodium acetate R* in *distilled water R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.2 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.650 g in 25 ml of *water R*. Titrate with *1 M sodium hydroxide* using 0.5 ml of *phenolphthalein solution R* as indicator, until a pink colour is obtained.

1 ml of *1 M sodium hydroxide* is equivalent to 75.05 mg of $C_4H_6O_6$.

01/2008:1837

TEA TREE OIL

Melaleucae aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the foliage and terminal branchlets of *Melaleuca alternifolia* (Maiden and Betch) Cheel, *M. linariifolia* Smith, *M. dissitiflora* F. Mueller and/or other species of *Melaleuca*.

CHARACTERS

Appearance: clear, mobile, colourless to pale yellow liquid with a characteristic odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.1 ml of the substance to be examined in 5 ml of *heptane R*.

Reference solution. Dissolve 30 µl of *cineole R*, 60 µl of *terpinen-4-ol R* and 10 mg of *α-terpineol R* in 10 ml of *heptane R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, heptane R* (20:80 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min while observing. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Cineole: a violet-brown zone	A violet-brown zone, less intense (cineole)
Terpinen-4-ol: a brownish-violet zone	A brownish-violet zone terpinen-4-ol)
α-terpineol: a violet or brownish-violet zone	A violet or brownish-violet zone (α-terpineol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*): 0.885 to 0.906.

Refractive index (*2.2.6*): 1.475 to 1.482.

Optical rotation (*2.2.7*): + 5° to + 15°.

Chromatographic profile. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Dissolve 0.15 ml of the substance to be examined in 10 ml of *hexane R*.

Reference solution. Dissolve 5 µl of *α-pinene R*, 5 µl of *sabinene R*, 15 µl of *α-terpinene R*, 5 µl of *limonene R*, 5 µl of *cineole R*, 30 µl of *γ-terpinene R*, 5 µl of *p-cymene R*, 5 µl of *terpinolene R*, 60 µl of *terpinen-4-ol R*, 5 µl of *aromadendrene R* and 5 mg of *α-terpineol R* in 10 ml of *hexane R*.

Column:

– *material*: fused silica,
– *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm,
– *stationary phase*: *macrogol 20 000 R*.

Carrier gas: *helium for chromatography R*.

Flow rate: 1.3 ml/min.

Split ratio: 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	50
	1 - 37	50 → 230
	37 - 45	230
Injection port		240
Detector		240

Detection: flame ionisation.

Injection: 1 µl.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

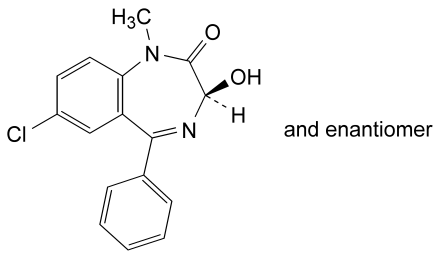
System suitability: reference solution:

– *resolution*: minimum 2.7 between the peaks due to terpinen-4-ol and aromadendrene.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution. Disregard the peak due to hexane.

Determine the percentage content of these components. The percentages are within the following ranges:

- *α-pinene*: 1.0 per cent to 6.0 per cent,
- *sabinene*: less than 3.5 per cent,
- *α-terpinene*: 5.0 per cent to 13.0 per cent,
- *limonene*: 0.5 per cent to 4.0 per cent,
- *cineole*: less than 15.0 per cent,
- *γ-terpinene*: 10.0 per cent to 28.0 per cent,
- *p-cymene*: 0.5 per cent to 12.0 per cent,
- *terpinolene*: 1.5 per cent to 5.0 per cent,
- *terpinen-4-ol*: minimum 30.0 per cent,
- *aromadendrene*: less than 7.0 per cent,
- *α-terpineol*: 1.5 per cent to 8.0 per cent.



STORAGE

In an airtight, well-filled container, protected from light, at a temperature not exceeding 25 °C.

01/2008:0954
corrected 6.0

TEMAZEPAM

Temazepamum

$C_{16}H_{13}ClN_2O_2$ M_r 300.7
[846-50-4]

DEFINITION

(3*RS*)-7-Chloro-3-hydroxy-1-methyl-5-phenyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *temazepam CRS*.

TESTS

Impurity A: maximum 0.05 per cent.

Dissolve 0.400 g in *methylene chloride R* and dilute to 20.0 ml with the same solvent. The absorbance (*2.2.25*) is not greater than 0.30 at 409 nm.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 10.0 mg of the substance to be examined in a mixture of 1 volume of *water R* and 9 volumes of *methanol R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of 1 volume of *water R* and 9 volumes of *methanol R*. Dilute 2.0 ml of this solution to 10.0 ml with a mixture of 1 volume of *water R* and 9 volumes of *methanol R*.

Reference solution (b). Dissolve 1 mg of *oxazepam R*, 1 mg of *temazepam impurity F CRS* and 1 mg of *temazepam impurity G CRS* in a mixture of 1 volume of *water R* and 9 volumes of *methanol R* and dilute to 25 ml with the same mixture of solvents.

Reference solution (c). Dissolve 1 mg of *temazepam impurity C CRS* and 1 mg of *temazepam impurity D CRS* with a mixture of 1 volume of *water R* and 9 volumes of *methanol R* and dilute to 25 ml with the same mixture of solvents.

Column:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (3.5 µm).

Mobile phase:

- *mobile phase A*: solution containing 4.9 g/l of *sodium dihydrogen phosphate R* and 0.63 g/l of *disodium hydrogen phosphate R* (pH 5.6);
- *mobile phase B*: *methanol R*;
- *mobile phase C*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)	Mobile phase C (per cent *V/V*)
0 - 18	54	39	7
18 - 25	54 → 22	39 → 63	7 → 15
25 - 31	22	63	15
31 - 37	22 → 54	63 → 39	15 → 7

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl.

Relative retention with reference to temazepam (retention time = about 16 min): impurity E = about 0.55; impurity F = about 0.67; impurity G = about 0.73; impurity B = about 0.8; impurity D = about 1.2; impurity C = about 1.3; impurity A = about 1.5.

System suitability: reference solution (b):

- *resolution*: minimum 1.5 between the peaks due to impurity F and impurity G;
- *peak-to-valley ratio*: minimum 1.7, where H_p = height above the baseline of the peak due to impurity G and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity B.

Limits:

- *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity F = 3.2; impurity G = 3.1;
- *impurities B, C, D, E, F, G*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *any other impurity*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);

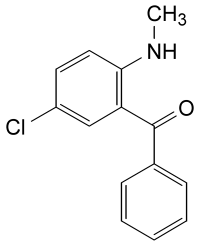
– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

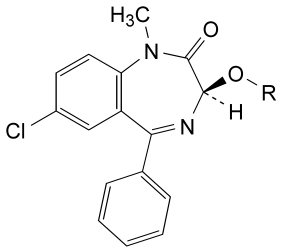
Dissolve 0.250 g in 50 ml of *nitroethane R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



1 ml of *0.1 M perchloric acid* is equivalent to 30.07 mg of $C_{16}H_{13}ClN_2O_2$.

STORAGE

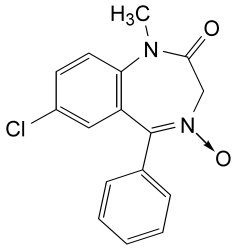
Protected from light.



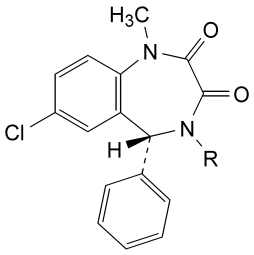
IMPURITIES

Specified impurities: A, B, C, D, E, F, G.

A. [5-chloro-2-(methylamino)phenyl]phenylmethanone,



B. oxazepam,



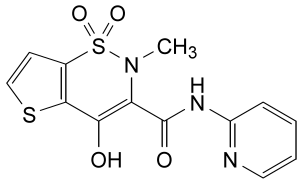
and enantiomer

C. R = CO-CH_3: (3*RS*)-7-chloro-1-methyl-2-oxo-5-phenyl-2,3-dihydro-1*H*-1,4-benzodiazepin-3-yl acetate,

D. R = CH_3: (3*RS*)-7-chloro-3-methoxy-1-methyl-5-phenyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one,

E. 7-chloro-1-methyl-5-phenyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one 4-oxide,

and enantiomer



F. R = H: (5*RS*)-7-chloro-1-methyl-5-phenyl-4,5-dihydro-1*H*-1,4-benzodiazepine-2,3-dione,

G. R = CH_3: (5*RS*)-7-chloro-1,4-dimethyl-5-phenyl-4,5-dihydro-1*H*-1,4-benzodiazepine-2,3-dione.

01/2008:1156

TENOXICAM

Tenoxicamum

$C_{13}H_{11}N_3O_4S_2$ M_r 337.4
[59804-37-4]

DEFINITION

Tenoxicam contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-hydroxy-2-methyl-*N*-(pyridin-2-yl)-2*H*-thieno[2,3-*e*]1,2-thiazine-3-carboxamide 1,1-dioxide, calculated with reference to the anhydrous substance.

CHARACTERS

A yellow, crystalline powder, practically insoluble in water, sparingly soluble in methylene chloride, very slightly soluble in ethanol. It dissolves in solutions of acids and alkalis.

It shows polymorphism (*5.9*).

IDENTIFICATION

Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *tenoxicam CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum quantity of *methylene chloride R*, evaporate to dryness on a water-bath and record new spectra using the residues.

TESTS

Appearance of solution. Dissolve 0.10 g in 20 ml of *methylene chloride R*. The solution is clear (*2.2.1*).

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel GF_{254} R* as the coating substance.

Test solution. Dissolve 0.4 g in a mixture of 4 volumes of *concentrated ammonia R* and 96 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (a). Dilute 1 ml of the test solution to 20 ml with a mixture of 4 volumes of *concentrated ammonia R* and 96 volumes of *methanol R*. Dilute 1 ml of the solution to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 20 mg of *tenoxicam CRS* and 20 mg of *salicylic acid CRS* in a mixture of 4 volumes of *concentrated ammonia R* and 96 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (c). Dissolve 20 mg of *pyridin-2-amine R* in a mixture of 4 volumes of *concentrated ammonia R* and 96 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents. Dilute 2 ml of the solution to 50 ml with the same mixture of solvents.

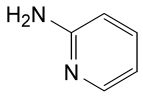
Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm with a mixture of 5 volumes of *anhydrous formic acid R*, 5 volumes of *methanol R*, 20 volumes of *acetone R* and 70 volumes of *methylene chloride R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. Any spot corresponding to pyridin-2-amine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent). Any spot in the chromatogram obtained with the test solution apart from the principal spot and any spot corresponding to pyridin-2-amine, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Heavy metals (*2.4.8*). 0.5 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 5 ml of *lead standard solution (2 ppm Pb) R*.

Water (*2.5.12*). Not more than 0.5 per cent, determined on 1.000 g by the semi-micro determination of water.

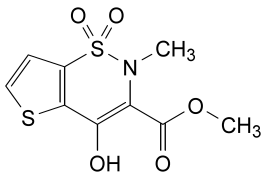
Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.250 g in 5 ml of *anhydrous formic acid R*. Add 70 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 33.74 mg of $C_{13}H_{11}N_3O_4S_2$.

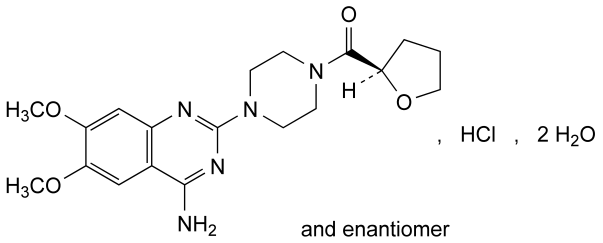


STORAGE

Store protected from light.

IMPURITIES

A. pyridin-2-amine,



B. methyl 4-hydroxy-2-methyl-2*H*-thieno[2,3-*e*]1,2-thiazine-3-carboxylate 1,1-dioxide.

01/2008:2021

TERAZOSIN HYDROCHLORIDE DIHYDRATE

Terazosini hydrochloridum dihydricum

, HCl , 2 H_2O

and enantiomer

$C_{19}H_{26}ClN_5O_4,2H_2O$ M_r 459.9

[70024-40-7]

DEFINITION

1-(4-Amino-6,7-dimethoxyquinazolin-2-yl)-4-[[(2*RS*)-tetrahydrofuran-2-yl]carbonyl]piperazine hydrochloride dihydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or slightly yellow, crystalline powder.

Solubility: sparingly soluble in water, slightly soluble in methanol, very slightly soluble in ethanol (96 per cent), practically insoluble in acetone.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *terazosin hydrochloride dihydrate CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 1.00 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Dilute 10 ml of solution S to 20 ml with *water R*.

pH (*2.2.3*): 3.0 to 5.0 for solution S.

Impurities N and O. Liquid chromatography (*2.2.29*).

Solvent mixture: *acetonitrile R1, water R* (20:80 *V/V*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 5 mg of *terazosin impurity A CRS* and 5.0 mg of *terazosin impurity N CRS* in *acetonitrile R1* using sonication, add 5.0 ml of the test solution and dilute to 50.0 ml with *acetonitrile R1*. Dilute 10.0 ml of this solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 100.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 25 °C.

Mobile phase: dissolve 2.80 g of *sodium laurilsulfate R* in 1000.0 ml of *water R* and add 11.0 ml of a solution containing 202.4 g/l of *triethylamine R* and 230.0 g/l of *phosphoric acid R*; adjust to pH 2.5 with *phosphoric acid R*; mix 600 volumes of this solution with 400 volumes of *acetonitrile R1*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Run time: 4 times the retention time of terazosin.

Relative retention with reference to terazosin (retention time = about 10 min): impurity O = about 0.2; impurity N = about 0.3; impurity A = about 0.4.

System suitability: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to impurities A and N.

Limits:

– *impurity N*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *impurity O*: not more than the area of the peak due to terazosin in the chromatogram obtained with reference solution (b) (0.1 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve the contents of a vial of *terazosin for system suitability CRS* (containing impurities A, B, C, J, K and M) in the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (c). Dissolve 5.0 mg of *terazosin impurity L CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (d). To 5 mg of *terazosin impurity E CRS*, add 70 ml of *methanol R* and 30 ml of *water R*. Allow to stand for at least 1 h to dissolve the substance. Use sonication if necessary.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 30 °C.

Mobile phase: mix 2 volumes of *triethylamine R*, 350 volumes of *acetonitrile R*, and 1650 volumes of a solution containing 6 g/l of *sodium citrate R* and 14.25 g/l of *anhydrous citric acid R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 245 nm.

Injection: 20 µl.

Run time: 4 times the retention time of terazosin.

Identification of impurities: use the chromatogram supplied with *terazosin for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, B, C, J, K and M; use the chromatograms obtained with reference solutions (c) and (d) to identify the peaks due to impurities L and E respectively.

Retention time: terazosin = about 11 min.

System suitability: reference solution (b):

– *resolution*: minimum 1.5 between the peaks due to impurities B and J; if necessary, adjust the proportion of the aqueous component in the mobile phase (an increase in the proportion of the aqueous component increases the retention times);
– the chromatogram obtained is similar to the chromatogram supplied with *terazosin for system suitability CRS*; in case of insufficient separation of the impurities, reduce the amount of triethylamine in the mobile phase.

Limits:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity C = 0.7; impurity M = 1.6;
– *impurities A, C, E, K*: for each impurity, not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
– *impurity L*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.1 per cent);
– *impurities B, J, M*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm) Pb R*.

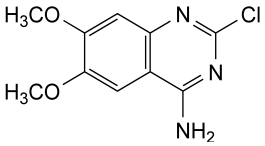
Water (*2.5.12*): 7.0 per cent to 8.6 per cent, determined on 0.200 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

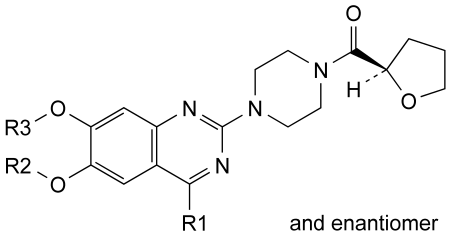
Dissolve 0.300 g in a mixture of 5.0 ml of *0.01 M hydrochloric acid* and 50 ml of *methanol R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*). Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 42.39 mg of $C_{19}H_{26}ClN_5O_4$.



STORAGE

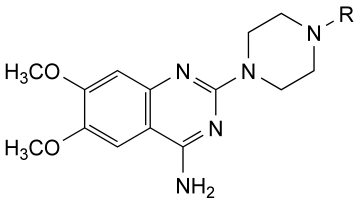
Protected from light.



IMPURITIES

Specified impurities: A, B, C, E, J, K, L, M, N, O.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *D, F, G, H, I.*



A. 2-chloro-6,7-dimethoxyquinazolin-4-amine,

B. R1 = OH, R2 = R3 = CH_3: 1-(4-hydroxy-6,7-dimethoxyquinazolin-2-yl)-4-[[(2*RS*)-tetrahydrofuran-2-yl]carbonyl]piperazine,

corrected 6.0

TERBINAFINE HYDROCHLORIDE

Terbinafini hydrochloridum

$C_{21}H_{26}ClN$ M_r 327.9
[78628-80-5]

DEFINITION

(2*E*)-*N*,6,6-Trimethyl-*N*-(naphthalen-1-ylmethyl)hept-2-en-4-yn-1-amine hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: very slightly or slightly soluble in water, freely soluble in anhydrous ethanol and in methanol, slightly soluble in acetone.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *terbinafine hydrochloride CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*) using *anhydrous ethanol R* as solvent.

TESTS

Related substances. Liquid chromatography (*2.2.29*).
Prepare the solutions protected from light.

Solvent mixture: *methanol R1, water R, acetonitrile R1* (25:25:50 *V/V/V*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 20.0 ml with the solvent mixture.

Reference solution (a). Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase. Expose to ultraviolet light at 254 nm for 1 h.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 50.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 300 ± 60 m^2/g and a pore size of 12 nm.

Mobile phase: mix 50 volumes of *acetonitrile R1*, 25 volumes of *methanol R1* and 25 volumes of a 1.74 g/l solution of *dipotassium hydrogen phosphate R* previously adjusted to pH 7.5 with *phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 224 nm.

Injection: 20 µl.

Run time: twice the retention time of terbinafine.

Relative retention with reference to terbinafine (retention time = about 31 min): impurity A = about 0.15; impurity C = about 0.8; impurity B = about 0.9; impurity D = about 1.5.

System suitability: reference solution (a):

– *resolution*: minimum 2.0 between the peaks due to impurity B and terbinafine.

Limits:

– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

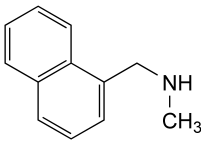
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

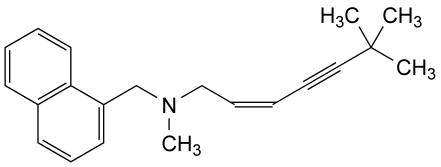
Dissolve 0.250 g in 50 ml of *ethanol (96 per cent) R*, add 5 ml of *0.01 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide* determining the end-point potentiometrically (*2.2.20*). Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 32.79 mg of $C_{21}H_{26}ClN$.



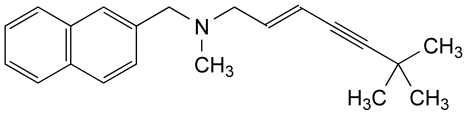
STORAGE

Protected from light.

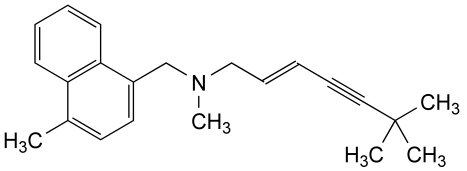


IMPURITIES

Specified impurities: B.



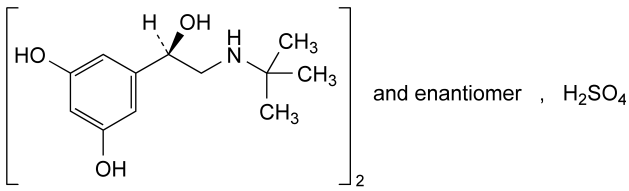
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, C, D.*



A. *N*-methyl-*C*-(naphthalen-1-yl)methanamine,

B. (2*Z*)-*N*,6,6-trimethyl-*N*-(naphthalen-1-ylmethyl)hept-2-en-4-yn-1-amine (*cis*-terbinafine),

C. (2*E*)-*N*,6,6-trimethyl-*N*-(naphthalen-2-ylmethyl)hept-2-en-4-yn-1-amine (*trans*-isoterbinafine),



D. (2*E*)-*N*,6,6-trimethyl-*N*-[(4-methylnaphthalen-1-yl)methyl]hept-2-en-4-yn-1-amine (4-methylterbinafine).

TERBUTALINE SULPHATE

Terbutalini sulfas

$C_{24}H_{40}N_2O_{10}S$ M_r 548.7
[23031-32-5]

DEFINITION

Bis[(1*RS*)-1-(3,5-dihydroxyphenyl)-2-[(1,1-dimethylethyl)-amino]ethanol] sulphate.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, slightly soluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *terbutaline sulphate CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *aldehyde-free methanol R*, evaporate to dryness and record new spectra using the residues.

B. 5 ml of solution S (see Tests) gives reaction (a) of sulphates (*2.3.1*).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and its absorbance (*2.2.25*) at 400 nm in a 2 cm cell is not greater than 0.11.

Acidity. To 10 ml of solution S add 0.05 ml of *methyl red solution R*. Not more than 1.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to yellow.

Optical rotation (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 75.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 7.5 mg of *terbutaline impurity C CRS* and 22.5 mg of *terbutaline sulphate CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 20.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dissolve 4.23 g of *sodium hexanesulphonate R* in 770 ml of 0.050 M ammonium formate solution prepared as follows: dissolve 3.15 g of *ammonium formate R* in about 980 ml of *water R*; adjust to pH 3.0 by adding about 8 ml of *anhydrous formic acid R* and dilute to 1000 ml with *water R*; then add 230 ml of *methanol R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 276 nm.

Injection: 20 µl.

Run time: 6 times the retention time of terbutaline.

Retention time: impurity C = about 9 min; terbutaline = about 11 min.

System suitability: reference solution (a):

– *resolution*: minimum 2.0 between the peaks due to impurity C and terbutaline; if necessary adjust the composition of the mobile phase, decrease the content of methanol to increase the retention time.

Limits:

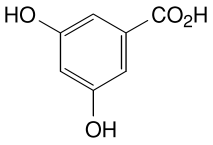
– *impurity C*: not more than twice the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *impurities A, B, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *sum of impurities other than C*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent);

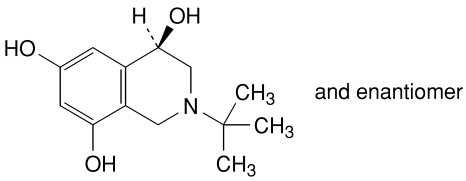
– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.



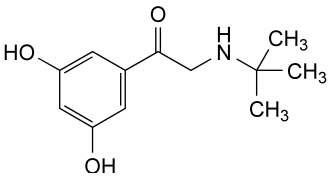
ASSAY

Dissolve 0.400 g in 70 ml of *anhydrous acetic acid R* with heating. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

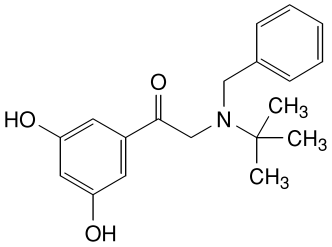


1 ml of *0.1 M perchloric acid* is equivalent to 54.87 mg of $C_{24}H_{40}N_2O_{10}S$.

IMPURITIES



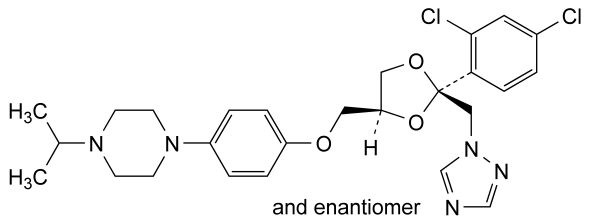
Specified impurities: *A, B, C, D*.



A. 3,5-dihydroxybenzoic acid (α-resorcylic acid),

B. (4*RS*)-2-(1,1-dimethylethyl)-1,2,3,4-tetrahydroisoquinoline-4,6,8-triol,

C. 1-(3,5-dihydroxyphenyl)-2-[(1,1-dimethylethyl)amino]-ethanone,



D. 2-[benzyl-(1,1-dimethylethyl)amino]-1-(3,5-dihydroxyphenyl)ethanone.

01/2008:1270
corrected 6.0

TERCONAZOLE

Terconazolum

$C_{26}H_{31}Cl_2N_5O_3$ M_r 532.5
[67915-31-5]

DEFINITION

1-[4-[[(2*RS*,4*SR*)-2-(2,4-Dichlorophenyl)-2-[(1*H*-1,2,4-triazol-1-yl)methyl]-1,3-dioxolan-4-yl]methoxy]phenyl]-4-(1-methylethyl)piperazine.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, soluble in acetone, sparingly soluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *terconazole CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *acetone R*, evaporate to dryness in a current of air and record new spectra using the residues.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 30 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 30 mg of *terconazole CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 30 mg of *terconazole CRS* and 30 mg of *ketoconazole CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Plate: *TLC octadecylsilyl silica gel plate R.*

Mobile phase: *ammonium acetate solution R, dioxan R, methanol R* (20:40:40 *V/V/V*).

Application: 5 µl.

Development: in an unsaturated tank over a path of 10 cm.

Drying: in a current of warm air for 15 min.

Detection: expose to iodine vapour until the spots appear and examine in daylight.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. To 30 mg in a porcelain crucible add 0.3 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Optical rotation (*2.2.7*): – 0.10° to + 0.10°.

Dissolve 1.0 g in *methylene chloride R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2.5 mg of *terconazole CRS* and 2.0 mg of *ketoconazole CRS* in *methanol R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 20.0 ml with *methanol R*.

Column:

– *size*: *l* = 0.1 m, Ø = 4.6 mm;
– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:

– *mobile phase A*: 3.4 g/l solution of *tetrabutylammonium hydrogen sulphate R*;
– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 10	95 → 50	5 → 50
10 - 15	50	50

Flow rate: 2 ml/min.

Detection: spectrophotometer at 220 nm.

Equilibration: with *acetonitrile R* for at least 30 min and then with the mobile phase at the initial composition for at least 5 min.

Injection: 10 µl; inject *methanol R* as a blank.

Retention time: ketoconazole = about 6 min; terconazole = about 7.5 min.

System suitability: reference solution (a):

– *resolution*: minimum 13 between the peaks due to ketoconazole and terconazole; if necessary, adjust the concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient elution.

Limits:

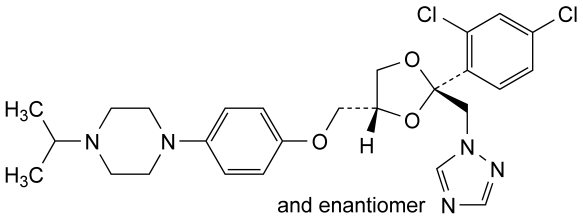
– *impurities A, B*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent);
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

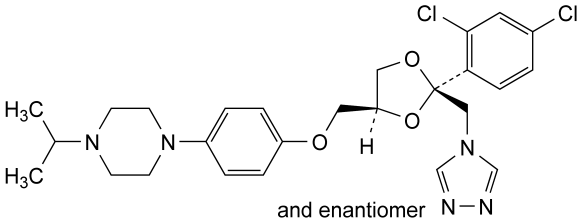
ASSAY

Dissolve 0.150 g in 70 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically at the 2nd point of inflexion (*2.2.20*).



1 ml of *0.1 M perchloric acid* is equivalent to 17.75 mg of $C_{26}H_{31}Cl_2N_5O_3$.

STORAGE

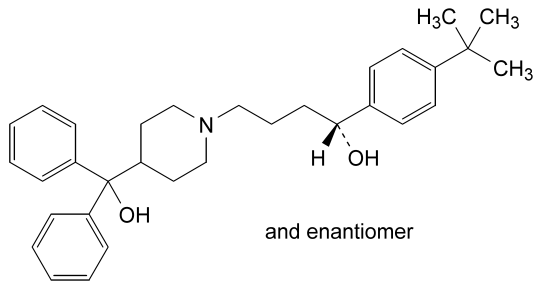


Protected from light.

IMPURITIES

Specified impurities: A, B.

A. 1-[4-[[(2*RS*,4*RS*)2-(2,4-dichlorophenyl)-2-[(1*H*-1,2,4-triazol-1-yl)methyl]-1,3-dioxolan-4-yl]methoxy]phenyl]-4-(1-methylethyl)piperazine,



B. 1-[4-[[(2*RS*,4*SR*)-2-(2,4-dichlorophenyl)-2-[(4*H*-1,2,4-triazol-4-yl)methyl]-1,3-dioxolan-4-yl]methoxy]phenyl]-4-(1-methylethyl)piperazine.

01/2008:0955
corrected 6.0

TERFENADINE

Terfenadinum

$C_{32}H_{41}NO_2$ M_r 471.7
[50679-08-8]

DEFINITION

(1*RS*)-1-[4-(1,1-Dimethylethyl)phenyl]-4-[4-(hydroxydiphenylmethyl)piperidin-1-yl]butan-1-ol.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very slightly soluble in water, freely soluble in methylene chloride, soluble in methanol. It is very slightly soluble in dilute hydrochloric acid.

It shows polymorphism (*5.9*).

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Melting point (*2.2.14*): 146 °C to 152 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent.

Spectral range: 230-350 nm.

Absorption maximum: at 259 nm.

Shoulders: at 253 nm and 270 nm.

Specific absorbance at the absorption maximum: 13.5 to 14.9.

C. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *terfenadine CRS*.

D. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 50 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 mg of *terfenadine CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *methanol R, methylene chloride R* (10:90 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 15 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 15 mg of *terfenadine impurity A CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. To 5.0 ml of this solution, add 5.0 ml of the test solution and dilute to 50.0 ml with the mobile phase.

Reference solution (c). Dilute 10.0 ml of reference solution (a) to 25.0 ml with the mobile phase.

Reference solution (d). Dissolve 0.1 g of *potassium iodide R* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 1 ml of this solution to 100 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dilute 600 ml of *acetonitrile R* to 1 litre with *diethylammonium phosphate buffer solution pH 6.0 R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 217 nm.

Injection: 20 µl.

Run time: 5 times the retention time of terfenadine.

System suitability: reference solution (b):

– *resolution*: minimum 5.0 between the peaks due to terfenadine and impurity A;

– *mass distribution ratio*: minimum 2.0 for the peak due to terfenadine; use *potassium iodide R* as the unretained compound (reference solution (d)).

Limits:

– *impurities A, B, C, D, E, F, G, H, I, J*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent);

– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);

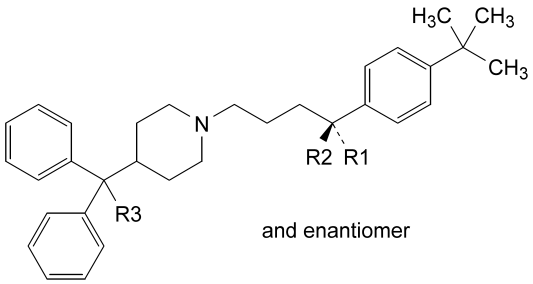
– *disregard limit*: 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.005 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 0.5 kPa.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

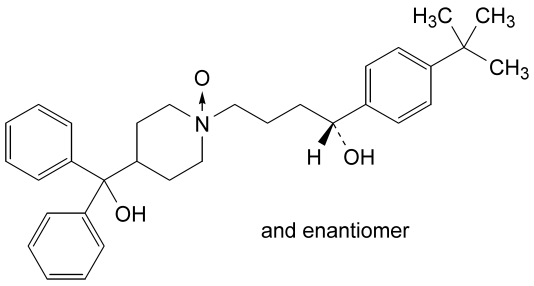


1 ml of *0.1 M perchloric acid* is equivalent to 47.17 mg of $C_{32}H_{41}NO_2$.

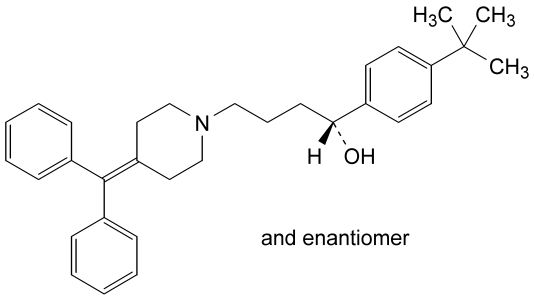
STORAGE

Protected from light.

IMPURITIES

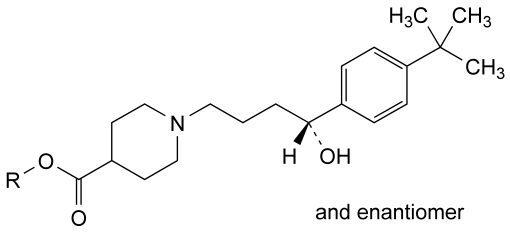


Specified impurities: A, B, C, D, E, F, G, H, I, J.



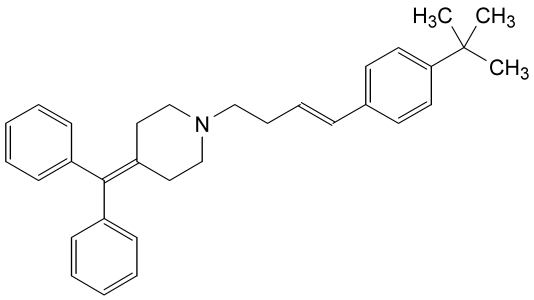
A. R1 + R2 = O, R3 = OH: 1-[4-(1,1-dimethylethyl)phenyl]-4-[4-(hydroxydiphenylmethyl)piperidin-1-yl]butan-1-one,

B. R1 = OH, R2 = R3 = H: (1*RS*)-1-[4-(1,1-dimethylethyl)-phenyl]-4-[4-(diphenylmethyl)piperidin-1-yl]butan-1-ol,

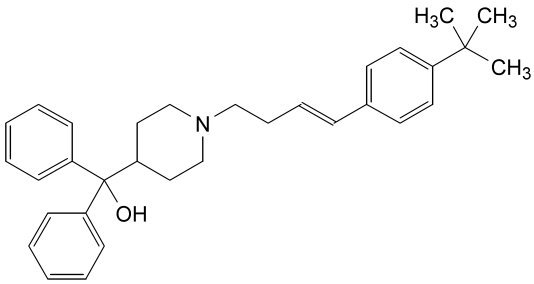


H. R1 = R2 = H, R3 = OH: [1-[4-[4-(1,1-dimethylethyl)-phenyl]butyl]piperidin-4-yl]diphenylmethanol,

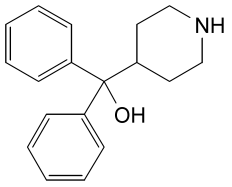
C. 1-[(4*RS*)-4-[4-(1,1-dimethylethyl)phenyl]-4-hydroxybutyl]-4-(hydroxydiphenylmethyl)piperidine 1-oxide,



D. (1*RS*)-1-[4-(1,1-dimethylethyl)phenyl]-4-[4-(diphenylmethylene)piperidin-1-yl]butan-1-ol,



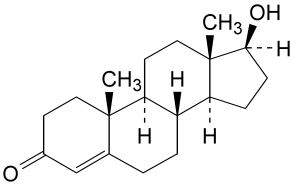
E. R = H: 1-[(4*RS*)-4-[4-(1,1-dimethylethyl)phenyl]-4-hydroxybutyl]piperidine-4-carboxylic acid,



J. R = C_2H_5: ethyl 1-[(4*RS*)-4-[4-(1,1-dimethylethyl)phenyl]-4-hydroxybutyl]piperidine-4-carboxylate,

F. 1-[4-[4-(1,1-dimethylethyl)phenyl]but-3-enyl]-4-(diphenylmethylene)piperidine,

G. [1-[4-[4-(1,1-dimethylethyl)phenyl]but-3-enyl]piperidin-4-yl]diphenylmethanol,



I. diphenyl(piperidin-4-yl)methanol.

corrected 6.0

TESTOSTERONE

Testosteronum

$C_{19}H_{28}O_2$ M_r 288.4
[58-22-0]

DEFINITION

17β-Hydroxyandrost-4-en-3-one.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white crystalline powder, or colourless or yellowish-white crystals.

Solubility: practically insoluble in water, freely soluble in alcohol and in methylene chloride, practically insoluble in fatty oils.

mp: about 155 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *testosterone CRS*.

TESTS

Specific optical rotation (*2.2.7*): + 106 to + 114 (dried substance).

Dissolve 0.250 g in *ethanol R* and dilute to 25.0 ml with the same solvent.

Impurities D and F. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 1 mg of *stanolone R* in *methanol R* and dilute to 10 ml with the same solvent. In 1 ml of this solution, dissolve 10 mg of *testosterone for impurity D identification CRS* (testosterone spiked with about 1 per cent of impurity D).

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 10.0 ml with *methanol R*.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 10.0 ml with *methanol R*.

Plate: *TLC silica gel F_{254} plate R* (6-8 μm).

Preconditioning (in the dark): add about 5 g of powdered *silver nitrate R* to 100 ml of *methanol R*. Stir the suspension for 30 min. Filter or decant the suspension and immerse the plate in the silver nitrate solution for at least 30 min. Dry at 75 °C for 30 min.

A pre-conditioned plate can be stored in the dark for 5-7 days.

Mobile phase: *acetic acid R, ethanol R, dioxan R, methylene chloride R* (1:2:10:90 *V/V/V/V*).

Application: 2 μl.

Development: in a saturated tank over 3/4 of the plate.

Drying: allow to stand at room temperature and protected from light for 30 min.

Detection: spray with a 200 g/l solution of *toluenesulphonic acid R* in *ethanol R* and heat at 105 °C for 10 min. Examine in ultraviolet light at 365 nm.

System suitability: the chromatogram obtained with reference solution (a) shows 3 clearly separated spots; impurity D R_F = about 0.5; testosterone R_F = about 0.65; impurity F R_F = about 0.7.

Limits:

- *impurity D*: any spot due to impurity D is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent),
- *impurity F*: any spot due to impurity F is not more intense than the spot in the chromatogram obtained with reference solution (d) (0.1 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *testosterone for system suitability CRS* (containing impurities C and I) in 1 ml of *methanol R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 10.0 ml with *methanol R*.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 μm) with a pore size of 15 nm,
- *temperature*: 40 °C.

Mobile phase:

- *mobile phase A*: *water for chromatography R, methanol R* (45:55 *V/V*),
- *mobile phase B*: *methanol R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 4	100	0
4 - 24	100 → 60	0 → 40
24 - 53	60 → 0	40 → 100
53 - 55	0	100
55 - 56	0 → 100	100 → 0
56 - 75	100	0

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μl.

Relative retention with reference to testosterone (retention time = about 18 min): impurity G = about 0.6; impurity H = about 0.8; impurity A = about 0.9; impurity I = about 0.95; impurity C = about 1.2; impurity E = about 1.7; impurity J = about 2.1; impurity B = about 2.5.

System suitability: reference solution (a):

– *resolution*: minimum baseline separation between the peaks due to impurity I and testosterone.

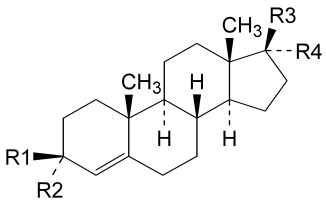
Limits: use the chromatogram obtained with reference solution (a) to identify the peaks due to impurities C and I:

– *correction factor*: for the calculation of content, multiply the peak area of impurity I by 2.9,
– *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
– *impurity I*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent),
– *impurities A, B, E, G, H, J*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
– *total*: not more than 1.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent),
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 0.500 g by drying in an oven at 105 °C for 2 h.

ASSAY

Dissolve 50.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml to 100.0 ml with *alcohol R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 241 nm.



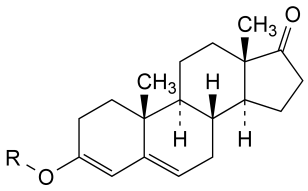
Calculate the content of $C_{19}H_{28}O_2$ taking the specific absorbance to be 569.

STORAGE

Protected from light.

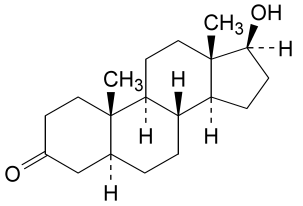
IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J.



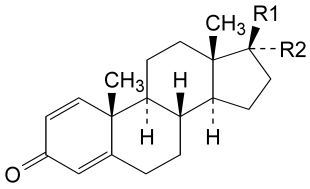
A. R1 + R2 = R3 + R4 = O: androst-4-ene-3,17-dione (androstenedione),

C. R1 + R2 = O, R3 = H, R4 = OH: 17α-hydroxyandrost-4-en-3-one (epitestosterone),



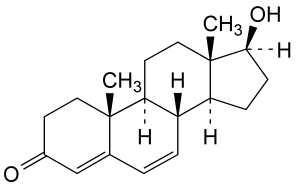
D. R1 = R3 = OH, R2 = R4 = H: androst-4-ene-3β,17β-diol (Δ4-androstenediol),

E. R1 + R2 = O, R3 = O-CO-CH_3, R4 = H: 3-oxoandrost-4-en-17β-yl acetate (testosterone acetate),



B. R = C_2H_5: 3-ethoxyandrosta-3,5-dien-17-one (androstenedione ethylenolether),

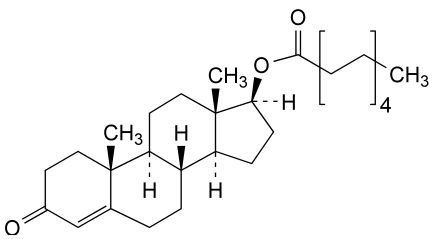
J. R = CH_3: 3-methoxyandrosta-3,5-dien-17-one (androstenedione methylenolether),



F. 17β-hydroxy-5α-androstan-3-one (androstanolone, stanolone),

G. R1 + R2 = O: androsta-1,4-diene-3,17-dione (androstadienedione).

H. R1 = OH, R2 = H: 17β-hydroxyandrosta-1,4-dien-3-one (boldenone),



I. 17β-hydroxyandrosta-4,6-dien-3-one (Δ6-testosterone).

01/2008:1736

TESTOSTERONE DECANOATE

Testosteroni decanoas

$C_{29}H_{46}O_3$ M_r 442.7

DEFINITION

3-Oxoandrost-4-en-17β-yl decanoate.

Content: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, very soluble in acetone, in methylene chloride and in anhydrous ethanol, freely soluble in fatty oils.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *testosterone decanoate CRS*.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (c).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Dissolve 0.20 g in 20 ml of *methanol R*.

Specific optical rotation (*2.2.7*): + 75.0 to + 80.0 (dried substance).

Dissolve 0.200 g in *anhydrous ethanol R* and dilute to 20.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve the contents of a vial of *testosterone decanoate for system suitability CRS* (containing impurities A, B, C, D, E and F) in 1 ml of the mobile phase.

Reference solution (b). Dilute 10.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (c). Dissolve 20.0 mg of *testosterone decanoate CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

Mobile phase: *water R, acetonitrile R* (5:95 *V/V*).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 20 µl of the test solution and reference solutions (a) and (b).

Run time: twice the retention time of testosterone decanoate.

Identification of impurities: use the chromatogram supplied with *testosterone decanoate for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A, B, C, D, E and F.

Relative retention with reference to testosterone decanoate (retention time = about 20 min): impurity A = about 0.2; impurity B = about 0.6; impurities C and G = about 0.79; impurity D = about 0.83; impurity E = about 1.3; impurity F = about 1.7.

System suitability: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to impurities C and D.

Limits:

– *correction factors*: for the calculation of content, multiply the peak area of impurity A by 0.7;
– *impurities A, B, D, E, F*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *sum of impurities C and G*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *unspecified impurities*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

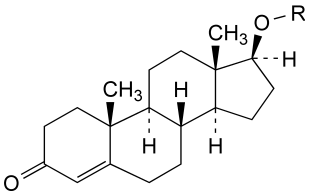
Free acid. Dissolve 0.65 g in 10 ml of *ethanol (96 per cent) R*, previously neutralised to *bromothymol blue solution R3*, and titrate immediately with *0.01 M sodium hydroxide*, using 0.1 ml of *bromothymol blue solution R3* as indicator. Not more than 0.6 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to blue.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: 20 µl of the test solution and reference solution (c).



Calculate the percentage content of $C_{29}H_{46}O_3$ from the declared content of *testosterone decanoate CRS*.

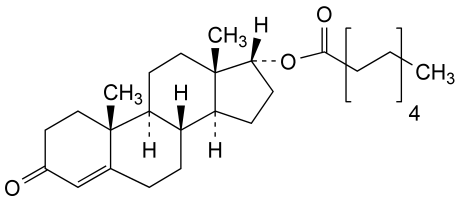
STORAGE

At a temperature of 2 °C to 8 °C.

IMPURITIES

Specified impurities: *A, B, C, D, E, F, G*.

A. R = H: testosterone,



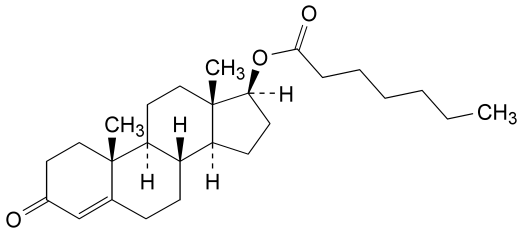
B. R = CO-$[CH_2]_6$-CH_3: 3-oxoandrost-4-en-17β-yl octanoate (testosterone octanoate),

C. R = CO-$[CH_2]_7$-CH_3: 3-oxoandrost-4-en-17β-yl nonanoate (testosterone nonanoate),

D. R = CO-$[CH_2]_8$-$CH{=}CH_2$: 3-oxoandrost-4-en-17β-yl undec-10-enoate (testosterone undecylenate),

E. R = CO-$[CH_2]_9$-CH_3: 3-oxoandrost-4-en-17β-yl undecanoate (testosterone undecanoate),

F. R = CO-$[CH_2]_{10}$-CH_3: 3-oxoandrost-4-en-17β-yl dodecanoate (testosterone laurate),



G. 3-oxoandrost-4-en-17α-yl decanoate (epitestosterone decanoate).

01/2008:1048

TESTOSTERONE ENANTATE

Testosteroni enantas

$C_{26}H_{40}O_3$ M_r 400.6
[315-37-7]

DEFINITION

3-Oxoandrost-4-en-17β-yl heptanoate.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish-white, crystalline powder.

Solubility: practically insoluble in water, very soluble in anhydrous ethanol, freely soluble in fatty oils.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 34 °C to 39 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *testosterone enantate CRS.*

C. Thin-layer chromatography (*2.2.27*).

Solvent mixture: *methanol R, methylene chloride R* (10:90 *V/V*).

Test solution. Dissolve 5 mg of the substance to be examined in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (a). Dissolve 5 mg of *testosterone enantate CRS* in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (b). Dissolve 5 mg of *testosterone enantate CRS*, 5 mg of *testosterone decanoate CRS* and 5 mg of *testosterone isocaproate CRS* in the solvent mixture and dilute to 10 ml with the solvent mixture.

Plate: *TLC octadecylsilyl silica gel F_{254} plate R.*

Mobile phase: *water R, acetonitrile R, 2-propanol R* (20:40:60 *V/V/V*).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air, then at 100 °C for 10 min; allow to cool.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

Detection B: spray with *alcoholic solution of sulphuric acid R*; heat at 120 °C for 10 min; allow to cool and examine in daylight.

Results B: the principal spot in the chromatogram obtained with the test solution is green and is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

System suitability: reference solution (b):

– the chromatogram shows 3 clearly separated principal spots by each method of visualisation.

D. To about 25 mg add 2 ml of a 10 g/l solution of *potassium hydroxide R* in *methanol R* and boil under a reflux condenser for 1 h. Cool. Add 10 ml of *water R*. Acidify with *dilute hydrochloric acid R* until *blue litmus paper R* turns red. Filter and wash the precipitate with a small quantity of *water R*. The residue, after drying at 60 °C at a pressure not exceeding 0.7 kPa for 3 h, melts (*2.2.14*) at 150 °C to 153 °C.

TESTS

Specific optical rotation (*2.2.7*): + 77 to + 82 (dried substance).

Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent.

Impurity A: maximum 0.16 per cent.

Dissolve 0.50 g in 10 ml of *ethanol (96 per cent) R* previously neutralised to *bromothymol blue solution R3*. Titrate immediately with *0.01 M sodium hydroxide*. Not more than 0.6 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to blue.

Impurities C and D. Thin-layer chromatography (*2.2.27*).

Solvent mixture: *methanol R, methylene chloride R* (10:90 *V/V*).

Test solution. Dissolve 0.20 g of the substance to be examined in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with the solvent mixture.

Reference solution (b). Dissolve 20 mg of *testosterone propionate CRS* in the solvent mixture, add 1 ml of the test solution and dilute to 100 ml with the solvent mixture.

Plate: *TLC silica gel G plate R.*

Mobile phase: *ethyl acetate R, toluene R* (20:80 *V/V*).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *alcoholic solution of sulphuric acid R* and heat at 120 °C for 10 min.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

Limit:

– *impurities C, D*: any spot, apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (1.0 per cent).

Impurity B. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *testosterone caproate CRS* (impurity B) in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. To 1 ml of this solution add 1 ml of reference solution (a).

Column:

– *size*: *l* = 0.12 m, Ø = 4 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *water R, acetonitrile R* (30:70 *V/V*).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 20 µl.

System suitability: reference solution (b):

– *relative retention* with reference to testosterone enantate: impurity B = about 0.7.

Limit:

– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

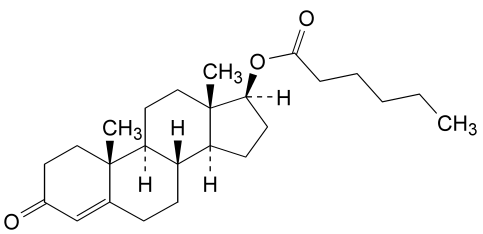
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in a desiccator over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa.

ASSAY

Dissolve 50.0 mg in *anhydrous ethanol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *anhydrous ethanol R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 241 nm.

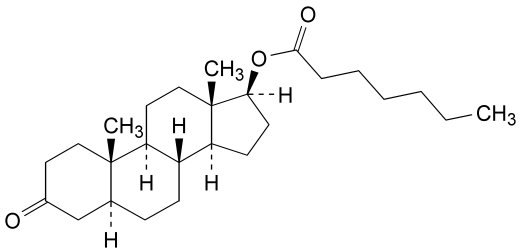
Calculate the content of $C_{26}H_{40}O_3$ taking the specific absorbance to be 422.

STORAGE



Protected from light, at a temperature of 2 °C to 8 °C.

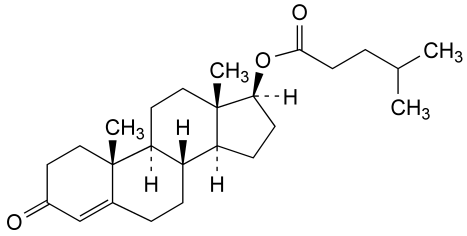
IMPURITIES



Specified impurities: A, B, C, D.

A. heptanoic acid,

B. 3-oxoandrost-4-en-17β-yl hexanoate (testosterone caproate),



C. 3-oxo-5α-androstan-17β-yl heptanoate,

D. 17β-hydroxyandrost-4-en-3-one (testosterone).

01/2008:1737

TESTOSTERONE ISOCAPROATE

Testosteroni isocaproas

$C_{25}H_{38}O_3$ M_r 386.6

DEFINITION

3-Oxoandrost-4-en-17β-yl 4-methylpentanoate.

Content: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, very soluble in acetone and in methylene chloride, freely soluble in fatty oils.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *testosterone isocaproate CRS*.

B. Examine the chromatograms obtained in the assay.
Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (c).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Dissolve 0.20 g in 20 ml of *methanol R*.

Specific optical rotation (*2.2.7*): + 82.0 to + 88.0 (dried substance).

Dissolve 0.200 g in *anhydrous ethanol R* and dilute to 20.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *testosterone isocaproate for system suitability CRS* (containing impurities A, B, C, D, E, F and G) in 10 ml of the mobile phase.

Reference solution (b). Dilute 10.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (c). Dissolve 20.0 mg of *testosterone isocaproate CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 40 °C.

Mobile phase: *water R, acetonitrile R* (15:85 *V/V*).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 20 µl of the test solution and reference solutions (a) and (b).

Run time: twice the retention time of testosterone isocaproate.

Identification of impurities: use the chromatogram supplied with *testosterone isocaproate for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A, B, C, D, E, F and G.

Relative retention with reference to testosterone isocaproate (retention time = about 14 min): impurity A = about 0.2; impurity B = about 0.4; impurity C = about 0.5; impurity D = about 0.7; impurity G = about 0.8; impurity E = about 1.1; impurity F = about 1.4.

System suitability: reference solution (a):

– *peak-to-valley ratio*: minimum 2.5, where H_p = height above the baseline of the peak due to impurity E and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to testosterone isocaproate.

Limits:

– *impurities A, B, C, D, E, F, G*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *unspecified impurities*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

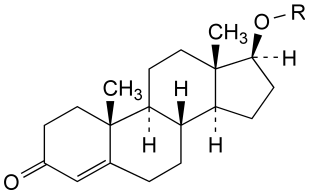
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Free acid. Dissolve 0.44 g in 10 ml of *ethanol (96 per cent) R*, previously neutralised to *bromothymol blue solution R3*, and titrate immediately with *0.01 M sodium hydroxide*, using 0.1 ml of *bromothymol blue solution R3* as indicator. Not more than 0.6 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to blue.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa.

ASSAY



Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

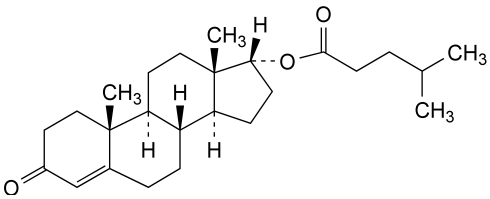
Injection: 20 µl of the test solution and reference solution (c).

Calculate the percentage content of $C_{25}H_{38}O_3$ from the declared content of *testosterone isocaproate CRS*.

IMPURITIES

Specified impurities: *A, B, C, D, E, F, G*.

A. R = H: testosterone,



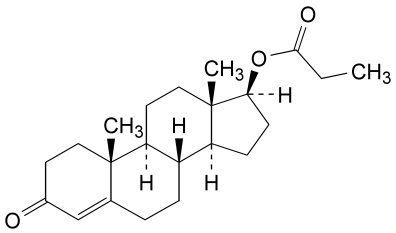
B. R = CO-CH_3: 3-oxoandrost-4-en-17β-yl acetate (testosterone acetate),

C. R = CO-C_2H_5: testosterone propionate,

D. R = CO-$CH(CH_3)_2$: 3-oxoandrost-4-en-17β-yl 2-methylpropanoate (testosterone isobutyrate),

E. R = CO-$[CH_2]_4$-CH_3: 3-oxoandrost-4-en-17β-yl hexanoate (testosterone caproate),

F. R = CO-$[CH_2]_5$-CH_3: testosterone enantate,



G. 3-oxoandrost-4-en-17α-yl 4-methylpentanoate (epitestosterone isocaproate).

TESTOSTERONE PROPIONATE

Testosteroni propionas

$C_{22}H_{32}O_3$ M_r 344.5
[57-85-2]

DEFINITION

3-Oxoandrost-4-en-17β-yl propanoate.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder or colourless crystals.

Solubility: practically insoluble in water, freely soluble in acetone and in alcohol, soluble in fatty oils.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of testosterone propionate.*

TESTS

Specific optical rotation (*2.2.7*): + 84 to + 90 (dried substance).

Dissolve 0.250 g in *ethanol R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of the substance to be examined and 2 mg of *testosterone acetate CRS* in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *water R, methanol R* (20:80 *V/V*).

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

Run time: twice the retention time of testosterone propionate.

Relative retention with reference to testosterone propionate (retention time = about 9 min): impurity C = about 0.5; impurity A = about 0.7; impurity D = about 0.8; impurity B = about 1.4.

System suitability: reference solution (a):

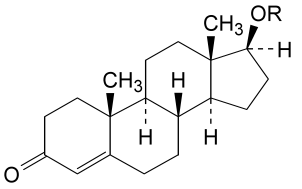
– *resolution*: minimum 4.0 between the peaks due to testosterone propionate and to impurity A.

Limits:

– *any impurity*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 0.500 g by drying in an oven at 105 °C for 2 h.

ASSAY

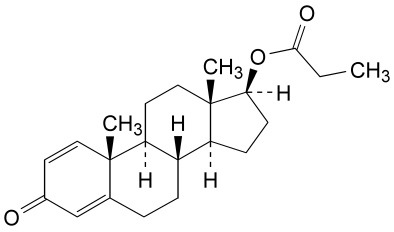


Dissolve 25.0 mg in *ethanol R* and dilute to 250.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *ethanol R*. Measure the absorbance (*2.2.25*) at the maximum at 240 nm.

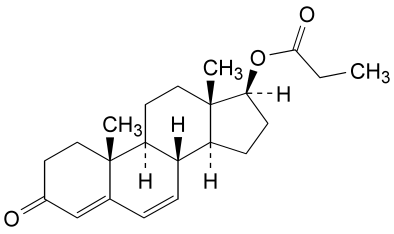
Calculate the content of $C_{22}H_{32}O_3$ taking the specific absorbance to be 490.

IMPURITIES

Specified impurities: A, B, C, D.



Other detectable impurities: E.

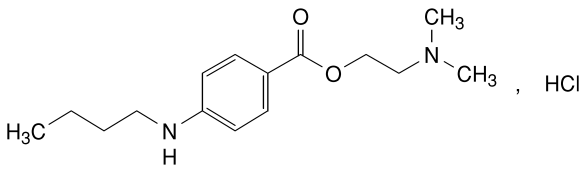


A. R = CO-CH_3: 3-oxoandrost-4-en-17β-yl acetate (testosterone acetate),

B. R = CO-$CH(CH_3)_2$: 3-oxoandrost-4-en-17β-yl 2-methylpropanoate (testosterone isobutyrate),

C. R = H: testosterone,

D. 3-oxoandrosta-1,4-dien-17β-yl propanoate,



E. 3-oxoandrosta-4,6-dien-17β-yl propanoate.

corrected 6.0

TETRACAINE HYDROCHLORIDE

Tetracaini hydrochloridum

$C_{15}H_{25}ClN_2O_2$ M_r 300.8
[136-47-0]

DEFINITION

Tetracaine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 2-(dimethylamino)ethyl 4-(butylamino)benzoate hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, slightly hygroscopic, freely soluble in water, soluble in alcohol.

It melts at about 148 °C or it may occur in either of 2 other crystalline forms which melt respectively at about 134 °C and 139 °C. Mixtures of these forms melt within the range 134 °C to 147 °C.

IDENTIFICATION

First identification: A, B, D.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *tetracaine hydrochloride CRS*.

B. To 10 ml of solution S (see Tests) add 1 ml of *ammonium thiocyanate solution R*. A white, crystalline precipitate is formed which, after recrystallisation from *water R* and drying at 80 °C for 2 h, melts (*2.2.14*) at about 131 °C.

C. To about 5 mg add 0.5 ml of *fuming nitric acid R*. Evaporate to dryness on a water-bath, allow to cool and dissolve the residue in 5 ml of *acetone R*. Add 1 ml of *0.1 M alcoholic potassium hydroxide*. A violet colour develops.

D. Solution S gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Dilute 2 ml of solution S to 10 ml with *water R*. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*). Dilute 1 ml of solution S to 10 ml with *carbon dioxide-free water R*. The pH of the solution is 4.5 to 6.5.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel GF_{254} plate R*. Carry out a preliminary development over a path of 12 cm using a mixture of 4 volumes of *glacial acetic acid R*, 16 volumes of *hexane R* and 80 volumes of *dibutyl ether R*. Remove the plate and dry it in a current of warm air for a few minutes. Allow the plate to cool before use.

Test solution. Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 mg of *4-aminobenzoic acid R* in *water R* and dilute to 100 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *water R*.

Apply to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 4 volumes of *glacial acetic acid R*, 16 volumes of *hexane R* and 80 volumes of *dibutyl ether R*. Dry the plate at 100 °C to 105 °C for 10 min and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.05 per cent). The principal spot in the chromatogram obtained with the test solution remains at the starting point.

Heavy metals (*2.4.8*). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *alcohol R* and add 5.0 ml of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 30.08 mg of $C_{15}H_{25}ClN_2O_2$.

STORAGE

Store protected from light.

01/2008:0644

TETRACOSACTIDE

Tetracosactidum

H-Ser-Tyr-Ser-Met-Glu-His-Phe-Arg-Trp-Gly-Lys-Pro-Val-Gly-Lys-Lys-Arg-Arg-Pro-Val-Lys-Val-Tyr-Pro-OH

$C_{136}H_{210}N_{40}O_{31}S$ M_r 2933

[16960-16-0]

DEFINITION

Tetracosactide is a synthetic tetracosapeptide in which the sequence of amino acids is the same as that of the first twenty-four residues of human corticotropin. It is available as an acetate and contains water. It increases the rate at which corticoid hormones are secreted by the adrenal glands. The potency is not less than 800 International Units per milligram, calculated with reference to the anhydrous, acetic acid-free substance.

CHARACTERS

A white or yellow, amorphous powder, sparingly soluble in water.

IDENTIFICATION

A. It increases the amount of corticosterone produced by isolated rat adrenal cells in the conditions of the assay.

B. Examine by electrophoresis (*2.2.31*) and thin-layer chromatography (*2.2.27*) to obtain a two-dimensional separation using two plates with *cellulose for chromatography R1* as the coating substance.

Test solution. Dissolve 1 mg of the substance to be examined in 0.2 ml of a 15.4 g/l solution of *ammonium acetate R* adjusted to pH 8.2 with *dilute ammonia R2*. Add 10 µl of a 2 g/l solution of *trypsin R*, maintain the mixture at 37 °C to 38 °C for 40 min, heat on a water-bath for 3 min and add 5 µl of *glacial acetic acid R*. Evaporate to dryness at 40 °C at a pressure not exceeding 3 kPa, dry the glassy residue at 40 °C for 1 h and dissolve in 0.1 ml of *glacial acetic acid R*. Dry the solution from the frozen state, dissolve the residue in 0.1 ml of *water R* and dry again from the frozen state. Dry the final residue at 45 °C for 1 h at a pressure not exceeding 3 kPa and dissolve in 50 µl of *water R*.

Reference solution. Prepare at the same time and in the same manner as the test solution, using *tetracosactide CRS* instead of the substance to be examined.

Spray the plates with the electrolyte solution which consists of a solution containing 0.2 per cent *V/V* of *glacial acetic acid R* and 0.2 per cent *V/V* of *pyridine R*. Place the filter paper tongues to connect the plates with the appropriate compartment of each trough so that each

tongue covers an area 1.5 cm wide at one end of the plate. Close the tank and allow to stand for 30 min. Apply the solutions on the anodic side. Apply to the first plate, at a point about 2.5 cm from each of two adjacent edges, 4 µl of the test solution. Apply to the second plate, at a similar position, 4 µl of the reference solution. Apply to both plates a potential of 280 V for a plate 200 mm long and allow electrophoresis to proceed for 90 min. Allow the plates to dry in air for 30 min and then dry in a current of air at 30 °C for 30 min. Carry out a second separation on each plate by thin-layer chromatography. Develop at right angles to the direction of electrophoresis over a path of 15 cm using a mixture of 8 volumes of *glacial acetic acid R*, 24 volumes of *pyridine R*, 30 volumes of *water R* and 38 volumes of *butanol R*. Dry the plates in a current of air and spray with *ninhydrin solution R1*. The principal spots in the chromatogram obtained with the test solution are similar in position to those in the chromatogram obtained with the reference solution, but their intensity may differ.

TESTS

Specific optical rotation (*2.2.7*). Dissolve 10.0 mg in 1.0 ml of a mixture of 1 volume of *glacial acetic acid R* and 99 volumes of *water R*. The specific optical rotation is – 99 to – 109, calculated with reference to the anhydrous, acetic acid-free substance.

Absorbance (*2.2.25*). Dissolve 1.0 mg in *0.1 M hydrochloric acid* and dilute to 5.0 ml with the same acid. Examined between 240 nm and 280 nm, the solution shows an absorption maximum at 276 nm. The absorbance at the maximum is 0.51 to 0.61, calculated with reference to the anhydrous, acetic acid-free substance. The ratio of the absorbance at the maximum at 276 nm to the absorbance at 248 nm is 2.4 to 2.9.

Amino acids. Examine by means of an amino-acid analyser. Standardise the apparatus with a mixture containing equimolar amounts of ammonia, glycine and the L-form of the following amino acids:

Lysine	Threonine	Alanine	Leucine
Histidine	Serine	Valine	Tyrosine
Arginine	Glutamic acid	Methionine	Phenylalanine
Aspartic acid	Proline	Isoleucine	

together with half the equimolar amount of L-cystine. For the validation of the method, an appropriate internal standard, such as *DL-norleucine R*, is used.

Test solution. Place 1.0 mg of the substance to be examined in a rigorously cleaned hard-glass tube, 100 mm long and 6 mm in internal diameter. Add a suitable amount of a 50 per cent *V/V* solution of *hydrochloric acid R*. Immerse the tube in a freezing mixture at – 5 °C, reduce the pressure to below 133 Pa and seal. Heat at 110 °C to 115 °C for 16 h. Cool, open the tube, transfer the contents to a 10 ml flask with the aid of five quantities, each of 0.2 ml, of *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure. Take up the residue in *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure; repeat these operations once. Take up the residue in a buffer solution suitable for the amino-acid analyser used and dilute to a suitable volume with the same buffer solution. Apply a suitable volume to the amino-acid analyser.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids, taking that for valine to be equivalent to three. The values fall within the following limits: lysine 3.5 to 4.7; histidine 0.9 to 1.1; arginine 2.7 to 3.3; serine 1.1 to 2.2; glutamic acid 0.9 to 1.1; proline 2.5 to 3.5; glycine 1.8 to 2.2; methionine 0.9 to 1.1; tyrosine 1.7 to 2.2; phenylalanine 0.9 to 1.1. Not more than traces of other amino acids are present, with the exception of tryptophan.

Related peptides

A. Examine by liquid chromatography (*2.2.29*). Use degassed solvents.

Test solution. Dissolve 1.0 mg of the substance to be examined in 1 ml of *water R*.

Reference solution (a). Dissolve 1.0 mg of the substance to be examined in 1 ml of a 1 per cent *V/V* solution of *glacial acetic acid R* and add 50 µl of a mixture of 1 volume of *strong hydrogen peroxide solution R* and 999 volumes of *water R*. Allow to stand for 2 h.

Reference solution (b). Dissolve 1.0 mg of *tetracosactide CRS* in 1 ml of *water R*.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (10 µm),
– as mobile phase at a flow rate of 2.0 ml/min, a mixture of 365 ml of *acetonitrile R*, 10.0 ml of *glacial acetic acid R* and 10.0 g of *ammonium sulphate R*, diluted to 2000 ml with *water R*,
– as detector a spectrophotometer set at 280 nm.

Inject 20 µl of each solution ensuring that the syringe used to inject the test solution is not contaminated with peroxide. The chromatogram obtained with reference solution (a) shows a peak due to tetracosactide corresponding to the principal peak in the chromatogram obtained with the test solution and a peak with a lower retention time, due to tetracosactide sulphoxide, of significantly greater area than any corresponding peak in the chromatogram obtained with the test solution. The test is not valid unless in the chromatogram obtained with reference solution (a), the resolution between the peaks corresponding to tetracosactide and tetracosactide sulphoxide is at least 7. In the chromatogram obtained with the test solution, the area of the peak corresponding to tetracosactide sulphoxide is not greater than 4 per cent of the sum of the areas of all the peaks, disregarding any peaks due to the solvent and the mobile phase.

B. Examine by thin-layer chromatography (*2.2.27*), using *cellulose for chromatography R* as the coating substance.

Test solution. Dissolve 3.0 mg of the substance to be examined in 1.5 ml of a mixture of equal volumes of *dilute acetic acid R* and *water R*.

Reference solution (a). Dilute 0.5 ml of the test solution to 10 ml with a mixture of equal volumes of *dilute acetic acid R* and *water R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with a mixture of equal volumes of *dilute acetic acid R* and *water R*.

Reference solution (c). To 0.5 ml of the test solution add 50 µl of a mixture of 1 volume of *strong hydrogen peroxide solution R* and 999 volumes of *water R*. Allow to stand for 2 h.

Apply to the plate as 1 cm bands 10 µl of each solution. Develop over a path of 15 cm using a mixture of 4 volumes of *glacial acetic acid R*, 24 volumes of *pyridine R*, 30 volumes of *water R* and 42 volumes of *butanol R*. Dry the plate in a current of air and spray with *ninhydrin solution R1*. In the chromatogram obtained with reference solution (c), the band corresponding in position

to the principal band in the chromatogram obtained with the test solution is reduced in intensity, and a prominent band, due to tetracosactide sulphoxide, of lower R_F is present. In the chromatogram obtained with the test solution, any band, apart from the principal band and any band due to tetracosactide sulphoxide, is not more intense than the band in the chromatogram obtained with reference solution (a) (5.0 per cent) and at most one such band is more intense than the band in the chromatogram obtained with reference solution (b) (2.5 per cent).

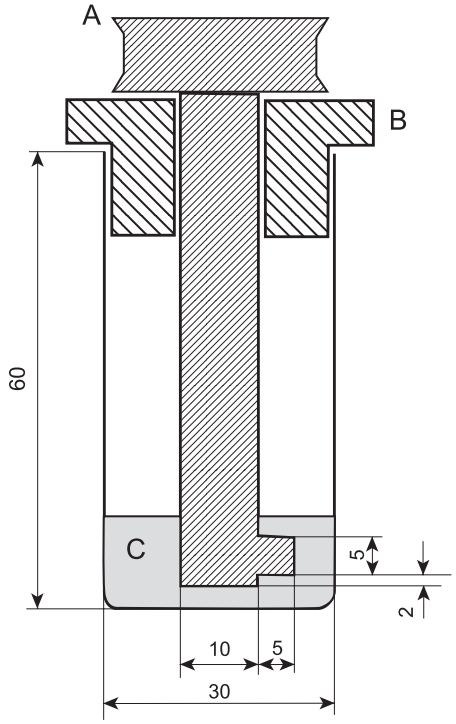
Peptide. Not less than 85.0 per cent of peptide, expressed as $C_{136}H_{210}N_{40}O_{31}S$, calculated with reference to the anhydrous, acetic acid-free substance.

Examine the chromatograms obtained in test A for related peptides. Calculate the content of $C_{136}H_{210}N_{40}O_{31}S$ from the peak heights or areas in the chromatograms obtained with the test solution and reference solution (b), and the declared content of $C_{136}H_{210}N_{40}O_{31}S$ in *tetracosactide CRS*.

Acetic acid (*2.5.34*): 8.0 per cent to 13.0 per cent.

Test solution. Dissolve 10.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of solvents.

Water (*2.5.12*): 5.0 per cent to 16.0 per cent, determined on 80.0 mg by the semi-micro determination of water.



ASSAY

The potency of tetracosactide is estimated by comparing in given conditions its activity in increasing the amount of corticosterone produced by isolated rat adrenal cells with that of the International Reference Preparation of tetracosactide or a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Reference Preparation which consists of a quantity of synthetic tetracosactide with mannitol. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organisation.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 64 per cent and not more than 156 per cent of the stated potency.

Use siliconised glassware and rinse well with *water R* before use. Euthanise four male rats, each weighing between 200 g and 400 g, by exsanguination. Remove the adrenal glands, carefully free them of adhering fat and immerse in solution B maintained at 4 °C. Cut each gland into four equal pieces and transfer to a suitable plastic stirring apparatus (see Figure 0644.-1) containing 5 ml of solution C maintained at 37 °C. Disperse the adrenal cells by stirring the mixture at 500 r/min. After 20 min, remove the supernatant liquid, cool to 4 °C, add 5 ml of solution C and repeat the dispersal procedure. Repeat the operation a further three times. Combine the five supernatant liquids, centrifuge at 4 °C in a polyethylene test-tube for 30 min after slow acceleration to 100 *g*. Suspend the resulting pellet in 8 ml of solution D and centrifuge for 30 min at 100 *g*. Again suspend the residue in 8 ml of solution D and filter the mixture through nylon gauze with 100 µm pores into a polyethylene beaker and add a suitable volume of solution D to the filtrate (a total volume of 65 ml to 105 ml has been found suitable). Maintain the resulting suspension at 4 °C.

A - pulley and stirring paddle,

B - bearing,

C - incubation medium.

Figure 0644.-1. – *Stirring Apparatus*

Dimensions in millimetres

Prepare four independent dilutions, with two-fold dose intervals, from solutions of suitable concentrations of the substance to be examined and of the reference preparation using solution E as diluent. Pipette 0.1 ml of each dilution into each of four polystyrene test-tubes and add 1.0 ml of the cell suspension prepared above to each tube. Incubate at 37 °C for 2 h and then cool to 4 °C. Transfer 1 ml of the contents of each tube to a glass tube containing 1.4 ml of *methylene chloride R*, mix in a vortex mixer for 10 s and centrifuge at 3000 *g* for 5 min. Transfer 1 ml of each of the methylene chloride layers, avoiding taking up aqueous phase, to a glass tube containing 0.6 ml of a mixture of 15 volumes of *alcohol R* and 35 volumes of *sulphuric acid R*. Mix in a vortex mixer for 10 s and centrifuge at 1500 *g* for 5 min. Allow each tube to stand for 30 min. Examine by fluorimetry (*2.2.21*), irradiating the lower layer with an excitant beam of suitable wavelength such as 436 nm or 470 nm and measuring the fluorescence at the maximum between 530 nm and 545 nm. If the solutions are not transferred to spectrophotometric measurement cells, select glass tubes that give fluorescence values for a standard corticosterone which do not differ from each other by more than 5 per cent. Calculate the result of the assay by the usual statistical methods using the linear portion of the log dose-response curve.

Solution A

Sodium chloride R	6.60 g
Potassium chloride R	0.353 g
Sodium hydrogen carbonate R	0.840 g
Potassium dihydrogen phosphate R	0.161 g

Magnesium sulphate R	0.291 g
Calcium chloride R	0.373 g
2-[4-(2-Hydroxyethyl)piperazin-1-yl]ethane sulphonic acid R	4.77 g

Dissolve the above ingredients in about 950 ml of *water R*, adjust to pH 7.4 with *1 M sodium hydroxide* and add 60 mg of *benzylpenicillin sodium R* and a quantity of *streptomycin sulphate R* equivalent to 100 mg of streptomycin. Dilute to 1000 ml with *water R*.

Solution B

Add 2 g/l of *glucose R* to solution A.

Solution C

To solution B add 1 g/l of a preparation of collagenase obtained from *Clostridium histolyticum* and of a grade suitable for the preparation of dispersed cells.

Solution D

Add 5 g/l of *bovine albumin R* to solution B.

Solution E

A 9 g/l sterile solution of *sodium chloride R* containing 1 g/l of *bovine albumin R* and adjusted to pH 2.0 with *1 M hydrochloric acid*.

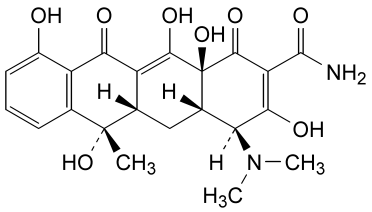
STORAGE

Store under nitrogen, protected from light, at a temperature between 2 °C and 8 °C.

LABELLING

The label states:

– the potency in International Units per milligram,



– the peptide content per container,

– the storage conditions.

corrected 6.0

TETRACYCLINE

Tetracyclinum

$C_{22}H_{24}N_2O_8$ M_r 444.4
[60-54-8]

DEFINITION

(4*S*,4a*S*,5a*S*,6*S*,12a*S*)-4-(Dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide.

Substance produced by certain strains of *Streptomyces aerofaciens* or obtained by any other means.

Content: 88.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: yellow, crystalline powder.

Solubility: very slightly soluble in water, soluble in ethanol (96 per cent) and in methanol, sparingly soluble in acetone. It dissolves in dilute acid and alkaline solutions.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 5 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *tetracycline hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *tetracycline hydrochloride CRS*, 5 mg of *demeclocycline hydrochloride R* and 5 mg of *oxytetracycline hydrochloride R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC octadecylsilyl silica gel F_{254} plate R*.

Mobile phase: mix 20 volumes of *acetonitrile R*, 20 volumes of *methanol R* and 60 volumes of a 63 g/l solution of *oxalic acid R* previously adjusted to pH 2 with *concentrated ammonia R*.

Application: 1 µl.

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 3 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

B. To about 2 mg add 5 ml of *sulphuric acid R*. A violet-red colour develops. Add the solution to 2.5 ml of *water R*. The colour becomes yellow.

C. Dissolve about 10 mg in a mixture of 1 ml of *dilute nitric acid R* and 5 ml of *water R*. Shake and add 1 ml of *silver nitrate solution R2*. Any opalescence in the solution is not more intense than that in a mixture of 1 ml of *dilute nitric acid R*, 5 ml of *water R* and 1 ml of *silver nitrate solution R2*.

TESTS

pH (*2.2.3*): 3.5 to 6.0.

Suspend 0.1 g in 10 ml of *carbon dioxide-free water R*.

Specific optical rotation (*2.2.7*): – 260 to – 280 (dried substance).

Dissolve 0.250 g in *0.1 M hydrochloric acid* and dilute to 50.0 ml with the same acid.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 25.0 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (a). Dissolve 25.0 mg of *tetracycline hydrochloride CRS* in *0.01 M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (b). Dissolve 12.5 mg of *4-epitetracycline hydrochloride CRS* in *0.01 M hydrochloric acid* and dilute to 50.0 ml with the same acid.

Reference solution (c). Dissolve 10.0 mg of *anhydrotetracycline hydrochloride CRS* in *0.01 M hydrochloric acid* and dilute to 100.0 ml with the same acid.

Reference solution (d). Dissolve 10.0 mg of *4-epianhydrotetracycline hydrochloride CRS* in *0.01 M hydrochloric acid* and dilute to 50.0 ml with the same acid.

Reference solution (e). Mix 1.0 ml of reference solution (a), 2.0 ml of reference solution (b) and 5.0 ml of reference solution (d) and dilute to 25.0 ml with *0.01 M hydrochloric acid.*

Reference solution (f). Mix 40.0 ml of reference solution (b), 20.0 ml of reference solution (c) and 5.0 ml of reference solution (d) and dilute to 200.0 ml with *0.01 M hydrochloric acid.*

Reference solution (g). Dilute 1.0 ml of reference solution (c) to 50.0 ml with *0.01 M hydrochloric acid.*

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *styrene-divinylbenzene copolymer R* (8 µm);

– *temperature*: 60 °C.

Mobile phase: weigh 80.0 g of *2-methyl-2-propanol R* and transfer to a 1000 ml volumetric flask with the aid of 200 ml of *water R*; add 100 ml of a 35 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 9.0 with *dilute phosphoric acid R*, 200 ml of a 10 g/l solution of *tetrabutylammonium hydrogen sulphate R* adjusted to pH 9.0 with *dilute sodium hydroxide solution R* and 10 ml of a 40 g/l solution of *sodium edetate R* adjusted to pH 9.0 with *dilute sodium hydroxide solution R*; dilute to 1000.0 ml with *water R.*

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl; inject the test solution and reference solutions (e), (f) and (g).

System suitability:

– *resolution*: minimum 2.5 between the peaks due to impurity A (1st peak) and tetracycline (2nd peak) and minimum 8.0 between the peaks due to tetracycline and impurity D (3rd peak) in the chromatogram obtained with reference solution (e); if necessary, adjust the concentration of 2-methyl-2-propanol in the mobile phase;

– *signal-to-noise ratio*: minimum 3 for the principal peak in the chromatogram obtained with reference solution (g);

– *symmetry factor*: maximum 1.25 for the peak due to tetracycline in the chromatogram obtained with reference solution (e).

Limits:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (5.0 per cent);

– *impurity B* (eluting on the tail of the principal peak): not more than 0.4 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (f) (2.0 per cent);

– *impurity C*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (1.0 per cent);

– *impurity D*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.5 per cent).

Heavy metals (*2.4.8*): maximum 50 ppm.

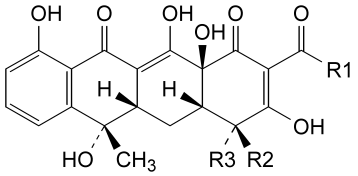
0.5 g complies with test C. Prepare the reference solution using 2.5 ml of *lead standard solution (10 ppm Pb) R.*

Loss on drying (*2.2.32*): maximum 13.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

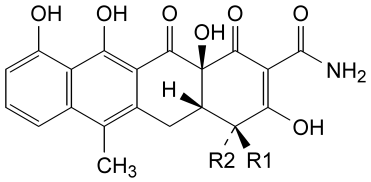
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.



Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{22}H_{24}N_2O_8$.

STORAGE

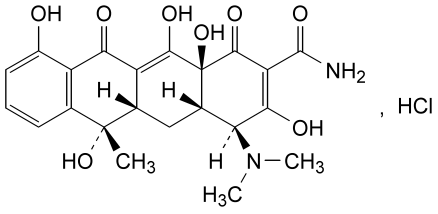


Protected from light.

IMPURITIES

A. R1 = NH_2, R2 = H, R3 = $N(CH_3)_2$: (4*R*,4a*S*,5a*S*,6*S*,12a*S*)-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide (4-epitetracycline),

B. R1 = CH_3, R2 = $N(CH_3)_2$, R3 = H: (4*S*,4a*S*,5a*S*,6*S*,12a*S*)-2-acetyl-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-4a,5a,6,12a-tetrahydrotetracene-1,11(4*H*,5*H*)-dione (2-acetyl-2-decarbamoyltetracycline),



C. R1 = $N(CH_3)_2$, R2 = H: (4*S*,4a*S*,12a*S*)-4-(dimethylamino)-3,10,11,12a-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,12,12a-hexahydrotetracene-2-carboxamide (anhydrotetracycline),

D. R1 = H, R2 = $N(CH_3)_2$: (4*R*,4a*S*,12a*S*)-4-(dimethylamino)-3,10,11,12a-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,12,12a-hexahydrotetracene-2-carboxamide (4-epianhydrotetracycline).

TETRACYCLINE HYDROCHLORIDE

Tetracyclini hydrochloridum

$C_{22}H_{25}ClN_2O_8$ M_r 480.9

[64-75-5]

DEFINITION

(4*S*,4a*S*,5a*S*,6*S*,12a*S*)-4-(Dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide hydrochloride.

Substance produced by certain strains of *Streptomyces aerofaciens* or obtained by any other means.

Content: 95.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: yellow, crystalline powder.

Solubility: soluble in water, slightly soluble in ethanol (96 per cent), practically insoluble in acetone. It dissolves in solutions of alkali hydroxides and carbonates. Solutions in water become turbid on standing, owing to the precipitation of tetracycline.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 5 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *tetracycline hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *tetracycline hydrochloride CRS*, 5 mg of *demeclocycline hydrochloride R* and 5 mg of *oxytetracycline hydrochloride R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC octadecylsilyl silica gel F_{254} plate R.*

Mobile phase: mix 20 volumes of *acetonitrile R*, 20 volumes of *methanol R* and 60 volumes of a 63 g/l solution of *oxalic acid R* previously adjusted to pH 2 with *concentrated ammonia R*.

Application: 1 µl.

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 3 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

B. To about 2 mg add 5 ml of *sulphuric acid R*. A violet-red colour develops. Add the solution to 2.5 ml of *water R*. The colour becomes yellow.

C. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

pH (*2.2.3*): 1.8 to 2.8.

Dissolve 0.1 g in 10 ml of *carbon dioxide-free water R*.

Specific optical rotation (*2.2.7*): – 240 to – 255 (dried substance).

Dissolve 0.250 g in *0.1 M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 25.0 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (a). Dissolve 25.0 mg of *tetracycline hydrochloride CRS* in *0.01 M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (b). Dissolve 15.0 mg of *4-epitetracycline hydrochloride CRS* in *0.01 M hydrochloric acid* and dilute to 50.0 ml with the same acid.

Reference solution (c). Dissolve 10.0 mg of *anhydrotetracycline hydrochloride CRS* in *0.01 M hydrochloric acid* and dilute to 100.0 ml with the same acid.

Reference solution (d). Dissolve 10.0 mg of *4-epianhydrotetracycline hydrochloride CRS* in *0.01 M hydrochloric acid* and dilute to 50.0 ml with the same acid.

Reference solution (e). Mix 1.0 ml of reference solution (a), 2.0 ml of reference solution (b) and 5.0 ml of reference solution (d) and dilute to 25.0 ml with *0.01 M hydrochloric acid*.

Reference solution (f). Mix 20.0 ml of reference solution (b), 10.0 ml of reference solution (c) and 5.0 ml of reference solution (d) and dilute to 200.0 ml using *0.01 M hydrochloric acid*.

Reference solution (g). Dilute 1.0 ml of reference solution (c) to 50.0 ml with *0.01 M hydrochloric acid*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *styrene-divinylbenzene copolymer R* (8 µm);

– *temperature*: 60 °C.

Mobile phase: weigh 80.0 g of *2-methyl-2-propanol R* and transfer to a 1000 ml volumetric flask with the aid of 200 ml of *water R*; add 100 ml of a 35 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 9.0 with *dilute phosphoric acid R*, 200 ml of a 10 g/l solution of *tetrabutylammonium hydrogen sulphate R* adjusted to pH 9.0 with *dilute sodium hydroxide solution R* and 10 ml of a 40 g/l solution of *sodium edetate R* adjusted to pH 9.0 with *dilute sodium hydroxide solution R*; dilute to 1000.0 ml with *water R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl; inject the test solution and reference solutions (e), (f) and (g).

System suitability:

– *resolution*: minimum 2.5 between the peaks due to impurity A (1st peak) and tetracycline (2nd peak) and minimum 8.0 between the peaks due to tetracycline and impurity D (3rd peak) in the chromatogram obtained with reference solution (e); if necessary, adjust the concentration of 2-methyl-2-propanol in the mobile phase;

– *signal-to-noise ratio*: minimum 3 for the principal peak in the chromatogram obtained with reference solution (g);

– *symmetry factor*: maximum 1.25 for the peak due to tetracycline in the chromatogram obtained with reference solution (e).

Limits:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (3.0 per cent);

– *impurity B* (eluting on the tail of the principal peak): not more than 0.5 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (f) (1.5 per cent);

– *impurity C*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.5 per cent);

– *impurity D*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.5 per cent).

Heavy metals (*2.4.8*): maximum 50 ppm.

0.5 g complies with test C. Prepare the reference solution using 2.5 ml of *lead standard solution (10 ppm Pb) R*.

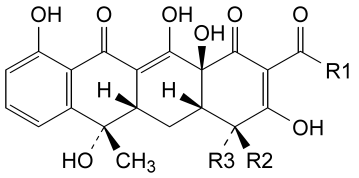
Loss on drying (*2.2.32*): maximum 2.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 670 Pa for 3 h.

Sulphated ash (*2.4.14*): maximum 0.5 per cent, determined on 1.0 g.

Bacterial endotoxins (*2.6.14*): less than 0.5 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

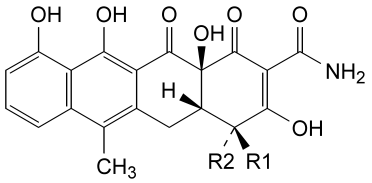
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.



Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{22}H_{25}ClN_2O_8$.

STORAGE

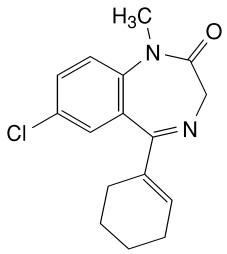


Protected from light. If the substance is sterile, store in a sterile, tamper-proof container.

IMPURITIES

A. R1 = NH_2, R2 = H, R3 = $N(CH_3)_2$: (4*R*,4a*S*,5a*S*,6*S*,12a*S*)-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide (4-epitetracycline),

B. R1 = CH_3, R2 = $N(CH_3)_2$, R3 = H: (4*S*,4a*S*,5a*S*,6*S*,12a*S*)-2-acetyl-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-4a,5a,6,12a-tetrahydrotetracene-1,11(4*H*,5*H*)-dione (2-acetyl-2-decarbamoyltetracycline),



C. R1 = $N(CH_3)_2$, R2 = H: (4*S*,4a*S*,12a*S*)-4-(dimethylamino)-3,10,11,12a-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,12,12a-hexahydrotetracene-2-carboxamide (anhydrotetracycline),

D. R1 = H, R2 = $N(CH_3)_2$: (4*R*,4a*S*,12a*S*)-4-(dimethylamino)-3,10,11,12a-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,12,12a-hexahydrotetracene-2-carboxamide (4-epianhydrotetracycline).

corrected 6.0

TETRAZEPAM

Tetrazepamum

$C_{16}H_{17}ClN_2O$ M_r 288.8
[10379-14-3]

DEFINITION

7-Chloro-5-(cyclohex-1-enyl)-1-methyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: light yellow or yellow crystalline powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, soluble in acetonitrile.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of tetrazepam*.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in *acetonitrile R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of the substance to be examined and 5.0 mg of *tetrazepam impurity C CRS* in *acetonitrile R* and dilute to 10.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *acetonitrile R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with *acetonitrile R*. Dilute 1.0 ml of this solution to 10.0 ml with *acetonitrile R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: mix 40 volumes of *acetonitrile R* and 60 volumes of a 3.4 g/l solution of *potassium dihydrogen phosphate R*,
– *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 35	100	0
35 - 40	100 → 55	0 → 45
40 - 50	55	45
50 - 60	55 → 100	45 → 0

Flow rate: 1.5 ml/min.

Detection: a spectrophotometer at 229 nm.

Injection: 20 µl.

System suitability: reference solution (a):

– *resolution*: minimum 2.0 between the peaks due to tetrazepam and to impurity C.

Limits:

– *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),

– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

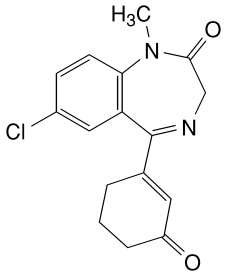
Chlorides (*2.4.4*): maximum 100 ppm.

Dissolve 0.750 g in 10 ml of *methylene chloride R* and add 15 ml of *water R*. Shake and separate the 2 layers. Dilute 10 ml of the aqueous layer to 15 ml with *water R*. The solution obtained complies with the limit test for chlorides.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

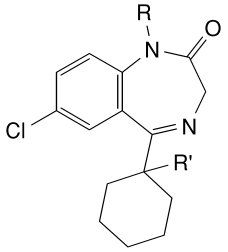
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.230 g in 50.0 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

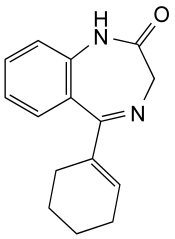
1 ml of *0.1 M perchloric acid* is equivalent to 28.88 mg of $C_{16}H_{17}ClN_2O$.



STORAGE

Protected from light.

IMPURITIES



A. 7-chloro-5-(3-oxocyclohex-1-enyl)-1-methyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one,

B. R = R′ = H: 7-chloro-5-cyclohexyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one,

corrected 6.0

TETRYZOLINE HYDROCHLORIDE

Tetryzolini hydrochloridum

$C_{13}H_{17}ClN_2$ M_r 236.7
[522-48-5]

DEFINITION

2-[(1*RS*)-1,2,3,4-Tetrahydronaphthalen-1-yl]-4,5-dihydro-1*H*-imidazole hydrochloride.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, in anhydrous ethanol and in ethanol (96 per cent), practically insoluble in acetone.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *tetryzoline hydrochloride CRS*.

B. Dissolve 50 mg in 10 ml of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 1.0 g in *water R* and dilute to 10 ml with the same solvent.

Related substances. Gas chromatography (*2.2.28*).

Test solution. Dissolve 1.0 g of the substance to be examined in a mixture of 25 volumes of *1 M sodium hydroxide* and 75 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of 25 volumes of *1 M sodium hydroxide* and 75 volumes of *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of 25 volumes of *1 M sodium hydroxide* and 75 volumes of *methanol R*.

Column:

– *material*: fused silica,

– *size*: *l* = 25 m, Ø = 0.32 mm,

– *stationary phase*: *poly(dimethyl)siloxane R* (1 µm).

Carrier gas: *helium for chromatography R*.

Split ratio: 1:40.

Flow rate: 2.5 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 8	160
	8 - 11	160 → 220
	11 - 15	220
Injection port		220
Detector		220

Detection: flame ionisation.

Injection: 1 µl.

Relative retention with reference to tetryzoline (retention time = about 12 min): impurity A = about 0.5.

System suitability: reference solution:

– *signal-to-noise ratio*: minimum 50 for the principal peak.

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent),

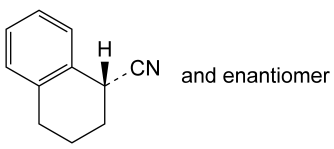
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent),

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent),

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.



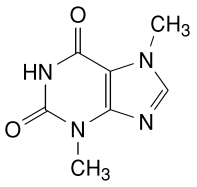
ASSAY

Dissolve 0.200 g in 100 ml of a mixture of 3 volumes of *anhydrous acetic acid R* and 7 volumes of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 23.67 mg of $C_{13}H_{17}ClN_2$.

IMPURITIES

Specified impurities: A.



and enantiomer

A. (1*RS*)-1,2,3,4-tetrahydronaphthalene-1-carbonitrile (α-cyanotetraline).

corrected 6.0

THEOBROMINE

Theobrominum

$C_7H_8N_4O_2$ M_r 180.2
[83-67-0]

DEFINITION

Theobromine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 3,7-dimethyl-3,7-dihydro-1*H*-purine-2,6-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, very slightly soluble in water and in ethanol, slightly soluble in ammonia. It dissolves in dilute solutions of alkali hydroxides and in mineral acids.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *theobromine CRS*.

B. Dissolve about 20 mg in 2 ml of *dilute ammonia R1*, warming slightly, and cool. Add 2 ml of *silver nitrate solution R2*. The solution remains clear. Boil the solution for a few minutes. A white, crystalline precipitate is formed.

C. It gives the reaction of xanthines (*2.3.1*).

TESTS

Acidity. To 0.4 g add 20 ml of boiling *water R* and boil for 1 min. Allow to cool and filter. Add 0.05 ml of *bromothymol blue solution R1*. The solution is yellow or yellowish-green. Not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution. To 0.2 g of the finely powdered substance to be examined add 10 ml of a mixture of 4 volumes of *methanol R* and 6 volumes of *chloroform R*. Heat under a reflux condenser on a water-bath for 15 min, shaking occasionally. Cool and filter.

Reference solution. Dissolve 5 mg of *theobromine CRS* in a mixture of 4 volumes of *methanol R* and 6 volumes of *chloroform R* and dilute to 50 ml with the same mixture of solvents.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 30 volumes of *acetone R*, 30 volumes of *chloroform R* and 40 volumes of *butanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with

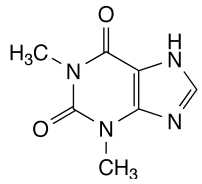
the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.150 g in 125 ml of boiling *water R*, cool to 50 °C to 60 °C and add 25 ml of *0.1 M silver nitrate*. Using 1 ml of *phenolphthalein solution R* as indicator, titrate with *0.1 M sodium hydroxide* until a pink colour is obtained.

1 ml of *0.1 M sodium hydroxide* is equivalent to 18.02 mg of $C_7H_8N_4O_2$.

01/2008:0299
corrected 6.0

THEOPHYLLINE

Theophyllinum

$C_7H_8N_4O_2$ M_r 180.2
[58-55-9]

DEFINITION

1,3-Dimethyl-3,7-dihydro-1*H*-purine-2,6-dione.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: slightly soluble in water, sparingly soluble in ethanol. It dissolves in solutions of alkali hydroxides, in ammonia and in mineral acids.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D, E.

A. Melting point (*2.2.14*): 270 °C to 274 °C, determined after drying at 100-105 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *Ph. Eur. reference spectrum of theophylline*.

C. Heat 10 mg with 1.0 ml of a 360 g/l solution of *potassium hydroxide R* in a water-bath at 90 °C for 3 min, then add 1.0 ml of *diazotised sulphanilic acid solution R*. A red colour slowly develops. Carry out a blank test.

D. It complies with the test for loss on drying (see Tests).

E. It gives the reaction of xanthines (*2.3.1*).

TESTS

Solution S. Dissolve 0.5 g with heating in *carbon dioxide-free water R*, cool and dilute to 75 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity. To 50 ml of solution S add 0.1 ml of *methyl red solution R*. The solution is red. Not more than 1.0 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to yellow.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 40.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *theobromine R* in the mobile phase, add 5 ml of the test solution and dilute to 100 ml with the mobile phase. Dilute 5 ml of this solution to 50 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (7 µm).

Mobile phase: mix 7 volumes of *acetonitrile for chromatography R* and 93 volumes of a 1.36 g/l solution of *sodium acetate R* containing 5.0 ml/l of *glacial acetic acid R*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 272 nm.

Injection: 20 µl.

Run time: 3.5 times the retention time of theophylline.

Relative retention with reference to theophylline (retention time = about 6 min): impurity C = about 0.3; impurity B = about 0.4; impurity D = about 0.5; impurity A = about 2.5.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to theobromine and theophylline.

Limits:

– *impurities A, B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

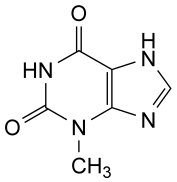
1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

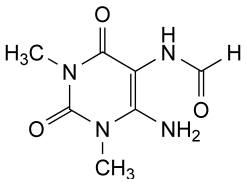
ASSAY

Dissolve 0.150 g in 100 ml of *water R*, add 20 ml of *0.1 M silver nitrate* and shake. Add 1 ml of *bromothymol blue solution R1*. Titrate with *0.1 M sodium hydroxide*.



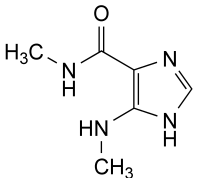
1 ml of *0.1 M sodium hydroxide* is equivalent to 18.02 mg of $C_7H_8N_4O_2$.

IMPURITIES

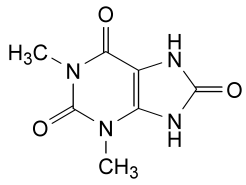


Specified impurities: A, B, C, D.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E, F.*



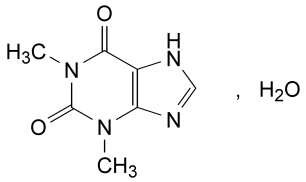
A. caffeine,



B. 3-methyl-3,7-dihydro-1*H*-purine-2,6-dione,

C. *N*-(6-amino-1,3-dimethyl-2,4-dioxo-1,2,3,4-tetrahydropyrimidin-5-yl)formamide,

D. *N*-methyl-5-(methylamino)-1*H*-imidazole-4-carboxamide,



E. 1,3-dimethyl-7,9-dihydro-1*H*-purine-2,6,8(3*H*)-trione,

F. etofylline.

THEOPHYLLINE MONOHYDRATE

Theophyllinum monohydricum

$C_7H_8N_4O_2,H_2O$ M_r 198.2
[5967-84-0]

DEFINITION

1,3-Dimethyl-3,7-dihydro-1*H*-purine-2,6-dione monohydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: slightly soluble in water, sparingly soluble in ethanol. It dissolves in solutions of alkali hydroxides, in ammonia and in mineral acids.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D, E.

A. Melting point (*2.2.14*): 270 °C to 274 °C, determined after drying at 100-105 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: dry the substance to be examined at 100-105 °C before use.

Comparison: *Ph. Eur. reference spectrum of theophylline.*

C. Heat 10 mg with 1.0 ml of a 360 g/l solution of *potassium hydroxide R* in a water-bath at 90 °C for 3 min, then add 1.0 ml of *diazotised sulphanilic acid solution R*. A red colour slowly develops. Carry out a blank test.

D. It complies with the test for water (see Tests).

E. It gives the reaction of xanthines (*2.3.1*).

TESTS

Solution S. Dissolve 0.5 g with heating in *carbon dioxide-free water R*, cool and dilute to 75 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity. To 50 ml of solution S add 0.1 ml of *methyl red solution R*. The solution is red. Not more than 1.0 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to yellow.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 40.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *theobromine R* in the mobile phase, add 5 ml of the test solution and dilute to 100 ml with the mobile phase. Dilute 5 ml of this solution to 50 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (7 µm).

Mobile phase: mix 7 volumes of *acetonitrile for chromatography R* and 93 volumes of a 1.36 g/l solution of *sodium acetate R* containing 5.0 ml/l of *glacial acetic acid R*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 272 nm.

Injection: 20 µl.

Run time: 3.5 times the retention time of theophylline.

Relative retention with reference to theophylline (retention time = about 6 min): impurity C = about 0.3; impurity B = about 0.4; impurity D = about 0.5; impurity A = about 2.5.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to theobromine and theophylline.

Limits:

– *impurities A, B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

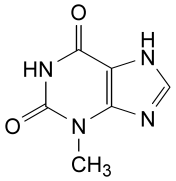
1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): 8.0 per cent to 9.5 per cent, determined on 0.20 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

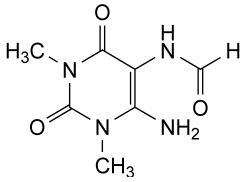
ASSAY

Dissolve 0.160 g in 100 ml of *water R*, add 20 ml of *0.1 M silver nitrate* and shake. Add 1 ml of *bromothymol blue solution R1*. Titrate with *0.1 M sodium hydroxide*.



1 ml of *0.1 M sodium hydroxide* is equivalent to 18.02 mg of $C_7H_8N_4O_2$.

IMPURITIES



Specified impurities: A, B, C, D.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. THEOPHYLLINE-ETHYLENEDIAMINE

Theophyllinum et ethylenediaminum

$C_{16}H_{24}N_{10}O_4$ M_r 420.4

[317-34-0]

DEFINITION

Theophylline-ethylenediamine contains not less than 84.0 per cent and not more than the equivalent of 87.4 per cent of theophylline ($C_7H_8N_4O_2$; M_r 180.2) and not less than 13.5 per cent and not more than the equivalent of 15.0 per cent of ethylenediamine ($C_2H_8N_2$; M_r 60.1), both calculated with reference to the anhydrous substance.

CHARACTERS

A white or slightly yellowish powder, sometimes granular, freely soluble in water (the solution becomes cloudy through absorption of carbon dioxide), practically insoluble in ethanol.

IDENTIFICATION

First identification: B, C, E.

Second identification: A, C, D, E, F.

Dissolve 1.0 g in 10 ml of *water R* and add 2 ml of *dilute hydrochloric acid R* dropwise with shaking. Filter. Use the precipitate for identification tests A, B, D and F and the filtrate for identification test C.

A. The precipitate, washed with *water R* and dried at 100 °C to 105 °C, melts (*2.2.14*) at 270 °C to 274 °C.

B. Examine the precipitate, washed with *water R* and dried at 100 °C to 105 °C, by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *theophylline CRS*.

C. To the filtrate add 0.2 ml of *benzoyl chloride R*, make alkaline with *dilute sodium hydroxide solution R* and shake vigorously. Filter the precipitate, wash with 10 ml of *water R*, dissolve in 5 ml of hot *alcohol R* and add 5 ml of *water R*. A precipitate is formed, which when washed and dried at 100 °C to 105 °C, melts (*2.2.14*) at 248 °C to 252 °C.

D. Heat about 10 mg of the precipitate with 1.0 ml of a 360 g/l solution of *potassium hydroxide R* in a water-bath at 90 °C for 3 min, then add 1.0 ml of *diazotised sulphanilic acid solution R*. A red colour slowly develops. Carry out a blank test.

E. It complies with the test for water (see Tests).

F. The precipitate gives the reaction of xanthines (*2.3.1*).

TESTS

Appearance of solution. Dissolve 0.5 g with gentle warming in 10 ml of *carbon dioxide-free water R*. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution GY_6 (*2.2.2, Method II*).

Related substances. Examine by thin-layer chromatography (*2.2.27*), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 0.2 g of the substance to be examined in 2 ml of *water R* with heating and dilute to 10 ml with *methanol R*.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 30 volumes of *acetone R*, 30 volumes of *chloroform R* and 40 volumes of *butanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*). Not more than 1.5 per cent, determined on 2.00 g dissolved in 20 ml of *anhydrous pyridine R*, by the semi-micro determination of water.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Ethylenediamine. Dissolve 0.250 g in 30 ml of *water R*. Add 0.1 ml of *bromocresol green solution R*. Titrate with *0.1 M hydrochloric acid* until a green colour is obtained.

1 ml of *0.1 M hydrochloric acid* is equivalent to 3.005 mg of $C_2H_8N_2$.

Theophylline. Heat 0.200 g to constant mass in an oven at 135 °C. Dissolve the residue with heating in 100 ml of *water R*, allow to cool, add 20 ml of *0.1 M silver nitrate* and shake. Add 1 ml of *bromothymol blue solution R1*. Titrate with *0.1 M sodium hydroxide*.

1 ml of *0.1 M sodium hydroxide* is equivalent to 18.02 mg of $C_7H_8N_4O_2$.

STORAGE

Store in airtight container, protected from light.

01/2008:0301

THEOPHYLLINE-ETHYLENEDIAMINE HYDRATE

Theophyllinum et ethylenediaminum hydricum

DEFINITION

Theophylline-ethylenediamine hydrate contains not less than 84.0 per cent and not more than the equivalent of 87.4 per cent of theophylline ($C_7H_8N_4O_2$; M_r 180.2) and not less than 13.5 per cent and not more than the equivalent of 15.0 per cent of ethylenediamine ($C_2H_8N_2$; M_r 60.1), both calculated with reference to the anhydrous substance.

CHARACTERS

A white or slightly yellowish powder, sometimes granular, freely soluble in water (the solution becomes cloudy through absorption of carbon dioxide), practically insoluble in ethanol.

IDENTIFICATION

First identification: B, C, E.

Second identification: A, C, D, E, F.

Dissolve 1.0 g in 10 ml of *water R* and add 2 ml of *dilute hydrochloric acid R* dropwise with shaking. Filter. Use the precipitate for identification tests A, B, D and F and the filtrate for identification test C.

A. The precipitate, washed with *water R* and dried at 100 °C to 105 °C, melts (*2.2.14*) at 270 °C to 274 °C.

B. Examine the precipitate, washed with *water R* and dried at 100 °C to 105 °C, by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *theophylline CRS*.

C. To the filtrate add 0.2 ml of *benzoyl chloride R*, make alkaline with *dilute sodium hydroxide solution R* and shake vigorously. Filter the precipitate, wash with 10 ml of *water R*, dissolve in 5 ml of hot *alcohol R* and add 5 ml of *water R*. A precipitate is formed, which when washed and dried at 100 °C to 105 °C, melts (*2.2.14*) at 248 °C to 252 °C.

D. Heat about 10 mg of the precipitate with 1.0 ml of a 360 g/l solution of *potassium hydroxide R* in a water-bath at 90 °C for 3 min, then add 1.0 ml of *diazotised sulphanilic acid solution R*. A red colour slowly develops. Carry out a blank test.

E. It contains 3.0 per cent to 8.0 per cent of water (see Tests).

F. The precipitate gives the reaction of xanthines (*2.3.1*).

TESTS

Appearance of solution. Dissolve 0.5 g with gentle warming in 10 ml of *carbon dioxide-free water R*. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution GY_6 (*2.2.2, Method II*).

Related substances. Examine by thin-layer chromatography (*2.2.27*), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 0.2 g of the substance to be examined in 2 ml of *water R* with heating and dilute to 10 ml with *methanol R*.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 30 volumes of *acetone R*, 30 volumes of *chloroform R* and 40 volumes of *butanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): 3.0 per cent to 8.0 per cent, determined on 0.50 g dissolved in 20 ml of *pyridine R*, by the semi-micro determination of water.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

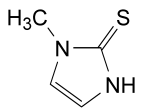
ASSAY

Ethylenediamine. Dissolve 0.250 g in 30 ml of *water R*. Add 0.1 ml of *bromocresol green solution R*. Titrate with *0.1 M hydrochloric acid* until a green colour is obtained.

1 ml of *0.1 M hydrochloric acid* is equivalent to 3.005 mg of $C_2H_8N_2$.

Theophylline. Heat 0.200 g to constant mass in an oven at 135 °C. Dissolve the residue with heating in 100 ml of *water R*, allow to cool, add 20 ml of *0.1 M silver nitrate* and shake. Add 1 ml of *bromothymol blue solution R1*. Titrate with *0.1 M sodium hydroxide*.

1 ml of *0.1 M sodium hydroxide* is equivalent to 18.02 mg of $C_7H_8N_4O_2$.



STORAGE

Store in a well-filled airtight container, protected from light.

THIAMAZOLE

Thiamazolum

$C_4H_6N_2S$ M_r 114.2
[60-56-0]

DEFINITION

1-Methyl-1,3-dihydro-2*H*-imidazole-2-thione.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or pale brown, crystalline powder.

Solubility: freely soluble in water, freely soluble in methylene chloride, freely soluble or soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. Melting point (*2.2.14*): 143 °C to 146 °C.

B. Dissolve 25 mg in 10 ml of a 0.28 per cent *V/V* solution of *sulphuric acid R* and dilute to 50.0 ml with the same solution. Dilute 1.0 ml of this solution to 100.0 ml with a 0.28 per cent *V/V* solution of *sulphuric acid R*. Examined between 200 nm and 300 nm (*2.2.25*), the solution shows 2 absorption maxima, at 211 nm and 251 nm. The ratio of the absorbance measured at the absorption maximum at 251 nm to that measured at the absorption maximum at 211 nm is 2.5 to 2.7.

C. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *thiamazole CRS*.

D. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 5.0 mg of the substance to be examined in *methanol R* and dilute to 5.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *thiamazole CRS* in *methanol R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dissolve 5.0 mg of *2-methylimidazole R* in *methanol R* and dilute to 5.0 ml with the same solvent. Dilute 1.0 ml of this solution to 2.0 ml with the test solution.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *concentrated ammonia R1, 2-propanol R, toluene R* (1:24:75 *V/V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– expose the plate to iodine vapour for 30 min; the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dissolve 2.0 g in *water R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution B_6 (*2.2.2, Method II*).

Related substances. Gas chromatography (*2.2.28*).

Test solution. Dissolve 0.100 g of the substance to be examined in *chloroform R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *chloroform R*. Dilute 1.0 ml of this solution to 10.0 ml with *chloroform R*.

Reference solution (b). Dissolve 5.0 mg of *thiamazole impurity A CRS*, 5.0 mg of *1-methylimidazole R1* and 5.0 mg of *thiamazole impurity C CRS* in *chloroform R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of this solution to 10.0 ml with *chloroform R*.

Column:

- *material*: fused silica,
- *size*: *l* = 30.0 m, Ø = 0.25 mm,
- *stationary phase*: *poly(dimethyl)(diphenyl)siloxane R* with special deactivation for basic compounds (film thickness 0.5 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.5 ml/min.

Split ratio: 3:20.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	100
	2 - 7	100 → 250
	7 - 22	250
Injection port		150
Detector		250

Detection: flame ionisation.

Injection: 1 µl.

Relative retention with reference to thiamazole (retention time = about 6.5 min): impurity A = about 0.3; impurity B = about 0.4; impurity C = about 0.7.

System suitability: reference solution (b):

- *resolution*: minimum 1.5 between the peaks due to impurity A and impurity B.

Limits:

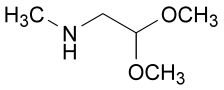
- *impurities A, B, C*: for each impurity, not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

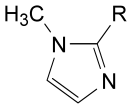
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.



ASSAY

Dissolve 0.250 g in 75 ml of *water R*. Add 15.0 ml of *0.1 M sodium hydroxide*, mix and add with stirring, about 30 ml of *0.1 M silver nitrate*. Continue the titration with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

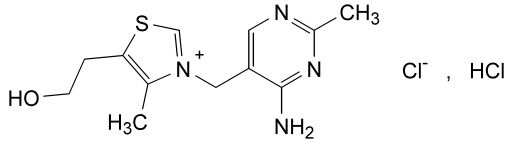


1 ml of *0.1 M sodium hydroxide* is equivalent to 11.42 mg of $C_4H_6N_2S$.

IMPURITIES

Specified impurities: A, B, C.

A. 2,2-dimethoxy-*N*-methylethanamine,



B. R = H: 1-methyl-1*H*-imidazole,

C. R = SCH_3: 1-methyl-2-(methylsulphanyl)-1*H*-imidazole.

01/2008:0303

THIAMINE HYDROCHLORIDE

Thiamini hydrochloridum

$C_{12}H_{18}Cl_2N_4OS$ M_r 337.3
[67-03-8]

DEFINITION

3-[(4-Amino-2-methylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazolium chloride hydrochloride.

Content: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: freely soluble in water, soluble in glycerol, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *thiamine hydrochloride CRS*.

B. Dissolve about 20 mg in 10 ml of *water R*, add 1 ml of *dilute acetic acid R* and 1.6 ml of *1 M sodium hydroxide*, heat on a water-bath for 30 min and allow to cool. Add 5 ml of *dilute sodium hydroxide solution R*, 10 ml of *potassium ferricyanide solution R* and 10 ml of *butanol R* and shake vigorously for 2 min. The upper alcoholic layer shows an intense light-blue fluorescence, especially in ultraviolet light at 365 nm. Repeat the test using 0.9 ml of *1 M sodium hydroxide* and 0.2 g of *sodium sulphite R* instead of 1.6 ml of *1 M sodium hydroxide*. Practically no fluorescence is seen.

C. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 2.5 g in *distilled water R* and dilute to 25 ml with the same solvent.

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 or GY_7 (*2.2.2, Method II*).

Dilute 2.5 ml of solution S to 5 ml with *water R*.

pH (*2.2.3*): 2.7 to 3.3.

Dilute 2.5 ml of solution S to 10 ml with *water R*.

Related substances. Liquid chromatography (*2.2.29*).

Solution A. Add 5 volumes of *glacial acetic acid R* to 95 volumes of *water R* and mix.

Test solution. Dissolve 0.35 g of the substance to be examined in 15.0 ml of solution A and dilute to 100.0 ml with *water R*.

Reference solution (a). Dissolve 5 mg of the substance to be examined and 5 mg of *thiamine impurity E CRS* in 4 ml of solution A and dilute to 25.0 ml with *water R*. Dilute 5.0 ml of the solution to 25.0 ml with *water R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with *water R*. Dilute 5.0 ml of this solution to 25.0 ml with *water R*.

Column:

- *size*: *l* = 0.25 m, Ø = 4.0 mm,
- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 350 m^2/g and a pore size of 10 nm,
- *temperature*: 45 °C.

Mobile phase:

- *mobile phase A*: 3.764 g/l solution of *sodium hexanesulphonate R* adjusted to pH 3.1 with *phosphoric acid R*,
- *mobile phase B*: *methanol R2*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 25	90 → 70	10 → 30
25 - 33	70 → 50	30 → 50
33 - 40	50	50
40 - 45	50 → 90	50 → 10

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 248 nm.

Injection: 25 µl.

Relative retention with reference to thiamine (retention time = about 30 min): impurity A = about 0.3; impurity B = about 0.9; impurity C = about 1.2.

System suitability: reference solution (a):

- *resolution*: minimum 1.6 between the peaks due to impurity E and to thiamine.

Limits:

- *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent),
- *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *disregard limit*: 0.125 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphates (*2.4.13*): maximum 300 ppm.

5 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates.

Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

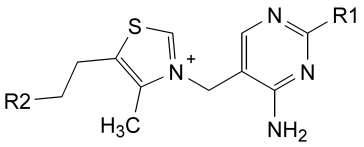
Water (*2.5.12*): maximum 5.0 per cent, determined on 0.40 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.110 g in 5 ml of *anhydrous formic acid R* and add 50 ml of *acetic anhydride R*. Titrate immediately with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*) and carrying out the titration within 2 min. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 16.86 mg of $C_{12}H_{18}Cl_2N_4OS$.



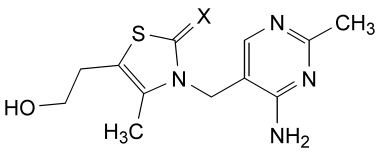
STORAGE

In a non-metallic container, protected from light.

IMPURITIES

Specified impurities: A, B, C.

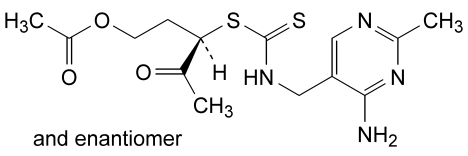
Other detectable impurities: D, E, F, G, H.



A. R1 = CH_3, R2 = O-SO_3^-: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-4-methyl-5-[2-(sulphonatooxy)ethyl]thiazolium (thiamine sulphate ester),

B. R1 = H, R2 = OH: 3-[(4-aminopyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazolium (desmethylthiamine),

C. R1 = CH_3, R2 = Cl: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-5-(2-chloroethyl)-4-methylthiazolium (chlorothiamine),

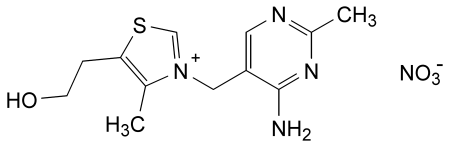


F. R1 = C_2H_5, R2 = OH: 3-[(4-amino-2-ethylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazolium (ethylthiamine),

G. R1 = CH_3, R2 = O-CO-CH_3: 5-[2-(acetyloxy)ethyl]-3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-4-methylthiazolium (acetylthiamine),

D. X = O: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazol-2(3*H*)-one (oxothiamine),

E. X = S: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazol-2(3*H*)-thione (thioxothiamine),



H. (3*RS*)-3-[[[(4-amino-2-methylpyrimidin-5-yl)methyl]thiocarbamoyl]sulphanyl]-4-oxopentyl acetate (ketodithiocarbamate).

corrected 6.0

THIAMINE NITRATE

Thiamini nitras

$C_{12}H_{17}N_5O_4S$ M_r 327.4
[532-43-4]

DEFINITION

3-[(4-Amino-2-methylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazolium nitrate.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or small, colourless crystals.

Solubility: sparingly soluble in water, freely soluble in boiling water, slightly soluble in alcohol and in methanol.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *Ph. Eur. reference spectrum of thiamine nitrate.*

B. Dissolve about 20 mg in 10 ml of *water R*, add 1 ml of *dilute acetic acid R* and 1.6 ml of *1 M sodium hydroxide*, heat on a water-bath for 30 min and allow to cool. Add 5 ml of *dilute sodium hydroxide solution R*, 10 ml of *potassium ferricyanide solution R* and 10 ml of *butanol R* and shake vigorously for 2 min. The upper alcoholic layer shows an intense light-blue fluorescence, especially in ultraviolet light at 365 nm. Repeat the test using 0.9 ml of *1 M sodium hydroxide* and 0.2 g of *sodium sulphite R* instead of 1.6 ml of *1 M sodium hydroxide*. Practically no fluorescence is produced.

C. About 5 mg gives the reaction of nitrates (*2.3.1*).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

pH (*2.2.3*): 6.8 to 7.6 for solution S.

Related substances. Liquid chromatography (*2.2.29*).

Solution A. Add 5 volumes of *glacial acetic acid R* to 95 volumes of *water R* and mix.

Test solution. Dissolve 0.35 g of the substance to be examined in 15.0 ml of solution A and dilute to 100.0 ml with *water R*.

Reference solution (a). Dissolve 5 mg of the substance to be examined and 5 mg of *thiamine impurity E CRS* in 4 ml of solution A and dilute to 25.0 ml with *water R*. Dilute 5.0 ml of the solution to 25.0 ml with *water R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *water R*.

Column:
- *size*: *l* = 0.25 m, Ø = 4.0 mm,
- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (4 µm) with a specific surface area of 350 m^2/g and a pore size of 10 nm,
- *temperature*: 45 °C.

Mobile phase:
- *mobile phase A*: 3.764 g/l solution of *sodium hexanesulphonate R* adjusted to pH 3.1 with *phosphoric acid R*,
- *mobile phase B*: *methanol R2*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 25	90 → 70	10 → 30
25 - 33	70 → 50	30 → 50
33 - 40	50	50
40 - 45	50 → 90	50 → 10

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 248 nm.

Injection: 25 µl.

Relative retention with reference to thiamine (retention time = about 30 min): impurity A = about 0.3; impurity B = about 0.9; impurity C = about 1.2.

System suitability: reference solution (a):
- *resolution*: minimum 1.6 between the peaks due to impurity E and to thiamine.

Limits:
- *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent),
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

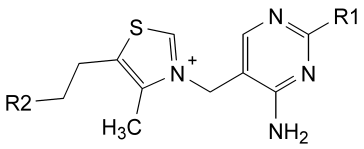
Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.140 g in 5 ml of *anhydrous formic acid R* and add 50 ml of *acetic anhydride R*. Titrate immediately with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*) and carrying out the titration within 2 min. Carry out a blank titration.

1.0 ml of *0.1 M perchloric acid* is equivalent to 16.37 mg of $C_{12}H_{17}N_5O_4S$.



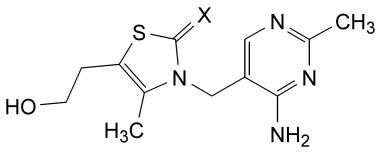
STORAGE

In a non-metallic container, protected from light.

IMPURITIES

Specified impurities: A, B, C.

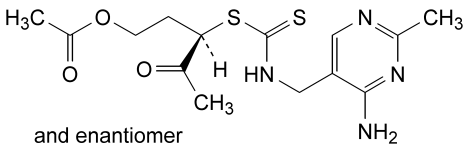
Other detectable impurities: D, E, F, G, H.



A. R1 = CH_3, R2 = O-SO_3^-: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-4-methyl-5-[2-(sulphonatooxy)ethyl]thiazolium (thiamine sulphate ester),

B. R1 = H, R2 = OH: 3-[(4-aminopyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazolium (desmethylthiamine),

C. R1 = CH_3, R2 = Cl: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-5-(2-chloroethyl)-4-methylthiazolium (chlorothiamine),

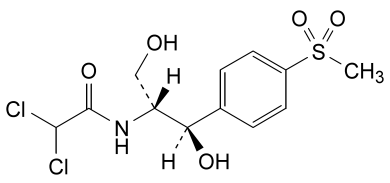


F. R1 = C_2H_5, R2 = OH: 3-[(4-amino-2-ethylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazolium (ethylthiamine),

G. R1 = CH_3, R2 = O-CO-CH_3: 5-[2-(acetyloxy)ethyl]-3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-4-methylthiazolium (acetylthiamine),

D. X = O: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazol-2(3*H*)-one (oxothiamine),

E. X = S: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazol-2(3*H*)-thione (thioxothiamine),



H. (3*RS*)-3-[[[(4-amino-2-methylpyrimidin-5-yl)methyl]thiocarbamoyl]sulphanyl]-4-oxopentyl acetate (ketodithiocarbamate).

01/2008:0109
corrected 6.0

THIAMPHENICOL

Thiamphenicolum

$C_{12}H_{15}Cl_2NO_5S$ M_r 356.2
[15318-45-3]

DEFINITION

2,2-Dichloro-*N*-[(1*R*,2*R*)-2-hydroxy-1-(hydroxymethyl)-2-[4-(methylsulphonyl)phenyl]ethyl]acetamide.

Content: 98.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: fine, white or yellowish-white, crystalline powder or crystals.

Solubility: slightly soluble in water, very soluble in dimethylacetamide, freely soluble in acetonitrile and in dimethylformamide, soluble in methanol, sparingly soluble in acetone and in anhydrous ethanol, slightly soluble in ethyl acetate.

A solution in anhydrous ethanol is dextrorotatory and a solution in dimethylformamide is laevorotatory.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: dry the substance to be examined and the reference substance at 100-105 °C for 2 h; examine as discs of *potassium bromide R*.

Comparison: *thiamphenicol CRS*.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.1 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.1 g of *thiamphenicol CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *silica gel* GF_{254} *R* as the coating substance.

Mobile phase: *methanol R, ethyl acetate R* (3:97 *V/V*).

Application: 5 µl.

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the spot in the chromatogram obtained with the reference solution.

C. To 50 mg in a porcelain crucible add 0.5 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Acidity or alkalinity. Shake 0.1 g with 20 ml of *carbon dioxide-free water R* and add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.1 ml of *0.02 M hydrochloric acid* or *0.02 M sodium hydroxide* is required to change the colour of the indicator.

Specific optical rotation (*2.2.7*): – 21 to – 24 (dried substance).

Dissolve 1.25 g in *dimethylformamide R* and dilute to 25.0 ml with the same solvent.

Melting point (*2.2.14*): 163 °C to 167 °C.

Absorbance (*2.2.25*).

Test solution (a). Dissolve 20 mg in *water R*, heating to about 40 °C, and dilute to 100.0 ml with the same solvent.

Test solution (b). Dilute 2.5 ml of test solution (a) to 50.0 ml with *water R*.

Spectral range: 240-300 nm for test solution (a); 200-240 nm for test solution (b).

Absorption maxima: at 266 nm and 273 nm for test solution (a); at 224 nm for test solution (b).

Specific absorbances at the absorption maxima:

– at 266 nm: 25 to 28 for test solution (a),

– at 273 nm: 21.5 to 23.5 for test solution (a),

– at 224 nm: 370 to 400 for test solution (b).

Chlorides (*2.4.4*): maximum 200 ppm.

Shake 0.5 g with 30 ml of *water R* for 5 min and filter.

Heavy metals (*2.4.8*): maximum 10 ppm.

1.0 g complies with test C. Prepare the reference solution using 1 ml of *lead standard solution (10 ppm Pb) R*.

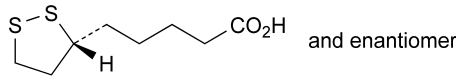
Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 2.0 g.

ASSAY

Dissolve 0.300 g in 30 ml of *ethanol (96 per cent) R*, add 20 ml of a 500 g/l solution of *potassium hydroxide R*, mix and heat under a reflux condenser for 4 h. Cool, add 100 ml of *water R*, neutralise with *dilute nitric acid R* and add 5 ml of the same acid in excess. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*), using a silver indicator electrode and a mercurous sulphate reference electrode or any other appropriate electrode. Carry out a blank test.

1 ml of *0.1 M silver nitrate* is equivalent to 17.81 mg of $C_{12}H_{15}Cl_2NO_5S$.



STORAGE

In an airtight container, protected from light.

01/2008:1648

THIOCTIC ACID

Acidum thiocticum

$C_8H_{14}O_2S_2$ M_r 206.3
[1077-28-7]

DEFINITION

5-[(3*RS*)-1,2-Dithiolan-3-yl]pentanoic acid.

Content: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: yellow, crystalline powder.

Solubility: very slightly soluble in water, very soluble in dimethylformamide, freely soluble in methanol.

mp: about 61 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *thioctic acid CRS*.

TESTS

Appearance of solution. The solution is clear (*2.2.1*).

Dissolve 0.50 g in a 20 g/l solution of *sodium hydroxide R* and dilute to 10 ml with the same solution.

Impurity B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.20 g of the substance to be examined in *dimethylformamide R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20 mg of *thioctic acid containing impurity B CRS* in *dimethylformamide R* and dilute to 1.0 ml with the same solvent (1.0 per cent impurity B solution).

Plate: *TLC silica gel plate R*.

Mobile phase: 25 per cent *V/V* solution of *ammonia R*, *water R*, *ethyl acetate R*, *propanol R* (5:10:40:40 *V/V/V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: at 50 °C for 20 min.

Detection: expose to iodine vapour for 30 min or until the spots appear.

System suitability: reference solution:

– the chromatogram shows 2 clearly separated principal spots due to impurity B (R_F = 0.0) and thioctic acid (R_F = about 0.3).

Limit:

– *impurity B*: any spot due to impurity B is not more intense than the corresponding spot in the chromatogram obtained with the reference solution (1.0 per cent).

Related substances. Liquid chromatography (*2.2.29*). *Protect the solutions from light.*

Solvent mixture: a mixture of equal volumes of *acetonitrile R1* and a 0.7 g/l solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.6 with *phosphoric acid R*.

Test solution. Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 5 mg of *thioctic acid for system suitability CRS* (containing impurity A) in the solvent mixture and dilute to 5 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Reference solution (c). Dissolve 50.0 mg of *thioctic acid CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Blank solution. Solvent mixture.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 35 °C.

Mobile phase: mix 8 volumes of *acetonitrile R1*, 41 volumes of a 0.7 g/l solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *phosphoric acid R*, and 51 volumes of *methanol R*.

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 20 µl.

Run time: 2.5 times the retention time of thioctic acid.

Relative retention with reference to thioctic acid (retention time = about 6 min): impurity A = about 2.2.

System suitability:

– *resolution*: minimum 6.0 between the peaks due to thioctic acid and impurity A in the chromatogram obtained with reference solution (a);

– *symmetry factor*: maximum 2.0 for the peak due to thioctic acid in the chromatogram obtained with reference solution (c).

Limits:

– *correction factor*: for the calculation of content, multiply the peak area of impurity A by 0.6;

– *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

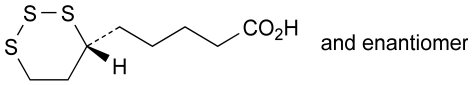
Loss on drying (*2.2.32*): maximum 0.2 per cent, determined on 1.000 g by drying *in vacuo* at 40 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

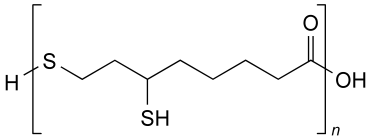
Injection: test solution and reference solution (c).



Calculate the percentage content of $C_8H_{14}O_2S_2$ from the peak areas and the declared content of *thioctic acid CRS*.

STORAGE

Protected from light.

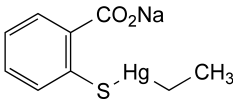


IMPURITIES

Specified impurities: A, B.

and enantiomer

A. 5-[(4*RS*)-1,2,3-trithian-4-yl]pentanoic acid,



B. α-hydro-ω-hydroxypoly[sulphanediyl(3-sulphanyl-8-oxooctane-1,8-diyl)] (mixture of thioctic acid polymers).

01/2008:1625

THIOMERSAL

Thiomersalum

$C_9H_9HgNaO_2S$ M_r 404.8

[54-64-8]

DEFINITION

Sodium ethyl[2-sulphanylbenzoato(2-)-*O*,*S*]mercurate(1-).

Content: 97.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, sparingly soluble or soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 103 °C to 115 °C.

Dissolve 0.5 g in *water R* and dilute to 10 ml with the same solvent. Add 2 ml of *dilute hydrochloric acid R*. A white precipitate is formed. Wash the precipitate with *water R* and dry over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *thiomersal CRS*.

C. Treat 50 mg by the oxygen-flask method (*2.5.10*). Use a mixture of 1 ml of *strong hydrogen peroxide solution R* and 50 ml of *water R* to absorb the combustion products. To the solution add 5 ml of *dilute nitric acid R*. 0.1 ml of this solution gives reaction (a) of mercury (*2.3.1*). To the remaining part of the solution add 10 ml of *dilute hydrochloric acid R* and filter. 5 ml of the filtrate, without further addition of acid, gives reaction (a) of sulphates (*2.3.1*).

D. Solution S (see Tests) gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution B_6 (*2.2.2, Method II*).

pH (*2.2.3*): 6.0 to 8.0.

Dilute 5 ml of solution S to 50 ml with *carbon dioxide-free water R*.

Inorganic mercury compounds: maximum 0.70 per cent.

Protect the solutions from light throughout the procedure.

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 25.0 ml with the same solvent.

Reference solution. Dissolve 95.0 mg of *mercuric chloride R* in *water R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 20.0 ml with *water R*.

Test, reference and blank preparations. Label five 10 ml volumetric flasks A, B, C, D and E. Place 5 ml of the test solution in flasks A, B, C and D. To each of the flasks C and D add 0.5 ml of the reference solution. Dilute the contents of flasks A and C to 10 ml with *water R* (blank preparations A and C). Dilute the contents of flasks B and D to 10 ml with a freshly prepared 332 g/l solution of *potassium iodide R* (test preparation B and reference preparation D). Place 5 ml of a 332 g/l solution of *potassium iodide R* in flask E. Dilute to 10 ml with *water R* (blank preparation E).

Measure the absorbance (*2.2.25*) of each solution (A_a, A_b, A_c, A_d and A_e) at 323 nm using *water R* as the compensation liquid. Calculate the content of inorganic mercury compounds, expressed as Hg from the expression:

$$\frac{(A_b - A_a - A_e) \times m_R \times 0.1847}{(A_d - A_c - A_b + A_a) \times m_T}$$

m_R = mass of mercuric chloride in the reference solution in milligrams,

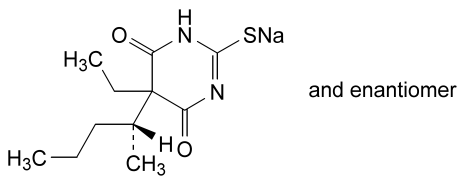
m_T = mass of the substance to be examined in milligrams.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in a desiccator over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa for 24 h.

ASSAY

Place 0.5 g in a 100 ml long-necked combustion flask, add 5 ml of *sulphuric acid R* and heat gently until charring occurs, continue to heat and add dropwise *strong hydrogen peroxide solution R* until the mixture is colourless. Dilute with *water R*, evaporate until slight fuming occurs, dilute to 10 ml with *water R*, cool down and titrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution R2* as indicator.

1 ml of *0.1 M ammonium thiocyanate* is equivalent to 20.24 mg of $C_9H_9HgNaO_2S$.



STORAGE

Protected from light.

01/2008:0212

THIOPENTAL SODIUM AND SODIUM CARBONATE

Thiopentalum natricum et natrii carbonas

DEFINITION

Thiopental sodium and sodium carbonate is a mixture of the sodium derivative of 5-ethyl-5-[(1*RS*)-1-methylbutyl]-2-thioxo-2,3-dihydropyrimidine-4,6(1*H*,5*H*)-dione ($C_{11}H_{17}N_2NaO_2S$; M_r 264.3) and anhydrous sodium carbonate, containing the equivalent of not less than 84.0 per cent and not more than 87.0 per cent of thiopental and not less than 10.2 per cent and not more than 11.2 per cent of Na, both calculated with reference to the dried substance.

CHARACTERS

A yellowish-white powder, hygroscopic, freely soluble in water, partly soluble in ethanol.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

A. Acidify 10 ml of solution S (see Tests) with *dilute hydrochloric acid R*. An effervescence is produced. Shake with 20 ml of *ether R*. Separate the ether layer, wash with 10 ml of *water R*, dry over *anhydrous sodium sulphate R* and filter. Evaporate the filtrate to dryness and dry the residue at 100 °C to 105 °C (test residue). Determine the melting point (*2.2.14*) of the test residue. Mix equal parts of the test residue and *thiopental CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 160 °C) is not greater than 2 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing the test residue (see identification test A) with the spectrum obtained with *thiopental CRS*.

C. Examine by thin-layer chromatography (*2.2.27*), using *silica gel GF_{254} R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in *water R* and dilute to 100 ml with the same solvent.

Reference solution. Dissolve 85 mg of *thiopental CRS* in 10 ml of *dilute sodium hydroxide solution R* and dilute to 100 ml with *water R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 18 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives the reaction of non-nitrogen substituted barbiturates (*2.3.1*).

E. It gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution GY_3 (*2.2.2, Method II*).

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel GF_{254} R* as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 100 ml with the same solvent. Disregard any slight residue.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *water R*.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent). Disregard any spot at the starting-point.

Chlorides (*2.4.4*). To 5 ml of solution S add 35 ml of *water R* and 10 ml of *dilute nitric acid R*. Shake with three quantities, each of 25 ml, of *ether R* and discard the ether layers. Eliminate the ether from the aqueous layer by heating on a water-bath.15 ml of the aqueous layer complies with the limit test for chlorides (330 ppm).

Loss on drying (*2.2.32*). Not more than 2.5 per cent, determined on 0.50 g by drying in vacuo at 100 °C for 4 h.

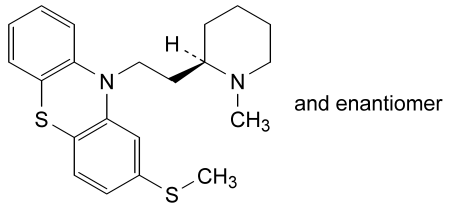
ASSAY

Sodium. Dissolve 0.400 g in 30 ml of *water R*. Add 0.1 ml of *methyl red solution R* and titrate with *0.1 M hydrochloric acid* until a red colour is obtained. Boil gently for 2 min. Cool and, if necessary, continue the titration with *0.1 M hydrochloric acid* until the red colour is again obtained.

1 ml of *0.1 M hydrochloric acid* is equivalent to 2.299 mg of Na.

Thiopental. Dissolve 0.150 g in 5 ml of *water R*. Add 2 ml of *dilute sulphuric acid R* and shake with four quantities, each of 10 ml, of *chloroform R*. Combine the chloroform layers, filter and evaporate the filtrate to dryness on a water-bath. Dissolve the residue in 30 ml of previously neutralised *dimethylformamide R* and add 0.1 ml of a 2 g/l solution of *thymol blue R* in *methanol R*. Titrate immediately with *0.1 M lithium methoxide* until a blue colour is obtained. Protect the solution from atmospheric carbon dioxide during the titration.

1 ml of *0.1 M lithium methoxide* is equivalent to 24.23 mg of $C_{11}H_{18}N_2O_2S$.



STORAGE

Store in an airtight container, protected from light.

THIORIDAZINE

Thioridazinum

$C_{21}H_{26}N_2S_2$ M_r 370.6
[50-52-2]

DEFINITION

10-[2-[(2*RS*)-1-Methylpiperidin-2-yl]ethyl]-2-(methylsulphanyl)-10*H*-phenothiazine

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, very soluble in methylene chloride, freely soluble in methanol, soluble in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *thioridazine CRS*.

TESTS

Solution S. Dissolve 1.25 g in *methanol R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

Related substances. Liquid chromatography (*2.2.29*). *Carry out the test as quickly as possible and protected from light.*

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 100 ml with the same solvent.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 2.0 ml of this solution to 100.0 ml with *methanol R*.

Reference solution (b). Dissolve the contents of a vial of *thioridazine for system suitability CRS* (containing impurities A, B, C, D and E) in 1.0 ml of *methanol R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* resistant to bases up to pH 11.

Mobile phase:

– *mobile phase A*: *triethylamine R1, acetonitrile R, water R* (2:400:600 *V/V/V*);

– *mobile phase B*: *triethylamine R1, acetonitrile R* (2:1000 *V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	100	0
5 - 35	100 → 5	0 → 95
35 - 40	5	95
40 - 41	5 → 100	95 → 0
41	100	0

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 275 nm.

Injection: 25 µl.

Identification of impurities: use the chromatogram supplied with *thioridazine for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, B, C, D and E.

Relative retention with reference to thioridazine (retention time = about 30 min): impurity D = about 0.1; impurity A = about 0.3; impurity C = about 0.4; impurity B = about 0.5; impurity E = about 0.6.

System suitability: reference solution (b):

– *resolution*: minimum 3.5 between the peaks due to impurities C and B.

Limits:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 1.9; impurity B = 2.4; impurity C = 0.5; impurity D = 1.5;

– *impurities A, B, C, D, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

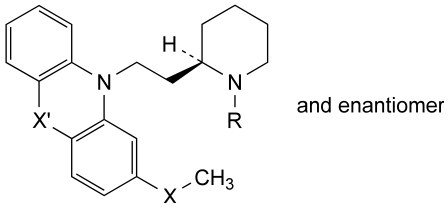
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g *in vacuo* at 50 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 60 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 37.06 mg of $C_{21}H_{26}N_2S_2$.



STORAGE

Protected from light.

IMPURITIES

Specified impurities: *A, B, C, D, E.*

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F.*

THIORIDAZINE HYDROCHLORIDE

Thioridazini hydrochloridum

and enantiomer , HCl

$C_{21}H_{27}ClN_2S_2$ M_r 407.0
[130-61-0]

DEFINITION

10-[2-[(2*RS*)-1-Methylpiperidin-2-yl]ethyl]-2-(methylsulphanyl)-10*H*-phenothiazine hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water and in methanol, soluble in ethanol 96 per cent.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *thioridazine hydrochloride CRS.*

B. 0.2 g gives reaction (b) of chlorides (*2.3.1*).

TESTS

Carry out all operations protected from light.

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

Dissolve 1.0 g in *methanol R* and dilute to 20 ml with the same solvent.

Optical rotation (*2.2.7*): – 0.10° to + 0.10°.

Dissolve 1.0 g in *methanol R* and dilute to 20.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*). *Carry out the test as quickly as possible and protected from light.*

Test solution. Dissolve 20.0 mg of the substance to be examined in *methanol R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 2.0 ml of this solution to 100.0 ml with *methanol R*.

Reference solution (b). Dissolve the content of a vial of *thioridazine for system suitability CRS* (containing impurities A, B, C, D and E) in 1.0 ml of *methanol R*.

corrected 6.0

THREONINE

Threoninum

$C_4H_9NO_3$ M_r 119.1
[72-19-5]

DEFINITION

Threonine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (2*S*,3*R*)-2-amino-3-hydroxybutanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, soluble in water, practically insoluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *threonine CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Mix 1 ml of a 2 g/l solution of the substance to be examined with 1 ml of a 20 g/l solution of *sodium periodate R*. Add 0.2 ml of *piperidine R* and 0.1 ml of a 25 g/l solution of *sodium nitroprusside R*. A blue colour develops that changes to yellow after a few minutes.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*). The pH of solution S is 5.0 to 6.5.

Specific optical rotation (*2.2.7*). Dissolve 1.50 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is – 27.6 to – 29.0, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *dilute hydrochloric acid R* and dilute to 10 ml with the same acid.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *threonine CRS* in a 1 per cent *V/V* solution of *hydrochloric acid R* and dilute to 50 ml with the same acid solution.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *threonine CRS* and 10 mg of *proline CRS* in a 1 per cent *V/V* solution of *hydrochloric acid R* and dilute to 25 ml with the same acid solution.

Apply to the plate 5 µl of each solution. Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Chlorides (*2.4.4*). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (*2.4.13*). Dissolve 0.5 g in *distilled water R* and dilute to 15 ml with the same solvent. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (*2.4.1*). 0.10 g complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.2 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (*2.4.9*). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (*2.4.8*). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 5 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 11.91 mg of $C_4H_9NO_3$.

STORAGE

Store protected from light.

01/2008:0865

THYME

Thymi herba

DEFINITION

Whole leaves and flowers separated from the previously dried stems of *Thymus vulgaris* L. or *Thymus zygis* L. or a mixture of both species.

Content:

– *essential oil*: minimum 12 ml/kg (anhydrous drug);
– *sum of the contents of thymol and carvacrol* (both $C_{10}H_{14}O$; M_r 150.2): minimum 40 per cent in the essential oil.

CHARACTERS

Strong aromatic odour reminiscent of thymol.

IDENTIFICATION

A. The leaf of *Thymus vulgaris* is usually 4 mm to 12 mm long and up to 3 mm wide, sessile or with a very short petiole. The lamina is tough, entire, lanceolate to ovate, covered on both surfaces by a grey or greenish-grey indumentum; the edges are markedly rolled up towards the abaxial surface. The midrib is depressed on the adaxial surface and is very prominent on the abaxial surface. The calyx is green, often with violet spots and is tubular; at the end are 2 lips of which the upper one is bent back and at the end has 3 lobes, the lower is longer and has 2 hairy teeth. After flowering, the calyx tube is closed by a crown of long, stiff hairs. The corolla, about twice as long as the calyx, is usually brownish in the dry state and is slightly bilabiate.

The leaf of *Thymus zygis* is usually 1.7 mm to 6.5 mm long and 0.4 mm to 1.2 mm wide; it is acicular to linear-lanceolate and the edges are markedly rolled towards the abaxial surface. Both surfaces of the lamina are green to greenish-grey and the midrib is sometimes violet; the edges, in particular at the base, have long, white hairs. The dried flowers are very similar to those of *Thymus vulgaris*.

B. Reduce to a powder (355) (*2.9.12*). The powder of both species is greyish-green or greenish-brown. Examine under a microscope using *chloral hydrate solution R*. The epidermises of the leaves have cells with anticlinal walls which are sinuous and beaded and the stomata are diacytic (*2.8.3*); numerous secretory trichomes made up of 12 secretory cells, the cuticle of which is generally raised by the secretion to form a globular to ovoid bladder-like covering; the glandular trichomes have a unicellular stalk and a globular to ovoid head; the covering trichomes of the adaxial surface are common

to both species; they have warty walls and are shaped as pointed teeth; the warty covering trichomes of the abaxial surface are of many types: unicellular, straight or slightly curved, and bicellular or tricellular, and often elbow-shaped (*Thymus vulgaris*); bicellular or tricellular, more or less straight (*Thymus zygis*). Fragments of calyx are covered by numerous, uniseriate trichomes with 5 or 6 cells and with a weakly striated cuticle. Fragments of the corolla have numerous uniseriate covering trichomes, often collapsed, and secretory trichomes generally with 12 cells. Pollen grains are relatively rare, spherical and smooth with 6 germinal slit-like pores, measuring about 35 µm in diameter. The powder of *Thymus zygis* also contains numerous thick bundles of fibres from the main veins and from fragments of stems.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 5 ml of *methylene chloride R* and shake for 3 min, filter through about 2 g of *anhydrous sodium sulphate R*.

Reference solution. Dissolve 5 mg of *thymol R* and 10 µl of *carvacrol R* in 10 ml of *methylene chloride R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *methylene chloride R*.

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
———	———
	A prominent quenching zone
Thymol: a quenching zone	A quenching zone (thymol)
———	———
	Quenching zones
Reference solution	**Test solution**

Detection B: spray with *anisaldehyde solution R* using 10 ml for a plate 200 mm square and heat at 100-105 °C for 10 min.

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the lower third of the chromatogram obtained with the test solution. The intensity of the zones due to thymol and carvacrol depends upon the species examined.

Top of the plate	
———	———
Thymol: a brownish-pink zone Carvacrol: a pale violet zone	A brownish-pink zone (thymol) A pale violet zone (carvacrol)
———	———
	A greyish-pink zone A violet zone (cineole and linalol) A greyish-brown zone (borneol) A violet-blue zone An intense violet zone
Reference solution	**Test solution**

D. Examine the chromatograms obtained in the assay for thymol and carvacrol.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Foreign matter (*2.8.2*): maximum 10 per cent of stems and maximum 2 per cent of other foreign matter. Stems must not be more than 1 mm in diameter and 15 mm in length. Leaves with long trichomes at their base and with weakly pubescent other parts (*Thymus serpyllum L.*) are absent.

Water (*2.2.13*): maximum 100 ml/kg, determined on 20.0 g of the powdered drug (355) (*2.9.12*).

Total ash (*2.4.16*): maximum 15.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 3.0 per cent.

ASSAY

Essential oil (*2.8.12*). Use 30.0 g of the drug, a 1000 ml round-bottomed flash and 400 ml of *water R* as the distillation liquid. Distil at a rate of 2-3 ml/min for 2 h without *xylene R* in the graduated tube.

Thymol and carvacrol. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Filter the essential oil obtained in the determination of essential oil over a small amount of *anhydrous sodium sulphate R* and dilute to 5.0 ml with *hexane R* by rinsing the apparatus and the anhydrous sodium sulphate.

Reference solution. Dissolve 0.20 g of *thymol R* and 50 mg of *carvacrol R* in *hexane R* and dilute to 5.0 ml with the same solvent.

Column:

– *material*: fused silica;
– *size*: *l* = 30-60 m, Ø = 0.25 mm;
– *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *nitrogen for chromatography R* or *helium for chromatography R*.

Flow rate: 1-2 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 45	40 → 220
Injection port		190
Detector		210

Detection: flame ionisation.

Injection: 0.2 µl.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

– *resolution*: minimum 1.5 between the peaks due to thymol and carvacrol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Monographs T-Z

Determine the percentage content of thymol and carvacrol. Disregard the peak due to hexane.

01/2008:1374

THYME OIL

Thymi aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the fresh flowering aerial parts of *Thymus vulgaris* L., *T. zygis* Loefl. ex L. or a mixture of both species.

CHARACTERS

Appearance: clear, yellow or very dark reddish-brown, mobile liquid with a characteristic, aromatic, spicy odour, reminiscent of thymol.

Solubility: miscible with ethanol and with light petroleum.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.2 g of the substance to be examined in *pentane R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.15 g of *thymol R*, 25 mg of *α-terpineol R*, 40 µl of *linalol R* and 10 µl of *carvacrol R* in *pentane R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R.*

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R* and heat the plate at 100-105 °C for 5-10 min while observing. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other bands may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A large violet zone (hydrocarbons) (at the solvent front)
Thymol: a brownish-pink zone	A brownish-pink zone (thymol)
Carvacrol: a pale violet zone	A pale violet zone (carvacrol)
Linalol: a violet zone	A violet zone (linalol)
α-Terpineol: a violet zone	A violet zone (α-terpineol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*): 0.915 to 0.935.

Refractive index (*2.2.6*): 1.490 to 1.505.

Chromatographic profile. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. The substance to be examined.

Reference solution. Dissolve 0.15 g of *β-myrcene R*, 0.1 g of *γ-terpinene R*, 0.1 g of *p-cymene R*, 0.1 g of *linalol R*, 0.2 g of *terpinen-4-ol R*, 0.2 g of *thymol R* and 50 mg of *carvacrol R* in 5 ml of *hexane R*.

Column:

- *material*: fused silica,
- *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm,
- *stationary phase*: *macrogol 20 000 R.*

Carrier gas: *helium for chromatography R.*

Split ratio: 1:100.

Temperature:

	Time (min)	**Temperature (°C)**
Column	0 - 15	60
	15 - 55	60→180
Injection port		200
Detector		220

Detection: flame ionisation.

Injection: 0.2 µl.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

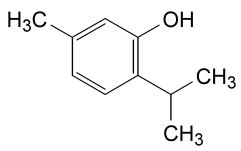
System suitability: reference solution:

- *resolution*: minimum 1.5 between the peaks due to thymol and carvacrol,
- *number of theoretical plates*: minimum 30 000, calculated for the peak due to *p*-cymene at 80 °C.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution. Disregard the peak due to hexane.

Determine the percentage content of these components. The limits are within the following ranges:

- *β-myrcene*: 1.0 per cent to 3.0 per cent,
- *γ-terpinene*: 5.0 per cent to 10.0 per cent,
- *p-cymene*: 15.0 per cent to 28.0 per cent,
- *linalol*: 4.0 per cent to 6.5 per cent,
- *terpinen-4-ol*: 0.2 per cent to 2.5 per cent,
- *thymol*: 36.0 per cent to 55.0 per cent,
- *carvacrol*: 1.0 per cent to 4.0 per cent.



STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

01/2008:0791

THYMOL

Thymolum

$C_{10}H_{14}O$ M_r 150.2
[89-83-8]

DEFINITION

5-Methyl-2-(methylethyl)phenol.

CHARACTERS

Appearance: colourless crystals.

Solubility: very slightly soluble in water, very soluble in ethanol (96 per cent), freely soluble in essential oils and in fatty oils, sparingly soluble in glycerol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 48 °C to 52 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *thymol CRS.*

C. Dissolve 0.2 g with heating in 2 ml of *dilute sodium hydroxide solution R* and add 0.2 ml of *chloroform R*. Heat on a water-bath. A violet colour develops.

D. Dissolve about 2 mg in 1 ml of *anhydrous acetic acid R*. Add 0.15 ml of *sulphuric acid R* and 0.05 ml of *nitric acid R*. A bluish-green colour develops.

TESTS

Appearance of solution. The solution is not more opalescent than reference suspension IV (*2.2.1*) and not more intensely coloured than reference solution R_6 (*2.2.2, Method II*).

Dissolve 1.0 g in 10 ml of *dilute sodium hydroxide solution R*.

Acidity. To 1.0 g in a 100 ml glass-stoppered conical flask add 20 ml of *water R*. Boil until dissolution is complete, cool and stopper the flask. Shake vigorously for 1 min. Add a few crystals of the substance to be examined to initiate crystallisation. Shake vigorously for 1 min and filter. To 5 ml of the filtrate add 0.05 ml of *methyl red solution R* and 0.05 ml of *0.01 M sodium hydroxide*. The solution is yellow.

Related substances. Gas chromatography (*2.2.28*).

Test solution. Dissolve 0.100 g of the substance to be examined in *ethanol (96 per cent) R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *ethanol (96 per cent) R*.

Reference solution (b). Dilute 1 ml of reference solution (a) to 10 ml with *ethanol (96 per cent) R*.

Reference solution (c). Dilute 5 ml of reference solution (b) to 10 ml with *ethanol (96 per cent) R*.

Column:

– *material*: glass or steel;
– *size*: *l* = 4 m, Ø = 2 mm;
– *stationary phase*: *diatomaceous earth for gas chromatography R*, impregnated with a mixture suitable for the separation of free fatty acids.

Carrier gas: *nitrogen for chromatography R.*

Flow rate: 30 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	80
	2 - 22	80 → 240
	22 - 37	240
Injection port		250
Detector		300

Detection: flame ionisation.

Injection: 1 µl.

System suitability: reference solution (b):

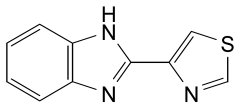
– *signal-to-noise ratio*: minimum 5 for the principal peak.

Limits:

– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Residue on evaporation: maximum 0.05 per cent.

Evaporate 2.00 g on a water-bath and heat in an oven at 100-105 °C for 1 h. The residue weighs not more than 1.0 mg.



STORAGE

Protected from light.

01/2008:0866

TIABENDAZOLE

Tiabendazolum

$C_{10}H_7N_3S$ M_r 201.2
[148-79-8]

DEFINITION

Tiabendazole contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 2-(thiazol-4-yl)-1*H*-benzimidazole, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, slightly soluble in alcohol and in methylene chloride. It dissolves in dilute mineral acids. It melts at about 300 °C.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Dissolve 25 mg in *0.1 M hydrochloric acid* and dilute to 100.0 ml with the same acid. Dilute 2.0 ml of the solution to 100.0 ml with *0.1 M hydrochloric acid*. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows two absorption maxima, at 243 nm and 302 nm. The ratio of the absorbance measured at the maximum at 302 nm to that measured at the maximum at 243 nm is 1.8 to 2.1.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *tiabendazole CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 5 mg in *0.1 M hydrochloric acid* and dilute to 5 ml with the same acid. Add 3 mg of *p-phenylenediamine dihydrochloride R* and shake until dissolved. Add 0.1 g of *zinc powder R*, mix, allow to stand for 2 min and add 5 ml of *ferric ammonium sulphate solution R2*. A bluish-violet colour develops.

TESTS

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* HF_{254} *R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 2 ml of test solution (a) to 20 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *tiabendazole CRS* in *methanol R* and dilute to 20 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 10 ml with *methanol R*.

Reference solution (c). Dilute 1 ml of test solution (b) to 25 ml with *methanol R*.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm using a mixture of 2.5 volumes of *water R*, 10 volumes of *acetone R*, 25 volumes of *glacial acetic acid R* and 62.5 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.4 per cent).

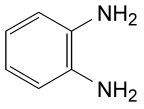
***o*-Phenylenediamine**. To 5.0 g in a flask fitted with a ground-glass stopper, add 25 ml of a mixture of 1 volume of *methanol R* and 2 volumes of *water R*. Shake for 3 min. Filter through a sintered-glass filter (16) (*2.1.2*) under reduced pressure. To 10 ml of the filtrate add 0.5 ml of *hydrochloric acid R* and 0.5 ml of *acetylacetone R* and shake until the solution is clear. The solution is not more intensely coloured than reference solution R_7 (*2.2.2, Method I*) (10 ppm).

Heavy metals (*2.4.8*). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*). Not more than 0.5 per cent, determined on 1.00 g by the semi-micro determination of water.

Sulphated ash (*2.4.14*). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY



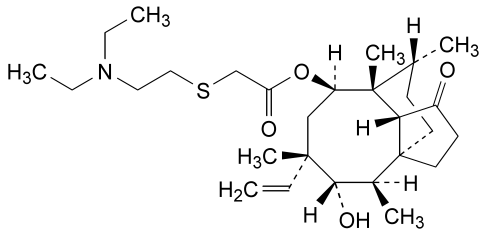
Dissolve 0.150 g in 30 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 20.12 mg of $C_{10}H_7N_3S$.

STORAGE

Store protected from light.

IMPURITIES



A. benzene-1,2-diamine.

corrected 6.0

TIAMULIN FOR VETERINARY USE

Tiamulinum ad usum veterinarium

$C_{28}H_{47}NO_4S$ M_r 493.8
[56142-71-3]

DEFINITION

(3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-Ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl [[2-(diethylamino)ethyl]sulphanyl]acetate.

Semi-synthetic product derived from a fermentation product.

Content: 96.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: sticky, translucent yellowish mass, slightly hygroscopic.

Solubility: practically insoluble in water, very soluble in methylene chloride, freely soluble in anhydrous ethanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of tiamulin*.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and its absorbance (*2.2.25*) at 420 nm is not greater than 0.050.

Dissolve 2.5 g in 50 ml of *methanol R*.

Related substances. Liquid chromatography (*2.2.29*).

Ammonium carbonate buffer solution pH 10.0. Dissolve 10.0 g of *ammonium carbonate R* in *water R*, add 22 ml of *perchloric acid solution R* and dilute to 1000.0 ml with *water R*. Adjust to pH 10.0 with *concentrated ammonia R1*.

Solvent mixture: ammonium carbonate buffer solution pH 10.0, *acetonitrile R1* (50:50 *V/V*).

Test solution. Dissolve 0.200 g of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 0.250 g of *tiamulin hydrogen fumarate CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (c). Dilute 0.1 ml of *toluene R* to 100 ml with *acetonitrile R*. Dilute 0.1 ml of this solution to 100.0 ml with the solvent mixture.

Column:

- *size*: *l* = 0.15 m, Ø = 4.6 mm,
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: 30 °C.

Mobile phase: *acetonitrile R1*, ammonium carbonate buffer solution pH 10.0, *methanol R1* (21:30:49 *V/V/V*).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 212 nm.

Injection: 20 µl.

Run time: 3 times the retention time of tiamulin.

Relative retention with reference to tiamulin (retention time = about 18 min): impurity A = about 0.22; impurity B = about 0.5; impurity C = about 0.66; impurity D = about 1.1; impurity F = about 1.6; impurity E = about 2.4.

System suitability: reference solution (a):

- baseline separation between the peaks due to tiamulin and impurity D.

Limits:

- *impurities A, B, C, D, E, F*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *any other impurity*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent); disregard any peak present in the chromatogram obtained with reference solution (c).

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 80 °C.

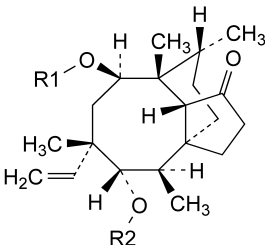
Bacterial endotoxins (*2.6.14, Method D*): less than 0.4 IU/mg, determined in a 1 mg/ml solution in *anhydrous ethanol R* (endotoxin free) diluted 1:40 with water for bacterial endotoxins test.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{28}H_{47}NO_4S$, from the declared content of *tiamulin hydrogen fumarate CRS*.



STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *G, H, I, J, K, L, M, N, O, P, Q, R.*

A. R1 = R2 = H: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5,8-dihydroxy-4,6,9,10-tetramethyloctahydro-3a,9-propano-3a*H*-cyclopentacycloocten-1(4*H*)-one (mutilin),

TIAMULIN HYDROGEN FUMARATE FOR VETERINARY USE

Tiamulini hydrogenofumaras ad usum veterinarium

$C_{32}H_{51}NO_8S$ M_r 610
[55297-96-6]

DEFINITION

(3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-Ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl [[2-(diethylamino)ethyl]sulphanyl]acetate hydrogen (*E*)-butenedioate.

Semi-synthetic product derived from a fermentation product.

Content: 96.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or light yellow, crystalline powder.

Solubility: soluble in water, freely soluble in anhydrous ethanol and soluble in methanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *tiamulin hydrogen fumarate CRS*.

TESTS

pH (*2.2.3*): 3.1 to 4.1.

Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Ammonium carbonate buffer solution pH 10.0. Dissolve 10.0 g of *ammonium carbonate R* in *water R*, add 22 ml of *perchloric acid solution R* and dilute to 1000.0 ml with *water R*. Adjust to pH 10.0 with *concentrated ammonia R1*.

Solvent mixture: ammonium carbonate buffer solution pH 10.0, *acetonitrile R1* (50:50 *V/V*).

Test solution. Dissolve 0.200 g of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 0.200 g of *tiamulin hydrogen fumarate CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 40.0 mg of *fumaric acid R* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (d). Dissolve 4 mg of *tiamulin for peak identification CRS* (tiamulin hydrogen fumarate containing impurities B, C, D, F, H and I) in the solvent mixture and dilute to 1 ml with the solvent mixture.

Column:
- *size*: *l* = 0.15 m, Ø = 4.6 mm,
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: 30 °C.

Mobile phase: *acetonitrile R1*, ammonium carbonate buffer solution pH 10.0, *methanol R1* (21:30:49 *V/V/V*).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 212 nm.

Injection: 20 µl.

Run time: 3 times the retention time of tiamulin.

Identification of impurities: use the chromatogram supplied with *tiamulin for peak identification CRS* and the chromatogram obtained with reference solution (d) to identify the peaks due to impurities B and H.

Relative retention with reference to tiamulin (retention time = about 18 min): impurity G = about 0.2; impurity A = about 0.22; impurity H = about 0.23; impurity I = about 0.3; impurity J = about 0.4; impurity K = about 0.45; impurity B = about 0.5; impurity L = about 0.65; impurity C = about 0.66; impurity F = about 0.8; impurity M = about 0.85; impurity D = about 1.1; impurity S = about 1.4; impurity T = about 1.6; impurity E = 2.4.

System suitability: reference solution (a):
- baseline separation between the peaks due to tiamulin and impurity D.

Limits:
- *impurities B, H*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent),
- *impurities A, C, D, E, F, G, I, J, K, L, M, S, T*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *any other impurity*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent); disregard any peak present in reference solution (c).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

ASSAY

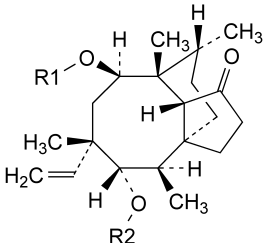
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{32}H_{51}NO_8S$ from the declared content of *tiamulin hydrogen fumarate CRS*.

STORAGE

Protected from light.



IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J, K, L, M, S, T.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified

Monographs T-Z

impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *N, O, P, Q, R*.

A. R1 = R2 = H: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5,8-dihydroxy-4,6,9,10-tetramethyloctahydro-3a,9-propano-3a*H*-cyclopentacycloocten-1(4*H*)-one (mutilin),

G. R1 = CO-CH_2OH, R2 = H: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl hydroxyacetate (pleuromutilin),

J. R1 = CO-CH_3, R2 = H: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl acetate (mutilin 14-acetate),

TIANEPTINE SODIUM

Tianeptinum natricum

$C_{21}H_{24}ClN_2NaO_4S$ M_r 458.9
[30123-17-2]

DEFINITION

Sodium 7-[[(11*RS*)-3-chloro-6-methyl-6,11-dihydrodibenzo[*c*,*f*][1,2]thiazepin-11-yl]amino]heptanoate *S*,*S*-dioxide.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or yellowish powder, very hygroscopic.

Solubility: freely soluble in water, in methanol and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of tianeptine sodium*.

B. It gives reaction (a) of sodium (*2.3.1*).

TESTS

Impurity A. Gas chromatography (*2.2.28*).

Internal standard solution. Dilute 1 ml of *ethyl 5-bromovalerate R* in *ethanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 250.0 ml with *ethanol R*.

Test solution. Dissolve 0.1000 g of the substance to be examined in the internal standard solution and dilute to 2.0 ml with the same solution.

Reference solution. Dissolve 10.0 mg of *tianeptine impurity A CRS* in the internal standard solution and dilute to 200.0 ml with the same solution.

Column:

– *material*: fused silica,
– *size*: *l* = 25 m, Ø = 0.25 mm,
– *stationary phase*: *poly(cyanopropyl)siloxane R* (film thickness 0.2 µm).

Carrier gas: *helium for chromatography R*.

Linear velocity: 26 cm/s.

Split ratio: 1:100.

Temperature:

– *column*: 150 °C,
– *injection port and detector*: 210 °C.

Detection: flame ionisation.

Injection: 1 µl.

Run time: twice the retention time of ethyl 5-bromovalerate.

System suitability: reference solution:

– *elution order*: ethanol, ethyl 5-bromovalerate, impurity A,
– *resolution*: minimum 10 between the peaks due to ethyl 5-bromovalerate and impurity A,
– *signal-to-noise ratio*: minimum 20 for the peak due to impurity A.

Limit:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Solvent mixture. Mix 50 volumes of *methanol R* and 50 volumes of *water for chromatography R*.

Test solution. Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 20.0 ml with the solvent mixture.

Reference solution (b). Dissolve 20.0 mg of *sodium tianeptine for system suitability CRS* in the solvent mixture and dilute to 200.0 ml with the solvent mixture.

Column:

- *size*: *l* = 0.15 m, Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm) with a pore size of 0.01 µm,
- *temperature*: 30 °C.

Mobile phase:

- *mobile phase A*: mix 21 volumes of *methanol R1*, 31.5 volumes of *acetonitrile R1* and 47.5 volumes of a 2 g/l solution of *sodium laurilsulfate R*, adjusted to pH 2.5 with *phosphoric acid R*,
- *mobile phase B*: mix 20 volumes of *methanol R1*, 20 volumes of a 2 g/l solution of *sodium laurilsulfate R*, adjusted to pH 2.5 with *phosphoric acid R* and 60 volumes of *acetonitrile R1*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 35	100	0
35 - 45	100 → 40	0 → 60
45 - 60	40	60
60 - 70	40 → 100	60 → 0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 10 µl.

Relative retention with reference to tianeptine (retention time = about 30 min): impurity C = about 0.4; impurity D1 = about 0.6; impurity D2 = about 0.8; impurity E = about 1.1; impurity B = about 1.7.

System suitability: reference solution (b):

- *resolution*: minimum 2.5 between the peaks due to tianeptine and impurity E.

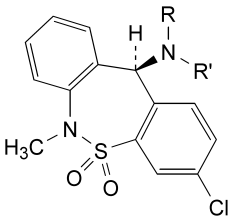
Limits:

- *any impurity*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *total*: not more than 8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent),
- *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (*2.5.12*): maximum 5.0 per cent, determined on 0.100 g.

ASSAY

Dissolve 0.165 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

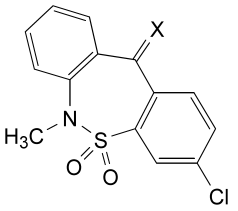


1 ml of *0.1 M perchloric acid* is equivalent to 22.95 mg of $C_{21}H_{24}ClN_2NaO_4S$.

STORAGE

In an airtight container.

IMPURITIES

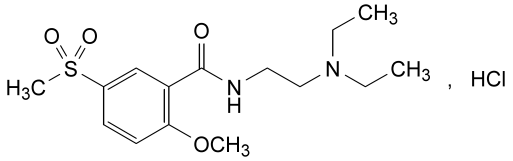


A. Br-$[CH_2]_6$-CO-O-C_2H_5: ethyl 7-bromoheptanoate,

and enantiomer

B. R = H, R′ = $[CH_2]_6$-CO-O-C_2H_5: ethyl 7-[[(11*RS*)-3-chloro-6-methyl-6,11-dihydrodibenzo[*c*,*f*][1,2]thiazepin-11-yl]amino]heptanoate *S*,*S*-dioxide,

E. R = R′ = $[CH_2]_6$-CO_2H: 7,7′-[[(11*RS*)-3-chloro-6-methyl-6,11-dihydrodibenzo[*c*,*f*][1,2]thiazepin-11-yl]imino]diheptanoic acid *S*,*S*-dioxide,



C. X = O: 3-chloro-6-methyldibenzo[*c*,*f*][1,2]thiazepin-11(6*H*)-one *S*,*S*-dioxide,

D. X = N-$[CH_2]_6$-CO_2H: 7-[[(11*RS*)-3-chloro-6-methyldibenzo[*c*,*f*][1,2]thiazepin-11(6*H*)-ylidene]amino]heptanoic acid *S*,*S*-dioxide.

corrected 6.0

TIAPRIDE HYDROCHLORIDE

Tiapridi hydrochloridum

$C_{15}H_{25}ClN_2O_4S$ M_r 364.9
[51012-33-0]

DEFINITION

N-[2-(Diethylamino)ethyl]-2-methoxy-5-(methylsulphonyl)-benzamide hydrochloride.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very soluble in water, soluble in methanol, slightly soluble in anhydrous ethanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Preparation: discs.
Comparison: *tiapride hydrochloride CRS*.

B. Solution S (see Tests) gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and its absorbance (*2.2.25*) at 450 nm is not greater than 0.030.

pH (*2.2.3*): 4.0 to 6.0 for solution S.

Impurity C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.400 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20.0 mg of *metoclopramide impurity E CRS* (impurity C) in *methanol R* and dilute to 50 ml with the same solvent. Dilute 2.0 ml of this solution to 20 ml with *methanol R*.

Plate: *TLC silica gel G plate R*.

Mobile phase: *concentrated ammonia R, dioxan R, methanol R, methylene chloride R* (2:10:14:90 *V/V/V/V*).

Application: 10 µl.

Development: over a path of 12 cm.

Drying: in air.

Detection: spray with a 2 g/l solution of *ninhydrin R* in *butanol R* and heat at 100 °C for 15 min.

Limit:

– *impurity C*: any spot due to impurity C is not more intense than the corresponding spot in the chromatogram obtained with the reference solution (0.1 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *tiapride hydrochloride CRS* and 5.0 mg of *tiapride N-oxide CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

Mobile phase: dissolve 5.44 g of *potassium dihydrogen phosphate R* and 0.08 g of *sodium octanesulphonate R* in 780 ml of *water R*, adjust to pH 2.7 using *phosphoric acid R* and dilute to 800 ml with *water R*; add 150 ml of *methanol R* and 50 ml of *acetonitrile R* and mix.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 10 µl.

Run time: 3 times the retention time of tiapride.

Retention time: tiapride = about 9 min; tiapride *N*-oxide = about 13 min.

System suitability: reference solution (b):

– *resolution*: minimum 4.0 between the peaks due to tiapride and tiapride *N*-oxide.

Limits:

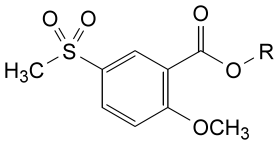
– *impurities A, B*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

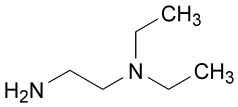
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.



ASSAY

Dissolve 0.300 g in 20 ml of *anhydrous acetic acid R*. Add 20 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 36.49 mg of $C_{15}H_{25}ClN_2O_4S$.

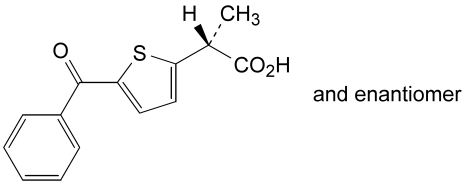


IMPURITIES

Specified impurities: A, B, C.

A. R = CH_3: methyl 2-methoxy-5-(methylsulphonyl)benzoate,

B. R = H: 2-methoxy-5-(methylsulphonyl)benzoic acid,



C. *N,N*-diethylethane-1,2-diamine.

01/2008:1157

TIAPROFENIC ACID

Acidum tiaprofenicum

$C_{14}H_{12}O_3S$ M_r 260.3
[33005-95-7]

DEFINITION

(2*RS*)-2-(5-Benzoylthiophen-2-yl)propanoic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in acetone, in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Melting point (*2.2.14*): 95 °C to 99 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 25.0 mg in *ethanolic hydrochloric acid R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of this solution to 50.0 ml with *ethanolic hydrochloric acid R*.

Spectral range: 220-350 nm.

Absorption maximum: at 305 nm.

Shoulder: at 262 nm.

Specific absorbance at the absorption maximum: 550 to 590.

C. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *tiaprofenic acid CRS*.

D. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *tiaprofenic acid CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *ketoprofen CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent. Dilute 1 ml of this solution to 2 ml with reference solution (a).

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *acetic acid R, methylene chloride R, acetone R* (1:20:80 *V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Dissolve 2.0 g in *ethanol (96 per cent) R* and dilute to 20 ml with the same solvent.

Optical rotation (*2.2.7*): – 0.10° to + 0.10°.

Dissolve 0.50 g in *ethyl acetate R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 10.0 mg of *tiaprofenic acid impurity C CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 2.0 ml with reference solution (c).

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *silica gel for chromatography R* (5 µm).

Mobile phase: *water R, glacial acetic acid R, hexane R, methylene chloride R* (0.25:20:500:500 *V/V/V/V*); add the water to the acetic acid, then hexane and methylene chloride; sonicate the mixture for 2 min. Do not degas with helium during analysis.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 250 nm.

Injection: 20 µl.

Run time: twice the retention time of tiaprofenic acid.

Relative retention with reference to tiaprofenic acid: impurity A = about 0.19; impurity B = about 0.43; impurity C = about 0.86.

System suitability: reference solution (d):

– *resolution*: minimum 3.0 between the peaks due to impurity C and tiaprofenic acid.

Limits:

– *impurity C*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.2 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *sum of impurities other than C*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

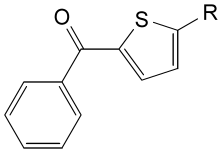
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 25 ml of *ethanol (96 per cent) R*. Add 25 ml of *water R* and 0.5 ml of *phenolphthalein solution R*. Titrate with *0.1 M sodium hydroxide*.

1 ml of *0.1 M sodium hydroxide* is equivalent to 26.03 mg of $C_{14}H_{12}O_3S$.

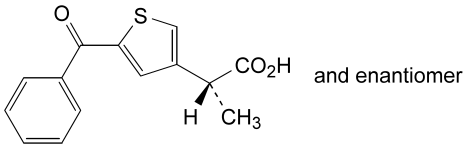


STORAGE

Protected from light.

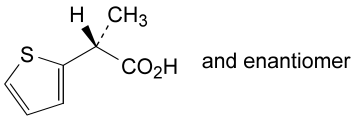
IMPURITIES

Specified impurities: C.



Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, D, E, F.*

A. R = C_2H_5: (5-ethylthiophen-2-yl)phenylmethanone,

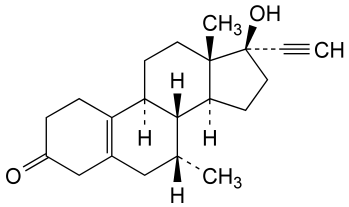


B. R = CO-CH_3: 1-(5-benzoylthiophen-2-yl)ethanone,

F. R = Br: (5-bromothiophen-2-yl)phenylmethanone,

C. (2*RS*)-2-(5-benzoylthiophen-3-yl)propanoic acid,

D. benzoic acid,



E. (2*RS*)-2-(thiophen-2-yl)propanoic acid.

TIBOLONE

Tibolonum

$C_{21}H_{28}O_2$ M_r 312.5

DEFINITION

17-Hydroxy-7α-methyl-19-nor-17α-pregn-5(10)-en-20-yn-3-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or crystals.

Solubility: practically insoluble in water, soluble in acetone and in methanol.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of tibolone*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined in the minimum volume of *anhydrous ethanol R*, evaporate to dryness on a water-bath and record a new spectrum using the residue.

TESTS

Specific optical rotation (*2.2.7*): + 100 to + 106 (dried substance).

Dissolve 0.250 g in *anhydrous ethanol R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Select a brand of acetonitrile such that the formation of possible artefact peaks, eluting after impurity C at relative retentions 0.6 to 0.8, is avoided.

Solvent mixture: *water R, acetonitrile R1* (25:75 *V/V*).

Test solution. Dissolve 40.0 mg of the substance to be examined in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dissolve 4 mg of *tibolone for system suitability CRS* (containing impurities A, B, C, D and E) in 1 ml of the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: spherical *end-capped octylsilyl silica gel for chromatography R* (5 μm).

Mobile phase: *methanol R, acetonitrile R1, water R* (8:40:52 *V/V/V*).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 5 μl.

Run time: 3 times the retention time of tibolone.

Identification of impurities: use the chromatogram supplied with *tibolone for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A, B, C, D and E.

Relative retention with reference to tibolone (retention time = about 14 min): impurity A = about 0.22; impurity B = about 0.24; impurity C = about 0.58; impurity D = about 1.12; impurity E = about 2.24.

System suitability: reference solution (a):

– *peak-to-valley ratio*: minimum 2.0, where H_p = height above the baseline of the peak due to impurity D and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to tibolone.

Limits:

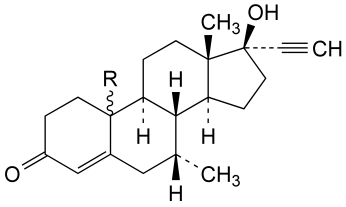
– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 1.7; impurity B = 1.5; impurity C = 2.1;
– *impurities A, E*: for each impurity, not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *impurity B*: not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent);
– *impurity C*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *impurity D*: not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
– *unspecified impurities*: for each impurity, not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 60 ml of *tetrahydrofuran R*. Add 25 ml of a 100 g/l solution of *silver nitrate R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

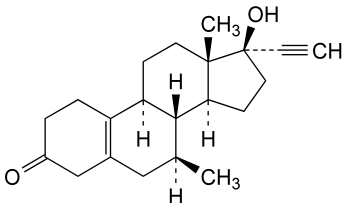


1 ml of *0.1 M sodium hydroxide* is equivalent to 31.25 mg of $C_{21}H_{28}O_2$.

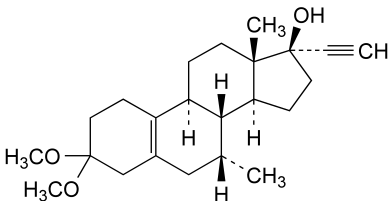
STORAGE

At a temperature of 2 °C to 8 °C.

IMPURITIES



Specified impurities: *A, B, C, D, E.*

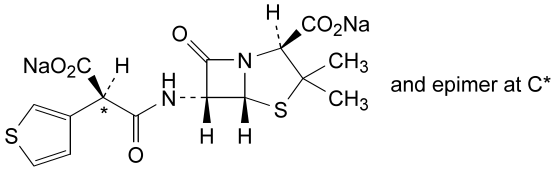


A. R = OH: 10,17-dihydroxy-7α-methyl-19-nor-10ξ,17α-pregn-4-en-20-yn-3-one,

B. R = O-OH: 10-hydroperoxy-17-hydroxy-7α-methyl-19-nor-10ξ,17α-pregn-4-en-20-yn-3-one,

C. R = H: 17-hydroxy-7α-methyl-19-nor-10ξ,17α-pregn-4-en-20-yn-3-one,

D. 17-hydroxy-7β-methyl-19-nor-17α-pregn-5(10)-en-20-yn-3-one,



E. 3,3-dimethoxy-7α-methyl-19-nor-17α-pregn-5(10)-en-20-yn-17-ol.

TICARCILLIN SODIUM

Ticarcillinum natricum

$C_{15}H_{14}N_2Na_2O_6S_2$ M_r 428.4
[4697-14-7]

DEFINITION

Disodium (2*S*,5*R*,6*R*)-6-[[(2*RS*)-2-carboxylato-2-(thiophen-3-yl)acetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate.

Semi-synthetic product derived from a fermentation product.

Content: 89.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or slightly yellow, hygroscopic powder.

Solubility: freely soluble in water, soluble in methanol.

IDENTIFICATION

First identification: A, D, E.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: dissolve 50 mg of the substance to be examined in 1 ml of *water R*, add 0.1 ml of *hydrochloric acid R1*, swirl and allow to stand in iced water for 10 min. Filter the precipitate and rinse with 2 ml of *water R*. Dissolve in a mixture of 1 volume of *water R* and 9 volumes of *acetone R*. Evaporate the solvent almost to dryness, then dry in an oven at 60 °C for 30 min.

Comparison: repeat the operations using *ticarcillin monosodium CRS*.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *ticarcillin monosodium CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 25 mg of *carbenicillin sodium CRS* and 25 mg of *ticarcillin monosodium CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Plate: *TLC silanised silica gel plate R.*

Mobile phase: mix 10 volumes of *acetone R* and 90 volumes of a 154 g/l solution of *ammonium acetate R*, adjusted to pH 5.0 with *glacial acetic acid R*.

Application: 1 µl.

Development: over a path of 12 cm.

Drying: in a current of hot air.

Detection: expose to iodine vapour.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Place about 2 mg in a test-tube about 15 cm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is brown. Place the test-tube in a water-bath for 1 min; a dark reddish-brown colour develops.

D. It gives reaction (a) of sodium (*2.3.1*).

E. Specific optical rotation (see Tests).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_5 (*2.2.2, Method II*).

pH (*2.2.3*): 5.5 to 7.5 for solution S.

Specific optical rotation (*2.2.7*): + 172 to + 187 (anhydrous substance).

Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in mobile phase A and dilute to 25.0 ml with mobile phase A.

Reference solution (a). Dissolve 20.0 mg of *ticarcillin impurity A CRS* in mobile phase A and dilute to 100.0 ml with mobile phase A. Dilute 5.0 ml of this solution to 50.0 ml with mobile phase A.

Reference solution (b). Dilute 1 ml of the test solution to 50 ml with mobile phase A.

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: 1.3 g/l solution of *ammonium phosphate R* adjusted to pH 7.0 with *phosphoric acid R*;

– *mobile phase B*: *methanol R*, mobile phase A (50:50 *V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 30	100 → 30	0 → 70
30 - 40	30	70

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the 2 principal peaks (diastereoisomers).

Limits:

– *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (4 per cent);

– *any other impurity*: for each impurity, not more than 1.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.5 per cent).

***N,N*-Dimethylaniline** (*2.4.26, Method B*): maximum 20 ppm.

2-Ethylhexanoic acid (*2.4.28*): maximum 0.5 per cent *m/m*.

Water (*2.5.12*): maximum 5.5 per cent, determined on 0.150 g.

Bacterial endotoxins (*2.6.14*): less than 0.05 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve 50.0 mg of *ticarcillin monosodium CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml of this solution to 50.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 20 volumes of *methanol R* and 80 volumes of a 1.3 g/l solution of *ammonium phosphate R* adjusted to pH 7.0 with *phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm.

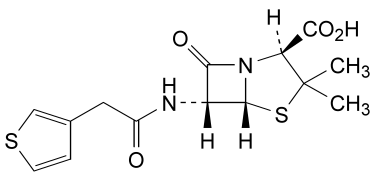
Injection: 20 µl.

System suitability: reference solution:

– *resolution*: minimum 2.5 between the 2 principal peaks;

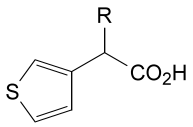
– *repeatability*: maximum relative standard deviation of 1.0 per cent for the 2 peaks due to ticarcillin after 6 injections.

Calculate the percentage content of ticarcillin sodium as the sum of the areas of the 2 peaks, multiplying the content of ticarcillin monosodium by 1.054.



STORAGE

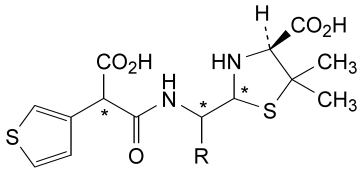
In an airtight container, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.



IMPURITIES

Specified impurities: A.

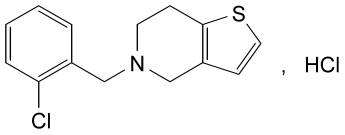
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, E.*



A. (2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[[(thiophen-3-yl)acetyl]amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (decarboxyticarcillin),

B. R = H: (thiophen-3-yl)acetic acid,

C. R = CO_2H: 2-(thiophen-3-yl)propanedioic acid (3-thienylmalonic acid),



D. R = CO_2H: (4*S*)-2-[carboxy[[2-carboxy-2-(thiophen-3-yl)acetyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of ticarcillin),

E. R = H: (4*S*)-2-[[[2-carboxy-2-(thiophen-3-yl)acetyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penilloic acids of ticarcillin).

TICLOPIDINE HYDROCHLORIDE

Ticlopidini hydrochloridum

$C_{14}H_{15}Cl_2NS$ M_r 300.2
[53885-35-1]

DEFINITION

5-(2-Chlorobenzyl)-4,5,6,7-tetrahydrothieno[3,2-*c*]pyridine hydrochloride.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: sparingly soluble in water and in anhydrous ethanol, very slightly soluble in ethyl acetate.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution (a). Dissolve 40 mg in *water R* and dilute to 100.0 ml with the same solvent.

Test solution (b). Dilute 5.0 ml of test solution (a) to 100.0 ml with *water R*.

Spectral range: 250-350 nm for test solution (a); 200-350 nm for test solution (b).

Absorption maxima: at 268 nm and 275 nm for test solution (a); at 214 nm and 232 nm for test solution (b).

Absorption ratio: A_{268}/A_{275} = 1.1 to 1.2.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *ticlopidine hydrochloride CRS*.

C. Mix about 6 mg of *citric acid R* and 0.3 ml of *acetic anhydride R*. Add about 5 mg of the substance to be examined and heat in a water-bath at 80 °C. A red colour develops.

D. About 20 mg gives reaction (a) of chlorides (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 0.5 g in a 1 per cent *V/V* solution of *hydrochloric acid R* and dilute to 20 ml with the same solution.

pH (*2.2.3*): 3.5 to 4.0.

Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Solvent mixture: mobile phase B, mobile phase A (20:80 *V/V*).

Test solution. Dissolve 0.250 g of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution. Dissolve 5.0 mg of *ticlopidine impurity F CRS* in the solvent mixture. Add 1.00 ml of the test solution and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

Mobile phase:

– *mobile phase A*: 0.95 g/l solution of *sodium pentanesulphonate monohydrate R*, adjusted to pH 3.4 with a 50 per cent *V/V* solution of *phosphoric acid R*;
– *mobile phase B*: *methanol R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 45	80 → 20	20 → 80
45 - 50	20	80

Flow rate: 1.3 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 10 µl; inject the solvent mixture as a blank.

Retention time: ticlopidine = about 15 min.

System suitability: reference solution:

– *resolution*: minimum 2.0 between the peaks due to ticlopidine and impurity F; if necessary, adjust the pH of mobile phase A;
– *signal-to-noise ratio*: minimum 50 for the peak due to ticlopidine.

Limits:

– *impurity F*: not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (0.05 per cent);
– *any other impurity*: for each impurity, not more than 0.5 times the area of the peak due to ticlopidine in the chromatogram obtained with the reference solution (0.05 per cent);
– *total*: not more than the area of the peak due to ticlopidine in the chromatogram obtained with the reference solution (0.1 per cent);

– *disregard limit*: 0.1 times the area of the peak due to ticlopidine in the chromatogram obtained with the reference solution (0.01 per cent).

Formaldehyde: maximum 20 ppm.

Dissolve 0.200 g in 4.0 ml of *water R*. Add 0.4 ml of *dilute sodium hydroxide solution R*. Centrifuge, filter the supernatant liquid through cotton previously impregnated with *water R* and dilute to 5.0 ml with *water R*. Transfer to a test-tube. Add 5.0 ml of *acetylacetone reagent R1*. Place the test-tube in a water-bath at 40 °C for 40 min. The test solution is not more intensely coloured than a standard prepared at the same time and in the same manner using 5.0 ml of a 0.8 ppm solution of formaldehyde (CH_2O), obtained by dilution of *formaldehyde standard solution (5 ppm CH_2O) R* with *water R*. Examine the tubes down their vertical axis.

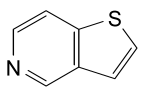
Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in a 85 per cent *V/V* solution of *methanol R* and dilute to 20.0 ml with the same solvent. 12 ml of the solution complies with test B. Prepare the reference solution using 10 ml of *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): maximum 0.5 per cent, determined on 0.500 g.

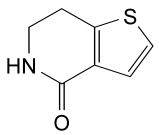
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



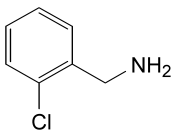
Dissolve 0.150 g in 15 ml of *anhydrous acetic acid R*. Add 35 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 30.02 mg of $C_{14}H_{15}Cl_2NS$.



IMPURITIES

Specified impurities: F.



Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. TILIDINE HYDROCHLORIDE HEMIHYDRATE

Tilidini hydrochloridum hemihydricum

$C_{17}H_{24}ClNO_2,{}^1/_2H_2O$ M_r 318.9

DEFINITION

Ethyl (1*RS*,2*SR*)-2-(dimethylamino)-1-phenylcyclohex-3-enecarboxylate hydrochloride hemihydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

A suitable antioxidant may be added.

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, very soluble in methylene chloride, freely soluble in alcohol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of tilidine hydrochloride hemihydrate.*

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Acidity or alkalinity. To 20 ml of solution S add 0.2 ml of *0.01 M sodium hydroxide*. The pH is not less than 4.1. Add 0.4 ml of *0.01 M hydrochloric acid*. The pH is not more than 4.3.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dilute 0.5 ml of the test solution to 100.0 ml with *water R*.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 10.0 ml with *water R*.

Precolumn:

– *size*: *l* = 4 mm, Ø = 4.0 mm,
– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm).

Column:

– *size*: *l* = 0.125 m, Ø = 4.0 mm,
– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix equal volumes of *acetonitrile R* and a 0.98 g/l solution of *ammonium carbonate R*.

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 10 µl.

Run time: twice the retention time of tilidine.

Relative retention with reference to tilidine (retention time = about 11 min): impurity D = about 0.4; impurity C = about 0.5; impurity B = about 0.7; impurity A = about 1.5.

Limits:

– *impurities A, B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

Dissolve 2.0 g in 20 ml of *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

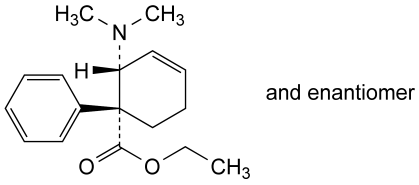
Water (*2.5.12*): 2.5 per cent to 3.1 per cent, determined on 0.300 g.

Bacterial endotoxins (*2.6.14*): less than 0.25 IU/mg, if intented for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

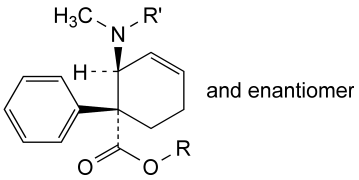
Dissolve 0.250 g in a mixture of 10 ml of *anhydrous acetic acid R* and 50 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 30.99 mg of $C_{17}H_{24}ClNO_2$.



STORAGE

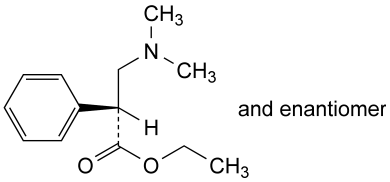
Protected from light.



IMPURITIES

Specified impurities: A, B, C.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *D.*



A. ethyl (1*RS*,2*RS*)-2-(dimethylamino)-1-phenylcyclohex-3-enecarboxylate,

and enantiomer

B. R = R′ = CH_3: methyl (1*RS*,2*SR*)-2-(dimethylamino)-1-phenylcyclohex-3-enecarboxylate,

C. R = C_2H_5, R′ = H: ethyl (1*RS*,2*SR*)-2-(methylamino)-1-phenylcyclohex-3-enecarboxylate,

corrected 6.0

TIMOLOL MALEATE

Timololi maleas

$C_{17}H_{28}N_4O_7S$ M_r 432.5
[26921-17-5]

DEFINITION

Timolol maleate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (2*S*)-1-[(1,1-dimethylethyl)amino]-3-[[4-(morpholin-4-yl)-1,2,5-thiadiazol-3-yl]oxy]propan-2-ol (*Z*)-butenedioate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, soluble in water and in ethanol (96 per cent).

It melts at about 199 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Dissolve 1.000 g in *1 M hydrochloric acid* and dilute to 10.0 ml with the same acid. The specific optical rotation (*2.2.7*) is −5.7 to −6.2.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *timolol maleate CRS*.

C. Examine the chromatograms obtained in the test for related substances after exposure to iodine vapour. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Triturate 0.1 g with a mixture of 1 ml of *dilute sodium hydroxide solution R* and 3 ml of *water R*. Shake with 3 quantities, each of 5 ml, of *ether R*. To 0.1 ml of the aqueous layer add a solution of 10 mg of *resorcinol R* in 3 ml of *sulphuric acid R*. Heat on a water-bath for 15 min. No violet-red colour develops. Neutralise the remainder of the aqueous layer with *dilute sulphuric acid R* and add 1 ml of *bromine water R*. Heat on a water-bath for 15 min, then heat to boiling and cool. To 0.2 ml of this solution add a solution of 10 mg of *resorcinol R* in 3 ml of *sulphuric acid R*. Heat on a water-bath for 15 min; a violet-red colour develops. Add 0.2 ml of a 100 g/l solution of *potassium bromide R* and heat for 5 min on a water-bath; the colour becomes violet-blue.

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution B_8 (*2.2.2, Method II*).

pH (*2.2.3*). The pH of solution S is 3.8 to 4.3.

Enantiomeric purity. Examine by liquid chromatography (*2.2.29*). *Carry out the test protected from actinic light.*

Test solution. Dissolve 30.0 mg of the substance to be examined in a mixture of 1 volume of *methylene chloride R* and 3 volumes of *2-propanol R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 30 mg of *timolol maleate CRS* in a mixture of 1 volume of *methylene chloride R* and 3 volumes of *2-propanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 15.0 mg of *(R)-timolol CRS* in a mixture of 1 volume of *methylene chloride R* and 3 volumes of *2-propanol R* and dilute to 10.0 ml with the same mixture of solvents. Dilute 1.0 ml of the solution to 50.0 ml with a mixture of 1 volume of *methylene chloride R* and 3 volumes of *2-propanol R*.

Reference solution (c). Dilute 1 ml of reference solution (a) to 100 ml with a mixture of 1 volume of *methylene chloride R* and 3 volumes of *2-propanol R*. Mix 1 ml of this solution with 1 ml of reference solution (b).

Reference solution (d). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of 1 volume of *methylene chloride R* and 3 volumes of *2-propanol R*.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *silica gel OD for chiral separations R* (5 µm);

– as mobile phase at a flow rate of 1 ml/min a mixture of 2 ml of *diethylamine R*, 40 ml of *2-propanol R* and 960 ml of *hexane R*;

– as detector a spectrophotometer set at 297 nm.

Under these conditions the peak corresponding to the (*R*)-isomer appears first.

Inject 5 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 5 µl of each solution. The test is not valid unless: in the chromatogram obtained with reference solution (c), the resolution between the peaks corresponding to the (*R*)-enantiomer and to the (*S*)-enantiomer is at least 4.0; the retention times of the principal peaks (corresponding to the (*S*)-enantiomer) in the chromatograms obtained with the test solution and reference solution (a) are identical. In the chromatogram obtained with the test solution, the area of any peak corresponding

to the (*R*)-enantiomer is not greater than the area of the principal peak in the chromatogram obtained with reference solution (d) (1 per cent).

Related substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate GF_{254} R*.

Test solution (a). Dissolve 0.50 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *methanol R*.

Reference solution (a). Dissolve 10 mg of *timolol maleate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

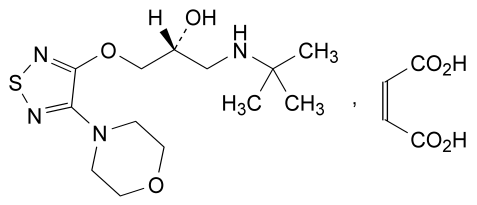
Reference solution (b). Dilute 10 ml of test solution (b) to 50 ml with *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 20 volumes of *methanol R* and 80 volumes of *methylene chloride R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.4 per cent). Disregard the spot remaining at the starting point. Expose the plate to iodine vapour for 2 h. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.4 per cent). Disregard the spot remaining at the starting point.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



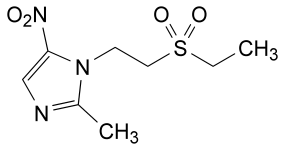
Dissolve 0.350 g in 60 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid* determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 43.25 mg of $C_{17}H_{28}N_4O_7S$.

STORAGE

Store protected from light.

IMPURITIES



A. (2*R*)-1-[(1,1-dimethylethyl)amino]-3-[[4-(morpholin-4-yl)-1,2,5-thiadiazol-3-yl]oxy]propan-2-ol (*Z*)-butenedioate.

01/2008:1051
corrected 6.0

TINIDAZOLE

Tinidazolum

$C_8H_{13}N_3O_4S$ M_r 247.3
[19387-91-8]

DEFINITION

Tinidazole contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 1-[2-(ethylsulphonyl)ethyl]-2-methyl-5-nitro-1*H*-imidazole, calculated with reference to the dried substance.

CHARACTERS

An almost white or pale yellow, crystalline powder, practically insoluble in water, soluble in acetone and in methylene chloride, sparingly soluble in methanol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

A. Melting point (*2.2.14*): 125 °C to 128 °C.

B. Dissolve 10.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *methanol R*. Examined between 220 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 310 nm. The specific absorbance at the maximum is 340 to 360.

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *tinidazole CRS*. Examine the substances prepared as discs.

D. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

E. To about 10 mg add about 10 mg of *zinc powder R*, 0.3 ml of *hydrochloric acid R* and 1 ml of *water R*. Heat in a water-bath for 5 min and cool. The solution gives the reaction of primary aromatic amines (*2.3.1*).

TESTS

Appearance of solution. Dissolve 1.0 g in *acetone R* and dilute to 20 ml with the same solvent. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_5 (*2.2.2, Method II*).

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel GF_{254} R* as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methanol R* with the aid of ultrasound and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *tinidazole CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of test solution (b) to 20 ml with *methanol R*.

Reference solution (c). Dilute 4 ml of reference solution (b) to 10 ml with *methanol R*.

Reference solution (d). Dissolve 10 mg of *2-methyl-5-nitroimidazole R* (impurity A) in *methanol R* and dilute to 100 ml with the same solvent.

Reference solution (e). Dissolve 10 mg of *tinidazole impurity B CRS* in *methanol R* and dilute to 100 ml with the same solvent.

Heat the plate at 110 °C for 1 h and allow to cool.

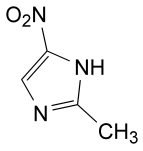
Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 25 volumes of *butanol R* and 75 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spots corresponding to tinidazole impurity A and tinidazole impurity B in the chromatogram obtained with test solution (a) are not more intense than the corresponding spots in the chromatogram obtained with reference solutions (d) and (e) (0.5 per cent), respectively. Any spot, apart from the principal spot and any spots corresponding to tinidazole impurity A and tinidazole impurity B in the chromatogram obtained with test solution (a), is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

Heavy metals (*2.4.8*). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

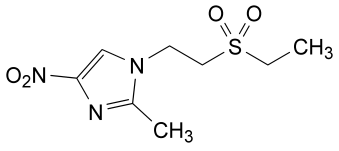
Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.150 g in 25 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 24.73 mg of $C_8H_{13}N_3O_4S$.

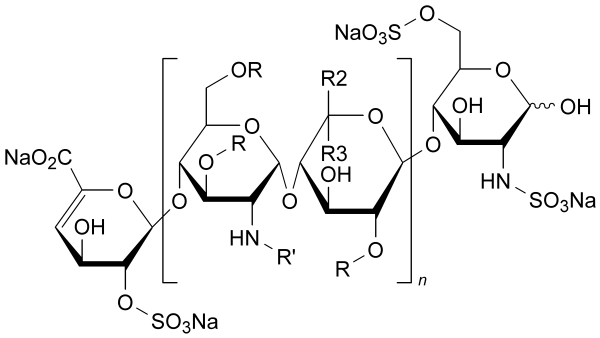


STORAGE

Store protected from light.

IMPURITIES

A. 2-methyl-5-nitro-1*H*-imidazole,



B. 1-[2-(ethylsulphonyl)ethyl]-2-methyl-4-nitro-1*H*-imidazole.

01/2008:1271

TINZAPARIN SODIUM

Tinzaparinum natricum

n = 1 to 25 , R = H or SO_3Na , R' = H or SO_3Na or CO-CH_3
R2 = H and R3 = CO_2Na or R2 = CO_2Na and R3 = H

DEFINITION

Tinzaparin sodium is the sodium salt of a low-molecular-mass heparin that is obtained by controlled enzymatic depolymerisation of heparin from porcine intestinal mucosa using heparinase from *Flavobacterium heparinum*. The majority of the components have a 2-*O*-sulpho-4-enepyranosuronic acid structure at the non-reducing end and a 2-*N*,6-*O*-disulpho-D-glucosamine structure at the reducing end of their chain.

Tinzaparin sodium complies with the monograph on Low-molecular-mass heparins (0828) with the modifications and additional requirements below.

The mass-average relative molecular mass ranges between 5500 and 7500 with a characteristic value of about 6500.

The degree of sulphatation is 1.8 to 2.5 per disaccharide unit.

The potency is not less than 70 IU and not more than 120 IU of anti-factor Xa activity per milligram calculated with reference to the dried substance. The ratio of the anti-factor Xa activity to anti-factor IIa activity is between 1.5 and 2.5.

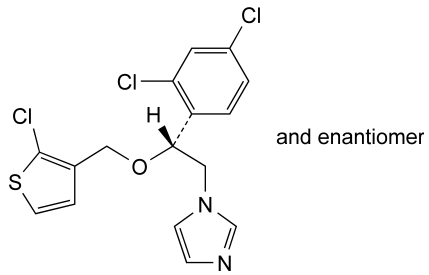
IDENTIFICATION

Carry out identification test A as described in the monograph for *Low-molecular-mass heparins (0828)* using *tinzaparin sodium CRS*.

Carry out identification test C as described in the monograph for *Low-molecular-mass heparins (0828)*. The following requirements apply.

The mass-average relative molecular mass ranges between 5500 and 7500. The mass percentage of chains lower than 2000 is not more than 10.0 per cent. The mass percentage of chains between 2000 and 8000 ranges between 60.0 and 72.0 per cent. The mass percentage of chains above 8000 ranges between 22.0 and 36.0 per cent.

TESTS



Appearance of solution. Dissolve 1.0 g in 10 ml of *water R*. The solution is clear (*2.2.1*) and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*)

Absorbance (*2.2.25*). Dissolve 50.0 mg in 100 ml of *0.01 M hydrochloric acid*. The specific absorbance, measured at 231 nm and calculated with reference to the dried substance, is 8.0 to 12.5.

01/2008:2074

TIOCONAZOLE

Tioconazolum

$C_{16}H_{13}Cl_3N_2OS$ M_r 387.7
[65899-73-2]

DEFINITION

1-[(2*RS*)-2-[(2-Chlorothiophen-3-yl)methoxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very slightly soluble in water, very soluble in methylene chloride, freely soluble in alcohol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of tioconazole.*

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *tioconazole for system suitability CRS* in the mobile phase and dilute to 2.5 ml with the mobile phase.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 170 m^2/g, a pore size of 12 nm and a carbon loading of 10 per cent.

Mobile phase: mix 1 volume of a 1.7 g/l solution of *tetrabutylammonium dihydrogen phosphate R* previously adjusted to pH 7.4 with *dilute ammonia R2* and 3 volumes of *methanol R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 218 nm.

Injection: 20 µl.

Run time: 2.5 times the retention time of tioconazole.

System suitability: reference solution (b):

- *resolution*: minimum 1.0 between the peaks due to impurity B and impurity C (locate impurities A, B and C by comparison with the chromatogram provided with *tioconazole for system suitability CRS*).

Limits:

- *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 1.7; impurity C = 1.7.
- *impurities A, B, C*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- *any other impurity*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
- *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

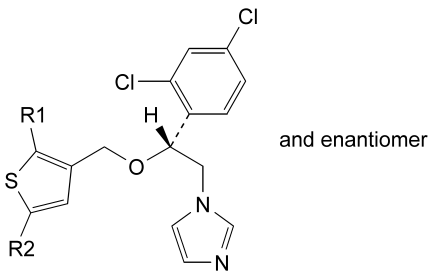
Water (*2.5.12*): maximum 0.5 per cent, determined on 1.00 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 38.77 mg of $C_{16}H_{13}Cl_3N_2OS$.

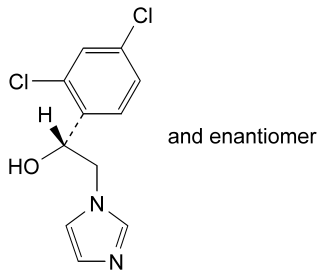


STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C.



Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *D.*

A. R1 = R2 = H: 1-[(2*RS*)-2-(2,4-dichlorophenyl)-2-[(thiophen-3-yl)methoxy]ethyl]-1*H*-imidazole,

B. R1 = R2 = Cl: 1-[(2*RS*)-2-(2,4-dichlorophenyl)-2-[(2,5-dichlorothiophen-3-yl)methoxy]ethyl]-1*H*-imidazole,

C. R1 = Cl, R2 = Br: 1-[(2*RS*)-2-[(5-bromo-2-chlorothiophen-3-yl)methoxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole,

D. (1*RS*)-1-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-yl)ethanol.

01/2008:0150

TITANIUM DIOXIDE

Titanii dioxidum

TiO_2 M_r 79.9
[13463-67-7]

DEFINITION

Content: 98.0 per cent to 100.5 per cent.

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water. It does not dissolve in dilute mineral acids but dissolves slowly in hot concentrated sulphuric acid.

IDENTIFICATION

A. When strongly heated, it becomes pale yellow; the colour disappears on cooling.

B. To 5 ml of solution S2 (see Tests) add 0.1 ml of *strong hydrogen peroxide solution R*. An orange-red colour appears.

C. To 5 ml of solution S2 add 0.5 g of *zinc R* in granules. After 45 min, the mixture has a violet-blue colour.

TESTS

Solution S1. Shake 20.0 g with 30 ml of *hydrochloric acid R* for 1 min. Add 100 ml of *distilled water R* and heat the mixture to boiling. Filter the hot mixture through a hardened filter paper until a clear filtrate is obtained. Wash the filter with 60 ml of *distilled water R* and dilute the combined filtrate and washings to 200 ml with *distilled water R*.

Solution S2. Mix 0.500 g (*m* g) with 5 g of *anhydrous sodium sulphate R* in a 300 ml long-necked combustion flask. Add 10 ml of *water R* and mix. Add 10 ml of *sulphuric acid R* and boil vigorously, with the usual precautions, until a clear solution is obtained. Cool, add slowly a cooled mixture of 30 ml of *water R* and 10 ml of *sulphuric acid R*, cool again and dilute to 100.0 ml with *water R*.

Appearance of solution. Solution S2 is not more opalescent than reference suspension II (*2.2.1*) and is colourless (*2.2.2, Method II*).

Acidity or alkalinity. Shake 5.0 g with 50 ml of *carbon dioxide-free water R* for 5 min. Centrifuge or filter until a clear solution is obtained. To 10 ml of the solution add 0.1 ml of *bromothymol blue solution R1*. Not more than 1.0 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Water-soluble substances: maximum 0.5 per cent.

To 10.0 g add a solution of 0.5 g of *ammonium sulphate R* in 150 ml of *water R* and boil for 5 min. Cool, dilute to 200 ml with *water R* and filter until a clear solution is obtained. Evaporate 100 ml of the solution to dryness in a tared evaporating dish and ignite. The residue weighs a maximum of 25 mg.

Antimony: maximum 100 ppm.

To 10 ml of solution S2 add 10 ml of *hydrochloric acid R* and 10 ml of *water R*. Cool to 20 °C, if necessary, and add 0.15 ml of *sodium nitrite solution R*. After 5 min, add 5 ml of a 10 g/l solution of *hydroxylamine hydrochloride R* and 10 ml of a freshly prepared 0.1 g/l solution of *rhodamine B R*. Mix thoroughly after each addition. Shake vigorously with 10.0 ml of *toluene R* for 1 min. Allow to separate and centrifuge for 2 min if necessary. Any pink colour in the toluene phase is not more intense than that in the toluene phase of a standard prepared at the same time in the same manner using a mixture of 5.0 ml of *antimony standard solution (1 ppm Sb) R*, 10 ml of *hydrochloric acid R* and 15 ml of a solution containing 0.5 g of *anhydrous sodium sulphate R* and 2 ml of *sulphuric acid R* instead of the mixture of 10 ml of solution S2, 10 ml of *hydrochloric acid R* and 10 ml of *water R*.

Arsenic (*2.4.2, Method A*): maximum 5 ppm.

Place 0.50 g in a 250 ml round-bottomed flask, fitted with a thermometer, a funnel with stopcock and a vapour-outlet tube connected to a flask containing 30 ml of *water R*. Add 50 ml of *water R*, 0.5 g of *hydrazine sulphate R*, 0.5 g of *potassium bromide R* and 20 g of *sodium chloride R*. Through the funnel, add dropwise 25 ml of *sulphuric acid R*, heat and maintain the temperature of the liquid at 110-115 °C for 20 min. Collect the vapour in the flask containing 30 ml of *water R*. Dilute to 50 ml with *water R*. 20 ml of the solution complies with the test.

Barium. To 10 ml of solution S1 add 1 ml of *dilute sulphuric acid R*. After 30 min, any opalescence in the solution is not more intense than that in a mixture of 10 ml of solution S1 and 1 ml of *distilled water R*.

Iron: maximum 200 ppm.

To 8 ml of solution S2 add 4 ml of *water R*. Mix and add 0.05 ml of *bromine water R*. Allow to stand for 5 min and remove the excess of bromine with a current of air. Add 3 ml of *potassium thiocyanate solution R*. Any colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using a mixture of 4 ml of *iron standard solution (2 ppm Fe) R* and 8 ml of a 200 g/l solution of *sulphuric acid R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

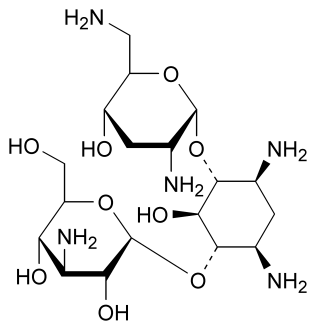
Dilute 10 ml of solution S1 to 20 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

ASSAY

To 300 g of *zinc R* in granules (710) add 300 ml of a 20 g/l solution of *mercuric nitrate R* and 2 ml of *nitric acid R*, shake for 10 min and wash with *water R*. Pack the amalgamated zinc into a glass tube about 400 mm long and about 20 mm in diameter fitted with a tap and a filter plate. Pass through the column 100 ml of *dilute sulphuric acid R* followed by 100 ml of *water R*, making sure that the amalgam is always covered with liquid. Pass slowly at a rate of about 3 ml/min through the column a mixture of 100 ml of *dilute sulphuric acid R* and 100 ml of *water R* followed by 100 ml of *water R*. Collect the eluate in a 500 ml conical flask containing 50.0 ml of a 150 g/l solution of *ferric ammonium sulphate R* in a mixture of 1 volume of *sulphuric acid R* and 3 volumes of *water R*. Add 0.1 ml of *ferroin R* and titrate immediately with *0.1 M ammonium and cerium nitrate* until a greenish colour is obtained (n_1 ml). Pass slowly at a rate of about 3 ml/min through the column a mixture of 50 ml of *dilute sulphuric acid R*

and 50 ml of *water R*, followed by 20.0 ml of solution S2, a mixture of 50 ml of *dilute sulphuric acid R* and 50 ml of *water R* and finally 100 ml of *water R*. Collect the eluate in a 500 ml conical flask containing 50.0 ml of a 150 g/l solution of *ferric ammonium sulphate R* in a mixture of 1 volume of *sulphuric acid R* and 3 volumes of *water R*. Rinse the lower end of the column with *water R*, add 0.1 ml of *ferroin R* and titrate immediately with *0.1 M ammonium and cerium nitrate* until a greenish colour is obtained (n_2 ml).

Calculate the percentage content of TiO_2 using the following expression:



$$\frac{3.99 \times (n_2 - n_1)}{m}$$

m = mass of the substance to be examined used for the preparation of solution S2, in grams.

01/2008:0645

TOBRAMYCIN

Tobramycinum

$C_{18}H_{37}N_5O_9$ M_r 467.5

[32986-56-4]

DEFINITION

4-*O*-(3-Amino-3-deoxy-α-D-glucopyranosyl)-2-deoxy-6-*O*-(2,6-diamino-2,3,6-trideoxy-α-D-*ribo*-hexopyranosyl)-L-streptamine.

Substance produced by *Streptomyces tenebrarius* or obtained by any other means.

Content: 97.0 per cent to 102.0 per cent (anhydrous substance).

PRODUCTION

It is produced by methods of manufacture designed to eliminate or minimise substances lowering blood pressure.

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Nuclear magnetic resonance spectrometry (*2.2.33*).

Preparation: 100 g/l solution in *deuterium oxide R*.

Comparison: 100 g/l solution of *tobramycin CRS* in *deuterium oxide R*.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 20 mg of the substance to be examined in *water R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *tobramycin CRS* in *water R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 4 mg of *neomycin sulphate CRS* and 4 mg of *kanamycin monosulphate CRS* in 1 ml of reference solution (a).

Plate: *TLC silica gel plate R*.

Mobile phase: *methylene chloride R, concentrated ammonia R, methanol R* (17:33:50 *V/V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in a current of warm air.

Detection: spray with a mixture of equal volumes of a 2 g/l solution of *1,3-dihydroxynaphthalene R* in *ethanol (96 per cent) R* and a 460 g/l solution of *sulphuric acid R*. Heat at 105 °C for 5-10 min.

System suitability: the chromatogram obtained with reference solution (b) shows 3 major spots which are clearly separated.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve about 5 mg in 5 ml of *water R*. Add 5 ml of a 1 g/l solution of *ninhydrin R* in *ethanol (96 per cent) R* and heat in a water-bath for 3 min. A violet-blue colour develops.

TESTS

pH (*2.2.3*): 9.0 to 11.0.

Dissolve 1.0 g in 10 ml of *carbon dioxide-free water R*.

Specific optical rotation (*2.2.7*): + 138 to + 148 (anhydrous substance).

Dissolve 1.00 g in *water R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Test solution (b). Dilute 10.0 ml of test solution (a) to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *tobramycin CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Reference solution (d). Dissolve 10.0 mg of *kanamycin B CRS* in 20.0 ml of the mobile phase. To 1.0 ml of this solution, add 2.0 ml of reference solution (a) and dilute to 10.0 ml with the mobile phase.

Reference solution (e). Dilute 10.0 ml of reference solution (a) to 25.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *styrene-divinylbenzene copolymer R* (8 µm) with a pore size of 100 nm,
– *temperature*: 55 °C.

Mobile phase: mixture prepared with *carbon dioxide-free water R* containing 52 g/l of *anhydrous sodium sulphate R*, 1.5 g/l of *sodium octanesulphonate R*, 3 ml/l of *tetrahydrofuran R* stabilised with *butylhydroxytoluene R*, 50 ml/l of *0.2 M potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *dilute phosphoric acid R*. Degas.

Flow rate: 1.0 ml/min.

Post-column solution: *carbonate-free sodium hydroxide solution R* diluted 1 to 25 with *carbon dioxide-free water R*, which is added pulseless to the column effluent using a 375 µl polymeric mixing coil.

Flow rate: 0.3 ml/min.

Detection: pulsed amperometric detector or equivalent with a gold working electrode, a silver-silver chloride reference electrode and a stainless steel auxiliary electrode which is the cell body, held at respectively + 0.05 V detection, + 0.75 V oxidation and – 0.15 V reduction potentials, with pulse durations according to the instrument used. The temperature of the detector is set at 35 °C.

Note: to prevent problems due to salt precipitation, the electrochemical cell can be flushed with water R overnight.

Injection: 20 µl using a refrigerated injector (4-8 °C); inject test solution (a) and reference solutions (b), (c) and (d).

Run time: 1.5 times the retention time of tobramycin.

Relative retention with reference to tobramycin (retention time = about 18 min): impurity C = about 0.35; impurity B = about 0.40, impurity A = about 0.70.

System suitability:

- *resolution*: minimum of 3.0 between the peaks due to impurity A and to tobramycin in the chromatogram obtained with reference solution (d). If necessary, adjust the concentration of sodium octanesulphonate in the mobile phase;
- *signal-to-noise ratio*: minimum of 10 for the principal peak in the chromatogram obtained with reference solution (b).

Limits:

- *any impurity*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent) and not more than 1 such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
- *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (1.5 per cent),
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent).

2-Methyl-1-propanol (*2.4.24, System B*): maximum 1.0 per cent *m/m*.

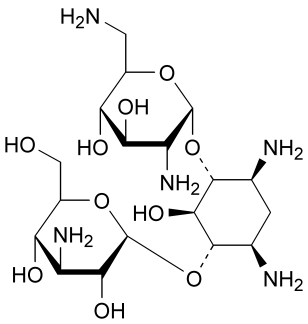
Water (*2.5.12*): maximum 8.0 per cent, determined on 0.30 g.

Sulphated ash (*2.4.14*): maximum 0.3 per cent, determined on 1.0 g.

Bacterial endotoxins (*2.6.14*): less than 2.0 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

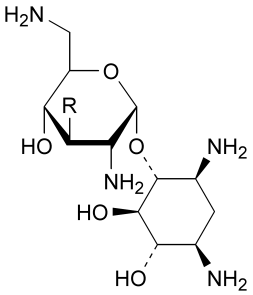
ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.



Injection: test solution (b) and reference solution (e).

Calculate the percentage content of tobramycin.

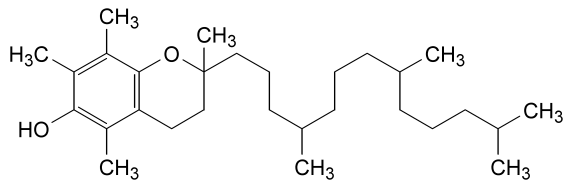


STORAGE

If the substance is sterile, store in a sterile, airtight, tamper-proof container.

IMPURITIES

A. 4-*O*-(3-amino-3-deoxy-α-D-glucopyranosyl)-2-deoxy-6-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-L-streptamine (kanamycin B),



B. R = H: 2-deoxy-4-*O*-(2,6-diamino-2,3,6-trideoxy-α-D-ribo-hexopyranosyl)-D-streptamine (nebramine),

C. R = OH: 2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-D-streptamine (neamine).

01/2008:0692

all-*rac*-α-TOCOPHEROL

int-*rac*-α-Tocopherolum

$C_{29}H_{50}O_2$ M_r 430.7

[59-02-9]

DEFINITION

all-*rac*-2,5,7,8-Tetramethyl-2-(4,8,12-trimethyltridecyl)-3,4-dihydro-2*H*-1-benzopyran-6-ol.

Content: 96.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: clear, colourless or yellowish-brown, viscous, oily liquid.

Solubility: practically insoluble in water, freely soluble in acetone, in anhydrous ethanol, in methylene chloride and in fatty oils.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. Optical rotation (*2.2.7*): – 0.01° to + 0.01°.

Dissolve 2.50 g in *anhydrous ethanol R* and dilute to 25.0 ml with the same solvent.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *α-tocopherol CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in 2 ml of *cyclohexane R*.

Reference solution. Dissolve 10 mg of *α-tocopherol CRS* in 2 ml of *cyclohexane R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *ether R, cyclohexane R* (20:80 *V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in a current of air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Gas chromatography (*2.2.28*): use the normalisation procedure.

Internal standard solution. Dissolve 1.0 g of *squalane R* in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Test solution (a). Dissolve 0.100 g of the substance to be examined in 10.0 ml of the internal standard solution.

Test solution (b). Dissolve 0.100 g of the substance to be examined in 10 ml of *cyclohexane R*.

Reference solution (a). Dissolve 0.100 g of *α-tocopherol CRS* in 10.0 ml of the internal standard solution.

Reference solution (b). Dissolve 10 mg of the substance to be examined and 10 mg of *α-tocopheryl acetate R* in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of *all-rac-α-tocopherol for peak identification CRS* (containing impurities A and B) in *cyclohexane R* and dilute to 1 ml with the same solvent.

Reference solution (d). Dilute 1.0 ml of test solution (b) to 100.0 ml with *cyclohexane R*. Dilute 1.0 ml of this solution to 10.0 ml with *cyclohexane R*.

Column:

– *material*: fused silica;
– *size*: *l* = 30 m, Ø = 0.25 mm;
– *stationary phase*: *poly(dimethyl)siloxane R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1 ml/min.

Split ratio: 1:100.

Temperature:

– *column*: 280 °C;
– *injection port and detector*: 290 °C.

Detection: flame ionisation.

Injection: 1 µl of test solution (b) and reference solutions (b), (c) and (d).

Run time: twice the retention time of all-*rac*-α-tocopherol.

Identification of impurities: use the chromatogram supplied with *all-rac-α-tocopherol for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A and B.

Relative retention with reference to all-*rac*-α-tocopherol (retention time = about 13 min): squalane = about 0.5; impurity A = about 0.7; impurity B = about 0.8; impurities C and D = about 1.05 (eluting immediately after the all-*rac*-α-tocopherol peak).

System suitability: reference solution (b):

– *resolution*: minimum 3.5 between the peaks due to all-*rac*-α-tocopherol and α-tocopheryl acetate.

Limits:

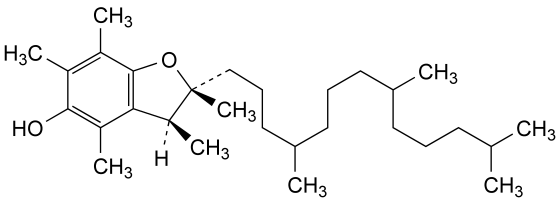
– *impurity A*: maximum 0.5 per cent;
– *impurity B*: maximum 1.5 per cent;
– *sum of impurities C and D*: maximum 1.0 per cent;
– *any other impurity*: for each impurity, maximum 0.25 per cent;
– *total*: maximum 2.5 per cent;
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

ASSAY

Gas chromatography (*2.2.28*) as described in the test for related substances with the following modification.

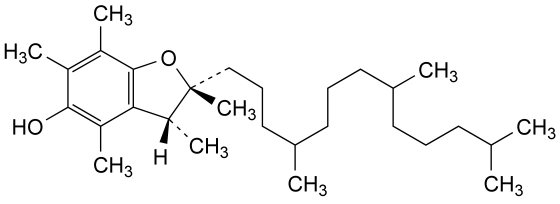
Injection: test solution (a) and reference solution (a).



Calculate the percentage content of $C_{29}H_{50}O_2$ from the declared content of *α-tocopherol CRS*.

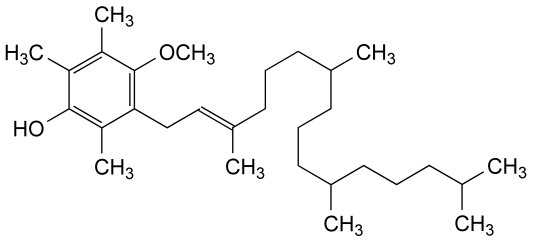
STORAGE

Under an inert gas, protected from light.



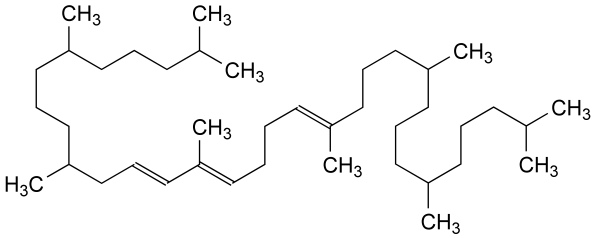
IMPURITIES

Specified impurities: A, B, C, D.



and diastereoisomers

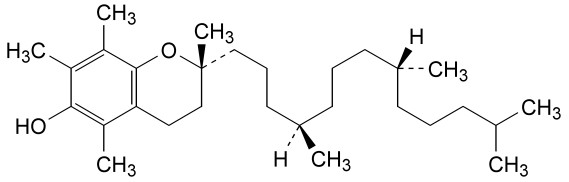
A. all-*rac-trans*-2,3,4,6,7-pentamethyl-2-(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-ol,



and diastereoisomers

B. all-*rac-cis*-2,3,4,6,7-pentamethyl-2-(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-ol.

C. 4-methoxy-2,3,6-trimethyl-5-[(all-*RS*,*E*)-3,7,11,15-tetramethylhexadec-2-enyl]phenol,



D. (all-*RS*,all-*E*)-2,6,10,14,19,23,27,31-octamethyldotriaconta-12,14,18-triene.

all-*rac*-α-TOCOPHERYL ACETATE

int-*rac*-α-Tocopherylis acetas

$C_{31}H_{52}O_3$ M_r 472.7
[7695-91-2]

DEFINITION

all-*rac*-2,5,7,8-Tetramethyl-2-(4,8,12-trimethyltridecyl)-3,4-dihydro-2*H*-1-benzopyran-6-yl acetate.

Content: 96.5 per cent to 102.0 per cent.

CHARACTERS

Appearance: clear, colourless or slightly greenish-yellow, viscous, oily liquid.

Solubility: practically insoluble in water, freely soluble in acetone, in anhydrous ethanol and in fatty oils.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. Optical rotation (*2.2.7*): – 0.01° to + 0.01°.
Dissolve 2.50 g in *anhydrous ethanol R* and dilute to 25.0 ml with the same solvent.

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *α-tocopheryl acetate CRS*.

C. Thin-layer chromatography (*2.2.27*).
Test solution. Dissolve about 10 mg of the substance to be examined in 2 ml of *cyclohexane R*.
Reference solution. Dissolve about 10 mg of *α-tocopheryl acetate CRS* in 2 ml of *cyclohexane R*.
Plate: *TLC silica gel F_{254} plate R*.
Mobile phase: *ether R, cyclohexane R* (20:80 *V/V*).
Application: 10 µl.
Development: over 2/3 of the plate.
Drying: in a current of air.
Detection: examine in ultraviolet light at 254 nm.
Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Gas chromatography (*2.2.28*): use the normalisation procedure.

Internal standard solution. Dissolve 1.0 g of *squalane R* in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Test solution (a). Dissolve 0.100 g of the substance to be examined in 10.0 ml of the internal standard solution.

Test solution (b). Dissolve 0.100 g of the substance to be examined in 10 ml of *cyclohexane R*.

Reference solution (a). Dissolve 0.100 g of *α-tocopheryl acetate CRS* in 10.0 ml of the internal standard solution.

Reference solution (b). Dissolve 10 mg of the substance to be examined and 10 mg of *α-tocopherol R* in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of *all-rac-α-tocopheryl acetate for peak identification CRS* (containing impurities A and B) in *cyclohexane R* and dilute to 1 ml with the same solvent.

Reference solution (d). Dilute 1.0 ml of test solution (b) to 100.0 ml with *cyclohexane R*. Dilute 1.0 ml of this solution to 10.0 ml with *cyclohexane R*.

Column:
– *material*: fused silica;
– *size*: *l* = 30 m, Ø = 0.25 mm;
– *stationary phase*: *poly(dimethyl)siloxane R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1 ml/min.

Split ratio: 1:100.

Temperature:
– *column*: 280 °C;
– *injection port and detector*: 290 °C.

Detection: flame ionisation.

Injection: 1 µl of test solution (b) and reference solutions (a), (b), (c) and (d); inject directly onto the column or via a sufficiently inert, glass-lined injection port using an automatic injection device or other reproducible injection method.

Run time: twice the retention time of all-*rac*-α-tocopheryl acetate.

Identification of impurities: use the chromatogram supplied with *all-rac-α-tocopheryl acetate for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A and B.

Relative retention with reference to all-*rac*-α-tocopheryl acetate (retention time = about 15 min): squalane = about 0.4; impurity A = about 0.7; impurity B = about 0.8; impurity C = about 0.9; impurities D and E = about 1.05 (eluting immediately after the all-*rac*-α-tocopheryl acetate peak).

System suitability:
– *resolution*: minimum 3.5 between the peaks due to impurity C and all-*rac*-α-tocopheryl acetate in the chromatogram obtained with reference solution (b);

– in the chromatogram obtained with reference solution (a), the area of the peak due to impurity C is not greater than 0.2 per cent of the area of the peak due to all-*rac*-α-tocopheryl acetate.

Limits:

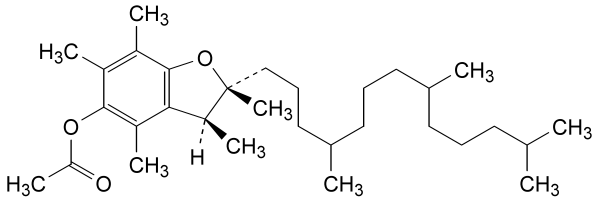
– *impurities A, C*: for each impurity, maximum 0.5 per cent;
– *impurity B*: maximum 1.5 per cent;
– *sum of impurities D and E*: maximum 1.0 per cent;
– *any other impurity*: for each impurity, maximum 0.25 per cent;
– *total*: maximum 2.5 per cent;
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

ASSAY

Gas chromatography (*2.2.28*) as described in the test for related substances with the following modification.

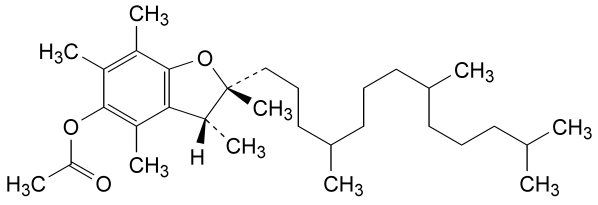
Injection: test solution (a) and reference solution (a).



Calculate the percentage content of $C_{31}H_{52}O_3$ from the declared content of *α-tocopheryl acetate CRS*.

STORAGE

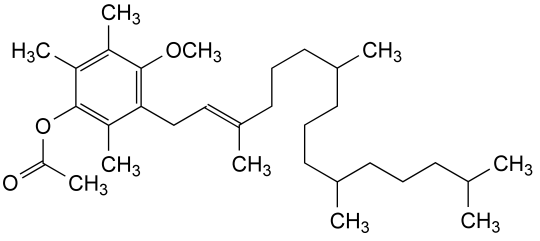
Protected from light.



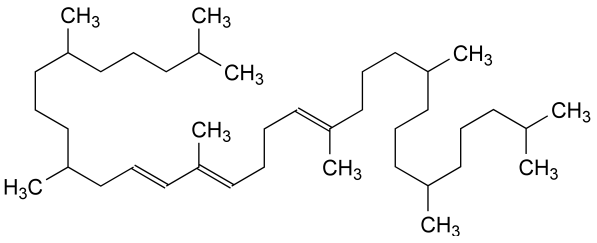
IMPURITIES

Specified impurities: A, B, C, D, E.

and diastereoisomers



A. all-*rac-trans*-2,3,4,6,7-pentamethyl-2-(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-yl acetate,



and diastereoisomers

B. all-*rac-cis*-2,3,4,6,7-pentamethyl-2-(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-yl acetate,

C. all-*rac*-α-tocopherol,

D. 4-methoxy-2,3,6-trimethyl-5-[(all-*RS*,*E*)-3,7,11,15-tetramethylhexadec-2-enyl]phenyl acetate,

01/2008:1257

RRR-α-TOCOPHERYL ACETATE

RRR-α-Tocopherylis acetas

$C_{31}H_{52}O_3$ M_r 472.7

DEFINITION

(2*R*)-2,5,7,8-Tetramethyl-2-[(4*R*,8*R*)-4,8,12-trimethyltridecyl]-3,4-dihydro-2*H*-1-benzopyran-6-yl acetate.

Content: 95.0 per cent to 101.0 per cent.

CHARACTERS

Appearance: clear, colourless or slightly greenish-yellow, viscous, oily liquid.

Solubility: practically insoluble in water, freely soluble in acetone, in anhydrous ethanol and in fatty oils, soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. Optical rotation (*2.2.7*): + 0.25° to + 0.35°.

Dissolve 2.50 g in *anhydrous ethanol R* and dilute to 25.0 ml with the same solvent.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *α-tocopheryl acetate CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 10 mg of the substance to be examined in 2 ml of *cyclohexane R*.

Test solution (b). In a ground-glass-stoppered tube, dissolve about 10 mg of the substance to be examined in 2 ml of *2.5 M alcoholic sulphuric acid R*. Heat on a water-bath for 5 min. Cool and add 2 ml of *water R* and 2 ml of *cyclohexane R*. Shake for 1 min. Use the upper layer.

Reference solution (a). Dissolve 10 mg of *α-tocopheryl acetate CRS* in 2 ml of *cyclohexane R*.

Reference solution (b). Prepare as described for test solution (b), using *α-tocopheryl acetate CRS* instead of the substance to be examined.

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *ether R, cyclohexane R* (20:80 *V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in a current of air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with test solution (a) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). In the chromatograms obtained with test solution (b) and reference solution (b), there may be 2 spots depending on the degree of hydrolysis: the spot with the higher R_F value is due to α-tocopheryl acetate and corresponds to the spot in the chromatogram obtained with reference solution (a); the spot with the lower R_F value is due to α-tocopherol.

TESTS

Related substances. Gas chromatography (*2.2.28*): use the normalisation procedure.

Internal standard solution. Dissolve 1.0 g of *squalane R* in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Test solution (a). Dissolve 0.100 g of the substance to be examined in 10.0 ml of the internal standard solution.

Test solution (b). Dissolve 0.100 g of the substance to be examined in 10 ml of *cyclohexane R*.

Reference solution (a). Dissolve 0.100 g of *α-tocopheryl acetate CRS* in 10.0 ml of the internal standard solution.

Reference solution (b). Dissolve 10 mg of *α-tocopherol R* and 10 mg of *α-tocopheryl acetate R* in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Column:

- *material*: fused silica;
- *size*: *l* = 30 m, Ø = 0.25 mm;
- *stationary phase*: *poly(dimethyl)siloxane R* (film thickness 0.25 μm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15	280
Injection port		290
Detector		290

Detection: flame ionisation.

Injection: 1 μl of test solution (b) and reference solutions (a) and (b); inject directly onto the column or via a sufficiently inert, glass-lined injection port using an automatic injection device or other reproducible injection method.

System suitability:

- *resolution*: minimum 3.5 between the peaks due to α-tocopherol and α-tocopheryl acetate in the chromatogram obtained with reference solution (b);
- in the chromatogram obtained with reference solution (a), the area of the peak due to α-tocopherol is not greater than 0.2 per cent of the area of the peak due to α-tocopheryl acetate.

Limits:

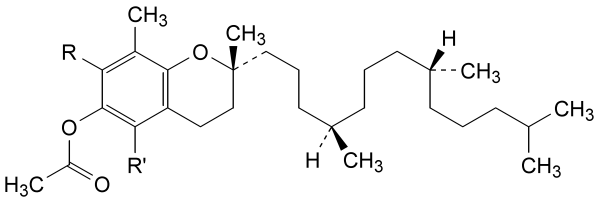
- *total*: maximum 4.0 per cent;
- *disregard limit*: 0.1 per cent.

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

ASSAY

Gas chromatography (*2.2.28*) as described in the test for related substances with the following modification.

Injection: test solution (a) and reference solution (a).



Calculate the percentage content of $C_{31}H_{52}O_3$ taking into account the declared content of *α-tocopheryl acetate CRS*.

STORAGE

Protected from light.

IMPURITIES

A. *RRR*-α-tocopherol,

B. R = H, R′ = CH_3: (2*R*)-2,5,8-trimethyl-2-[(4*R*,8*R*)–4,8,12-trimethyltridecyl]-3,4-dihydro-2*H*-1-benzopyran-6-yl acetate (*RRR*-β-tocopheryl acetate),

C. R = CH_3, R′ = H: (2*R*)-2,7,8-trimethyl-2-[(4*R*,8*R*)–4,8,12-trimethyltridecyl]-3,4-dihydro-2*H*-1-benzopyran-6-yl acetate (*RRR*-γ-tocopheryl acetate),

D. R = R′ = H: (2*R*)-2,8-dimethyl-2-[(4*R*,8*R*)-4,8,12-trimethyltridecyl]-3,4-dihydro-2*H*-1-benzopyran-6-yl acetate (*RRR*-δ-tocopheryl acetate).

01/2008:0691

α-TOCOPHERYL ACETATE CONCENTRATE (POWDER FORM)

α-Tocopherylis acetatis pulvis

DEFINITION

Preparation obtained either by finely dispersing *all-rac-α-Tocopheryl acetate (0439)* in a suitable carrier of suitable quality (for example gelatin, acacia, carbohydrates, lactoproteins or a mixture thereof) or by adsorbing *all-rac-α-Tocopheryl acetate (0439)* on silicic acid of suitable quality.

Content: 90.0 per cent to 115.0 per cent of the α-tocopheryl acetate content stated on the label, which is not less than 25 g per 100 g of concentrate.

CHARACTERS

Appearance: almost white, yellowish or light brown, small particles.

Solubility: practically insoluble or swells or forms a dispersion in water, depending on the formulation.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. To a quantity of the preparation to be examined corresponding to 50 mg of α-tocopheryl acetate add 5 ml of *0.01 M hydrochloric acid* and treat with ultrasound at 60 °C. Add 5 ml of *anhydrous ethanol R* and 10 ml of *cyclohexane R*, shake for 1 min and centrifuge for 5 min. Use the upper layer.

Reference solution. Dissolve 50 mg of *α-tocopheryl acetate CRS* in *cyclohexane R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *ether R, cyclohexane R* (20:80 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in a current of air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

ASSAY

Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 0.20 g of *dotriacontane R* in *hexane R* and dilute to 100.0 ml with the same solvent.

Test solution. Weigh accurately a quantity of the preparation to be examined corresponding to about 0.100 g of α-tocopheryl acetate in a 250 ml conical flask. Add 20 ml of *1 M hydrochloric acid* and treat with ultrasound at 70 °C for 20 min. Add 50 ml of *anhydrous ethanol R* and 50.0 ml of the internal standard solution and thoroughly mix the 2 layers for 30 min. Allow to separate, and use the upper layer.

Reference solution. Dissolve 0.100 g of *α-tocopheryl acetate CRS* in the internal standard solution and dilute to 50.0 ml with the same solution.

Column:

– *material*: silanised glass;
– *size*: *l* = 2.0-3.0 m, Ø = 2.2-4.0 mm;
– *stationary phase*: *diatomaceous earth for gas chromatography R* (125-150 µm or 150-180 µm), silanised with dimethyldichlorosilane and impregnated with 1-5 per cent *m/m* of *poly(dimethyl)siloxane R*;
– *plug*: silanised glass wool placed at each end of the column.

Carrier gas: *nitrogen for chromatography R.*

Flow rate: 25-90 ml/min.

Temperature:

– *column*: constant between 245 °C and 280 °C;
– *injection port and detector*: constant between 270 °C and 320 °C.

Detection: flame ionisation.

Injection: 1 µl; inject directly onto the column or via an injection port (preferably glass-lined) using an automatic injection device or other reproducible injection method.

System suitability: reference solution:

– *resolution*: minimum 1.4 between the peaks due to dotriacontane and α-tocopheryl acetate. Set the temperature of the column and the flow rate of the carrier gas in such a manner that the required resolution is achieved. Repeat the injection until the response factor (RF) determined as described below is constant to within ± 2 per cent.

Interference test. Weigh accurately a quantity of the substance to be examined corresponding to about 0.100 g of α-tocopheryl acetate in a 250 ml conical flask. Add 20 ml of *1 M hydrochloric acid* and treat with ultrasound at 70 °C for 20 min. Add 50 ml of *anhydrous ethanol R* and 50 ml of *hexane R* and thoroughly mix the 2 layers for 30 min. Allow to separate. Inject 1 µl of the upper layer and record the chromatogram, choosing an attenuation such that the height of the peak due to α-tocopheryl acetate is greater than 50 per cent of the maximum recorder response; during the recording, change the attenuation so that any peak appearing with the same retention time as that of the peak due to dotriacontane is recorded with a sensitivity at least 8 times greater than for the peak due to α-tocopheryl acetate. If a peak with a height of at least 5 mm for a recorder paper width of 250 mm is detected with the same retention time as that of dotriacontane, use the corrected peak area $S'_{D(corr)}$ for the final calculation.

$$S'_{D(corr)} = S'_D - \frac{S_I \times S'_T}{f \times S_{TI}}$$

S'_D = area of the peak due to dotriacontane in the chromatogram obtained with the test solution;

S_I = area of the peak with the same retention time as that of the peak due to dotriacontane in the chromatogram obtained in the interference test;

S'_T = area of the peak due to α-tocopheryl acetate in the chromatogram obtained with the test solution;

S_{TI} = area of the peak due to α-tocopheryl acetate in the chromatogram obtained in the interference test;

f = factor by which the attenuation was changed.

Record the chromatograms choosing an attenuation such that the peak due to α-tocopheryl acetate is greater than 50 per cent of the maximum recorder response.

Measure the areas of the peaks due to *α-tocopheryl acetate CRS* (S_T) and to dotriacontane (S_D) in the chromatogram obtained with the reference solution and the areas of the peaks due to α-tocopheryl acetate (S'_T) and to dotriacontane (S'_D) in the chromatogram obtained with the test solution.

Determine the response factor (RF) for α-tocopheryl acetate from the areas of the peak due to α-tocopheryl acetate and the peak due to dotriacontane in the chromatogram obtained with the reference solution using the following expression:

$$\frac{S_D \times m_T}{S_T \times m_D}$$

Calculate the percentage content of α-tocopheryl acetate using the following expression:

$$\frac{100 \times S'_T \times m_D \times RF}{S'_{D(corr.)} \times m}$$

S_D = area of the peak due to dotriacontane in the chromatogram obtained with the reference solution;

$S'_{D(corr.)}$ = corrected area of the peak due to dotriacontane in the chromatogram obtained with the test solution;

S_T = area of the peak due to *α-tocopheryl acetate CRS* in the chromatogram obtained with the reference solution;

S'_T = area of the peak due to α-tocopheryl acetate in the chromatogram obtained with the test solution;

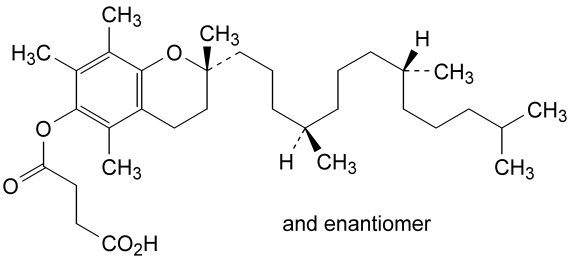
m_D = mass of dotriacontane in the test solution and in the reference solution, in milligrams;

m_T = mass of *α-tocopheryl acetate CRS* in the reference solution, in milligrams;

m = mass of the substance to be examined in the test solution, in milligrams.

STORAGE

In an airtight, well-filled container, protected from light.



LABELLING

The label states the content of α-tocopheryl acetate, expressed in grams per 100 g of concentrate.

01/2008:1258

DL-α-TOCOPHERYL HYDROGEN SUCCINATE

DL-α-Tocopherylis hydrogenosuccinas

$C_{33}H_{54}O_5$ M_r 530.8

DEFINITION

(2*RS*)-2,5,7,8-Tetramethyl-2-[(4*RS*,8*RS*)-4,8,12-trimethyltridecyl]-3,4-dihydro-2*H*-1-benzopyran-6-yl hydrogen succinate.

Content: 96.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, very soluble in methylene chloride, soluble in acetone and in anhydrous ethanol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Absorbance (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *RRR-α-tocopheryl hydrogen succinate CRS.*

C. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 10 mg of the substance to be examined in 2 ml of *cyclohexane R.*

Test solution (b). In a ground-glass-stoppered tube, dissolve 10 mg of the substance to be examined in 2 ml of *2.5 M alcoholic sulphuric acid R.* Heat on a water-bath for 5 min. Cool and add 2 ml of *water R* and 2 ml of *cyclohexane R.* Shake for 1 min. Use the upper layer.

Reference solution (a). Dissolve 10 mg of *RRR-α-tocopheryl hydrogen succinate CRS* in 2 ml of *cyclohexane R.*

Reference solution (b). Prepare as described for test solution (b), using *RRR-α-tocopheryl hydrogen succinate CRS* instead of the substance to be examined.

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *glacial acetic acid R, ether R, cyclohexane R* (0.2:20:80 *V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in a current of air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the principal spot in the chromatogram obtained with test solution (a) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). In the chromatograms obtained with test solution (b) and reference solution (b), there are 2 spots: the spot with the higher R_F value is due to α-tocopherol, the spot with the lower R_F value is due to DL-α-tocopheryl hydrogen succinate and corresponds to the spot obtained with reference solution (a). Depending on the degree of hydrolysis, the lower spot may be weak or even absent.

Detection B: spray with a mixture of 10 volumes of *hydrochloric acid R*, 40 volumes of a 2.5 g/l solution of *ferric chloride R* in *ethanol (96 per cent) R* and 40 volumes of a 10 g/l solution of *phenanthroline hydrochloride R* in *ethanol (96 per cent) R.*

Results B: in the chromatograms obtained with test solution (b) and reference solution (b), the spot due to α-tocopherol is orange.

D. Optical rotation (see Tests).

TESTS

Optical rotation (*2.2.7*): – 0.01° to + 0.01°.

Dissolve 2.50 g in *anhydrous ethanol R* and dilute to 25.0 ml with the same solvent.

Absorbance (*2.2.25*).

Solution A. Dissolve 0.150 g in *anhydrous ethanol R* and dilute to 100 ml with the same solvent.

Test solution (a). Dilute 10.0 ml of solution A to 100.0 ml with *anhydrous ethanol R.*

Test solution (b). Dilute 20.0 ml of solution A to 50.0 ml with *anhydrous ethanol R.*

Absorption maximum: at 284 nm for test solution (a).

Absorption minimum: at 254 nm for test solution (b).

Specific absorbance at the absorption maximum: 35 to 38 for test solution (a).

Specific absorbance at the absorption minimum: 6.0 to 8.0 for test solution (b).

Acid value (*2.5.1*): 101 to 108, determined on 1.00 g.

Free tocopherol: maximum 1.0 per cent.

Dissolve 0.500 g in 100 ml of *0.25 M alcoholic sulphuric acid R.* Add 20 ml of *water R* and 0.1 ml of a 2.5 g/l solution of *diphenylamine R* in *sulphuric acid R.* Titrate with *0.01 M ammonium and cerium sulphate* until a blue colour is

obtained that persists for at least 5 s. Carry out a blank titration.

1 ml of *0.01 M ammonium and cerium sulphate* is equivalent to 2.154 mg of free tocopherol.

Related substances

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

Heavy metals (*2.4.8*): maximum 20 ppm.

0.50 g complies with test D. Prepare the reference solution using 1 ml of *lead standard solution (10 ppm Pb) R*.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 0.300 g of *dotriacontane R* in *hexane R* and dilute to 100.0 ml with the same solvent.

Test solution. Weigh 30.0 mg of the substance to be examined into a 20 ml vial. Add 2.0 ml of *methanol R*, 1.0 ml of *dimethoxypropane R* and 0.1 ml of *hydrochloric acid R*. Cap tightly and sonicate. Allow to stand in the dark for 1 h ± 5 min. Remove from the dark, uncap and evaporate just to dryness on a steam bath with the aid of a stream of nitrogen. Add 10.0 ml of the internal standard solution. Vortex into solution.

Reference solution. Weigh 30.0 mg of *RRR-α-tocopheryl hydrogen succinate CRS* into a 20 ml vial. Add 2.0 ml of *methanol R*, 1.0 ml of *dimethoxypropane R* and 0.1 ml of *hydrochloric acid R*. Cap tightly and sonicate. Allow to stand in the dark for 1 h ± 5 min. Remove from the dark, uncap and evaporate just to dryness on a steam bath with the aid of a stream of nitrogen. Add 10.0 ml of the internal standard solution. Vortex into solution.

Column:

– *material*: fused silica;
– *size*: *l* = 15 m, Ø = 0.32 mm;
– *stationary phase*: *poly(dimethyl)siloxane R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 3-6 ml/min.

Split ratio: 1:10 to 1:20.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	200 → 250
	10 - 20	250
Injection port		300
Detector		330

Detection: flame ionisation.

Injection: 1 µl; inject directly onto the column or via a glass-lined injection port using an automatic injection device or some other reproducible injection method.

System suitability: reference solution:

– *resolution*: minimum 12.0 between the peaks due to dotriacontane and DL-α-tocopheryl hydrogen succinate.

Interference test. Dissolve 0.100 g of the substance to be examined in *hexane R* and dilute to 50.0 ml with the same solvent. Inject 1 µl of the solution and record the chromatogram. If a peak is detected with the same retention time as that of the peak due to dotriacontane, calculate the area of this peak relative to the peak area of the substance to be examined. If the relative peak area is greater than 0.5 per cent, use the corrected peak area $S'_{D(corr)}$ for the final calculation.

$$S'_{D(corr)} = S'_D - \frac{S_I \times S'_T}{S_{TI}}$$

S'_D = area of the peak due to dotriacontane in the chromatogram obtained with the test solution;

S_I = area of the peak with the same retention time as that of the peak due to dotriacontane in the chromatogram obtained in the interference test;

S'_T = area of the peak due to DL-α-tocopheryl hydrogen succinate in the chromatogram obtained with the test solution;

S_{TI} = area of the peak due to DL-α-tocopheryl hydrogen succinate in the chromatogram obtained in the interference test.

Measure the areas of the peaks due to *RRR-α-tocopheryl hydrogen succinate CRS* (S_T) and dotriacontane (S_D) in the chromatogram obtained with the reference solution and the areas of the peaks due to DL-α-tocopheryl hydrogen succinate (S'_T) and dotriacontane (S'_D) in the chromatogram obtained with the test solution.

Determine the response factor (RF) for DL-α-tocopheryl hydrogen succinate from the areas of the peaks due to *RRR-α-tocopheryl hydrogen succinate CRS* and dotriacontane in the chromatogram obtained with the reference solution, using the following expression:

$$\frac{S_D \times m_T}{S_T \times m_D}$$

Calculate the percentage content of DL-α-tocopheryl hydrogen succinate using the following expression:

$$\frac{100 \times S'_T \times m_D \times RF}{S'_{D(corr)} \times m}$$

S_D = area of the peak due to dotriacontane in the chromatogram obtained with the reference solution;

$S'_{D(corr)}$ = corrected area of the peak due to dotriacontane in the chromatogram obtained with the test solution;

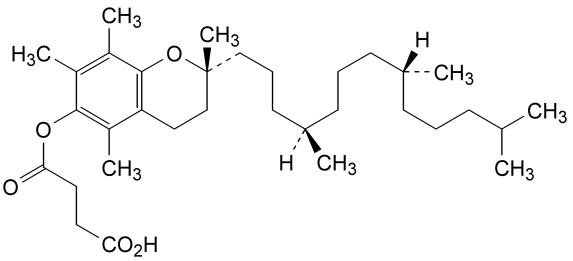
S_T = area of the peak due to *RRR-α-tocopheryl hydrogen succinate CRS* in the chromatogram obtained with the reference solution;

S'_T = area of the peak due to DL-α-tocopheryl hydrogen succinate in the chromatogram obtained with the test solution;

m_D = mass of dotriacontane in the test solution and in the reference solution, in milligrams;

m_T = mass of *RRR-α-tocopheryl hydrogen succinate CRS* in the reference solution, in milligrams;

m = mass of the substance to be examined in the test solution, in milligrams.



STORAGE

RRR-α-TOCOPHERYL HYDROGEN SUCCINATE

RRR-α-Tocopherylis hydrogenosuccinas

$C_{33}H_{54}O_5$ M_r 530.8
[4345-03-3]

DEFINITION

(2*R*)-2,5,7,8-Tetramethyl-2-[(4*R*,8*R*)-4,8,12-trimethyltridecyl]-3,4-dihydro-2*H*-1-benzopyran-6-yl hydrogen succinate.

Content: 96.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, very soluble in methylene chloride, soluble in acetone and in anhydrous ethanol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Absorbance (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *RRR-α-tocopheryl hydrogen succinate CRS.*

C. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 10 mg of the substance to be examined in 2 ml of *cyclohexane R.*

Test solution (b). In a ground-glass-stoppered tube, dissolve 10 mg of the substance to be examined in 2 ml of *2.5 M alcoholic sulphuric acid R.* Heat on a water-bath for 5 min. Cool and add 2 ml of *water R* and 2 ml of *cyclohexane R.* Shake for 1 min. Use the upper layer.

Reference solution (a). Dissolve 10 mg of *RRR-α-tocopheryl hydrogen succinate CRS* in 2 ml of *cyclohexane R.*

Reference solution (b). Prepare as described for test solution (b), using *RRR-α-tocopheryl hydrogen succinate CRS* instead of the substance to be examined.

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *glacial acetic acid R, ether R, cyclohexane R* (0.2:20:80 *V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in a current of air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the principal spot in the chromatogram obtained with test solution (a) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). In the chromatograms obtained with test solution (b) and reference solution (b), there are 2 spots: the spot with the higher R_F value is due to α-tocopherol, the spot with the lower R_F value is due to *RRR*-α-tocopheryl hydrogen succinate and corresponds to the spot obtained with reference solution (a). Depending on the degree of hydrolysis, the lower spot may be weak or even absent.

Detection B: spray with a mixture of 10 volumes of *hydrochloric acid R*, 40 volumes of a 2.5 g/l solution of *ferric chloride R* in *ethanol (96 per cent) R* and 40 volumes of a 10 g/l solution of *phenanthroline hydrochloride R* in *ethanol (96 per cent) R.*

Results B: in the chromatograms obtained with test solution (b) and reference solution (b), the spot due to α-tocopherol is orange.

D. After saponification, the resulting *RRR*-α-tocopherol is dextrorotatory (*2.2.7*). The specific optical rotation after oxidation to the quinone form is not less than + 24.

Carry out the test avoiding exposure to actinic light. Transfer 1.0 g to a round bottomed, ground-glass-stoppered, 250 ml flask, dissolve in 30 ml of *anhydrous ethanol R* and heat under reflux for 3 min. While the solution is boiling, add, through the condenser, 20 ml of *2 M alcoholic potassium hydroxide solution R.* Continue heating under reflux for 20 min and, without cooling, add 4.0 ml of *hydrochloric acid R* dropwise through the condenser. Cool, rinse the condenser with 10 ml of *anhydrous ethanol R*, transfer the contents of the flask to a 500 ml separating funnel, and rinse the flask with 4 quantities, each of 25 ml, of *water R* and 4 quantities, each of 25 ml, of *ether R.* Add the rinsings to the separating funnel. Shake vigorously for 2 min, allow the layers to separate and collect each of the 2 layers in individual separating funnels. Shake the aqueous layer with 2 quantities, each of 50 ml, of *ether R* and add these extracts to the main ether extract. Wash the combined ether extracts with 4 quantities, each of 100 ml, of *water R* and discard the washings.

To the ether solution add 40 ml of a 100 g/l solution of *potassium ferricyanide R* in an 8 g/l solution of *sodium hydroxide R* and shake for 3 min. Wash the ether solution with 4 quantities, each of 50 ml, of *water R*, discard the washings and dry the ether layer over *anhydrous sodium sulphate R.* Evaporate the ether on a water-bath under reduced pressure or in an atmosphere of nitrogen until a few millilitres remain, then complete the evaporation removing the last traces of ether without the application of heat. Immediately dissolve the residue in 25.0 ml of *trimethylpentane R* and determine the optical rotation.

Calculate the specific optical rotation of the substance in the test solution using as *c* the number of grams equivalent to α-tocopherol (factor 0.811) in 1000 ml.

TESTS

Absorbance (*2.2.25*).

Solution A. Dissolve 0.150 g in *anhydrous ethanol R* and dilute to 100 ml with the same solvent.

Test solution (a). Dilute 10.0 ml of solution A to 100.0 ml with *anhydrous ethanol R.*

Test solution (b). Dilute 20.0 ml of solution A to 50.0 ml with *anhydrous ethanol R.*

Absorption maximum: at 284 nm for test solution (a).

Absorption minimum: at 254 nm for test solution (b).

Specific absorbance at the absorption maximum: 35 to 38 for test solution (a).

Specific absorbance at the absorption minimum: 6.0 to 8.0 for test solution (b).

Acid value (*2.5.1*): 101 to 108, determined on 1.00 g.

Free tocopherol: maximum 1.0 per cent.

Dissolve 0.500 g in 100 ml of *0.25 M alcoholic sulphuric acid R*. Add 20 ml of *water R* and 0.1 ml of a 2.5 g/l solution of *diphenylamine R* in *sulphuric acid R*. Titrate with *0.01 M ammonium and cerium sulphate* until a blue colour is obtained that persists for at least 5 s. Carry out a blank titration.

1 ml of *0.01 M ammonium and cerium sulphate* is equivalent to 2.154 mg of free tocopherol.

Related substances

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

Heavy metals (*2.4.8*): maximum 20 ppm.

0.50 g complies with test D. Prepare the reference solution using 1 ml of *lead standard solution (10 ppm Pb) R*.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 0.300 g of *dotriacontane R* in *hexane R* and dilute to 100.0 ml with the same solvent.

Test solution. Weigh 30.0 mg of the substance to be examined into a 20 ml vial. Add 2.0 ml of *methanol R*, 1.0 ml of *dimethoxypropane R* and 0.1 ml of *hydrochloric acid R*. Cap tightly and sonicate. Allow to stand in the dark for 1 h ± 5 min. Remove from the dark, uncap and evaporate just to dryness on a steam bath with the aid of a stream of nitrogen. Add 10.0 ml of the internal standard solution. Vortex into solution.

Reference solution. Weigh 30.0 mg of *RRR-α-tocopheryl hydrogen succinate CRS* into a 20 ml vial. Add 2.0 ml of *methanol R*, 1.0 ml of *dimethoxypropane R* and 0.1 ml of *hydrochloric acid R*. Cap tightly and sonicate. Allow to stand in the dark for 1 h ± 5 min. Remove from the dark, uncap and evaporate just to dryness on a steam bath with the aid of a stream of nitrogen. Add 10.0 ml of the internal standard solution. Vortex into solution.

Column:

– *material*: fused silica;
– *size*: *l* = 15 m, Ø = 0.32 mm;
– *stationary phase*: *poly(dimethyl)siloxane R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 3-6 ml/min.

Split ratio: 1:10 to 1:20.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	200 → 250
	10 - 20	250
Injection port		300
Detector		330

Detection: flame ionisation.

Injection: 1 µl; inject directly onto the column or via a glass-lined injection port using an automatic injection device or some other reproducible injection method.

System suitability: reference solution:

– *resolution*: minimum 12.0 between the peaks due to dotriacontane and *RRR*-α-tocopheryl hydrogen succinate.

Interference test. Dissolve 0.100 g of the substance to be examined in *hexane R* and dilute to 50.0 ml with the same solvent. Inject 1 µl of the solution and record the chromatogram. If a peak is detected with the same retention time as that of the peak due to dotriacontane, calculate the area of this peak relative to the peak area of the substance to be examined. If the relative peak area is greater than 0.5 per cent, use the corrected peak area $S'_{D(corr)}$ for the final calculation.

$$S'_{D(corr)} = S'_D - \frac{S_I \times S'_T}{S_{TI}}$$

S'_D = area of the peak due to dotriacontane in the chromatogram obtained with the test solution;

S_I = area of the peak with the same retention time as that of the peak due to dotriacontane in the chromatogram obtained in the interference test;

S'_T = area of the peak due to *RRR*-α-tocopheryl hydrogen succinate in the chromatogram obtained with the test solution;

S_{TI} = area of the peak due to *RRR*-α-tocopheryl hydrogen succinate in the chromatogram obtained in the interference test.

Measure the areas of the peaks due to *RRR-α-tocopheryl hydrogen succinate CRS* (S_T) and dotriacontane (S_D) in the chromatogram obtained with the reference solution and the areas of the peaks due to *RRR*-α-tocopheryl hydrogen succinate (S'_T) and dotriacontane (S'_D) in the chromatogram obtained with the test solution.

Determine the response factor (RF) for *RRR*-α-tocopheryl hydrogen succinate from the areas of the peaks due to *RRR-α-tocopheryl hydrogen succinate CRS* and dotriacontane in the chromatogram obtained with the reference solution, using the following expression:

$$\frac{S_D \times m_T}{S_T \times m_D}$$

Calculate the percentage content of *RRR*-α-tocopheryl hydrogen succinate using the following expression:

$$\frac{100 \times S'_T \times m_D \times RF}{S'_{D(corr)} \times m}$$

S_D = area of the peak due to dotriacontane in the chromatogram obtained with the reference solution;

$S'_{D(corr)}$ = corrected area of the peak due to dotriacontane in the chromatogram obtained with the test solution;

S_T = area of the peak due to *RRR-α-tocopheryl hydrogen succinate CRS* in the chromatogram obtained with the reference solution;

S'_T = area of the peak due to *RRR*-α-tocopheryl hydrogen succinate in the chromatogram obtained with the test solution;

m_D = mass of dotriacontane in the test solution and in the reference solution, in milligrams;

m_T = mass of *RRR-α-tocopheryl hydrogen succinate CRS* in the reference solution, in milligrams;

m = mass of the substance to be examined in the test solution, in milligrams.

TOLBUTAMIDE

Tolbutamidum

$C_{12}H_{18}N_2O_3S$ M_r 270.3
[64-77-7]

DEFINITION

Tolbutamide contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1-butyl-3-[(4-methylphenyl)sulphonyl]urea, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, soluble in acetone and in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. Melting point (*2.2.14*): 126 °C to 130 °C.

B. Dissolve 25.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Examined between 245 nm and 300 nm (*2.2.25*), the solution shows three absorption maxima, at 258 nm, 263 nm and 275 nm, and a shoulder at 268 nm. Dilute 10.0 ml of the solution to 250.0 ml with *methanol R*. Examined between 220 nm and 235 nm, the solution shows a single absorption maximum, at 228 nm. The specific absorbance at this maximum is 480 to 520.

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *tolbutamide CRS*.

D. To 0.2 g add 8 ml of a 500 g/l solution of *sulphuric acid R* and heat under a reflux condenser for 30 min. Allow to cool. Crystals are formed which, after recrystallisation from hot *water R* and drying at 100 °C to 105 °C, melt (*2.2.14*) at 135 °C to 140 °C.

TESTS

Appearance of solution. Dissolve 0.2 g in 5 ml of *dilute sodium hydroxide solution R* and add 5 ml of *water R*. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*). To 2.0 g add 50 ml of *carbon dioxide-free water R* and heat at 70 °C for 5 min. Cool rapidly and filter. The pH of the filtrate is 4.5 to 5.5.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.50 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 15 mg of *toluenesulphonamide R* in *acetone R* and dilute to 100 ml with the same solvent.

Reference solution (b). To 5 ml of the test solution add 5 ml of reference solution (a).

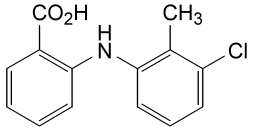
Apply to the plate 5 µl of the test solution and of reference solution (a) and 10 µl of reference solution (b). Develop over a path of 15 cm using a mixture of 2 volumes of *anhydrous formic acid R*, 8 volumes of *methanol R* and 90 volumes of *chloroform R*. Dry the plate in a current of warm air and heat at 110 °C for 10 min. At the bottom of a chromatography tank, place an evaporating dish containing a 50 g/l solution of *potassium permanganate R* and add an equal volume of *hydrochloric acid R*. Place the plate whilst still hot in the tank and close the tank. Leave the plate in contact with the chlorine vapour for 2 min. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed and an area of coating below the points of application gives at most a very faint blue colour with a drop of *potassium iodide and starch solution R*; avoid prolonged exposure to cold air. Spray with *potassium iodide and starch solution R* and allow to stand for 5 min. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.3 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Heavy metals (*2.4.8*). Dissolve 1.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *acetone R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with limit test B for heavy metals (20 ppm). Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *acetone R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.2500 g in a mixture of 20 ml of *water R* and 40 ml of *alcohol R*. Titrate with *0.1 M sodium hydroxide*, using 1 ml of *phenolphthalein solution R* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 27.03 mg of $C_{12}H_{18}N_2O_3S$.

corrected 6.0

TOLFENAMIC ACID

Acidum tolfenamicum

$C_{14}H_{12}ClNO_2$ M_r 261.7
[13710-19-5]

DEFINITION

2-[(3-Chloro-2-methylphenyl)amino]benzoic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or slightly yellow, crystalline powder.

Solubility: practically insoluble in water, soluble in dimethylformamide, sparingly soluble in ethanol and in methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

mp: about 213 °C.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Dissolve 20 mg in a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol R* and dilute to 100 ml with the same mixture of solvents. Dilute 5.0 ml of the solution to 50 ml with a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol R*. Examined between 250 nm and 380 nm (*2.2.25*), the solution shows 2 absorption maxima, at 286 nm and 345 nm. The ratio of the absorbance measured at the maximum at 286 nm to that measured at the maximum at 345 nm is 1.2 to 1.4.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *tolfenamic acid CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 25 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 3 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 25 mg of *tolfenamic acid CRS* in a mixture of 1 volume of *methanol R* and 3 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Plate: *TLC silica gel GF_{254} plate R*.

Mobile phase: *glacial acetic acid R, dioxan R, toluene R* (1:25:90 *V/V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in a current of warm air.

Detection: ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in 5 ml of *ethanol R* and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 25 mg of *2-chlorobenzoic acid R* and 25 mg of *3-chloro-2-methylaniline R* in 5 ml of *ethanol R* and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *spherical end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 450 m^2/g and a pore size of 8 nm.

Mobile phase: *glacial acetic acid R, water R, ethanol R* (2:350:650 *V/V/V*).

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 232 nm.

Injection: 20 µl.

Run time: 3 times the retention time of tolfenamic acid.

Relative retention with reference to tolfenamic acid (retention time = about 15 min): impurity A = about 0.25; impurity B = about 0.34.

System suitability: reference solution (a):

- *resolution*: minimum 2.5 between the peaks due to impurity A and to impurity B.

Limits:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *impurity B*: not more than half the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.05 per cent),
- *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Copper: maximum 10.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Place 1.00 g of the substance to be examined in a silica crucible, moisten with *sulphuric acid R*, heat cautiously on a flame for 30 min and then progressively to about 650 ± 50 °C. Continue ignition until all black particles have disappeared. Allow to cool, dissolve the residue in *0.1 M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solutions. Prepare the reference solutions using *copper standard solution (0.1 per cent Cu) R*, diluted as necessary using *0.1 M nitric acid*.

Source: copper hollow-cathode lamp.

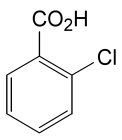
Wavelength: 324.8 nm.

Flame: air-acetylene.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

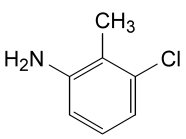
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



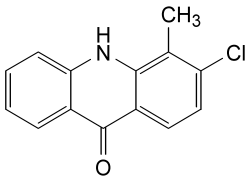
Dissolve 0.200 g with the aid of ultrasound in 100 ml of *ethanol R*. Add 0.1 ml of *phenol red solution R* and titrate with *0.1 M sodium hydroxide*.

1 ml of *0.1 M sodium hydroxide* is equivalent to 26.17 mg of $C_{14}H_{12}ClNO_2$.



STORAGE

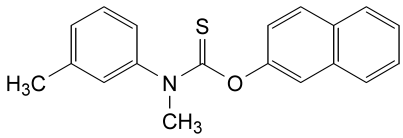
Protected from light.



IMPURITIES

A. 2-chlorobenzoic acid,

B. 3-chloro-2-methylaniline,



C. 3-chloro-4-methyl-9-oxo-9,10-dihydroacridine.

01/2008:1158

TOLNAFTATE

Tolnaftatum

$C_{19}H_{17}NOS$ M_r 307.4
[2398-96-1]

DEFINITION

Tolnaftate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of *O*-naphthalen-2-yl methyl(3-methylphenyl)thiocarbamate, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white powder, practically insoluble in water, freely soluble in acetone and in methylene chloride, very slightly soluble in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 109 °C to 112 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *tolnaftate CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Mix about 1 mg with 0.5 ml of *sulphuric acid R*. Add 0.05 ml of *formaldehyde solution R*. A greenish-blue colour develops.

TESTS

Appearance of solution. Dissolve 0.5 g in 10 ml of *acetone R*. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *acetone R* and dilute to 2 ml with the same solvent.

Test solution (b). Dilute 0.5 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dissolve 25 mg of *tolnaftate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 10 ml with *acetone R*.

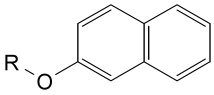
Reference solution (c). Dissolve 50 mg of *β-naphthol R* in 1 ml of test solution (a) and dilute to 10 ml with *acetone R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 12 cm using *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

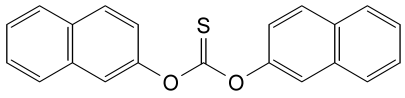
ASSAY



Dissolve 50.0 mg in *methanol R* and dilute to 250.0 ml with the same solvent. Dilute 2.0 ml to 50.0 ml with *methanol R*. Measure the absorbance (*2.2.25*) at the maximum at 257 nm.

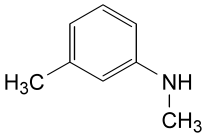
Calculate the content of $C_{19}H_{17}NOS$ taking the specific absorbance to be 720.

STORAGE



Store protected from light.

IMPURITIES



A. R = H: naphthalen-2-ol (β-naphtol),

C. R = CS-Cl: *O*-naphthalen-2-yl chlorothioformate,

B. *O,O*-dinaphtalen-2-yl thiocarbonate,

D. *N*,3-dimethylaniline.

01/2008:1596

TOLU BALSAM

Balsamum tolutanum

DEFINITION

Oleo-resin obtained from the trunk of *Myroxylon balsamum* (L.) Harms var. *balsamum*.

Content: 25.0 per cent to 50.0 per cent of free or combined acids, expressed as cinnamic acid ($C_9H_8O_2$; M_r 148.2) (dried drug).

CHARACTERS

Appearance: hard, friable, brownish to reddish-brown mass; thin fragments are brownish-yellow when examined against the light.

Reminiscent odour of vanillin.

Solubility: practically insoluble in water, very soluble to freely soluble in alcohol, practically insoluble in light petroleum.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. Stir 0.40 g of the fragmented drug with 10 ml of *methylene chloride R* for 5 min and filter.

Reference solution. Dissolve 50 mg of *benzyl cinnamate R* in *methylene chloride R*, add 50 µl of *benzyl benzoate R* and dilute to 10 ml with *methylene chloride R*.

Plate: *TLC silica gel G plate R*.

Mobile phase: *light petroleum R, toluene R* (5:95 *V/V*).

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *vanillin reagent R* and heat at 100-105 °C for 5 min. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the test and reference solutions. Furthermore, other coloured zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Benzyl benzoate: a greyish-blue zone	a greyish-blue zone
Benzyl cinnamate: a greyish-green zone	a greyish-green zone
Reference solution	**Test solution**

TESTS

Acid value: 100 to 160.

Dissolve 0.5 g of the fragmented drug in 50 ml of *alcohol R*. Add 0.5 ml of *acid blue 93 solution R* and 5.0 ml of *0.5 M alcoholic potassium hydroxide*. Stir vigorously and titrate with *0.5 M hydrochloric acid* until the colour changes from brownish-red to blackish-green (n_1 ml of *0.5 M hydrochloric acid*). Carry out a blank test in the same manner (n_2 ml of *0.5 M hydrochloric acid*). Calculate the acid value in the same manner as the saponification value (*2.5.6*).

Matter insoluble in alcohol: maximum 5 per cent.

Boil 2.0 g of the fragmented drug with 25 ml of *alcohol (90 per cent V/V) R* and filter. Wash the residue with *alcohol (90 per cent V/V) R*, boiling until completely extracted, then dry the residue at 100-105 °C. Weigh the residue.

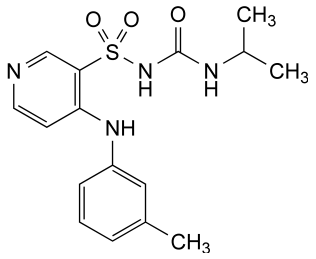
Loss on drying (*2.2.32*): maximum 5.0 per cent, determined on 2.000 g of the fragmented drug by spreading on a flat evaporating dish 9 cm in diameter and allowing to dry *in vacuo* for 4 h.

Total ash (*2.4.16*): maximum 0.3 per cent.

ASSAY

Boil 1.500 g under a reflux condenser with 25 ml of *0.5 M alcoholic potassium hydroxide* for 1 h. Evaporate the ethanol and heat the residue with 50 ml of *water R* until the substance is homogeneously distributed. After cooling, add 80 ml of *water R* and a solution of 1.5 g of *magnesium sulphate R* in 50 ml of *water R*. Mix, and allow to stand for 10 min. Filter through a pleated filter paper and wash the residue with 20 ml of *water R*. Combine the filtrate and the washings, acidify with *hydrochloric acid R* and extract with 4 quantities, each of 40 ml, of *ether R*. Discard the aqueous layer. Combine the organic extracts and wash with 2 quantities, each of 20 ml, and with 3 quantities, each of 10 ml, of a 50 g/l solution of *sodium bicarbonate R*. Discard the ether layer. Combine the aqueous extracts, acidify with *hydrochloric acid R* and stir once with 30 ml, twice with 20 ml and once with 10 ml of *methylene chloride R*. Dry the combined methylene chloride extracts over *anhydrous sodium sulphate R*. Filter through a pleated filter and wash the residue with 10 ml of *methylene chloride R*. Reduce the combined methylene chloride extracts to 10 ml by distillation and eliminate the remaining methylene chloride in a current of air. Dissolve the residue with heating in 10 ml of *alcohol R* previously neutralised to *phenol red solution R*. After cooling, titrate with *0.1 M sodium hydroxide*, using the same indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 14.82 mg of total acids, expressed as cinnamic acid.



STORAGE

Do not store in powdered form.

01/2008:2132
corrected 6.0

TORASEMIDE, ANHYDROUS

Torasemidum anhydricum

$C_{16}H_{20}N_4O_3S$ M_r 348.4
[56211-40-6]

DEFINITION

1-(1-Methylethyl)-3-[[4-[(3-methylphenyl)amino]pyridin-3-yl]sulphonyl]urea.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, slightly soluble in ethanol (96 per cent). It is sparingly soluble in dilute solutions of alkali hydroxides and slightly soluble in dilute acids.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *anhydrous torasemide CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Solution A. Dissolve 2.7 g of *potassium dihydrogen phosphate R* in 950 ml of *water R*, adjust to pH 3.5 with *phosphoric acid R* and dilute to 1000 ml with *water R*.

Test solution. Dissolve 20.0 mg of the substance to be examined in 15 ml of *methanol R*, sonicate for 15 min. Add 22.5 ml of solution A, cool to room temperature and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve the contents of a vial of *torasemide for system suitability CRS* (containing impurities A, B, C and D) in 0.5 ml of *methanol R*. Add 0.5 ml of solution A.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.125 m, Ø = 4.0 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 30 °C.

Mobile phase: *methanol R*, solution A (40:60 *V/V*).

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 288 nm.

Injection: 20 µl.

Run time: 2.5 times the retention time of torasemide.

Relative retention with reference to torasemide (retention time = about 10 min): impurity A = about 0.3; impurity B = about 0.4; impurity C = about 0.5; impurity D = about 2.3.

System suitability: reference solution (a):

– *resolution*: minimum 3.0 between the peaks due to impurity B and impurity C;
– the chromatogram obtained is similar to the chromatogram supplied with *torasemide for system suitability CRS*.

Limits:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 5.1; impurity B = 0.76;
– *impurities A, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *impurity B*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *total*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

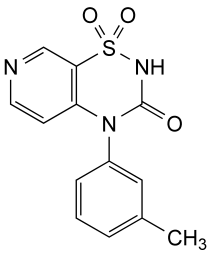
2.0 g complies with limit test F. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

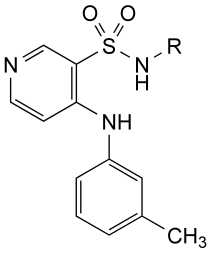
ASSAY

Dissolve 0.300 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



1 ml of *0.1 M perchloric acid* is equivalent to 34.84 mg of $C_{16}H_{20}N_4O_3S$.

STORAGE



Protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

A. 4-(3-methylphenyl)-2*H*-pyrido[4,3-*e*]-1,2,4-thiadiazin-3(4*H*)-one 1,1-dioxide,

B. R = H: 4-[(3-methylphenyl)amino]pyridine-3-sulphonamide,

C. R = CO-NH-C_2H_5: 1-ethyl-3-[[4-[(3-methylphenyl)-amino]pyridin-3-yl]sulphonyl]urea,

D. R = CO-NH-[CH_2]$_3$-CH_3: 1-butyl-3-[[4-[(3-methylphenyl)amino]pyridin-3-yl]sulphonyl]urea.

01/2008:1478
corrected 6.0

TORMENTIL

Tormentillae rhizoma

DEFINITION

Whole or cut, dried rhizome, freed from the roots, of *Potentilla erecta* (L.) Raeusch. (*P. tormentilla* Stokes).

Content: minimum 7 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

IDENTIFICATION

A. The rhizome is cylindrically spindle-shaped, with a very irregular appearance, often forming, twisted, knotty tubers, up to 10 cm long and 1 cm to 2 cm thick, very hard and scarcely branched. The surface is brown to reddish-brown, rugose and has remains of roots and transversely elongated depressed whitish scars from the

stems. At the top of the rhizome the remains of numerous aerial stems may be present. The fracture is short and granular, dark red to brownish-yellow.

B. Reduce to a powder (355) (*2.9.12*). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: coarsely serrate cluster crystals of calcium oxalate, up to 60 µm in diameter; fragments of thin-walled parenchyma containing reddish-brown tannin; groups of narrow, bordered-pitted vessels with lateral pores; thick-walled and pitted, polygonal parenchyma; groups and fragments of sclerenchymatous thick-walled fibres; occasional fragments of cork with thin-walled, brown, tabular cells. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows spherical or elliptical starch granules, up to about 20 µm in length.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 0.5 g of the powdered drug (355) (*2.9.12*) add 10 ml of *water R*, shake for 10 min and filter. Shake the filtrate with 2 quantities, each of 10 ml, of *ethyl acetate R* and filter the combined upper phases over 6 g of *anhydrous sodium sulphate R*. Evaporate the filtrate to dryness under reduced pressure and dissolve the residue in 1.0 ml of *ethyl acetate R*.

Reference solution. Dissolve 1.0 mg of *catechin R* in 1.0 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *glacial acetic acid R, ether R, hexane R, ethyl acetate R* (20:20:20:40 *V/V/V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air for 10-15 min.

Detection: spray with a freshly prepared 5 g/l solution of *fast blue B salt R*. Reddish zones appear. Expose the plate to ammonia vapour, the zones become more intense turning reddish-brown. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fainter zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Catechin: an intense reddish-brown zone	A more intense reddish-brown zone (catechin) A fainter zone An intense zone Fainter zones
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 3 per cent of root and stems as well as rhizomes with black fracture and maximum 2 per cent of other foreign matter.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 5.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (*2.8.14*). Use 0.500 g of the powdered drug (180) (*2.9.12*).

01/2008:1895

TORMENTIL TINCTURE

Tormentillae tinctura

DEFINITION

Tincture produced from *Tormentil (1478)*.

Content: minimum 1.5 per cent *m/m* of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1).

PRODUCTION

The tincture is produced from 1 part of comminuted drug and 5 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

Red or reddish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. Mix 1.0 ml of the tincture to be examined with 1.0 ml of *alcohol (70 per cent V/V) R*.

Reference solution. Dissolve 1.0 mg of *catechin R* in 1.0 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ether R, glacial acetic acid R, hexane R, ethyl acetate R* (20:20:20:40 *V/V/V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air for 10-15 min.

Detection: spray with a freshly prepared 5 g/l solution of *fast blue B salt R*. Reddish zones appear. Expose the plate to ammonia vapour, the zones become more intense, turning reddish-brown. Examine in daylight.

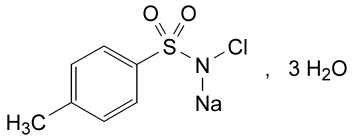
Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Catechin: an intense zone	An intense zone (catechim) A fainter zone An intense zone Fainter zones
Reference solution	**Test solution**

TESTS

Ethanol content (*2.9.10*): 64 per cent *V/V* to 69 per cent *V/V*.

Methanol and 2-propanol (*2.9.11*): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.



ASSAY

Carry out the determination of tannins in herbal drugs (*2.8.14*). Use 2.50 g of the tincture to be examined.

corrected 6.0

TOSYLCHLORAMIDE SODIUM

Tosylchloramidum natricum

$C_7H_7ClNNaO_2S,3H_2O$ M_r 281.7

DEFINITION

Sodium *N*-chloro-4-methylbenzene-sulphonimidate trihydrate.

Content: 98.0 per cent to 103.0 per cent of $C_7H_7ClNNaO_2S,3H_2O$.

CHARACTERS

Appearance: white or slightly yellow, crystalline powder.

Solubility: freely soluble in water, soluble in ethanol (96 per cent).

IDENTIFICATION

A. Solution S (see Tests) turns *red litmus paper R* blue and then bleaches it.

B. To 10 ml of solution S add 10 ml of *dilute hydrogen peroxide solution R*. A white precipitate is formed which dissolves on heating. Filter the hot solution and allow to cool. White crystals are formed which, when washed and dried at 100-105 °C, melt (*2.2.14*) at 137 °C to 140 °C.

C. Ignite cautiously 1 g, because of the risk of deflagration. Dissolve the residue in 10 ml of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

D. The solution prepared for identification test C gives reaction (a) of sulphates (*2.3.1*).

E. The solution prepared for identification test C gives reaction (b) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (*2.2.1*) and is colourless (*2.2.2, Method II*).

pH (*2.2.3*): 8.0 to 10.0 for solution S.

Ortho compound. To 2 g add 10 ml of *water R*, mix, add 1 g of *sodium metabisulphite R* and heat to boiling. Cool to 0 °C, filter rapidly and wash with 3 quantities, each of 5 ml, of iced *water R*. The precipitate, dried over *diphosphorus pentoxide R* at a pressure not exceeding 600 Pa, melts (*2.2.14*) at a minimum of 134 °C.

Residue insoluble in anhydrous ethanol: maximum 2 per cent.

Shake 1.00 g with 20 ml of *anhydrous ethanol R* for 30 min, filter on a tared filter, wash any residue with 5 ml of *anhydrous ethanol R* and dry at 100-105 °C. The residue weighs a maximum of 20 mg.

ASSAY

Dissolve 0.125 g in 100 ml of *water R* in a ground-glass-stoppered flask. Add 1 g of *potassium iodide R* and 5 ml of *dilute sulphuric acid R*. Allow to stand for 3 min. Titrate with *0.1 M sodium thiosulphate*, using 1 ml of *starch solution R* as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 14.08 mg of $C_7H_7ClNNaO_2S,3H_2O$.

STORAGE

In an airtight container, protected from light.

01/2008:0532

TRAGACANTH

Tragacantha

DEFINITION

Tragacanth is the air-hardened, gummy exudate, flowing naturally or obtained by incision from the trunk and branches of *Astragalus gummifer* Labill. and certain other species of *Astragalus* from western Asia.

IDENTIFICATION

A. Tragacanth occurs in thin, flattened, ribbon-like, white or pale yellow, translucent strips, about 30 mm long and 10 mm wide and up to 1 mm thick, more or less curved; horny, fracture short; the surface is marked by fine longitudinal striae and concentric transverse ridges. It may also contain pieces similar in shape but somewhat thicker, more opaque and more difficult to fracture.

B. Reduce to a powder (355) (*2.9.12*). The powder is white or almost white and it forms a mucilaginous gel with about ten times its mass of *water R*. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows in the gummy mass numerous stratified cellular membranes turning slowly violet when treated with *iodinated zinc chloride solution R*. The gummy mass includes starch grains, isolated or in small groups, usually rounded in shape and sometimes deformed, with diameters varying between 4 µm and 10 µm, occasionally up to 20 µm, and a central hilum visible between crossed nicol prisms.

C. Examine the chromatograms obtained in the test for acacia. The chromatogram obtained with the test solution shows three zones, corresponding to galactose, arabinose and xylose. A faint yellowish zone at the solvent front and a greyish-green zone between the zones due to galactose and arabinose may be present.

D. Moisten 0.5 g of the powdered drug (355) (*2.9.12*) with 1 ml of *alcohol R* and add gradually, while shaking, 50 ml of *water R* until a homogeneous mucilage is obtained. To 5 ml of the mucilage add 5 ml of *water R* and 2 ml of *barium hydroxide solution R*. A slight flocculent precipitate is formed. Heat on a water-bath for 10 min. An intense yellow colour develops.

TESTS

Acacia. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution. To 100 mg of the powdered drug (355) (*2.9.12*) in a thick-walled, centrifuge test tube, add 2 ml of a 100 g/l solution of *trifluoroacetic acid R*, shake vigorously to dissolve the forming gel, stopper the test tube and heat the mixture at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant carefully into a 50 ml flask,

add 10 ml of *water R* and evaporate the solution to dryness under reduced pressure. To the resulting clear film add 0.1 ml of *water R* and 0.9 ml of *methanol R*. Centrifuge to separate the amorphous precipitate and dilute the supernatant if necessary to 1 ml with *methanol R*.

Reference solution. Dissolve 10 mg of *arabinose R*, 10 mg of *galactose R*, 10 mg of *rhamnose R* and 10 mg of *xylose R* in 1 ml of *water R* and dilute to 10 ml with *methanol R*.

Apply to the plate as bands 10 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of a 16 g/l solution of *sodium dihydrogen phosphate R*, 40 volumes of *butanol R* and 50 volumes of *acetone R*. Dry the plate in a current of warm air for a few minutes and again develop over a path of 15 cm using the same mobile phase. Dry the plate at 110 °C for 10 min, spray with *anisaldehyde solution R* and dry again at 110 °C for 10 min. The chromatogram obtained with the reference solution shows four clearly separated coloured zones due to galactose (greyish-green to green), arabinose (yellowish-green), xylose (greenish-grey or yellowish-grey) and rhamnose (yellowish-green), in order of increasing R_F value. The chromatogram obtained with the test solution does not show a yellowish-green zone corresponding to the zone of rhamnose in the chromatogram obtained with the reference solution.

Methylcellulose. Examine the chromatograms obtained in the test for acacia. The chromatogram obtained with the test solution does not show a red zone near the solvent front.

Sterculia gum

A. Place 0.2 g of the powdered drug (355) (*2.9.12*) in a 10 ml ground-glass-stoppered cylinder graduated in 0.1 ml. Add 10 ml of *alcohol (60 per cent V/V) R* and shake. Any gel formed occupies not more than 1.5 ml.

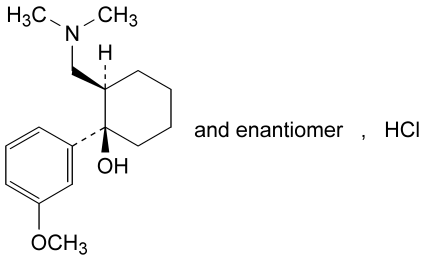
B. To 1.0 g of the powdered drug (355) (*2.9.12*) add 100 ml of *water R* and shake. Add 0.1 ml of *methyl red solution R*. Not more than 5.0 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Foreign matter. Place 2.0 g of the powdered drug (355) (*2.9.12*) in a 250 ml round-bottomed flask and add 95 ml of *methanol R*. Swirl to moisten the powder and add 60 ml of *hydrochloric acid R1*. Add a few glass beads about 4 mm in diameter and heat on a water-bath under a reflux condenser for 3 h, shaking occasionally. Remove the glass beads and filter the hot suspension *in vacuo* through a sintered-glass filter (160) (*2.1.2*). Rinse the flask with a small quantity of *water R* and pass the rinsings through the filter. Wash the residue on the filter with about 40 ml of *methanol R* and dry to constant mass at 110 °C (about 1 h). Allow to cool in a desiccator and weigh. The residue weighs not more than 20 mg (1.0 per cent).

Flow time. Not less than 10 s or, if the substance to be examined is to be used for the preparation of emulsions, not less than 50 s. Place 1.0 g of the powdered drug (125 to 250) (*2.9.12*) in a 1000 ml round bottomed flask with a ground-glass stopper and add 8.0 ml of *alcohol R* and close the flask. Disperse the suspension over the inner surface of the flask by shaking, taking care not to wet the stopper. Open the flask and add in one portion 72.0 ml of *water R*. Stopper the flask and shake vigorously for 3 min. Allow to stand for 24 h and shake vigorously again for 3 min. Eliminate air bubbles by applying vacuum above the mucilage for 5 min. Transfer the mucilage to a 50 ml cylinder. Dip in the mucilage a piece of glass tubing 200 mm long and 6.0 mm in internal diameter and graduated at 20 mm and 120 mm from the lower end; the tubing must not be rinsed with surface-active substances. When the mucilage has reached the upper mark, close the tube with a finger. Withdraw the closed tube, remove the finger and measure with a stop-watch the time needed for the meniscus to reach the lower graduation. Carry out this operation four times and determine the average value of the last three determinations.

Total ash (*2.4.16*). Not more than 4.0 per cent.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^4 micro-organisms per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (*2.6.13*).



LABELLING

The label states whether or not the contents are suitable for preparing emulsions.

01/2008:1681
corrected 6.0

TRAMADOL HYDROCHLORIDE

Tramadoli hydrochloridum

$C_{16}H_{26}ClNO_2$ M_r 299.8
[36282-47-0]

DEFINITION

(1*RS*,2*RS*)-2-[(Dimethylamino)methyl]-1-(3-methoxyphenyl)cyclohexanol hydrochloride.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water and in methanol, very slightly soluble in acetone.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 180 °C to 184 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *tramadol hydrochloride CRS*.

C. Chromatograms obtained in the test for impurity E.
Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 1.0 g in *water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity. To 10 ml of solution S, add 0.2 ml of *methyl red solution R* and 0.2 ml of *0.01 M hydrochloric acid*. The solution is red. Not more than 0.4 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to yellow.

Optical rotation (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

Impurity E. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 0.10 g in *methanol R* and dilute to 2 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 25 mg of *tramadol hydrochloride CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *tramadol impurity E CRS* in 5 ml of *methanol R*. Dilute 1 ml of the solution to 10 ml with *methanol R*.

Reference solution (c). Dissolve 5 mg of *tramadol impurity A CRS* in 1 ml of reference solution (a).

Plate: *TLC silica gel F_{254} plate R*, prewashed with *methanol R*.

Mobile phase: *concentrated ammonia R, 2-propanol R, toluene R* (1:19:80 *V/V/V*).

Application: 10 µl.

Development: over 2/3 of the plate. Saturate the plate for 20 min with *concentrated ammonia R*. For this, add *concentrated ammonia R* to one trough of a twin trough tank. Just before developing, add the mobile phase to the other trough. Place the plate in the chromatographic tank, ensuring that the layer of silica gel is orientated towards the middle of the tank.

Drying: in air.

Detection: expose the plate to iodine vapour for 1 h, examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (c) shows 2 clearly separated spots.

Limit: in the chromatogram obtained with test solution (a):

– *impurity E*: any spot corresponding to impurity E is not more intense and not greater than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.15 g of the substance to be examined in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *tramadol impurity A CRS* in 4.0 ml of the test solution and dilute to 100 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm,

– *stationary phase*: *base-deactivated end-capped octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: 295 volumes of *acetonitrile R* and 705 volumes of a mixture of 0.2 ml of *trifluoroacetic acid R* and 100 ml of *water R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 270 nm.

Injection: 20 µl.

Run time: 4 times the retention time of tramadol.

Relative retention with reference to tramadol (retention time = about 5 min): impurity A = about 0.85.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to impurity A and tramadol.

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),

– *any other impurity*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent),

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

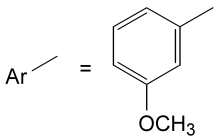
Heavy metals (*2.4.8*): maximum 20 ppm.

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of this solution complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

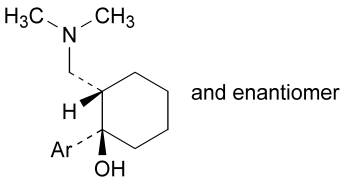
Water (*2.5.12*): maximum 0.5 per cent, determined on 1.000 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

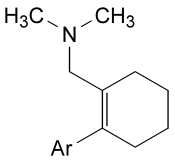


Dissolve 0.180 g in 25 ml of *anhydrous acetic acid R* and add 10 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



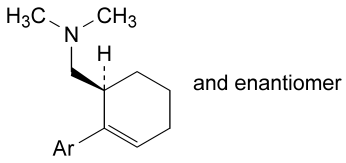
1 ml of *0.1 M perchloric acid* is equivalent to 29.98 mg of $C_{16}H_{26}ClNO_2$.

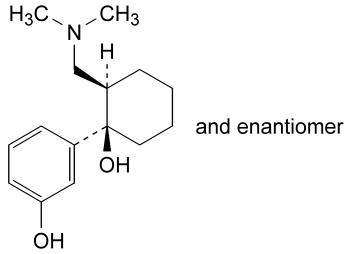
STORAGE



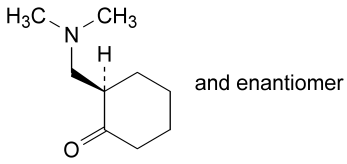
Protected from light.

IMPURITIES





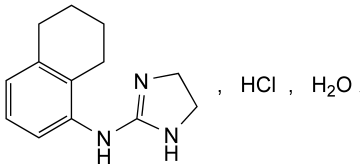
A. (1*RS*,2*SR*)-2-[(dimethylamino)methyl]-1-(3-methoxyphenyl)cyclohexanol,



B. [2-(3-methoxyphenyl)cyclohex-1-enyl]-*N*,*N*-dimethylmethanamine,

C. (1*RS*)-[2-(3-methoxyphenyl)cyclohex-2-enyl]-*N*,*N*-dimethylmethanamine,

D. (1*RS*,2*RS*)-2-[(dimethylamino)methyl]-1-(3-hydroxyphenyl)cyclohexanol,



E. (2*RS*)-2-[(dimethylamino)methyl]cyclohexanone.

01/2008:1597

TRAMAZOLINE HYDROCHLORIDE MONOHYDRATE

Tramazolini hydrochloridum monohydricum

$C_{13}H_{18}ClN_3,H_2O$ M_r 269.8
[74195-73-6]

DEFINITION

N-(5,6,7,8-Tetrahydronaphthalen-1-yl)-4,5-dihydro-1*H*-imidazol-2-amine hydrochloride monohydrate.

Content: 98.5 per cent to 101.5 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water and in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *tramazoline hydrochloride monohydrate CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

pH (*2.2.3*): 4.9 to 6.3 for solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in a mixture of 50 volumes of *acetonitrile R* and 50 volumes of *water R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 5.0 mg of *tramazoline impurity A CRS* and 5.0 mg of *tramazoline impurity B CRS* in 5 ml of a mixture of 50 volumes of *acetonitrile R* and 50 volumes of *water R* and add 5 ml of the test solution.

Reference solution (b). Dilute 0.2 ml of reference solution (a) to 100 ml with a mixture of 50 volumes of *acetonitrile R* and 50 volumes of *water R*.

Column:

– *size*: *l* = 0.125 m, Ø = 4 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: 2.0 g/l solution of *sodium dodecyl sulphate R* in a mixture of 6 volumes of *2-propanol R*, 42 volumes of *acetonitrile R* and 52 volumes of *water R*.

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 5 µl.

Run time: 3 times the retention time of tramazoline.

Relative retention with reference to tramazoline (retention time = about 6.5 min): impurity A = about 0.71; impurity B = about 0.86.

System suitability: reference solution (a):

– the chromatogram obtained shows 3 clearly separated peaks,

– *resolution*: minimum 1.5 between tramazoline and impurity B.

Limits:

– *impurity A*: not more than 3 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.3 per cent),

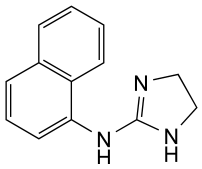
– *impurity B*: not more than 3 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.3 per cent),

– *any other impurity*: not more than the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *sum of other impurities*: not more than twice the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.2 per cent),

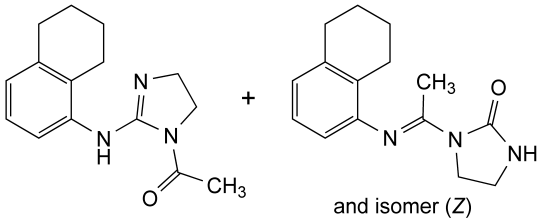
– *disregard limit*: 0.2 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.02 per cent).

Water (*2.5.12*): 6.2 per cent to 7.2 per cent, determined on 0.500 g.



Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

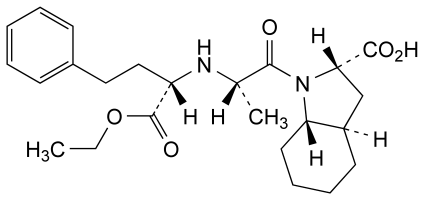


Dissolve 2.000 g in a mixture of 5 ml of *0.1 M hydrochloric acid* and 75 ml of *ethanol (96 per cent) R*. Carry out a potentiometric titration (*2.2.20*) using *1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *1 M sodium hydroxide* is equivalent to 251.8 mg of $C_{13}H_{18}ClN_3$.

IMPURITIES

A. *N*-(naphthalen-1-yl)-4,5-dihydro-1*H*-imidazol-2-amine,



B. mixture of 1-acetyl-*N*-(5,6,7,8-tetrahydronaphthalen-1-yl)-4,5-dihydro-1*H*-imidazol-2-amine and 1-[(*EZ*)-1-[(5,6,7,8-tetrahydronaphthalen-1-yl)imino]ethyl]imidazolidin-2-one.

01/2008:2245

TRANDOLAPRIL

Trandolaprilum

$C_{24}H_{34}N_2O_5$ M_r 430.5
[87679-37-6]

DEFINITION

(2*S*,3a*R*,7a*S*)-1-[(2*S*)-2-[[(1*S*)-1-(Ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in anhydrous ethanol.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *trandolapril CRS*.

TESTS

Appearance of solution. The solution is not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Dissolve 1.0 g in *methanol R* and dilute to 10 ml with the same solvent.

Specific optical rotation (*2.2.7*): – 16.5 to – 18.5 (anhydrous substance).

Dissolve 1.0 g in *anhydrous ethanol R* and dilute to 50.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with mobile phase A. Dilute 1.0 ml of this solution to 100.0 ml with mobile phase A.

Reference solution (b). Dissolve 5 mg of *trandolapril impurity C CRS* and 5 mg of *trandolapril impurity D CRS* in mobile phase A and dilute to 5 ml with mobile phase A. Dilute 1 ml of this solution to 20 ml with mobile phase A.

Column:
- *size*: *l* = 0.15 m, Ø = 4.6 mm,
- *stationary phase*: *end-capped polar-embedded octadecylsilyl amorphous organosilica polymer R* (3.5 µm),
- *temperature*: 40 °C.

Mobile phase:
- *mobile phase A*: mix 25 volumes of *acetonitrile R*, and 75 volumes of a 6.8 g/l solution of *potassium dihydrogen phosphate R* previously adjusted to pH 2.5 ± 0.1 with *phosphoric acid R*;
- *mobile phase B*: mix equal volumes of *acetonitrile R*, and a 6.8 g/l solution of *potassium dihydrogen phosphate R* previously adjusted to pH 2.2 ± 0.1 with *phosphoric acid R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 20	95	5
20 - 35	95 → 5	5 → 95
35 - 45	5	95
45 - 46	5 → 95	95 → 5
46 - 60	95	5

Flow rate: 1.3 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Relative retention with reference to trandolapril (retention time = about 14.5 min): impurity C = about 2.1; impurity D = about 2.5.

System suitability: reference solution (b):
- *resolution*: minimum 4 between the peaks due to impurity C and impurity D.

Limits:
- *correction factor*: for the calculation of content, multiply the peak area of impurity C by 2.2,
- *impurity C*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- *impurity D*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
– *sum of impurities other than D*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Palladium: maximum 5.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Solvent mixture: *nitric acid R, water R* (1:99 *V/V*).

Test solution. To the residue of the test for sulphated ash add 3 ml of *hydrochloric acid R* and 1 ml of *fuming nitric acid R*. Cover the crucible with a watch glass and heat at 160-170 °C for 1 h to dissolve the residue. Afterwards continue heating in the open crucible and evaporate the solution. Stop heating before the residue is completely dried, add 1 ml of *nitric acid R*, heat at 160-170 °C for further 10 min, and after cooling dilute to 10.0 ml with *water R*.

Reference solutions. Prepare reference solutions containing 0.5 µg, 1.0 µg and 1.5 µg of Pd per millilitre by diluting *palladium standard solution (500 ppm Pd) R* with the solvent mixture.

Source: palladium hollow-cathode lamp.

Wavelength: 244.8 nm.

Atomisation device: air-acetylene flame.

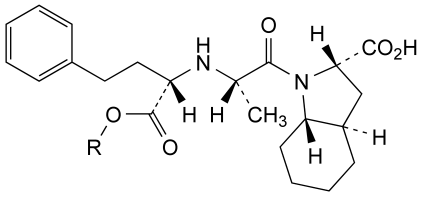
Water (*2.5.32*): maximum 0.2 per cent, determined on 1.000 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 2.0 g in a porcelain or quartz crucible.

ASSAY

Dissolve 0.300 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 43.05 mg of $C_{24}H_{34}N_2O_5$.

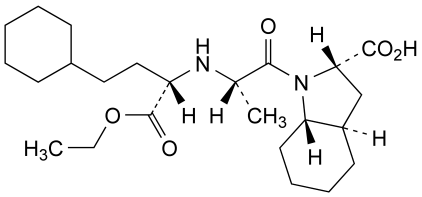


STORAGE

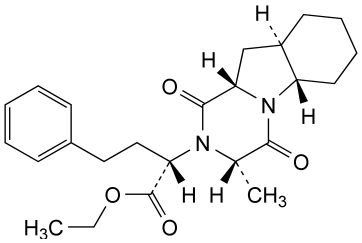
Protected from light.

IMPURITIES

Specified impurities: C, D.

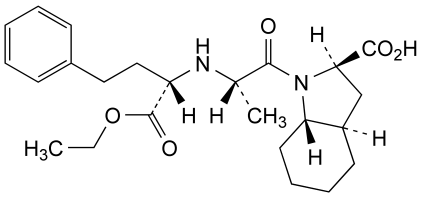


Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, E, F.*



A. R = CH_3: (2*S*,3a*R*,7a*S*)-1-[(2*S*)-2-[[(1*S*)-1-(methoxycarbonyl)-3-phenylpropyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid (methyl ester derivative),

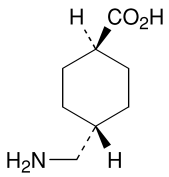
B. R = $CH(CH_3)_2$: (2*S*,3a*R*,7a*S*)-1-[(2*S*)-2-[[(1*S*)-1-[(1-methylethoxy)carbonyl]-3-phenylpropyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid (isopropyl ester derivative),



E. R = H: (2*S*,3a*R*,7a*S*)-1-[(2*S*)-2-[[(1*S*)-1-carboxy-3-phenylpropyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid (trandolaprilate),

C. (2*S*,3a*R*,7a*S*)-1-[(2*S*)-2-[[(1*S*)-3-cyclohexyl-1-(ethoxycarbonyl)propyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid (hexahydrotrandolapril),

D. ethyl (2*S*)-2-[(3*S*,5a*S*,9a*R*,10a*S*)-3-methyl-1,4-dioxodecahydropyrazino[1,2-*a*]indol-2(1*H*)-yl]-4-phenylbutanoate (trandolapril diketopiperazine),



F. (2*R*,3a*R*,7a*S*)-1-[(2*S*)-2-[[(1*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid.

TRANEXAMIC ACID

Acidum tranexamicum

$C_8H_{15}NO_2$ M_r 157.2
[1197-18-8]

DEFINITION

trans-4-(Aminomethyl)cyclohexanecarboxylic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water and in glacial acetic acid, practically insoluble in acetone and in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *tranexamic acid CRS*.

TESTS

pH (*2.2.3*): 7.0 to 8.0.

Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.20 g of the substance to be examined in *water R* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with *water R*. Dilute 1.0 ml of this solution to 10.0 ml with *water R*.

Reference solution (b). Dissolve 20 mg of *tranexamic acid CRS* (containing impurity C) in *water R* and dilute to 2 ml with the same solvent.

Reference solution (c). Dissolve 12 mg of *4-aminomethylbenzoic acid R* (impurity D) in *water R* and dilute to 100 ml with the same solvent. Dilute 1 ml of the solution to 50 ml with *water R*. Dilute 5 ml of this solution to 200 ml with *water R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm or *l* = 0.25 m, Ø = 6.0 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dissolve 11.0 g of *anhydrous sodium dihydrogen phosphate R* in 500 ml of *water R* and add 5 ml of *triethylamine R* and 1.4 g of *sodium laurilsulfate R*. Adjust to pH 2.5 with *dilute phosphoric acid R* and dilute to 600 ml with *water R*. Add 400 ml of *methanol R* and mix.

Flow rate: 0.9 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl.

Run time: 3 times the retention time of tranexamic acid.

Identification of impurities: use the chromatogram supplied with *tranexamic acid CRS* and the chromatogram obtained with reference solution (b) to identify the peak due to impurity C; use the chromatogram obtained with reference solution (c) to identify the peak due to impurity D.

Relative retention with reference to tranexamic acid (retention time = about 13 min): impurity C = about 1.1; impurity D = about 1.3; impurity B = about 1.5; impurity A = about 2.1.

System suitability: reference solution (b):

– *resolution*: minimum 1.5 between the peaks due to tranexamic acid and impurity C.

Limits:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 1.2; impurity C = 0.005; impurity D = 0.006;

– *impurity A*: not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);

– *impurity B*: not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *unspecified impurities*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *sum of unspecified impurities*: not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.025 per cent).

Halides expressed as chlorides (*2.4.4*): maximum 140 ppm.

Dissolve 1.2 g in *water R* and dilute to 50 ml with the same solvent.

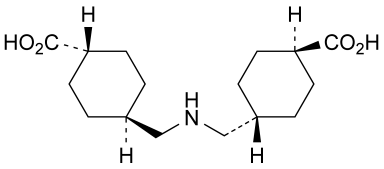
Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of this solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

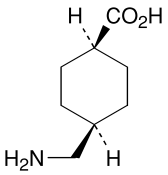
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



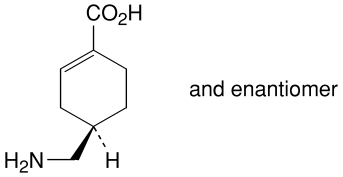
Dissolve 0.140 g in 20 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 15.72 mg of $C_8H_{15}NO_2$.

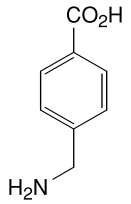


IMPURITIES

Specified impurities: A, B.



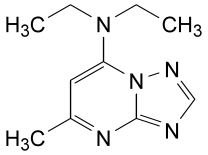
Other detectable impurities: C, D.



A. *trans,trans*-4,4′-(iminodimethylene)di(cyclohexanecarboxylic) acid,

B. *cis*-4-(aminomethyl)cyclohexanecarboxylic acid,

C. (*RS*)-4-(aminomethyl)cyclohex-1-enecarboxylic acid,



D. 4-aminomethylbenzoic acid.

01/2008:1576

TRAPIDIL

Trapidilum

$C_{10}H_{15}N_5$ M_r 205.3
[15421-84-8]

DEFINITION

N,N-Diethyl-5-methyl-[1,2,4]triazolo[1,5-*a*]pyrimidin-7-amine.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, soluble in ethanol and in methylene chloride.

mp: about 102 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *trapidil CRS*.

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.2 ml of *methyl red solution R* and 0.2 ml of *0.01 M hydrochloric acid*. The solution is red. Add 0.4 ml of *0.01 M sodium hydroxide*. The solution is yellow.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 5.0 mg of *trapidil impurity A CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *trapidil impurity B CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (c). Mix equal volumes of reference solution (a) and reference solution (b).

Column:

– *size*: *l* = 0.125 m, Ø = 4.0 mm,

– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (5 µm),

Mobile phase: 50 ml of *methanol R*, 75 ml of *acetonitrile R* and 800 ml of a 1.7 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 2.45 with *phosphoric acid R*; dilute to 1000 ml with *water R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 10 µl.

Run time: 3 times the retention time of trapidil.

System suitability:

– *resolution*: minimum of 4.0 between the peaks due to impurity A and impurity B in the chromatogram obtained with reference solution (c).

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.01 per cent).

Chlorides (*2.4.4*): maximum 100 ppm.

Dissolve 0.25 g in 10 ml of *water R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides. Prepare the standard using 5 ml of *chloride standard solution (5 ppm Cl) R*.

Ammonium (*2.4.1*): maximum 20 ppm.

0.50 g complies with limit test A. Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH_4) R*.

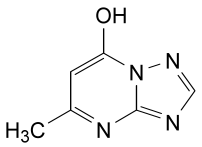
Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in 20 ml of *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

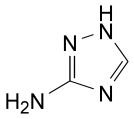
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.180 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 20.53 mg of $C_{10}H_{15}N_5$.

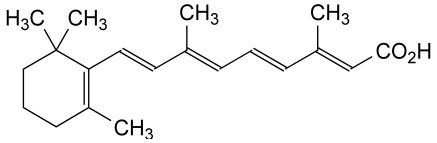


STORAGE

Protected from light.

IMPURITIES

A. 5-methyl-[1,2,4]triazolo[1,5-*a*]pyrimidin-7-ol,



B. 1,2,4-triazol-3-amine.

01/2008:0693
corrected 6.0

TRETINOIN

Tretinoinum

$C_{20}H_{28}O_2$ M_r 300.4
[302-79-4]

DEFINITION

Tretinoin contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (2*E*,4*E*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid, calculated with reference to the dried substance.

CHARACTERS

A yellow or light orange, crystalline powder, practically insoluble in water, soluble in methylene chloride, slightly soluble in alcohol. It is sensitive to air, heat and light, especially in solution.

It melts at about 182 °C, with decomposition.

Carry out all operations as rapidly as possible and avoid exposure to actinic light; use freshly prepared solutions.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Dissolve 75.0 mg in 5 ml of *methylene chloride R* and dilute immediately to 100.0 ml with acidified 2-propanol (prepared by diluting 1 ml of *0.01 M hydrochloric acid* to 1000 ml with *2-propanol R*). Dilute 5.0 ml of this solution to 100.0 ml with the acidified 2-propanol. Dilute 5.0 ml of this latter solution to 50.0 ml with the acidified 2-propanol. Examined between 300 nm and 400 nm (*2.2.25*), the solution shows a single maximum, at 353 nm. The specific absorbance at the maximum is 1455 to 1545.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *tretinoin CRS*. Examine the substances prepared as discs.

C. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel GF_{254} plate R*.

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *tretinoin CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of *glacial acetic acid R*, 4 volumes of *acetone R*, 40 volumes of *peroxide-free ether R* and 54 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve about 5 mg in 2 ml of *antimony trichloride solution R*. An intense red colour develops and later becomes violet.

TESTS

Related substances. Examine by liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of *isotretinoin CRS* in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 25.0 ml with *methanol R*.

Reference solution (c). Mix 1.0 ml of reference solution (a) with 0.5 ml of the test solution and dilute to 25.0 ml with *methanol R*.

Reference solution (d). Dilute 0.5 ml of the test solution to 100.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),

– as mobile phase at a flow rate of 1.0 ml/min a mixture of 5 volumes of *glacial acetic acid R*, 225 volumes of *water R* and 770 volumes of *methanol R*,

– as detector a spectrophotometer set at 355 nm.

Inject separately 10 µl of reference solutions (b), (c) and (d) and of the test solution. Adjust the sensitivity of the detector so that the height of the principal peak in the chromatogram obtained with reference solution (b) is about 70 per cent of the full scale of the recorder. The test is not valid unless the resolution between isotretinoin and tretinoin in the chromatogram obtained with reference solution (c) is at least 2.0. In the chromatogram obtained with the test solution, the area of the peak due to isotretinoin is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and the sum of the areas of any peaks, apart from the principal peak and any peak due to isotretinoin, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent).

Heavy metals (*2.4.8*). 0.5 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

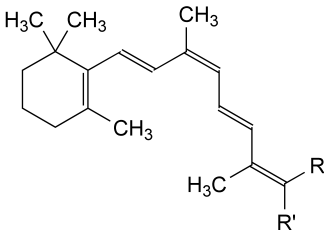
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 70 ml of *acetone R*. Titrate with *0.1 M tetrabutylammonium hydroxide* determining the end-point potentiometrically (*2.2.20*).

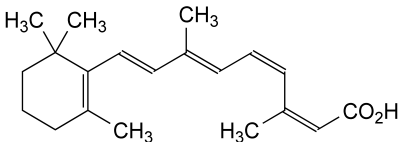
1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 30.04 mg of $C_{20}H_{28}O_2$.



STORAGE

Store in an airtight container, protected from light, at a temperature not exceeding 25 °C.

It is recommended that the contents of an opened container be used as soon as possible and any unused part be protected by an atmosphere of an inert gas.

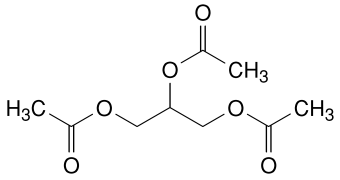


IMPURITIES

A. isotretinoin,

B. R = CO_2H, R′ = H: (2*Z*,4*E*,6*Z*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid (9,13-di-*cis*-retinoic acid),

D. R = H, R′ = CO_2H: (2*E*,4*E*,6*Z*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid (9-*cis*-retinoic acid),



C. (2*Z*,4*Z*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid (11,13-di-*cis*-retinoic acid),

E. oxidation products of tretinoin.

01/2008:1106
corrected 6.0

TRIACETIN

Triacetinum

$C_9H_{14}O_6$ M_r 218.2
[102-76-1]

DEFINITION

Propane-1,2,3-triyl triacetate.

Content: 97.0 per cent to 100.5 per cent (anhydrous substance).

CHARACTERS

Appearance: clear, colourless, slightly viscous oily liquid.

Solubility: soluble in water, miscible with ethanol (96 per cent) and toluene.

bp: about 260 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of triacetin*.

TESTS

Appearance. It is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Acidity. Dissolve 5.00 g in 25 ml of *anhydrous ethanol R*, previously neutralised to 0.2 ml of *phenolphtalein solution R* and add 0.20 ml of *0.1 M sodium hydroxide*. The pink colour of the mixture persists for 15 s.

Relative density (*2.2.5*): 1.159 to 1.164.

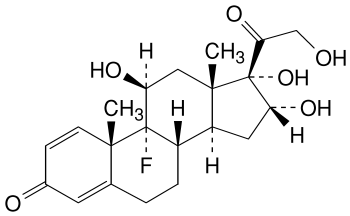
Refractive index (*2.2.6*): 1.429 to 1.432.

Water (*2.5.12*): maximum 0.2 per cent, determined on 5.00 g.

ASSAY

Introduce 0.300 g into a 250 ml borosilicate glass flask fitted with a reflux condenser. Add 25.0 ml of *0.5 M alcoholic potassium hydroxide* and a few glass beads. Attach the condenser and heat under reflux for 30 min. Add 1 ml of *phenolphthalein solution R1* and titrate immediately with *0.5 M hydrochloric acid*. Carry out a blank test under the same conditions. Calculate the content from the difference in consumption of alkali in the main and the blank procedure.

1 ml of *0.5 M alcoholic potassium hydroxide* is equivalent to 36.37 mg of $C_9H_{14}O_6$.



STORAGE

In a well-filled container.

01/2008:1376

TRIAMCINOLONE

Triamcinolonum

$C_{21}H_{27}FO_6$ M_r 394.4
[124-94-7]

DEFINITION

9-Fluoro-11β,16α,17,21-tetrahydroxypregna-1,4-diene-3,20-dione.

Content: 97.0 per cent to 103.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, slightly soluble in methanol, practically insoluble in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *triamcinolone CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness, dry the residues at 60 °C at a pressure not exceeding 0.7 kPa and record new spectra using the residues.

B. Thin-layer chromatography (*2.2.27*). *Prepare the solutions immediately before use and protect from light. Examine the plate under ultraviolet light immediately after development.*

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *triamcinolone CRS* in *methanol R* and dilute to 20 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *dexamethasone CRS* in reference solution (a) and dilute to 10 ml with the same solution.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: add a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*.

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Specific optical rotation (*2.2.7*): + 65 to + 72 (anhydrous substance).

Dissolve 0.100 g in *dimethylformamide R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use and protect from light.*

Test solution. Dissolve 25.0 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *water R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 2 mg of *triamcinolone CRS* and 2 mg of *triamcinolone impurity C CRS* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of equal volumes of *methanol R* and *water R*.

Blank: *methanol R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: a mixture prepared as follows: in a 1000 ml volumetric flask mix 525 ml of *methanol R* with 400 ml of *water R* and allow to equilibrate; adjust the volume to 1000 ml with *water R* and mix again.

Flow rate: 1 ml/min.

Detection: spectrophotometer set at 238 nm.

Injection: 20 µl.

Run time: 4.5 times the retention time of triamcinolone.

Retention time: triamcinolone = about 11 min.

System suitability: reference solution (a):

– *resolution*: minimum of 1.8 between the peaks due to triamcinolone and to impurity C.

Limits:

– *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent) and not more than 2 such peaks have an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

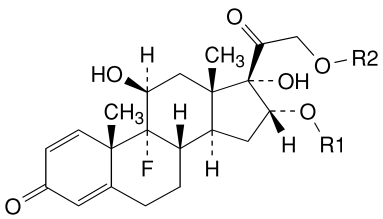
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent),

– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (*2.5.12*): maximum 1.0 per cent, determined on 0.500 g.

ASSAY

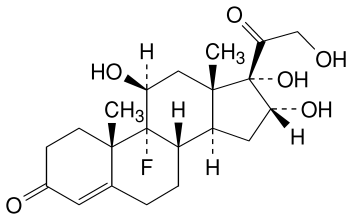
Prepare the solutions immediately before use and protect from light.



Dissolve 50.0 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *alcohol R*. Measure the absorbance (*2.2.25*) at the maximum at 238 nm.

Calculate the content of $C_{21}H_{27}FO_6$ taking the specific absorbance to be 389.

STORAGE

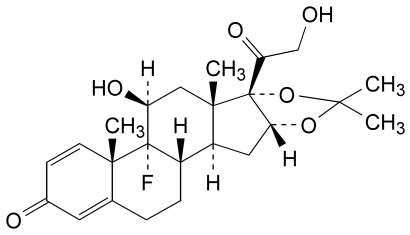


Protected from light.

IMPURITIES

A. R1 = R2 = CO-CH_3: 9-fluoro-11β,17-dihydroxy-3,20-dioxopregna-1,4-diene-16α,21-diyl diacetate (triamcinolone 16,21-diacetate),

B. R1 = H, R2 = CO-CH_3: 9-fluoro-11β,16α,17-trihydroxy-3,20-dioxopregna-1,4-dien-21-yl acetate (triamcinolone 21-acetate),



C. 9-fluoro-11β,16α,17,21-tetrahydroxypregn-4-ene-3,20-dione (pretriamcinolone).

01/2008:0533

TRIAMCINOLONE ACETONIDE

Triamcinoloni acetonidum

$C_{24}H_{31}FO_6$ M_r 434.5
[76-25-5]

DEFINITION

9-Fluoro-11β,21-dihydroxy-16α,17-(1-methylethylidenedioxy)-pregna-1,4-diene-3,20-dione.

Content: 97.0 per cent to 103.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, sparingly soluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

First identification: A, B.

Second identification: C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *triamcinolone acetonide CRS.*

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *methanol R* and evaporate to dryness. Using the residues, prepare halogen salt discs or mulls in *liquid paraffin R* and record new spectra.

B. Thin-layer chromatography (*2.2.27*). *Prepare the solutions immediately before use and protect from light.*

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *triamcinolone acetonide CRS* in *methanol R* and dilute to 20 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *triamcinolone hexacetonide CRS* in reference solution (a) and dilute to 10 ml with reference solution (a).

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: add a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R.*

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm, immediately after development.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Thin-layer chromatography (*2.2.27*). *Prepare the solutions immediately before use and protect from light.*

Test solution (a). Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). In a separating funnel, dissolve 10 mg of the substance to be examined in 1.5 ml of *glacial acetic acid R*, add 0.5 ml of a 20 g/l solution of *chromium trioxide R* and allow to stand for 60 min. Add 5 ml of *water R*, 2 ml of *methylene chloride R* and shake vigorously for 2 min. Allow to separate and use the lower layer.

Reference solution (a). Dissolve 10 mg of *triamcinolone acetonide CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). In a separating funnel, dissolve 10 mg of *triamcinolone acetonide CRS* in 1.5 ml of *glacial acetic acid R*, add 0.5 ml of a 20 g/l solution of *chromium trioxide R* and allow to stand for 60 min. Add 5 ml of *water R*, 2 ml of *methylene chloride R* and shake vigorously for 2 min. Allow to separate and use the lower layer.

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: add a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R.*

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm, immediately after development.

Results: the principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution. The principal spot in the chromatograms obtained with test solution (b) and reference solution (b) has an R_F value distinctly higher than that of the principal spot in the chromatograms obtained with test solution (a) and reference solution (a).

D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*, add 1.0 ml of the filtrate. Mix, allow to

stand for 5 min and compare the colour of the solution to that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Specific optical rotation (*2.2.7*): + 100 to + 107 (anhydrous substance).

Dissolve 0.100 g in *dioxan R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

Test solution. Dissolve 25.0 mg of the substance to be examined in 7 ml of *methanol R* and dilute to 10.0 ml with *water R*.

Reference solution (a). Dissolve 2 mg of *triamcinolone acetonide CRS* and 2 mg of *triamcinolone R* (impurity A) in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: in a 1000 ml volumetric flask mix 525 ml of *methanol R* with 400 ml of *water R* and allow to equilibrate; dilute to 1000 ml with *water R* and mix again.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Equilibration: with the mobile phase for about 10 min.

Injection: 20 µl.

Run time: 3.5 times the retention time of triamcinolone acetonide.

Retention time: impurity A = about 5 min; triamcinolone acetonide = about 17 min.

System suitability: reference solution (a):

– *resolution*: minimum 15 between the peaks due to impurity A and triamcinolone acetonide; if necessary, adjust the concentration of methanol in the mobile phase.

Limits:

– *impurity A*: not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent);
– *total*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (*2.5.12*): maximum 2.0 per cent, determined on 0.500 g.

ASSAY

Protect the solutions from light throughout the assay.

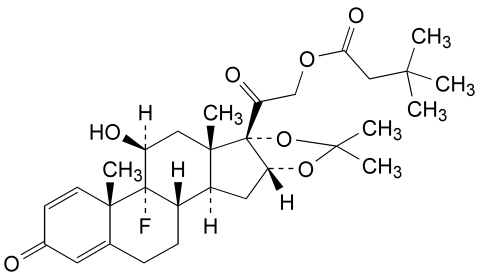
Dissolve 50.0 mg in *ethanol (96 per cent) R* and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *ethanol (96 per cent) R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 238.5 nm.

Calculate the content of $C_{24}H_{31}FO_6$ taking the specific absorbance to be 355.

STORAGE

Protected from light.

IMPURITIES



Specified impurities: A.

A. triamcinolone.

01/2008:0867

TRIAMCINOLONE HEXACETONIDE

Triamcinoloni hexacetonidum

$C_{30}H_{41}FO_7$ M_r 532.6
[5611-51-8]

DEFINITION

9-Fluoro-11β-hydroxy-16α,17-(1-methylethylidenedioxy)-3,20-dioxopregna-1,4-diene-21-yl 3,3-dimethylbutanoate.

Content: 97.0 per cent to 103.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, sparingly soluble in anhydrous ethanol and in methanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *triamcinolone hexacetonide CRS*.

B. Thin-layer chromatography (*2.2.27*). *Prepare the solutions immediately before use and protect from light.*
Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.
Reference solution (a). Dissolve 20 mg of *triamcinolone hexacetonide CRS* in *methanol R* and dilute to 20 ml with the same solvent.
Reference solution (b). Dissolve 10 mg of *triamcinolone acetonide CRS* in reference solution (a) and dilute to 10 ml with reference solution (a).
Plate: *TLC silica gel F_{254} plate R*.
Mobile phase: add a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*.
Application: 5 µl.
Development: over a path of 15 cm.
Drying: in air.
Detection: examine in ultraviolet light at 254 nm, immediately after development.
System suitability: reference solution (b):
– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Specific optical rotation (*2.2.7*): + 92 to + 98 (anhydrous substance).

Dissolve 0.100 g in *methylene chloride R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

Test solution. Dissolve 25.0 mg of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of *triamcinolone hexacetonide CRS* and 2 mg of *triamcinolone acetonide CRS* (impurity A) in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: in a 1000 ml volumetric flask mix 750 ml of *methanol R* with 200 ml of *water R* and allow to equilibrate; dilute to 1000 ml with *water R* and mix again.

Flow rate: 2 ml/min.

Detection: spectrophotometer at 254 nm.

Equilibration: with the mobile phase for about 10 min.

Injection: 20 µl.

Run time: 3 times the retention time of triamcinolone hexacetonide.

Retention time: impurity A = about 3 min; triamcinolone hexacetonide = about 12 min.

System suitability: reference solution (a):

– *resolution*: minimum 20.0 between the peaks due to impurity A and triamcinolone hexacetonide; if necessary, adjust the concentration of methanol in the mobile phase.

Limits:

– *impurity A*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent);
– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (*2.5.12*): maximum 2.0 per cent, determined on 0.50 g.

ASSAY

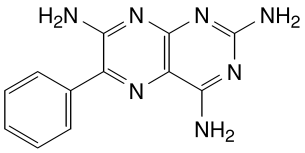
Dissolve 50.0 mg in *ethanol (96 per cent) R* and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *ethanol (96 per cent) R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 238 nm.

Calculate the content of $C_{30}H_{41}FO_7$ taking the specific absorbance to be 291.

STORAGE

Protected from light.

IMPURITIES



Specified impurities: *A*.

A. triamcinolone acetonide.

corrected 6.0

TRIAMTERENE

Triamterenum

$C_{12}H_{11}N_7$ M_r 253.3
[396-01-0]

DEFINITION

Triamterene contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 6-phenylpteridine-2,4,7-triamine, calculated with reference to the dried substance.

CHARACTERS

A yellow, crystalline powder, very slightly soluble in water and in alcohol.

IDENTIFICATION

A. Dissolve 0.1 g in a 10 per cent *V/V* solution of *1 M hydrochloric acid* in *ethanol R* and dilute to 100 ml with the same acid mixture. Dilute 1 ml of this solution to 100 ml with a 10 per cent *V/V* solution of *1 M hydrochloric acid* in *ethanol R*. Examined between 255 nm and 380 nm, the solution shows 2 absorption maxima (*2.2.25*), at 262 nm and 360 nm, and a shoulder at 285 nm.
B. Examined in ultraviolet light at 365 nm, acid solutions, especially a 1 g/l solution in *anhydrous formic acid R*, show an intense blue fluorescence.

TESTS

Acidity. Boil 1.0 g with 20 ml of *water R* for 5 min, cool, filter and wash the filter with 3 quantities, each of 10 ml, of *water R*. Combine the filtrate and washings and add 0.3 ml of *phenolphthalein solution R*. Not more than 1.5 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Nitrosotriaminopyrimidine. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* HF_{254} *R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in 5 ml of *anhydrous formic acid R*, stirring with a glass rod if necessary. Prepare immediately before use.

Reference solution. Dissolve 4 mg of *nitrosotriaminopyrimidine CRS* in *anhydrous formic acid R* and dilute to 100 ml with the same acid.

Apply separately to the plate as bands 1.5 cm long, 20 µl of each solution as 2 applications of 10 µl each, drying in a current of air after each application. Develop over a path of 5 cm using *ether R*. Allow the plate to dry in air and develop over a path of 10 cm using a mixture of 10 volumes of *glacial acetic acid R*, 10 volumes of *methanol R* and 80 volumes of *ethyl acetate R*, the mixture containing 0.5 g/l of *sodium*

fluoresceinate R. Dry the plate in a current of air and expose to ammonia vapour for a few seconds. Examine in ultraviolet light at 254 nm and at 365 nm. Any band corresponding to nitrosotriaminopyrimidine in the chromatogram obtained with the test solution is not more intense than the band in the chromatogram obtained with the reference solution (0.1 per cent).

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in 20 ml of *dimethyl sulphoxide R*. Dilute 2 ml of the solution to 50 ml with *methanol R*.

Reference solution. Dilute 1 ml of the test solution to 200 ml with *methanol R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R1*, 10 volumes of *methanol R* and 90 volumes of *ethyl acetate R*. Allow the plate to dry in air until the solvents have evaporated and examine in ultraviolet light at 365 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

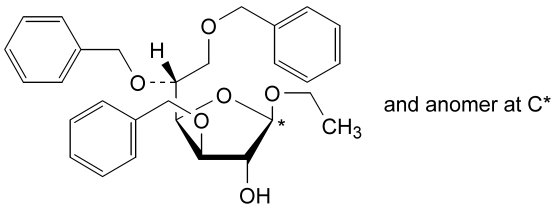
Loss on drying (*2.2.32*). Not more than 1.0 per cent, determined on 1.00 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 5 ml of *anhydrous formic acid R* and add 100 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid* determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 25.33 mg of $C_{12}H_{11}N_7$.



STORAGE

Store protected from light.

01/2008:1740

TRIBENOSIDE

Tribenosidum

$C_{29}H_{34}O_6$ M_r 478.6
[10310-32-4]

DEFINITION

Mixture of α- and β-anomers of ethyl 3,5,6-tri-*O*-benzyl-D-glucofuranoside.

Content: 96.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: yellowish to pale yellow, clear, viscous liquid.

Solubility: practically insoluble in water, very soluble in acetone, in methanol and in methylene chloride.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *tribenoside CRS*.

TESTS

Solution S. Dissolve 4.00 g in *methanol R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and its absorbance (*2.2.25*) at 420 nm has a maximum of 0.10.

Specific optical rotation (*2.2.7*): – 31.0 to – 40.0.

Dilute 2.0 ml of solution S to 20.0 ml with *methanol R*.

Related substances. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 1.000 g of the substance to be examined in a mixture of 5 volumes of *water R* and 95 volumes of *acetonitrile R* and dilute to 25.0 ml with the same mixture of solvents.

Test solution (b). Dissolve 50.0 mg of the substance to be examined in a mixture of 5 volumes of *water R* and 95 volumes of *acetonitrile R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 25.0 mg of *benzaldehyde R* and 30.0 mg of *tribenoside impurity A CRS* to 100.0 ml with *acetonitrile R*. Introduce 20.0 ml of this solution into a 50 ml volumetric flask, add 2.5 ml of *water R* and dilute to 50.0 ml with *acetonitrile R*.

Reference solution (b). Dissolve 50.0 mg of *tribenoside CRS* in a mixture of 5 volumes of *water R* and 95 volumes of *acetonitrile R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (c). Dissolve 12.0 mg of *benzyl ether R* in a mixture of 5 volumes of *water R* and 95 volumes of *acetonitrile R* and dilute to 100.0 ml with the same mixture of solvents.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:

– *mobile phase A*: 0.1 per cent *V/V* solution of *phosphoric acid R*,
– *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 40	55 → 10	45 → 90
40 - 55	10	90
55 - 56	10 → 55	90 → 45
56 - 60	55	45

Flow rate: 1.3 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl; inject test solution (a) and reference solutions (a), (b) and (c).

Relative retentions with reference to the β-anomer of tribenoside (retention time = about 18 min): α-anomer = about 1.1; impurity C = about 0.2; impurity B = about 0.6; impurity D = about 0.8; impurity A = about 1.4.

System suitability: reference solution (b):

– *resolution*: minimum 3.0 between the peaks due to the α-anomer and to the β-anomer of tribenoside.

Limits:

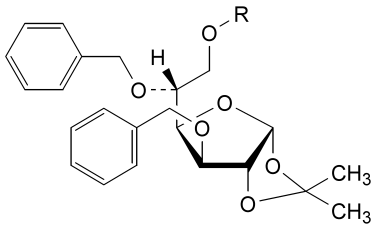
- *impurity A*: not more than 1.7 times the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *impurity C*: not more than twice the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 per cent); if the area of the peak due to impurity C in the chromatogram obtained with the test solution is greater than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.25 per cent), dilute the test solution to obtain an area equal to or smaller than the area of the peak in the chromatogram obtained with reference solution (a); calculate the content of impurity C taking into account the dilution factor;
- *impurity D*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent),
- *any other impurity*: not more than the area of the peak due to impurity A in the chromatogram obtained with reference solution (a) (0.3 per cent),
- *total*: not more than 6.7 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (a) (2.0 per cent),
- *disregard limit*: 0.17 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

Dilute 5.0 ml of solution S to 20.0 ml with *methanol R*. 12 ml of the solution complies with limit test B. Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with *methanol R*.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.



Injection: test solution (b) and reference solution (b).

Calculate the sum of the percentage contents of the α-anomer and the β-anomer of tribenoside.

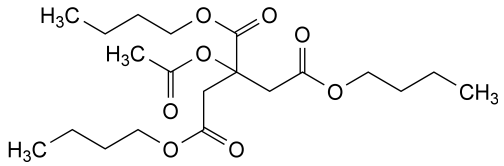
STORAGE

Under nitrogen, in an airtight container.

IMPURITIES

A. R = CH_2-C_6H_5: 3,5,6-tri-*O*-benzyl-1,2-*O*-(1-methylethylidene)-α-D-glucofuranose,

B. R = H: 3,5-di-*O*-benzyl-1,2-*O*-(1-methylethylidene)-α-D-glucofuranose,



C. C_6H_5-CHO: benzaldehyde,

D. C_6H_5-CH_2-O-CH_2-C_6H_5: dibenzyl ether.

01/2008:1770

TRIBUTYL ACETYLCITRATE

Tributylis acetylcitras

$C_{20}H_{34}O_8$ M_r 402.5

[77-90-7]

DEFINITION

Tributyl 2-(acetyloxy)propane-1,2,3-tricarboxylate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: clear, oily liquid.

Solubility: not miscible with water, miscible with alcohol and with methylene chloride.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of tributyl acetylcitrate.*

TESTS

Appearance. The substance to be examined is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Acidity. Dilute 10 g with 10 ml of previously neutralised *alcohol R*, add 0.5 ml of *bromothymol blue solution R2*. Not more than 0.3 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to blue.

Refractive index (*2.2.6*): 1.442 to 1.445.

Related substances. Gas chromatography (*2.2.28*).

Test solution. Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of the substance to be examined and 50 mg of *tributyl citrate R* in *methylene chloride R* and dilute to 20.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with *methylene chloride R*. Dilute 1.0 ml of this solution to 25.0 ml with *methylene chloride R*.

Column:

- *material*: fused silica,
- *size*: *l* = 30 m, Ø = 0.53 mm,
- *stationary phase*: *poly[(cyanopropyl)(methyl)][(phenyl)(methyl)]siloxane R* (film thickness 1.0 μm).

Carrier gas: *helium for chromatography R*.

Linear velocity: 36 cm/s.

Split ratio: 1:20.

Temperature:

- *column*: 200 °C,
- *injection port and detector*: 250 °C.

Detection: flame ionisation.

Injection: 1 μl.

Run time: twice the retention time of tributyl acetylcitrate.

Relative retention with reference to tributyl acetylcitrate (retention time = abou 26 min): impurity B = about 0.83; impurity A = about 0.87.

System suitability: reference solution (a):

– *resolution*: minimum 2.0 between the peaks due to impurity A and tributyl acetylcitrate.

Limits:

– *impurities A, B*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),

– *any other impurity*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

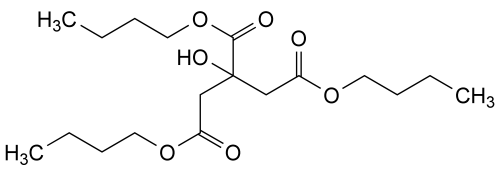
– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with limit test F. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

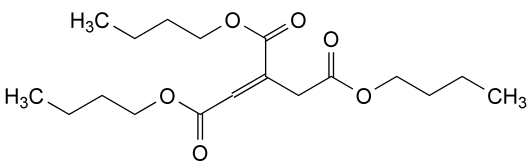
Water (*2.5.12*): maximum 0.25 per cent, determined on 2.00 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.



ASSAY

Introduce 1.500 g into a 250 ml borosilicate glass flask. Add 25 ml of *2-propanol R*, 50 ml of *water R*, 25.0 ml of *1 M sodium hydroxide* and a few glass beads. Heat under a reflux condenser for 1 h. Allow to cool. Add 1 ml of *phenolphthalein solution R1* and titrate with *1 M hydrochloric acid*. Carry out a blank titration.

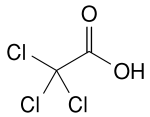


1 ml of *1 M sodium hydroxide* is equivalent to 100.6 mg of $C_{20}H_{34}O_8$.

IMPURITIES

Specified impurities: A, B.

A. tributyl 2-hydroxypropane-1,2,3-tricarboxylate (tributyl citrate),



B. tributyl propene-1,2,3-tricarboxylate (tributyl aconitate).

01/2008:1967
corrected 6.0

TRICHLOROACETIC ACID

Acidum trichloraceticum

$C_2HCl_3O_2$ M_r 163.4
[76-03-9]

DEFINITION

2,2,2-Trichloroacetic acid.

Content: 98.0 per cent to 100.5 per cent.

CHARACTERS

Appearance: white or almost white, crystalline mass or colourless crystals, very deliquescent.

Solubility: very soluble in water, in alcohol and in methylene chloride.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of trichloroacetic acid.*

B. To 0.5 ml of solution S (see Tests) add 2 ml of *pyridine R* and 5 ml of *strong sodium hydroxide solution R*. Shake vigorously and heat in a water-bath at 60-70 °C for 5 min. The upper layer shows an intense red colour.

C. Solution S is strongly acidic (*2.2.4*).

TESTS

Solution S. Dissolve 2.5 g in *water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

Chlorides (*2.4.4*): maximum 100 ppm.

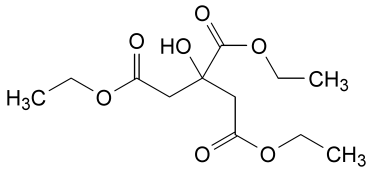
Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 20 ml of *water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M sodium hydroxide* is equivalent to 16.34 mg of $C_2HCl_3O_2$.



STORAGE

In an airtight container.

01/2008:1479

TRIETHYL CITRATE

Triethylis citras

$C_{12}H_{20}O_7$ M_r 276.3
[77-93-0]

DEFINITION

Triethyl 2-hydroxypropane-1,2,3-tricarboxylate.

Content: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: clear, viscous, colourless or almost colourless, hygroscopic liquid.

Solubility: soluble in water, miscible with ethanol (96 per cent), slightly soluble in fatty oils.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Refractive index (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of triethyl citrate.*

C. It gives the reaction of esters (*2.3.1*).

D. To 0.5 ml add 5 ml of *ethanol (96 per cent) R* and 4 ml of *dilute sodium hydroxide solution R*. Boil under reflux for about 10 min. 2 ml of the solution gives the reaction of citrates (*2.3.1*).

TESTS

Appearance. The substance to be examined is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Acidity. Dilute 10 g with 10 ml of previously neutralised *ethanol (96 per cent) R*, add 0.5 ml of *bromothymol blue solution R2*. Not more than 0.3 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to blue.

Refractive index (*2.2.6*): 1.440 to 1.446.

Related substances. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Dissolve 1.0 ml of the substance to be examined in *methylene chloride R* and dilute to 50.0 ml with the same solvent.

Reference solution. Dissolve 1.0 ml of the substance to be examined and 0.5 ml of *methyl tridecanoate R* in *methylene chloride R*, then dilute to 50.0 ml with the same solvent.

Column:

– *material*: fused silica;

– *size*: *l* = 30 m, Ø = 0.32 mm;

– *stationary phase*: *poly(dimethyl)siloxane R* (5 µm).

Carrier gas: *helium for chromatography R.*

Linear velocity: about 26 cm/s.

Split ratio: about 1:50.

Temperature:

– *column*: 200 °C;

– *injection port and detector*: 220 °C.

Detection: flame ionisation.

Injection: 1.0 µl.

Run time: twice the retention time of triethyl citrate.

Retention time: triethyl citrate = about 13.6 min.

System suitability: reference solution:

– *resolution*: minimum 1.5 between the peaks due to triethyl citrate and methyl tridecanoate.

Limits:

– *any impurity*: for each impurity, maximum 0.2 per cent;

– *total*: maximum 0.5 per cent;

– *disregard limit*: 0.04 per cent.

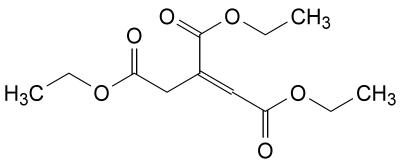
Heavy metals (*2.4.8*): maximum 5 ppm.

Dissolve 4.0 g in 8 ml of *ethanol (96 per cent) R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with test B. Prepare the reference solution using lead standard solution (1 ppm) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of equal volumes of *ethanol (96 per cent) R* and *water R*.

Water (*2.5.12*): maximum 0.25 per cent, determined on 1.000 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



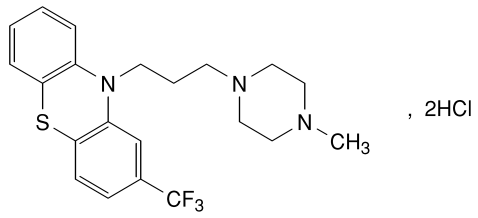
Introduce 1.500 g into a 250 ml borosilicate-glass flask fitted with a reflux condenser. Add 25 ml of *2-propanol R*, 50 ml of *water R*, 25.0 ml of *1 M sodium hydroxide* and a few glass beads. Heat under a reflux condenser for 1 h. Allow to cool. Add 1 ml of *phenolphthalein solution R1* and titrate with *1 M hydrochloric acid*. Carry out a blank titration.

1 ml of *1 M sodium hydroxide* is equivalent to 92.1 mg of $C_{12}H_{20}O_7$.

STORAGE

In an airtight container.

IMPURITIES



A. triethyl propene-1,2,3-tricarboxylate (triethyl aconitate).

01/2008:0059
corrected 6.0

TRIFLUOPERAZINE HYDROCHLORIDE

Trifluoperazini hydrochloridum

, 2HCl

$C_{21}H_{26}Cl_2F_3N_3S$ M_r 480.4
[440-17-5]

DEFINITION

Trifluoperazine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 10-[3-(4-methylpiperazin-1-yl)propyl]-2-(trifluoromethyl)-10*H*-phenothiazine dihydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white to pale yellow, crystalline powder, hygroscopic, freely soluble in water, soluble in alcohol.

It melts at about 242 °C, with decomposition.

IDENTIFICATION

A. *Protect the solutions from bright light and measure the absorbances immediately.* Dissolve 50 mg in *0.1 M hydrochloric acid* and dilute to 500 ml with the same acid. Examined between 280 nm and 350 nm, the solution shows an absorption maximum (*2.2.25*) at 305 nm. Dilute 5 ml of the solution to 100 ml with *0.1 M hydrochloric acid*. Examined between 230 nm and 280 nm, this solution shows an absorption maximum at 255 nm. The specific absorbance at this maximum is about 650.

B. It complies with the identification test for phenothiazines by thin-layer chromatography (*2.3.3*): use *trifluoperazine hydrochloride CRS* to prepare the reference solution.

C. Place 0.25 g in a 100 ml separating funnel, add 5 ml of *water R* and 2 ml of *dilute sodium hydroxide solution R*. Shake vigorously with 20 ml of *ether R*. Wash the ether layer with 5 ml of *water R*, add 0.15 g of *maleic acid R* and evaporate the ether. The residue, recrystallised from 30 ml of *alcohol R* and dried, melts (*2.2.14*) at about 192 °C.

D. Dissolve about 0.5 mg in 1 ml of *water R*, add 0.1 ml of *bromine water R* and shake for about 1 min. Add dropwise 1 ml of *sulphuric acid R* with constant, vigorous agitation. A red colour develops.

E. Dissolve about 50 mg in 5 ml of *water R* and add 2 ml of *nitric acid R*. A dark-red colour develops which turns to pale yellow. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

pH (*2.2.3*). Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. The pH of the solution is 1.6 to 2.5.

Related substances. *Carry out the test protected from bright light.*

Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel GF_{254} plate R*.

Test solution. Dissolve 0.2 g of the substance to be examined in a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents. Prepare immediately before use.

Reference solution. Dilute 1 ml of the test solution to 200 ml with a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 12 cm using a mixture of 10 volumes of *acetone R*, 10 volumes of *diethylamine R* and 80 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

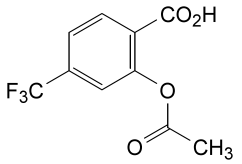
Loss on drying (*2.2.32*). Not more than 1.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of *alcohol R* and add 5.0 ml of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 48.04 mg of $C_{21}H_{26}Cl_2F_3N_3S$.



STORAGE

Store in an airtight container, protected from light.

01/2008:1377

TRIFLUSAL

Triflusalum

$C_{10}H_7F_3O_4$ M_r 248.2
[322-79-2]

DEFINITION

2-(Acetyloxy)-4-(trifluoromethyl)benzoic acid.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, very soluble in ethanol, freely soluble in methylene chloride.

mp: about 118 °C, with decomposition.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *triflusal CRS*.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.20 g of the substance to be examined in *acetonitrile R* and dilute to 20.0 ml with the same solvent. *Prepare the solution immediately before use.*

Reference solution (a). Dissolve 5.0 mg of *triflusal impurity B CRS* in *acetonitrile R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 25.0 ml with *acetonitrile R.*

Reference solution (c). Dissolve 2.5 mg of the substance to be examined in *acetonitrile R,* add 5 ml of reference solution (a) and dilute to 10 ml with *acetonitrile R. Prepare the solution immediately before use.*

Column:

– *size*: *l* = 0.15 m, Ø = 4.0 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (4-5 µm).

Mobile phase:

– *mobile phase A*: *acetonitrile R,*
– *mobile phase B*: 0.5 per cent *V/V* solution of *phosphoric acid R,*

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 20	20 → 70	80 → 30
20 - 25	70	30
25 - 26	70 → 20	30 → 80
26 - 30	20	80

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 237 nm.

Injection: 10 µl of the test solution and reference solutions (b) and (c).

Relative retention with reference to triflusal (retention time = about 13 min): impurity A = about 0.3; impurity B = about 1.2; impurity C = about 1.3; impurity D = about 1.6.

System suitability: reference solution (c):

– *resolution*: minimum 3.0 between the peaks due to triflusal and impurity B.

Limits:

– *impurity B*: not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
– *total of impurities other than B*: not more than 0.5 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.1 per cent),
– *disregard limit*: 0.1 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.02 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in 12 ml of *alcohol R* and dilute to 20 ml with *water R*. 12 ml complies with limit test B. Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 2 volumes of *water R* and 3 volumes of *alcohol R*.

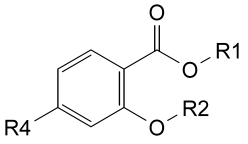
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in a desiccator *in vacuo* over *diphosphorus pentoxide R*.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.200 g in 50 ml of *ethanol R*. Titrate with *0.1 M sodium hydroxide,* determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M sodium hydroxide* is equivalent to 24.82 mg of $C_{10}H_7F_3O_4$.

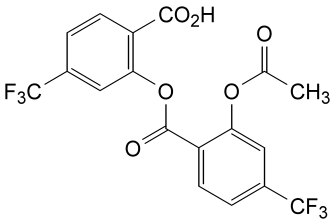


STORAGE

In an airtight container, at a temperature not exceeding 25 °C.

IMPURITIES

Specified impurities: B.



Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034).* It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, C, D.*

A. R1 = H, R2 = CO-CH_3, R4 = CO_2H: 2-(acetyloxy)benzene-1,4-dicarboxylic acid (2-acetoxyterephthalic acid),

B. R1 = R2 = H, R4 = CF_3: 2-hydroxy-4-(trifluoromethyl)benzoic acid (4-(trifluoromethyl)salicylic acid),

C. R1 = R2 = CO-CH_3, R4 = CF_3: acetic 2-(acetyloxy)-4-(trifluoromethyl)benzoic anhydride,

D. 2-[[2-(acetyloxy)-4-(trifluoromethyl)benzoyl]oxy]-4-(trifluoromethyl)benzoic acid.

01/2008:0868

TRIGLYCERIDES, MEDIUM-CHAIN

Triglycerida saturata media

DEFINITION

Mixture of triglycerides of saturated fatty acids, mainly of caprylic (octanoic) acid and of capric (decanoic) acid. Medium-chain triglycerides are obtained from the oil extracted from the hard, dried fraction of the endosperm of *Cocos nucifera* L. or from the dried endosperm of *Elaeis guineensis* Jacq.

Content: minimum 95.0 per cent of saturated fatty acids with 8 and 10 carbon atoms.

CHARACTERS

Appearance: colourless or slightly yellowish, oily liquid.

Solubility: practically insoluble in water, miscible with alcohol, with methylene chloride, with light petroleum and with fatty oils.

IDENTIFICATION

First identification: *B, C.*

Second identification: *A, D.*

A. Heat 3.0 g under a reflux condenser for 30 min with 50 ml of a mixture of equal volumes of *alcohol R* and *2 M alcoholic potassium hydroxide R*. Reserve 10 ml of the mixture for identification test D. To 40 ml of the mixture add 30 ml of *water R*, evaporate the alcohol and acidify the hot solution with 25 ml of *dilute hydrochloric acid R*. After cooling, shake with 50 ml of *peroxide-free ether R*. Wash the ether layer with 3 quantities, each of 10 ml, of *sodium chloride solution R*, dry over *anhydrous sodium sulphate R* and filter. Evaporate the ether and determine the acid value (*2.5.1*) of the residue, using 0.300 g. The acid value is 350 to 390.

B. It complies with the test for saponification value (see Tests).

C. It complies with the test for composition of fatty acids (see Tests).

D. Evaporate 10 ml of the alcoholic mixture obtained in identification test A to dryness on a water-bath. Transfer the residue into a test-tube, add 0.3 ml of *sulphuric acid R* and close the test-tube with a stopper through which a U-shaped glass tube is inserted. One end of the U-tube is dipped into 3 ml of a 10 g/l solution of *tryptophan R* in a mixture of equal volumes of *sulphuric acid R* and *water R*. Heat the test-tube in a silicone-oil bath at 180 °C for 10 min and collect the liberated fumes in the tryptophan reagent. Heat the tryptophan reagent on a water-bath for 1 min. A violet colour develops.

TESTS

Appearance. The substance to be examined is clear (*2.2.1*) and not more intensely coloured than reference solution Y_3 (*2.2.2, Method I*).

Alkaline impurities. Dissolve 2.00 g in a mixture of 1.5 ml of *alcohol R* and 3.0 ml of *ether R*. Add 0.05 ml of *bromophenol blue solution R*. Not more than 0.15 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to yellow.

Relative density (*2.2.5*): 0.93 to 0.96.

Refractive index (*2.2.6*): 1.440 to 1.452.

Viscosity (*2.2.9*): 25 mPa·s to 33 mPa·s.

Acid value (*2.5.1*): maximum 0.2.

Hydroxyl value (*2.5.3, Method A*): maximum 10.

Iodine value (*2.5.4*): maximum 1.0.

Peroxide value (*2.5.5, Method A*): maximum 1.0.

Saponification value (*2.5.6*): 310 to 360.

Unsaponifiable matter (*2.5.7*): maximum 0.5 per cent, determined on 5.0 g.

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*).

Column:

– *material*: fused silica,

– *size*: *l* = 30 m, Ø = 0.32 mm,

– *stationary phase*: *macrogol 20 000 R* (film thickness 0.5 µm),

Carrier gas: *helium for chromatography R.*

Flow rate: 1.3 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	70
	1 - 35	70 → 240
	35 - 50	240
Injection port		250
Detector		250

Detection: flame ionisation.

Split ratio: 1:100.

Composition of the fatty acid fraction of the substance:

– *caproic acid*: maximum 2.0 per cent,

– *caprylic acid*: 50.0 per cent to 80.0 per cent,

– *capric acid*: 20.0 per cent to 50.0 per cent,

– *lauric acid*: maximum 3.0 per cent,

– *myristic acid*: maximum 1.0 per cent.

Chromium: maximum 0.05 ppm, if intended for use in parenteral nutrition.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Dissolve 2.0 g of the substance to be examined in *methyl isobutyl ketone R3* and dilute to 10.0 ml with the same solvent.

Solution A. Dilute 0.100 ml of *chromium liposoluble standard solution (1000 ppm Cr) R* to 10.0 ml with *methyl isobutyl ketone R3*.

Stock solution. Dilute 0.100 ml of solution A to 10.0 ml with *methyl isobutyl ketone R3*.

Reference solutions. Prepare 3 reference solutions by dissolving for each 2.0 g of the substance to be examined in the minimum volume of *methyl isobutyl ketone R3*, adding 0.5 ml, 1.0 ml and 2.0 ml, respectively, of stock solution and diluting to 10.0 ml with *methyl isobutyl ketone R3*.

Source: chromium hollow-cathode lamp.

Wavelength: 357.8 nm.

Atomic generator: graphite furnace.

Carrier gas: *argon R.*

Copper: maximum 0.1 ppm, if intended for use in parenteral nutrition.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Dissolve 2.0 g of the substance to be examined in *methyl isobutyl ketone R3* and dilute to 10.0 ml with the same solvent.

Solution A. Dilute 0.100 ml of *copper liposoluble standard solution (1000 ppm Cu) R* to 10.0 ml with *methyl isobutyl ketone R3*.

Stock solution. Dilute 0.100 ml of solution A to 10.0 ml with *methyl isobutyl ketone R3*.

Reference solutions. Prepare 3 reference solutions by dissolving for each 2.0 g of the substance to be examined in the minimum volume of *methyl isobutyl ketone R3*, adding 1.0 ml, 2.0 ml and 4.0 ml, respectively, of stock solution and diluting to 10.0 ml with *methyl isobutyl ketone R3*.

Source: copper hollow-cathode lamp.

Wavelength: 324.7 nm.

Atomic generator: graphite furnace.

Carrier gas: *argon R.*

Lead: maximum 0.1 ppm, if intended for use in parenteral nutrition.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Dissolve 2.0 g of the substance to be examined in *methyl isobutyl ketone R3* and dilute to 10.0 ml with the same solvent.

Solution A. Dilute 0.100 ml of *lead liposoluble standard solution (1000 ppm Pb) R* to 10.0 ml with *methyl isobutyl ketone R3*.

Stock solution. Dilute 0.100 ml of solution A to 10.0 ml with *methyl isobutyl ketone R3*.

Reference solutions. Prepare 3 reference solutions by dissolving for each 2.0 g of the substance to be examined in the minimum volume of *methyl isobutyl ketone R3*, adding 1.0 ml, 2.0 ml and 4.0 ml, respectively, of stock solution and diluting to 10.0 ml with *methyl isobutyl ketone R3*.

Source: lead hollow-cathode lamp.

Wavelength: 283.3 nm.

Atomic generator: graphite furnace coated inside with palladium carbide; calcination is carried out in the presence of oxygen at a temperature below 800 °C.

Carrier gas: *argon R*.

Nickel: maximum 0.2 ppm, if intended for use in parenteral nutrition.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Dissolve 2.0 g of the substance to be examined in *methyl isobutyl ketone R3* and dilute to 10.0 ml with the same solvent.

Solution A. Dilute 0.100 ml of *nickel liposoluble standard solution (1000 ppm Ni) R* to 10.0 ml with *methyl isobutyl ketone R3*.

Stock solution. Dilute 0.100 ml of solution A to 10.0 ml with *methyl isobutyl ketone R3*.

Reference solutions. Prepare 3 reference solutions by dissolving for each 2.0 g of the substance to be examined in the minimum volume of *methyl isobutyl ketone R3*, adding 1.0 ml, 2.0 ml and 4.0 ml, respectively, of stock solution and diluting to 10.0 ml with *methyl isobutyl ketone R3*.

Source: nickel hollow-cathode lamp.

Wavelength: 232 nm.

Atomic generator: graphite furnace.

Carrier gas: *argon R*.

Tin: maximum 0.1 ppm, if intended for use in parenteral nutrition.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Dissolve 2.0 g of the substance to be examined in *methyl isobutyl ketone R3* and dilute to 10.0 ml with the same solvent.

Solution A. Dilute 0.100 ml of *tin liposoluble standard solution (1000 ppm Sn) R* to 10.0 ml with *methyl isobutyl ketone R3*.

Stock solution. Dilute 0.100 ml of solution A to 10.0 ml with *methyl isobutyl ketone R3*.

Reference solutions. Prepare 3 reference solutions by dissolving for each 2.0 g of the substance to be examined in the minimum volume of *methyl isobutyl ketone R3*, adding 1.0 ml, 2.0 ml and 4.0 ml, respectively, of stock solution and diluting to 10.0 ml with *methyl isobutyl ketone R3*.

Source: tin hollow-cathode lamp.

Wavelength: 286.3 nm.

Atomic generator: graphite furnace coated inside with palladium carbide.

Carrier gas: *argon R*.

Heavy metals (*2.4.8*): maximum 10 ppm, if intended for use other than parenteral nutrition.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 0.2 per cent, determined on 10.00 g.

Total ash (*2.4.16*): maximum 0.1 per cent, determined on 2.0 g.

STORAGE

In a well-filled container, protected from light.

LABELLING

The label states, where applicable, that the substance is intended for use in parenteral nutrition.

01/2008:2032

TRIGLYCEROL DIISOSTEARATE

Triglyceroli diisostearas

DEFINITION

Mixture of polyglycerol diesters of mainly isostearic acid, obtained by esterification of polyglycerol and isostearic acid. The polyglycerol consists mainly of triglycerol.

CHARACTERS

Appearance: clear, yellowish, viscous liquid.

Solubility: practically insoluble in water, miscible with ethanol (96 per cent) and with fatty oils.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Preparation: film between 2 plates of *sodium chloride R*.
Comparison: *triglycerol diisostearate CRS*.

B. Composition of fatty acids (see Tests).

TESTS

Appearance of solution. The solution is not more intensely coloured than reference solution BY_3 (*2.2.2, Method I*).

Mix 10 ml with 10 ml of *ethanol (96 per cent) R*.

Acid value (*2.5.1*): maximum 3.0, determined on 1.0 g.

Hydroxyl value (*2.5.3, Method A*): 180 to 230, determined on 0.25 g.

Iodine value (*2.5.4, Method B*): maximum 3.0.

Peroxide value (*2.5.5, Method B*): maximum 6.0.

Saponification value (*2.5.6*): 128 to 160.

Composition of fatty acids (*2.4.22, Method B*). Use the mixture of calibrating substances in Table 2.4.22.-1.

Composition of the fatty-acid fraction of the substance:

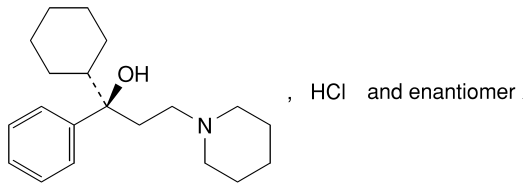
– *sum of the contents of the fatty acids eluting between palmitic acid and stearic acid*: minimum 60.0 per cent;

– *sum of the contents of myristic acid, palmitic acid and stearic acid*: maximum 11.0 per cent.

Water (*2.5.12*): maximum 0.5 per cent, determined on 2.00 g.

Sulphated ash: maximum 0.1 per cent, determined on 1.0 g.

Heat a silica crucible to redness for 30 min, allow to cool in a desiccator and weigh. Evenly distribute 1.00 g of the substance to be examined in the crucible and weigh. Dry at 100-105 °C for 1 h and ignite in a muffle furnace at 600 °C ± 25 °C, until the substance is thoroughly charred. Carry out the test for sulphated ash (*2.4.14*) on the residue obtained, starting with "Moisten the substance to be examined...".



STORAGE

In an airtight container, protected from light.

01/2008:1626
corrected 6.0

TRIHEXYPHENIDYL HYDROCHLORIDE

Trihexyphenidyli hydrochloridum

$C_{20}H_{32}ClNO$ M_r 337.9
[52-49-3]

DEFINITION

(1*RS*)-1-Cyclohexyl-1-phenyl-3-(piperidin-1-yl)propan-1-ol hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: slightly soluble in water, sparingly soluble in alcohol and in methylene chloride.

mp: about 250 °C, with decomposition.

IDENTIFICATION

First identification: *A, D.*

Second identification: *B, C, D.*

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *trihexyphenidyl hydrochloride CRS.*

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 25 mg of the substance to be examined in a mixture of 20 volumes of *methanol R* and 80 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 25 mg of *trihexyphenidyl hydrochloride CRS* in a mixture of 20 volumes of *methanol R* and 80 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Plate: *TLC silica gel G plate R.*

Mobile phase: *diethylamine R, hexane R* (5:95 *V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with a 0.1 g/l solution of *chloroplatinic acid R* in *hydrochloric acid R* containing 0.4 per cent *V/V* of *hydriodic acid R.*

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. Dissolve 0.5 g in 5 ml of warm *methanol R* and make just alkaline to *red litmus paper R* with *sodium hydroxide solution R.* A precipitate is formed which, after recrystallisation from *methanol R*, melts (*2.2.14*) at about 113°C to 115 °C.

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

pH (*2.2.3*): 5.2 to 6.2.

Dissolve 0.5 g with heating in 25 ml of *carbon dioxide-free water R.* Cool to room temperature and dilute to 50 ml with *carbon dioxide-free water R.*

Optical rotation (*2.2.7*): – 0.10° to + 0.10°.

Dissolve 1.25 g in a mixture of 20 volumes of *methanol R* and 80 volumes of *methylene chloride R* and dilute to 25.0 ml with the same mixture of solvents.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase. Dilute 10.0 ml to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *trihexyphenidyl impurity A CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (d). To 1 ml of reference solution (b), add 1 ml of the test solution and dilute to 100 ml with the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 200 ml of *water R* with 0.2 ml of *triethylamine R.* Adjust to pH 4.0 with *phosphoric acid R* and add 800 ml of *acetonitrile R.*

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Run time: 3 times the retention time of trihexyphenidyl.

System suitability: reference solution (d):

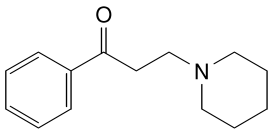
– *resolution*: minimum 4.0 between the peaks corresponding to trihexyphenidyl and to impurity A.

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
– *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
– *total*: not more than 0.5 per cent,

– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.



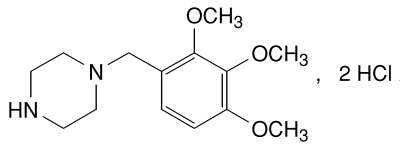
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *alcohol R* and add 5.0 ml of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mlof *0.1 M sodium hydroxide* is equivalent to 33.79 mg of $C_{20}H_{32}ClNO$.

IMPURITIES



A. 1-phenyl-3-(piperidin-1-yl)propan-1-one.

TRIMETAZIDINE DIHYDROCHLORIDE

Trimetazidini dihydrochloridum

$C_{14}H_{24}Cl_2N_2O_3$ M_r 339.3
[13171-25-0]

DEFINITION

1-(2,3,4-Trimethoxybenzyl)piperazine dihydrochloride.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder, slightly hygroscopic.

Solubility: freely soluble in water, sparingly soluble in alcohol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *Ph. Eur. reference spectrum of trimetazidine dihydrochloride.*

B. Dissolve 25 mg in 5 ml of *water R*. 2 ml of the solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Dissolve 1.0 g in *water R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.200 g of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 20.0 mg of *trimetazidine for system suitability CRS* in *water R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with *water R*. Dilute 5.0 ml of this solution to 100.0 ml with *water R*.

Reference solution (c). Dilute 25.0 ml of reference solution (b) to 50.0 ml with *water R*.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 10 nm,
– *temperature*: 30 °C.

Mobile phase:

– *mobile phase A*: mix 357 volumes of *methanol R* and 643 volumes of a 2.87 g/l solution of *sodium heptanesulphonate R* adjusted to pH 3.0 with *dilute phosphoric acid R*,
– *mobile phase B*: *methanol R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 50	95 → 75	5 → 25
50 - 52	75 → 95	25 → 5

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 240 nm.

Equilibration: for at least 1 h with the mobile phase at the initial composition.

Injection: 10 µl.

Relative retention with reference to trimetazidine (retention time = about 25 min): impurity D = about 0.2; impurity C = about 0.4; impurity H = about 0.6; impurities A and I = about 0.9; impurity E = about 0.95; impurity F = about 1.4; impurity B = about 1.8.

System suitability:

– *peak-to-valley ratio*: minimum 3, where H_p = height above the baseline of the peak due to impurity E and H_v = height above the baseline of the lowest point of the curve separating this peak from the principal peak in the chromatogram obtained with reference solution (a);
– *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (c).

Limits:

– *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.55; impurity C = 0.37; impurity F = 0.71;
– *impurities A, B, C, D, E, F, H, I*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Impurity G. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 22.6 mg of *piperazine hydrate R* in *methanol R* and dilute to 100 ml with the same solvent. Dilute 10 ml of the solution to 100 ml with *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *concentrated ammonia R, alcohol R* (20:80 *V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: at 100-105 °C for 30 min.

Detection: spray with *iodoplatinate reagent R*.

Limit:

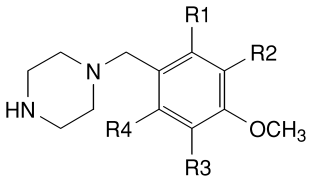
– *impurity G*: any spot due to impurity G is not more intense than the spot in the chromatogram obtained with the reference solution (0.1 per cent, expressed as anhydrous piperazine).

Loss on drying (*2.2.32*): maximum 2.5 per cent, determined on 1.000 g by drying in an oven at 105 °C over *diphosphorus pentoxide R* at a pressure not exceeding 15 kPa.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.120 g in 50.0 ml of *water R*. Add 1 ml of *nitric acid R* and titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*).

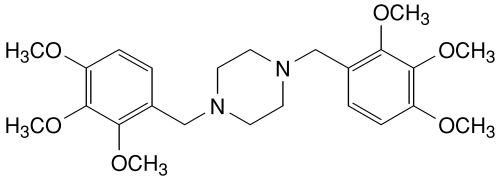


1 ml of *0.1 M silver nitrate* is equivalent to 16.96 mg of $C_{14}H_{24}Cl_2N_2O_3$.

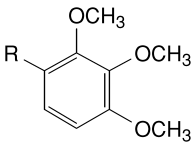
STORAGE

In an airtight container.

IMPURITIES



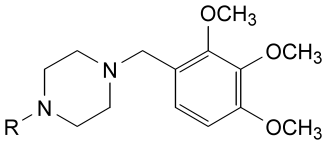
Specified impurities: A, B, C, D, E, F, G, H, I.



A. R1 = R4 = H, R2 = R3 = OCH_3: 1-(3,4,5-trimethoxybenzyl)piperazine,

E. R1 = R3 = OCH_3, R2 = R4 = H: 1-(2,4,5-trimethoxybenzyl)piperazine,

F. R1 = R4 = OCH_3, R2 = R3 = H: 1-(2,4,6-trimethoxybenzyl)piperazine,

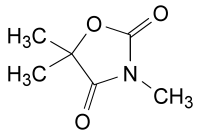


B. 1,4-bis(2,3,4-trimethoxybenzyl)piperazine,

C. R = CHO: 2,3,4-trimethoxybenzaldehyde,

D. R = CH_2OH: (2,3,4-trimethoxyphenyl)methanol,

G. piperazine,



H. R = $COOC_2H_5$: ethyl 4-(2,3,4-trimethoxybenzyl)piperazine-1-carboxylate,

I. R = CH_3: 1-methyl-4-(2,3,4-trimethoxybenzyl)piperazine (*N*-methyltrimetazidine).

01/2008:0440

TRIMETHADIONE

Trimethadionum

$C_6H_9NO_3$ M_r 143.1

[127-48-0]

DEFINITION

3,5,5-Trimethyloxazolidine-2,4-dione.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: colourless or almost colourless crystals.

Solubility: soluble in water, very soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 45 °C to 47 °C, determined without previous drying.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs prepared using 3 mg of substance per 0.4 g of *potassium bromide R*.

Comparison: *trimethadione CRS*.

C. To 2 ml of solution S (see Tests) add 1 ml of *barium hydroxide solution R*. A white precipitate is formed, which dissolves on addition of 1 ml of *dilute hydrochloric acid R*.

D. Dissolve 0.3 g in a mixture of 5 ml of *alcoholic potassium hydroxide solution R* and 5 ml of *ethanol (96 per cent) R*. Allow to stand for 10 min. Add 0.05 ml of *phenolphthalein solution R1* and neutralise exactly with *hydrochloric acid R*. Evaporate to dryness on a water-bath and take up the residue with 4 quantities, each of 5 ml, of *ether R*. Filter the combined ether layers and evaporate to dryness. The residue, recrystallised from 5 ml of *toluene R* and dried, melts (*2.2.14*) at about 80 °C.

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 40 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *methyl red solution R*. Not more than 0.1 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.00 g by drying in a desiccator over *anhydrous silica gel R* for 6 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 0.125 g of *decanol R* in *anhydrous ethanol R* and dilute to 25 ml with the same solvent.

Test solution. Dissolve 0.100 g of the substance to be examined in the internal standard solution and dilute to 10.0 ml with the same solution.

Reference solution. Dissolve 0.100 g of *trimethadione CRS* in the internal standard solution and dilute to 10.0 ml with the same solution.

Column:

– *material*: stainless steel,

– *size*: *l* = 0.75 m, Ø = 3 mm,

– *stationary phase*: *styrene-divinylbenzene copolymer R* (125-150 µm).

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 20 ml/min.

Temperature:

– *column*: 210 °C,

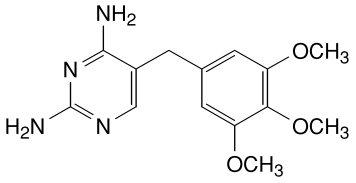
– *injection port*: 240 °C,

– *detector*: 270 °C.

Detection: flame ionisation.

Injection: 1 µl.

Calculate the content of $C_6H_9NO_3$ from the declared content of *trimethadione CRS*.



STORAGE

Protected from light.

corrected 6.0

TRIMETHOPRIM

Trimethoprimum

$C_{14}H_{18}N_4O_3$ M_r 290.3
[738-70-5]

DEFINITION

5-(3,4,5-Trimethoxybenzyl)pyrimidine-2,4-diamine.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish-white powder.

Solubility: very slightly soluble in water, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Melting point (*2.2.14*): 199 °C to 203 °C.

B. Dissolve about 20 mg in *0.1 M sodium hydroxide* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 10.0 ml with *0.1 M sodium hydroxide*. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 287 nm. The specific absorbance at the absorption maximum is 240 to 250.

C. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *trimethoprim CRS*.

D. Dissolve about 25 mg, heating if necessary, in 5 ml of *0.005 M sulphuric acid* and add 2 ml of a 16 g/l solution of *potassium permanganate R* in *0.1 M sodium hydroxide*. Heat to boiling and add to the hot solution 0.4 ml of *formaldehyde R*. Mix, add 1 ml of *0.5 M sulphuric acid*, mix and heat again to boiling. Cool and filter. To the filtrate, add 2 ml of *methylene chloride R* and shake vigorously. The organic layer, examined in ultraviolet light at 365 nm, shows green fluorescence.

TESTS

Appearance of solution. The solution is not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

Dissolve 0.5 g in 10 ml of a mixture of 1 volume of *water R*, 4.5 volumes of *methanol R* and 5 volumes of *methylene chloride R*.

Related substances

A. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). Dissolve the contents of a vial of *trimethoprim for system suitability CRS* (containing impurity E) in 1 ml of the mobile phase.

Column:

– *size*: *l* = 0.250 m, Ø = 4.0 mm;

– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 30 volumes of *methanol R* and 70 volumes of a 1.4 g/l solution of *sodium perchlorate R* adjusted to pH 3.6 with *phosphoric acid R*.

Flow rate: 1.3 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl loop injector.

Run time: 11 times the retention time of trimethoprim.

Relative retention with reference to trimethoprim (retention time = about 5 min): impurity C = about 0.8; impurity E = about 0.9; impurity A = about 1.5; impurity D = about 2.0; impurity G = about 2.1; impurity B = about 2.3; impurity J = about 2.7; impurity F = about 4.0.

System suitability: reference solution (b):

– *resolution*: minimum 2.5 between the peaks due to impurity E and trimethoprim.

Limits:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.43; impurity E = 0.53; impurity J = 0.66;

– *any impurity*: not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);

– *total*: not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *disregard limit*: 0.04 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent); disregard any peak corresponding to impurity H (relative retention = about 10.3).

B. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *trimethoprim CRS* and 5.0 mg of *trimethoprim impurity B CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *nitrile silica gel for chromatography R* (5 µm) with a specific surface area of 350 m^2/g and a pore diameter of 10 nm.

Mobile phase: dissolve 1.14 g of *sodium hexane sulphonate R* in 600 ml of a 13.6 g/l solution of *potassium dihydrogen phosphate R*; adjust to pH 3.1 with *phosphoric acid R* and mix with 400 ml of *methanol R*.

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl loop injector.

Run time: 6 times the retention time of trimethoprim.

Relative retention with reference to trimethoprim (retention time = about 4 min): impurity H = about 1.8; impurity I = about 4.9.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to trimethoprim and impurity B.

Limits:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity H = 0.50; impurity I = 0.28;

– *any impurity*: not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);

– *total*: not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *disregard limit*: 0.04 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent); disregard any peak due to impurity B (relative retention = about 1.3).

Impurity K. Gas chromatography (*2.2.28*).

Test solution. Dissolve 0.500 g of the substance to be examined in 35.0 ml of *citrate buffer solution pH 5.0 R*, add 10.0 ml of *1,1-dimethylethyl methyl ether R*, shake thoroughly and centrifuge for 10 min. Use the upper layer.

Reference solution. Dilute 5.0 ml of *hydrochloric acid R* to 50.0 ml with *water R*, add 12.5 mg of *aniline R* and shake thoroughly. Add 10.0 µl of this solution and 10.0 ml of *1,1-dimethylethyl methyl ether R* to 35.0 ml of *citrate buffer solution pH 5.0 R*, shake thoroughly and centrifuge for 10 min. Use the upper layer.

Column:

– *material*: fused silica;

– *size*: *l* = 30 m, Ø = 0.53 mm;

– *stationary phase*: *poly(dimethyl)siloxane R* (film thickness 3 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 12 ml/min.

Temperature:

– *column*: 80 °C;

– *injection port*: 230 °C;

– *detector*: 270 °C.

Detection: nitrogen-phosphorus detector.

Injection: 3 µl.

Run time: 15 min.

System suitability: reference solution:

– *repeatability*: maximum relative standard deviation of 5.0 per cent after 6 injections.

Limit:

– *impurity K*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (5 ppm).

Heavy metals (*2.4.8*): maximum 20 ppm.

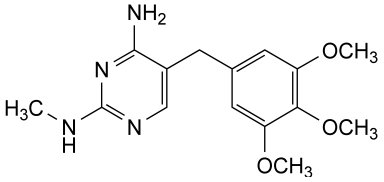
1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

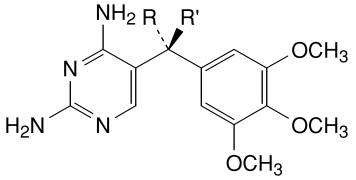
ASSAY

Dissolve 0.250 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



1 ml of *0.1 M perchloric acid* is equivalent to 29.03 mg of $C_{14}H_{18}N_4O_3$.

IMPURITIES



By liquid chromatography A: A, B, C, D, E, F, G, H, J.

By liquid chromatography B: B, H, I.

By gas chromatography: K.

TRIMIPRAMINE MALEATE

Trimipramini maleas

and enantiomer ,

$C_{24}H_{30}N_2O_4$ M_r 410.5

[521-78-8]

DEFINITION

(2*RS*)-3-(10,11-Dihydro-5*H*-dibenzo[*b,f*]azepin-5-yl)-*N*,*N*,2-trimethylpropan-1-amine (*Z*)-butenedioate.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: slightly soluble in water and in ethanol (96 per cent).

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

A. Melting point (*2.2.14*): 140 °C to 144 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 40.0 mg in *0.01 M hydrochloric acid* and dilute to 100.0 ml with the same acid. Dilute 5.0 ml of this solution to 100.0 ml with *0.01 M hydrochloric acid*.

Spectral range: 230-350 nm.

Absorption maximum: at 250 nm.

Shoulder: at 270 nm.

Specific absorbance at the absorption maximum: 205 to 235.

C. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *trimipramine maleate CRS*.

D. Thin-layer chromatography (*2.2.27*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 0.50 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent. Dilute 1 ml of this solution to 20 ml with *methanol R*.

Reference solution. Dissolve 25 mg of *trimipramine maleate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: *concentrated ammonia R, anhydrous ethanol R, toluene R* (0.7:10:90 *V/V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in air for 15 min.

Detection: spray with a 5 g/l solution of *potassium dichromate R* in a mixture of 1 volume of *sulphuric acid R* and 4 volumes of *water R* and examine immediately.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

E. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 56 mg of *maleic acid R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel* GF_{254} *R.*

Mobile phase: *water R, anhydrous formic acid R, di-isopropyl ether R* (3:7:90 *V/V/V*).

Application: 5 µl as bands of 10 mm.

Development: over 2/3 of the plate.

Drying: in a current of air for a few minutes and then at 120 °C for 10 min.

Detection: examine in ultraviolet light at 254 nm.

Results: the chromatogram obtained with the test solution shows 2 zones: one is on the starting line and the other is similar in position and size to the principal zone in the chromatogram obtained with the reference solution.

TESTS

Related substances. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

Buffer solution pH 7.7: 2.64 g/l solution of *ammonium phosphate R* in *water for chromatography R*; adjust to pH 7.7 with *phosphoric acid R*.

Test solution. Dissolve 50 mg of the substance to be examined in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of the substance to be examined and 5 mg of *iminodibenzyl R* (impurity F) in the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve the contents of a vial of *trimipramine for peak identification CRS* (containing impurities A, B, C, D and E) in 1 ml of *acetonitrile R1*.

Column:

- *size*: *l* = 0.125 m, Ø = 4.0 mm;
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *acetonitrile R1*, buffer solution pH 7.7 (38:62 *V/V*).

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Run time: 3 times the retention time of trimipramine.

Identification of impurities: use the chromatogram supplied with *trimipramine for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, B, C, D and E; doubling of the peak due to impurity E may be observed.

Relative retention with reference to trimipramine (retention time = about 27 min): impurity A = about 0.1; impurity B = about 0.3; impurity C = about 0.4; impurity D = about 0.5; impurity F = about 1.4; impurity E = about 1.5.

System suitability:

- *resolution*: minimum 3.5 between the peaks due to trimipramine and impurity F in the chromatogram obtained with reference solution (a);
- the chromatogram obtained with reference solution (c) is similar to the chromatogram supplied with *trimipramine for peak identification CRS*.

Limits:

- *correction factor*: for the calculation of content, multiply the peak area of impurity F by 0.5;
- *impurity E*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *impurity F*: not more than 2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *impurities A, B, C, D*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.15 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

2.0 g complies with test C. Prepare the reference solution using 4 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

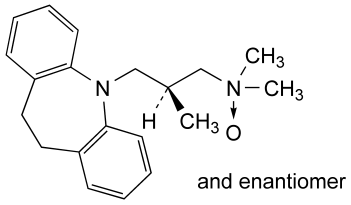
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid* determining the end-point potentiometrically (*2.2.20*).

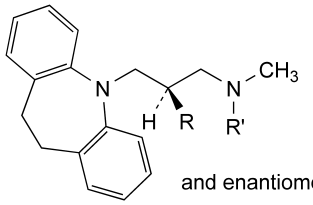
1 ml of *0.1 M perchloric acid* is equivalent to 41.05 mg of $C_{24}H_{30}N_2O_4$.

STORAGE



Protected from light.

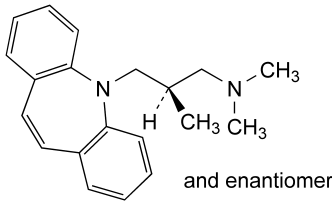
IMPURITIES



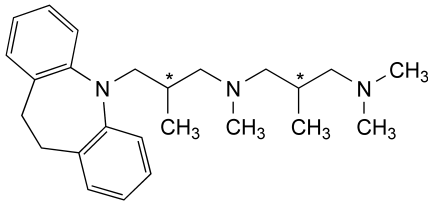
Specified impurities: *A, B, C, D, E, F.*

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for*

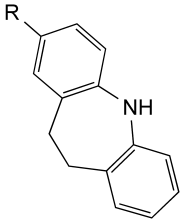
pharmaceutical use (2034). It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *G.*



A. (2*RS*)-3-(10,11-dihydro-5*H*-dibenzo[*b*,*f*]azepin-5-yl)-*N*,*N*,2-trimethylpropan-1-amine *N*-oxide,



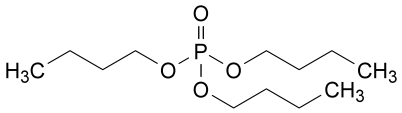
B. R = CH_3, R′ = H: (2*RS*)-3-(10,11-dihydro-5*H*-dibenzo[*b*,*f*]azepin-5-yl)-*N*,2-dimethylpropan-1-amine,



D. R = H, R′ = CH_3: imipramine,

C. (2*RS*)-3-(5*H*-dibenzo[*b*,*f*]azepin-5-yl)-*N*,*N*,2-trimethylpropan-1-amine,

E. mixture of the stereoisomers of *N*-[3-(10,11-dihydro-5*H*-dibenzo[*b*,*f*]azepin-5-yl)-2-methylpropyl]-*N*,*N*′,*N*′,2-tetramethylpropane-1,3-diamine,



F. R = H: 10,11-dihydro-5*H*-dibenzo[*b*,*f*]azepine,

G. R = CH_3: 2-methyl-10,11-dihydro-5*H*-dibenzo[*b*,*f*]azepine.

TRI-*n*-BUTYL PHOSPHATE

Tri-*n*-butylis phosphas

$C_{12}H_{27}O_4P$ M_r 266.3
[126-73-8]

CHARACTERS

Appearance: clear, colourless to pale yellow liquid.

Solubility: slightly soluble in water, miscible with alcohol.

bp: about 289 °C, with decomposition.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *tri-n-butyl phosphate CRS.*

TESTS

Appearance. The substance to be examined is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Acidity. Dissolve 50 ml in 50 ml of *alcohol R* previously adjusted with *0.02 M potassium hydroxide* or *0.02 M hydrochloric acid* to a bluish-green colour, using 0.5 ml of *bromothymol blue solution R1* as indicator. Titrate with *0.02 M potassium hydroxide* to (the initial) bluish-green coloration. Not more than 0.8 ml are required.

Related substances. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Substance to be examined.

Reference solution. Dissolve 10 mg of the substance to be examined and 10 mg of *methyl myristate R* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Column:

– *material*: fused silica,
– *size*: *l* = 30 m, Ø = 0.32 mm,
– *stationary phase*: *poly(dimethyl)siloxane R* (5 µm).

Carrier gas: *helium for chromatography R.*

Linear velocity: 32 cm/s.

Split-ratio: 65:1.

Temperature:

– *column*: 250 °C,
– *injection port and detector*: 250 °C.

Detector: flame ionisation.

Injection: 1 µl.

Run time: twice the retention time of tri-*n*-butyl phosphate.

System suitability: reference solution:

– *resolution*: minimum 10 between the peaks due to tri-*n*-butyl phosphate and methyl myristate.

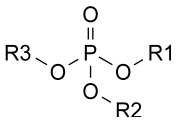
Limits:

– *any impurity*: maximum 0.1 per cent,
– *total*: maximum 0.3 per cent,
– *disregard limit*: 0.01 per cent.

Chlorides (*2.4.4*): maximum 200 ppm.

Dissolve 0.25 g in 15 ml of *alcohol (70 per cent V/V) R*. The solution complies with the limit test for chlorides. Prepare the reference solution with 10 ml of *chloride standard solution (5 ppm Cl) R* and 5 ml of *ethanol R*.

Heavy metals (*2.4.8*): maximum 20 ppm.



Dissolve 2.0 g in 13 ml of *alcohol R* and dilute to 20.0 ml with *water R*. 12 ml of the solution complies with limit test B. Prepare the standard using lead standard solution (2 ppm Pb) prepared by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 5 volumes of *water R* and 13 volumes of *alcohol R*.

Water (*2.5.32*): maximum 0.1 per cent, determined on 1.0 g.

STORAGE

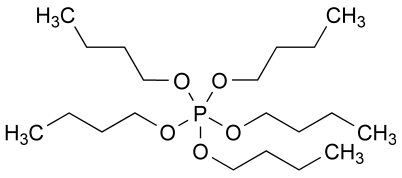
Protected from light.

IMPURITIES

A. R1 = R2 = $[CH_2]_3$-CH_3, R3 = H: dibutyl hydrogen phosphate,

B. R1 = $[CH_2]_3$-CH_3, R2 = R3 = H: butyl dihydrogen phosphate,

D. R1 = R2 = $[CH_2]_3$-CH_3, R3 = CH_3: dibutyl methyl phosphate,



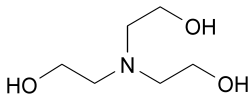
E. R1 = R2 = $[CH_2]_3$-CH_3, R3 = C_2H_5: dibutyl ethyl phosphate,

F. R1 = R2 = $[CH_2]_3$-CH_3, R3 = $[CH_2]_2$-CH_3: dibutyl propyl phosphate,

G. R1 = R2 = $[CH_2]_3$-CH_3, R3 = CH_2-$CH(CH_3)_2$: dibutyl 2-methylpropyl phosphate,

H. R1 = R2 = $[CH_2]_3$-CH_3, R3 = $[CH_2]_4$-CH_3: dibutyl pentyl phosphate,

C. H_3C-$[CH_2]_3$-OH: butan-1-ol,



I. pentabutyl phosphate.

01/2008:1577

TROLAMINE

Trolaminum

$C_6H_{15}NO_3$ M_r 149.2

[102-71-6]

DEFINITION

2,2′,2″-Nitrilotriethanol.

Content: 99.0 per cent *m/m* to 103.0 per cent *m/m* of total bases (anhydrous substance).

CHARACTERS

Appearance: clear, viscous, colourless or slightly yellow liquid, very hygroscopic.

Solubility: miscible with water and with alcohol, soluble in methylene chloride.

IDENTIFICATION

First identification: B, C.

Second identification: A, B, D.

A. Relative density (*2.2.5*): 1.120 to 1.130.

B. Refractive index (*2.2.6*): 1.482 to 1.485.

C. Examine the chromatograms obtained in the test for related substances.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

D. To 1 ml add 0.3 ml of *copper sulphate solution R*. A blue colour develops. Add 2.5 ml of *dilute sodium hydroxide solution R* and heat to boiling. The blue colour remains unchanged.

TESTS

Solution S. Dissolve 12 g in *water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution B_6 (*2.2.2, Method II*).

Related substances. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 5.0 g of *3-aminopropanol R* in *water R* and dilute to 100.0 ml with the same solvent.

Test solution. Dissolve 10.0 g of the substance to be examined in *water R*. Add 1.0 ml of the internal standard solution and dilute to 100.0 ml with *water R*.

Reference solution (a). Dissolve 1.0 g of *trolamine CRS* in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dissolve 1.0 g of *ethanolamine R*, 5.0 g of *diethanolamine R* and 1.0 g of *trolamine CRS* in *water R* and dilute to 100.0 ml with the same solvent. To 1.0 ml of the solution add 1.0 ml of the internal standard solution and dilute to 100.0 ml with *water R*.

Column:

– *material*: fused silica,

– *size*: *l* = 25 m, Ø = 0.25 mm,

– *stationary phase*: *poly(dimethyl)(diphenyl)siloxane R* (film thickness 0.50 μm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1 ml/min.

Split ratio: 1:35.

Temperature:

	Time (min)	Temperature (°C)
Column	0	60
	0 - 8.5	60 → 230
	8.5 - 14	230
Injection port		260
Detector		280

Detection: flame ionisation.

Injection: 2 µl; if necessary inject a blank.

Elution order: impurity A, 3-aminopropanol, impurity B, trolamine.

System suitability: reference solution (b):

– *resolution*: minimum 2 between the peaks due to 3-aminopropanol and impurity A.

Limits:

– *impurity A*: calculate the ratio R1 of the area of the peak due to impurity A to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (b); from the chromatogram obtained with the test solution, calculate the ratio of the area of any peak due to impurity A to the area of the peak due to the internal standard: this ratio is not greater than R1 (0.1 per cent),

– *impurity B*: calculate the ratio R2 of the area of the peak due to impurity B to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (b); from the chromatogram obtained with the test solution, calculate the ratio of the area of any peak due to impurity B to the area of the peak due to the internal standard: this ratio is not greater than R2 (0.5 per cent),

– *total*: calculate the ratio R3 of the area of the peak due to trolamine to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (b); from the chromatogram obtained with the test solution, calculate the ratio of the sum of the areas of any peaks, apart from the principal peak and the peak due to the internal standard, to the area of the peak due to the internal standard: this ratio is not greater than 10 times R3 (1.0 per cent),

– *disregard limit*: 0.5 times the ratio of the area of the peak due to trolamine to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (b) (0.05 per cent).

Impurity C. Gas chromatography (*2.2.28*). *Carry out the test under a ventilated hood, wear gloves and safety glasses.*

Test solution. In a suitable distillation apparatus mix 100.0 g of the substance to be examined and 100.0 ml of *ethylene glycol R* and gently distil 10.0 ml under vacuum at a pressure not exceeding 1.3 kPa. From this distillate, distil 1 ml.

Reference solution. Dilute 25.0 mg of *N-nitrosodiethanolamine R* to 100.0 ml with *ethylene glycol R*. Dilute 5.0 ml of the solution to 50.0 ml with *ethylene glycol R*. Dilute 5.0 ml of this solution to 50.0 ml with *ethylene glycol R*.

Column:

– *material*: fused silica,

– *size*: *l* = 30 m, Ø = 0.25 mm,

– *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 0.75 ml/min.

Split ratio: 1:15.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	180
	2 - 8	180 → 240
	8 - 25	240
Injection port		240
Detector		250

Detection: mass selective spectrometer set at 72 m/e or 91 m/e.

Injection: 3 µl; if necessary inject a blank between each injection.

Retention times: impurity C = about 20 min.

Limit:

– *impurity C*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (25 ppb).

Heavy metals (*2.4.8*): maximum 10 ppm.

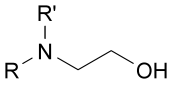
Dilute 5 ml of solution S to 30 ml with *water R*. The solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.000 g.

Open the titration vessel, introduce the substance to be examined directly into the previously titrated solvent. Stopper the flask immediately.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g. Do not carry out the initial heating on a water-bath.

ASSAY



Dissolve 1.200 g in 75 ml of *carbon dioxide-free water R*. Add 0.3 ml of *methyl red solution R*. Titrate with *1 M hydrochloric acid*.

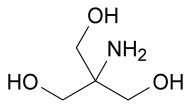
1 ml of *1 M hydrochloric acid* is equivalent to 0.149 g of $C_6H_{15}NO_3$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

A. R = R′ = H: 2-aminoethanol (ethanolamine),



B. R = CH_2-CH_2OH, R′ = H: 2,2′-iminodiethanol (diethanolamine),

C. R = CH_2-CH_2OH, R′ = NO: 2,2′-(nitrosoimino)diethanol (*N*-nitrosodiethanolamine).

01/2008:1053
corrected 6.0

TROMETAMOL

Trometamolum

$C_4H_{11}NO_3$ M_r 121.1
[77-86-1]

DEFINITION

Trometamol contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of aminomethylidynetri(methanol), calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, or colourless crystals, freely soluble in water, sparingly soluble in alcohol, very slightly soluble in ethyl acetate.

IDENTIFICATION

First identification: B, C.

Second identification: A, B, D.

A. Solution S (see Tests) is strongly alkaline (*2.2.4*).

B. Melting point (*2.2.14*): 168 °C to 174 °C.

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *trometamol CRS*.

D. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*). The pH of freshly prepared solution S is 10.0 to 11.5.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance. Wash the plate with *methanol R* before applying the solutions.

Test solution (a). Dissolve 0.20 g in 1 ml of *water R*, with heating, and dilute to 10 ml with *methanol R*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *trometamol CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (a) to 100 ml with *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *dilute ammonia R1* and 90 volumes of *2-propanol R*. Dry the plate at 100 °C to 105 °C. Spray with a 5 g/l solution of *potassium permanganate R* in a 10 g/l solution of *sodium carbonate R*. After about 10 min examine in daylight. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent).

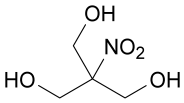
Chlorides (*2.4.4*). To 10 ml of solution S add 2.5 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm).

Heavy metals (*2.4.8*). Dissolve 2.0 g in 10 ml of *water R*. Neutralise the solution with *hydrochloric acid R1* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Iron (*2.4.9*). Dissolve 1.0 g in *water R* and dilute to 10 ml with the same solvent. The solution complies with the limit test for iron (10 ppm).

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.



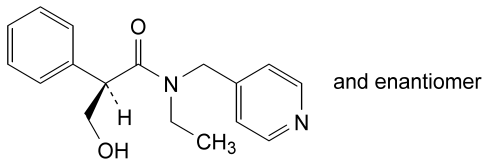
Bacterial endotoxins (*2.6.14*): less than 0.03 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.100 g in 20 ml of *water R*. Add 0.2 ml of *methyl red solution R*. Titrate with *0.1 M hydrochloric acid* until the colour changes from yellow to red.

1 ml of *0.1 M hydrochloric acid* is equivalent to 12.11 mg of $C_4H_{11}NO_3$.

IMPURITIES



A. nitromethylidynetri(methanol).

01/2008:1159

TROPICAMIDE

Tropicamidum

$C_{17}H_{20}N_2O_2$ M_r 284.4
[1508-75-4]

DEFINITION

Tropicamide contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (2*RS*)-*N*-ethyl-3-hydroxy-2-phenyl-*N*-(pyridin-4-ylmethyl)propanamide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water, freely soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: C.

Second identification: A, B, D, E.

A. Melting point (*2.2.14*): 95 °C to 98 °C.

B. Dissolve 20.0 mg in *0.1 M hydrochloric acid* and dilute to 50.0 ml with the same acid. Dilute 2.0 ml of the solution to 20.0 ml with *0.1 M hydrochloric acid*. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 254 nm. The specific absorbance at the maximum is 170 to 190.

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *tropicamide CRS*. Examine the substances prepared as discs.

D. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the spot in the chromatogram obtained with reference solution (a).

E. Dissolve about 5 mg in 3 ml of a mixture of 9 ml of *acetic anhydride R*, 1 ml of *acetic acid R* and 0.1 g of *citric acid R*. Heat on a water-bath for 5 min to 10 min. A reddish-yellow colour is produced.

TESTS

Appearance of solution. Dissolve 0.1 g in *alcohol R* and dilute to 10 ml with the same solvent. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Optical rotation (*2.2.7*). Dissolve 2.5 g in *ethanol R* and dilute to 25.0 ml with the same solvent. The angle of optical rotation is – 0.1° to + 0.1°.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *methylene chloride R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 20 ml with *methylene chloride R*.

Reference solution (a). Dissolve 10 mg of *tropicamide CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 10 ml with *methylene chloride R*.

Reference solution (c). Dilute 2 ml of reference solution (b) to 5 ml with *methylene chloride R*.

Reference solution (d). Dissolve 20 mg of *4-[(ethylamino)methyl]pyridine R* in *methylene chloride R* and dilute to 20 ml with the same solvent. Dilute 1 ml of the solution and 1 ml of reference solution (a) to 10 ml with *methylene chloride R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 0.5 volumes of *concentrated ammonia R*, 5 volumes of *methanol R* and 95 volumes of *methylene chloride R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots.

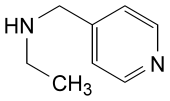
Tropic acid. To 10.0 mg add 5 mg of *disodium tetraborate R* and 0.35 ml of a freshly prepared 100 g/l solution of *dimethylaminobenzaldehyde R* in a mixture of 1 volume of *water R* and 9 volumes of *sulphuric acid R*. Heat on a water-bath for 3 min. Cool in ice water and add 5 ml of *acetic anhydride R*. No violet-red colour develops (0.05 per cent).

Chlorides (*2.4.4*). Dissolve 1.0 g with heating in 8 ml of *acetic acid R*, cool and dilute to 10 ml with the same acid. Dilute 5 ml of the solution to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm).

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 80 °C at a pressure not exceeding 0.7 kPa for 4 h.

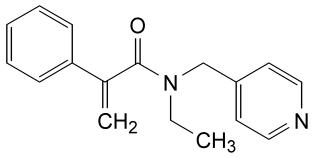
Sulphated ash (*2.2.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



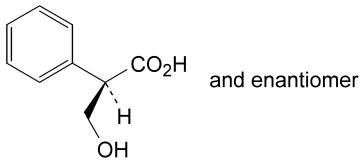
Dissolve 0.200 g in 50 ml of *anhydrous acetic acid R*. Add 0.2 ml of *naphtholbenzein solution R* and titrate with *0.1 M perchloric acid* until the colour changes from orange to green.

1 ml of *0.1 M perchloric acid* is equivalent to 28.44 mg of $C_{17}H_{20}N_2O_2$.



STORAGE

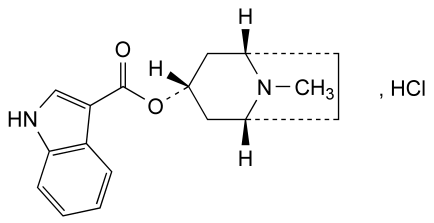
Store protected from light.



IMPURITIES

A. *N*-(pyridin-4-ylmethyl)ethanamine,

B. *N*-ethyl-2-phenyl-*N*-(pyridin-4-ylmethyl)propenamide,



C. (2*RS*)-3-hydroxy-2-phenylpropanoic acid (tropic acid).

01/2008:2102
corrected 6.0

TROPISETRON HYDROCHLORIDE

Tropisetroni hydrochloridum

$C_{17}H_{21}ClN_2O_2$ M_r 320.8
[105826-92-4]

DEFINITION

Hydrochloride of (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl 1*H*-indole-3-carboxylate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble or soluble in water, sparingly soluble in ethanol (96 per cent), very slightly soluble in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50 mg in *methanol R* and dilute to 25.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with *methanol R*.

Spectral range: 220-360 nm.

Absorption maxima: at 228 nm and 282 nm.

Absorbance ratio: A_{228}/A_{282} = 1.3 to 1.4.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *tropisetron hydrochloride CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 5 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Reference solution. Dissolve 5 mg of *tropisetron hydrochloride CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *anhydrous formic acid R, water R, methanol R, methylene chloride R* (2:2:30:70 *V/V/V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in cold air.

Detection A: examine in ultraviolet light at 254 nm.

Detection B: spray first with a solution prepared as follows: dissolve 0.85 g of *bismuth subnitrate R* in a mixture of 10 ml of *acetic acid R* and 40 ml of *water R*; to 5 ml of this solution add 5 ml of a 400 g/l solution of *potassium iodide R* and dilute to 100 ml with *water R*. Then spray with *strong hydrogen peroxide solution R*.

Results: for both detection methods, the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution B_7 (*2.2.2, Method II*).

Dissolve 1.00 g in *water R* and dilute to 20 ml with the same solvent.

Impurity A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.200 g of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 5.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 5.0 mg of *tropine CRS* (impurity A) in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 25.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with a mixture of equal volumes of *methanol R* and *methylene chloride R*. To 0.1 ml of this solution add 1.0 ml of reference solution (a).

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *ammonia R, methanol R, methylene chloride R* (5:40:60 *V/V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in a current of cold air.

Detection: dip the plate in *potassium iodobismuthate solution R1.*

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Limit:

– *impurity A*: any spot due to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in mobile phase A and dilute to 20.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A. Dilute 1.0 ml of this solution to 10.0 ml with mobile phase A.

Reference solution (b). Dissolve 5.0 mg of *tropisetron impurity B CRS* and 5 mg of *ethyl indole-3-carboxylate CRS* in mobile phase A and dilute to 20.0 ml with mobile phase A. Dilute 1.0 ml of this solution to 50.0 ml with mobile phase A.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: *triethylamine R, acetonitrile R, water R, methanol R* (0.3:35:400:565 *V/V/V/V*);

– *mobile phase B*: *triethylamine R, acetonitrile R, water R, methanol R* (0.3:100:100:800 *V/V/V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 14	100	0
14 - 32	100 → 0	0 → 100
32 - 36	0	100
36 - 37	0 → 100	100 → 0
37 - 52	100	0

Flow rate: 2 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl.

Relative retention with reference to tropisetron (retention time = about 22 min): impurity B = about 0.05; ethyl indole-3-carboxylate = about 0.2.

System suitability: reference solution (b):

– *resolution*: minimum 4 between the peaks due to impurity B and ethyl indole-3-carboxylate.

Limits:

– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

***N,N*-Dimethylaniline**. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 250 mg of the substance to be examined in mobile phase A and dilute to 5.0 ml with mobile phase A.

Reference solution. Dissolve 10.0 mg of *N,N-dimethylaniline R* in mobile phase A and dilute to 100.0 ml with mobile phase A. Dilute 1.0 ml of this solution to 100.0 ml with mobile phase A.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: *triethylamine R, acetonitrile R, water R, methanol R* (0.3:35:400:565 *V/V/V/V*);
– *mobile phase B*: *triethylamine R, acetonitrile R, water R*; *methanol R* (0.3:100:100:800 *V/V/V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 10	100	0
10 - 11	100 → 0	0 → 100
11 - 30	0	100
30 - 31	0 → 100	100 → 0
31 - 50	100	0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 248 nm.

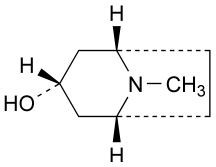
Injection: 20 µl.

Limit:

– *N,N-dimethylaniline*: not more than the area of the principal peak in the chromatogram obtained with the reference solution (20 ppm).

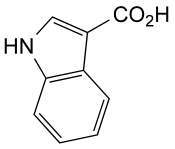
Loss on drying (*2.2.32*): maximum 0.3 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.



ASSAY

Dissolve 0.250 g in 10 ml of *anhydrous acetic acid R* and add 70 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid,* determining the end-point potentiometrically (*2.2.20*).

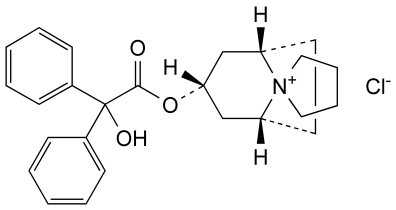


1 ml of *0.1 M perchloric acid* is equivalent to 32.08 mg of $C_{17}H_{21}ClN_2O_2$.

IMPURITIES

Specified impurities: A, B.

A. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]octan-3-ol (tropine),



B. 1*H*-indole-3-carboxylic acid.

corrected 6.0

TROSPIUM CHLORIDE

Trospii chloridum

$C_{25}H_{30}ClNO_3$ M_r 428.0
[10405-02-4]

DEFINITION

(1*R*,3*r*,5*S*)-3-[(Hydroxydiphenylacetyl)oxy]spiro[8-azoniabicyclo[3.2.1]octane-8,1′-pyrrolidinium] chloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very soluble in water, freely soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *trospium chloride CRS.*
B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 3.0 g in *carbon dioxide-free water R* and dilute to 30 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution B_7 (*2.2.2, Method II*).

pH (*2.2.3*): 5.0 to 7.0.

Dilute 5 ml of solution S to 50 ml with *carbon dioxide-free water R.*

Impurity C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.20 g of the substance to be examined in 2.0 ml of *methanol R.*

Reference solution (a). Dissolve 1.0 mg of *trospium impurity C CRS* in 2.0 ml of *methanol R.*

Reference solution (b). Dilute 1.0 ml of test solution to 10.0 ml with *methanol R*. To 50 µl of this solution add 1 ml of reference solution (a).

Plate: *TLC silica gel plate R.*

Mobile phase: *glacial acetic acid R, hydrochloric acid R, acetonitrile R* (1:3.5:45 *V/V/V*).

Application: 10 µl as bands.

Development: over 2/3 of the plate.

Drying: in a current of warm air until the odour of acetic acid is no longer perceptible.

Detection: spray with *potassium iodobismuthate solution R* and subsequently with a 5 g/l solution of *sodium nitrite R.*

System suitability: reference solution (b):

– the chromatogram shows 2 clearly visible and separated zones.

Limit:

– *impurity C*: any zone due to impurity C is not more intense than the zone in the chromatogram obtained with reference solution (a) (0.5 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 30.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 6.0 mg of *trospium impurity A CRS* in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 7.5 mg of *trospium impurity B CRS* in the mobile phase and dilute to 5.0 ml with the mobile phase.

Reference solution (c). Dilute a mixture of 0.3 ml of the test solution, 1.0 ml of reference solution (a) and 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *end-capped octylsilyl silica gel for chromatography R* (5 µm),

– *temperature*: 40 °C.

Mobile phase: mix 1 volume of *triethylamine R* and 3 volumes of *phosphoric acid R* with 700 volumes of *water R* and add 300 volumes of *acetonitrile R.*

Flow rate: 1 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 20 µl.

Run time: 3 times the retention time of trospium.

Relative retention with reference to trospium (retention time = about 10 min): impurity B = about 0.7; impurity A = about 1.9.

System suitability: reference solution (c):

– *resolution*: minimum 3 between the peaks due to impurity B and trospium.

Limits:

– *impurity A*: not more than 3 times the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.3 per cent),

– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.5 per cent),

– *any other impurity*: for each impurity, not more than 0.2 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (c) (0.1 per cent),

– *total*: not more than twice the area of the peak due to impurity B in the chromatogram obtained with reference solution (c) (1.0 per cent),

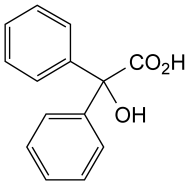
– *disregard limit*: 0.1 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (c) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

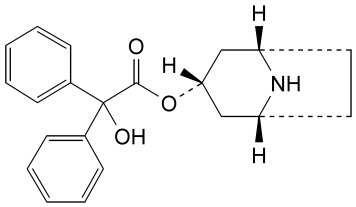
ASSAY

Dissolve 0.300 g in 50 ml of *water R*. Titrate with *0.1 M silver nitrate,* determining the end-point potentiometrically (*2.2.20*).



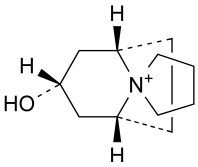
1 ml of *0.1 M silver nitrate* is equivalent to 42.80 mg of $C_{25}H_{30}ClNO_3$.

STORAGE



Protected from light.

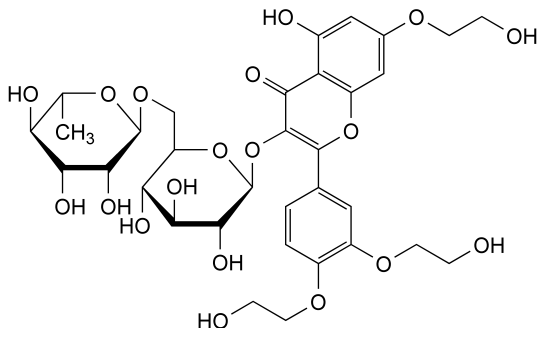
IMPURITIES



Specified impurities: A, B, C.

A. hydroxydiphenylacetic acid (benzilic acid),

B. (1*R*,3*r*,5*S*)-8-azabicyclo[3.2.1]oct-3-yl hydroxydiphenylacetate,



C. (1*R*,3*r*,5*S*)-3-hydroxyspiro[8-azoniabicyclo[3.2.1]octane-8,1′-pyrrolidinium].

corrected 6.0

TROXERUTIN

Troxerutinum

$C_{33}H_{42}O_{19}$ M_r 743

DEFINITION

Mixture of *O*-hydroxyethylated derivatives of rutin containing minimum 80 per cent of 2-[3,4-bis(2-hydroxyethoxy)phenyl]-3-[[6-*O*-(6-deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-5-hydroxy-7-(2-hydroxyethoxy)-4*H*-1-benzopyran-4-one (tris(hydroxyethyl)rutin).

Content: 95.0 per cent to 105.0 per cent (dried substance).

CHARACTERS

Appearance: yellowish-green, crystalline powder, hygroscopic.

Solubility: freely soluble in water, slightly soluble in ethanol (96 per cent) and practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *troxerutin CRS*.

B. Examine the chromatograms obtained in the test for composition.
Results: the principal peak in the chromatogram obtained with the test solution is similar in position and size to the principal peak in the chromatogram obtained with the reference solution (a).

TESTS

Composition. Liquid chromatography (*2.2.29*): use the normalisation procedure.

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase, if necessary using an ultrasonic bath and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *troxerutin CRS* in the mobile phase, if necessary using an ultrasonic bath and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 10 ml with the mobile phase. Dilute 1 ml of this solution to 100 ml with the mobile phase.

Column:
- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 20 volumes of *acetonitrile R* and 80 volumes of a 15.6 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 4.4 with *dilute phosphoric acid R* or *dilute sodium hydroxide solution R*.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 350 nm.

Injection: 10 µl.

Run time: twice the retention time of the main compound of troxerutin (tris(hydroxyethyl)rutin).

Relative retention with reference to tris(hydroxyethyl)rutin (retention time = about 25 min): tetrakis(hydroxyethyl)-rutin = about 0.5; mono(hydroxyethyl)rutin = about 0.8; bis(hydroxyethyl)rutin = about 1.1.

System suitability: reference solution (a):
- *peak-to-valley ratio*: minimum 2.0, where H_p = height above the baseline of the peak due to bis(hydroxyethyl)rutin and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to tris(hydroxyethyl)rutin;
- *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (b).

Limits:
- *principal peak*: minimum 80 per cent,
- *any other peak*: for each peak, maximum 5 per cent, except for 1 peak which can be maximum 10 per cent.
- *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (b).

Ethylene oxide. Head-space gas chromatography (*2.2.28*).

Test solution. To 1.00 g of the substance to be examined in a vial, add 1.0 ml of *water R*. Mix to obtain a homogeneous solution. Heat at 70 °C for 45 min.

Reference solution. To 1.00 g of the substance to be examined in a vial, add 50 µl of *ethylene oxide solution R4* and 950 µl of *water R* and close tightly. Mix to obtain a homogeneous solution. Heat at 70 °C for 45 min.

Column:
- *material*: fused silica,
- *size*: *l* = 30 m, Ø = 0.32 mm,
- *stationary phase*: *poly(cyanopropyl)(7)(phenyl)(7)methyl(86)siloxane R* (film thickness 1 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.1 ml/min.

Static head-space conditions which may be used:
- *equilibration temperature*: 80 °C,
- *equilibration time*: 45 min,
- *transfer line temperature*: 110 °C,
- *pressurisation time*: 2 min,
- *injection time*: 12 s.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	40
	5 - 18	40 → 200
Injection port		150
Detector		250

Detection: flame ionisation.

Injection: 1.0 ml.

The peak due to ethylene oxide is identified by injecting solutions of ethylene oxide of increasing concentration.

Determine the content of ethylene oxide (ppm) in the substance to be examined using the following expression:

$$\frac{A_1 \times m_1}{(A_2 \times m_2) - (A_1 \times m_3)}$$

A_1 = area of the peak due to ethylene oxide in the chromatogram obtained with the test solution,

A_2 = area of the peak due to ethylene oxide in the chromatogram obtained with the reference solution,

m_1 = mass of ethylene oxide in the reference solution, in micrograms,

m_2 = mass of the substance to be examined in the test solution, in grams,

m_3 = mass of the substance to be examined in the reference solution, in grams.

Limit:
- *ethylene oxide*: maximum 1 ppm.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test F. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.4 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 100.0 ml of *water R*. Dilute 10.0 ml of this solution to 100.0 ml with *water R*. Dilute 10.0 ml to 100.0 ml with *water R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 350 nm.

Calculate the percentage content of $C_{33}H_{42}O_{19}$ taking the specific absorbance to be 250.

STORAGE

In an airtight container, protected from light.

01/2008:0694

TRYPSIN

Trypsinum

[9002-07-7]

DEFINITION

Trypsin is a proteolytic enzyme obtained by the activation of trypsinogen extracted from the pancreas of healthy mammals. It has an activity of not less than 0.5 microkatal per milligram, calculated with reference to the dried substance. In solution, it has maximum enzymic activity at pH 8; the activity is reversibly inhibited at pH 3, at which pH it is most stable.

PRODUCTION

The animals from which trypsin is derived must fulfil the requirements for the health of animals suitable for human consumption.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test.

Histamine (*2.6.10*). Not more than 1 µg of histamine base per 0.2 microkatal of trypsin activity. Use a 10 g/l solution of the substance to be examined in *0.0015 M borate buffer solution pH 8.0 R* inactivated by heating on a water-bath for 30 min. Carry out dilutions with a 9 g/l solution of *sodium chloride R*.

CHARACTERS

A white or almost white, crystalline or amorphous powder, sparingly soluble in water. The amorphous form is hygroscopic.

IDENTIFICATION

A. Dilute 1 ml of solution S (see Tests) to 100 ml with *water R*. In a depression in a white spot-plate, mix 0.1 ml of this solution with 0.2 ml of *tosylarginine methyl ester hydrochloride solution R*. A reddish-violet colour develops within 3 min.

B. Dilute 0.5 ml of solution S to 5 ml with *water R*. Add 0.1 ml of a 20 g/l solution of *tosyl-lysyl-chloromethane hydrochloride R*. Adjust to pH 7.0, shake for 2 h and dilute to 50 ml with *water R*. In one of the depressions of a white spot-plate, mix 0.1 ml of this solution with 0.2 ml of *tosylarginine methyl ester hydrochloride solution R*. No reddish-violet colour develops within 3 min.

TESTS

Solution S. Dissolve 0.10 g in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension III (*2.2.1*).

pH (*2.2.3*). The pH of solution S is 3.0 to 6.0.

Absorbance (*2.2.25*). Dissolve 30.0 mg in *0.001 M hydrochloric acid* and dilute to 100.0 ml with the same acid. The solution shows an absorption maximum at 280 nm and a minimum at 250 nm. The specific absorbance at the absorption maximum is 13.5 to 16.5 and at the absorption minimum is not greater than 7.0.

Chymotrypsin. To 1.8 ml of *buffer solution pH 8.0 R* add 7.4 ml of *water R* and 0.5 ml of *0.2 M acetyltyrosine ethyl ester R*. While shaking the solution, add 0.3 ml of solution S and start a timer. After exactly 5 min, measure the pH (*2.2.3*) (test solution). Prepare a reference solution in the same manner, replacing solution S by 0.3 ml of a 0.5 g/l solution of *chymotrypsin BRP* and measure the pH (*2.2.3*) exactly 5 min after adding the chymotrypsin. The pH of the test solution is higher than that of the reference solution.

Loss on drying (*2.2.32*). Not more than 5.0 per cent, determined on 0.500 g by drying at 60 °C at a pressure not exceeding 670 Pa for 2 h.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^4 micro-organisms per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (*2.6.13*).

ASSAY

The activity of trypsin is determined by comparing the rate at which it hydrolyses *benzoylarginine ethyl ester hydrochloride R* with the rate at which *trypsin BRP* hydrolyses the same substrate in the same conditions.

Apparatus. Use a reaction vessel of about 30 ml capacity provided with:

- a device that will maintain a temperature of 25.0 ± 0.1 °C;
- a stirring device (for example, a magnetic stirrer);
- a lid with holes for the insertion of electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of reagents.

An automatic or manual titration device may be used. For the latter, the burette is graduated in 0.005 ml and the pH meter is provided with a wide-range scale and glass-calomel or glass-silver-silver chloride electrodes.

Test solution. Dissolve sufficient of the substance to be examined in *0.001 M hydrochloric acid* and dilute to 25.0 ml with the same acid in order to obtain a solution containing approximately 700 nanokatals per millilitre.

Reference solution. Dissolve 25.0 mg of *trypsin BRP* in *0.001 M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Store the solutions at 0-5 °C. Warm 1 ml of each solution to about 25 °C over 15 min and use 50 µl of each solution for each titration. Carry out the titration in an atmosphere of nitrogen. Transfer 10.0 ml of *0.0015 M borate buffer solution pH 8.0 R* to the reaction vessel and, while stirring, add 1.0 ml of a freshly prepared 6.86 g/l solution of *benzoylarginine ethyl ester hydrochloride R*. When the temperature is steady at 25.0 ± 0.1 °C (after about 5 min) adjust the pH to exactly 8.0 with *0.1 M sodium hydroxide*. Add 50 µl of the test solution and start a timer. Maintain the pH at 8.0 by the addition of *0.1 M sodium hydroxide*, the tip of the microburette being immersed in the solution; note the volume added every 30 s. Follow the reaction for 8 min. Calculate the volume of *0.1 M sodium hydroxide* used per second. Carry out a titration in the same manner using the reference solution and calculate the volume of *0.1 M sodium hydroxide* used per second.

Calculate the activity in microkatals per milligram using the following expression:

$$\frac{m' \times V}{m \times V'} \times A$$

m = mass of the substance to be examined, in milligrams;

m' = mass of *trypsin BRP*, in milligrams;

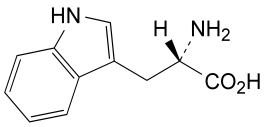
V = volume of *0.1 M sodium hydroxide* used per second by the test solution;

V' = volume of *0.1 M sodium hydroxide* used per second by the reference solution;

A = activity of *trypsin BRP*, in microkatals per milligram.

STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.



LABELLING

The label states the activity in microkatals per milligram.

01/2008:1272
corrected 6.0

TRYPTOPHAN

Tryptophanum

$C_{11}H_{12}N_2O_2$ M_r 204.2
[73-22-3]

DEFINITION

(*S*)-2-Amino-3-(1*H*-indol-3-yl)propanoic acid.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline or amorphous powder.

Solubility: sparingly soluble in water, slightly soluble in ethanol (96 per cent). It dissolves in dilute solutions of mineral acids and alkali hydroxides.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *tryptophan CRS.*

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 20 mg in 10 ml of *water R*. Add 5 ml of *dimethylaminobenzaldehyde solution R6* and 2 ml of *hydrochloric acid R1*. Heat on a water-bath. A purple-blue colour develops.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Dissolve 0.1 g in *1 M hydrochloric acid* and dilute to 10 ml with the same acid.

Specific optical rotation (*2.2.7*): – 30.0 to – 33.0 (dried substance).

Dissolve 0.25 g in *water R*, heating on a water-bath if necessary, and dilute to 25.0 ml with the same solvent.

Ninhydrin-positive substances. Thin-layer chromatography (*2.2.27*).

Solvent mixture: *glacial acetic acid R, water R* (50:50 *V/V*).

Test solution (a). Dissolve 0.10 g of the substance to be examined in the solvent mixture and dilute to 10 ml with the solvent mixture.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with the solvent mixture.

Reference solution (a). Dissolve 10 mg of *tryptophan CRS* in the solvent mixture and dilute to 50 ml with the solvent mixture.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with the solvent mixture.

Reference solution (c). Dissolve 10 mg of *tryptophan CRS* and 10 mg of *tyrosine CRS* in the solvent mixture and dilute to 25 ml with the solvent mixture.

Plate: *TLC silica gel plate R.*

Mobile phase: *glacial acetic acid R, water R, butanol R* (20:20:60 *V/V/V*).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *ninhydrin solution R* and heat at 100-105 °C for 15 min.

System suitability: reference solution (c):

– the chromatogram shows 2 clearly separated spots.

Limit: test solution (a):

– *any impurity*: any spot, apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Impurity A and other related substances. Liquid chromatography (*2.2.29*). *Prepare the standard, test and reference solutions immediately before use.*

Buffer solution pH 2.3. Dissolve 3.90 g of *sodium dihydrogen phosphate R* in 1000 ml of *water R*. Add about 700 ml of a 2.9 g/l solution of *phosphoric acid R* and adjust to pH 2.3 with the same acid solution.

Solvent mixture: *acetonitrile R, water R* (10:90 *V/V*).

Standard solution. Dissolve 10.0 mg of *N-acetyltryptophan R* in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 2.0 ml of this solution to 100.0 ml with the solvent mixture.

Test solution (a). Dissolve 0.10 g of the substance to be examined in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Test solution (b). Dissolve 0.10 g of the substance to be examined in the standard solution and dilute to 10.0 ml with the standard solution.

Reference solution (a). Dissolve 1.0 mg of *1,1′-ethylidenebistryptophan CRS* (impurity A) in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 50.0 ml with the standard solution.

Reference solution (c). Dilute 10.0 ml of reference solution (a) to 50.0 ml with the solvent mixture.

Reference solution (d). Dissolve 0.10 g of the substance to be examined in reference solution (c) and dilute to 10.0 ml with reference solution (c).

Reference solution (e). Dilute 1.0 ml of reference solution (c) to 10.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

Mobile phase:

– *mobile phase A*: *acetonitrile R*, buffer solution pH 2.3 (115:885 *V/V*);
– *mobile phase B*: *acetonitrile R*, buffer solution pH 2.3 (350:650 *V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 10	100	0
10 - 45	100 → 0	0 → 100
45 - 65	0	100
65 - 66	0 → 100	100 → 0
66 - 80	100	0

Flow rate: 0.7 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl of test solutions (a) and (b) and reference solutions (b), (d) and (e).

Retention time: tryptophan = about 8 min; *N*-acetyltryptophan = about 29 min; impurity A = about 34 min.

System suitability:

– *resolution*: minimum 8.0 between the peaks due to *N*-acetyltryptophan and impurity A in the chromatogram obtained with reference solution (b); if necessary, adjust the time programme for the elution gradient (an increase in the duration of elution with mobile phase A produces longer retention times and a better resolution);
– *signal-to-noise ratio*: minimum 15 for the principal peak in the chromatogram obtained with reference solution (e);
– in the chromatogram obtained with test solution (a) there is no peak with the same retention time as *N*-acetyltryptophan (in such case correct the area of the *N*-acetyltryptophan peak).

Limits: test solution (b):

– *impurity A*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (10 ppm);
– *sum of impurities with a retention time less than that of tryptophan*: not more than 0.6 times the area of the peak due to *N*-acetyltryptophan in the chromatogram obtained with reference solution (b) (100 ppm);
– *sum of impurities with a retention time greater than that of tryptophan and up to 1.8 times the retention time of N-acetyltryptophan*: not more than 1.9 times the area of the peak due to *N*-acetyltryptophan in the chromatogram obtained with reference solution (b) (300 ppm);
– *disregard limit*: 0.02 times the area of the peak due to *N*-acetyltryptophan in the chromatogram obtained with reference solution (b); disregard the peak due to *N*-acetyltryptophan.

Chlorides (*2.4.4*): maximum 200 ppm.

Dissolve 0.25 g in 3 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution, without any further addition of nitric acid, complies with the test.

Sulphates (*2.4.13*): maximum 300 ppm.

Dissolve 0.5 g in a mixture of 5 volumes of *dilute hydrochloric acid R* and 25 volumes of *distilled water R*, and dilute to 15 ml with the same mixture of solvents.

Ammonium (*2.4.1, Method B*): maximum 200 ppm, determined on 0.10 g.

Prepare the standard using 0.2 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (*2.4.9*): maximum 20 ppm.

In a separating funnel, dissolve 0.50 g in 10 ml of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. Examine the aqueous layer.

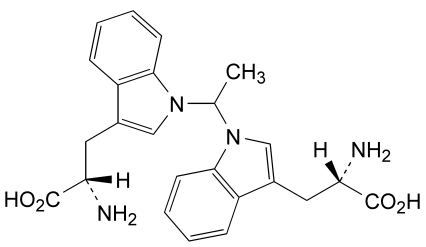
Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test D. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

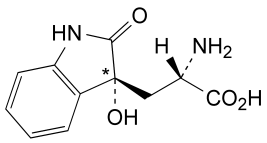
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.150 g in 3 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, using 0.1 ml of *naphtholbenzein solution R* as indicator.

1 ml of *0.1 M perchloric acid* is equivalent to 20.42 mg of $C_{11}H_{12}N_2O_2$.



STORAGE

Protected from light.

TUBERCULIN FOR HUMAN USE, OLD

Tuberculinum pristinum ad usum humanum

DEFINITION

Old tuberculin for human use consists of a filtrate, concentrated by heating, containing the soluble products of the culture and lysis of one or more strains of *Mycobacterium bovis* and/or *Mycobacterium tuberculosis* that is capable of demonstrating a delayed hypersensitivity in an animal sensitised to micro-organisms of the same species.

Old tuberculin for human use in concentrated form is a transparent, viscous, yellow or brown liquid.

PRODUCTION

GENERAL PROVISIONS

The production of old tuberculin is based on a seed-lot system. The production method shall have been shown to yield consistently old tuberculin of adequate potency and safety in man. A batch of old tuberculin, calibrated in International Units by the method described under Assay and for which adequate clinical information is available as to its activity in man, is set aside to serve as a reference preparation.

The International Unit is the activity of a stated quantity of the International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

SEED LOTS

The strains of mycobacteria used shall be identified by historical records that include information on their origin and subsequent manipulation.

The working seed lots used to inoculate the media for the production of a concentrated harvest shall not have undergone more than 4 subcultures from the master seed lot.

Only seed lots that comply with the following requirements may be used for propagation.

Identification. The species of mycobacterium of the master and working seed lots is identified.

Bacterial and fungal contamination. Carry out the test for sterility (*2.6.1*), using 10 ml for each medium. The working seed lot complies with the test for sterility except for the presence of mycobacteria.

PROPAGATION AND HARVEST

The bacteria are grown in a liquid medium which may be a glycerolated broth or a synthetic medium. Growth must be typical for the strain. The culture is inactivated by a suitable method, such as treatment in an autoclave (121 °C for not less than 30 min) or in flowing steam at a temperature

not less than 100 °C for at least 1 h. The culture liquid, from which the micro-organisms may or may not have been separated by filtration, is concentrated by evaporation, usually to one-tenth of its initial volume. The preparation is free from live mycobacteria. The concentrated harvest is shown to comply with the test for mycobacteria (*2.6.2*) before addition of any antimicrobial preservative or other substance that might interfere with the test. Phenol (5 g/l) or another suitable antimicrobial preservative that does not give rise to false positive reactions may be added.

Only a concentrated harvest that complies with the following requirements may be used in the preparation of the final bulk tuberculin.

pH (*2.2.3*). The pH of the concentrated harvest is 6.5 to 8.

Glycerol. Where applicable, determine the glycerol content of the concentrated harvest. The amount is within the limits approved for the particular product.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than 85 per cent and not more than 115 per cent of the intended amount. If phenol has been used in the preparation, the concentration is not more than 5 g/l (*2.5.15*).

Sensitisation. Carry out the test described under Tests.

Sterility (*2.6.1*). The concentrated harvest complies with the test for sterility, carried out using 10 ml for each medium.

Potency. Determine the potency as described under Assay.

FINAL BULK TUBERCULIN

The concentrated harvest is diluted aseptically.

Only a final bulk tuberculin that complies with the following requirement may be used in the preparation of the final lot.

Sterility (*2.6.1*). The final bulk tuberculin complies with the test for sterility, carried out using 10 ml for each medium.

FINAL LOT

The final bulk tuberculin is distributed aseptically into sterile containers which are then closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

The following tests may be omitted on the final lot if they have been carried out at the stages indicated:

– live mycobacteria: concentrated harvest,

– sensitisation: concentrated harvest,

– toxicity: concentrated harvest or final bulk tuberculin,

– antimicrobial preservative: final bulk tuberculin.

IDENTIFICATION

Inject increasing doses of the preparation to be examined intradermally into healthy, white or pale-coloured guinea-pigs, specifically sensitised (for example, as described under Assay). A reaction varying from erythema to necrosis is produced at the site of the injection. Similar injections administered to non-sensitised guinea-pigs do not stimulate a reaction. The assay may also serve as identification.

TESTS

Old tuberculin for human use in concentrated form (≥ 100 000 IU/ml) complies with each of the tests prescribed below; the diluted product complies with the tests for antimicrobial preservative and sterility.

Toxicity. Inject a quantity equivalent to 50 000 IU subcutaneously into each of two healthy guinea-pigs weighing 250 g to 350 g and which have not been subjected to any treatment likely to interfere with the test. Observe the animals for 7 days. No adverse effect is produced.

Sensitisation. Use 3 guinea-pigs that have not been subjected to any treatment likely to interfere with the test. On 3 occasions at intervals of 5 days, inject intradermally into each guinea-pig about 500 IU of the preparation to be examined in a volume of 0.1 ml. 2 to 3 weeks after the third injection, administer the same dose intradermally to the same animals and to a control group of 3 guinea-pigs of the same mass that have not previously received injections of tuberculin. After 24 h to 72 h, the reactions in the 2 groups of animals are not substantially different.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than the minimum amount shown to be effective and not more than 115 per cent of the amount stated on the label. If phenol has been used in the preparation, the concentration is not more than 5 g/l (*2.5.15*).

Live mycobacteria (*2.6.2*). It complies with the test for mycobacteria.

Sterility (*2.6.1*). It complies with the test for sterility.

ASSAY

The potency of old tuberculin is determined by comparing the reactions produced by the intradermal injection of increasing doses of the preparation to be examined into sensitised guinea-pigs with the reactions produced by known concentrations of the reference preparation.

Prepare a suspension containing a suitable amount (0.1 mg to 0.4 mg/ml) of heat-inactivated, dried mycobacteria in mineral oil with or without emulsifier; use mycobacteria of a strain of the same species as that used in the preparation to be examined. Sensitise not fewer than 6 pale-coloured guinea-pigs weighing not less than 300 g by injecting intramuscularly or intradermally a total of about 0.5 ml of the suspension, divided between several sites if necessary. Carry out the test after the period of time required for optimal sensitisation which is usually 4 to 8 weeks after sensitisation. Depilate the flanks of the animals so that it is possible to make at least three injections on each side and not more than a total of 12 injection points per animal. Use at least three different doses of the reference preparation and at least 3 different doses of the preparation to be examined. For both preparations, use doses such that the highest dose is about 10 times the lowest dose. Choose the doses such that when they are injected the lesions produced have a diameter of not less than 8 mm and not more than 25 mm. In any given test, the order of the dilutions injected at each point is chosen at random in a Latin square design. Inject each dose intradermally in a constant volume of 0.1 ml or 0.2 ml. Measure the diameters of the lesions 24 h to 48 h later and calculate the results of the test by the usual statistical methods, assuming that the diameters of the lesions are directly proportional to the logarithm of the concentration of the preparation.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

Store protected from light.

LABELLING

The label states:

- the number of International Units per millilitre,
- the species of mycobacterium used to prepare the product,
- the name and quantity of any antimicrobial preservative or other substance added to the preparation,
- the expiry date,
- where applicable, that old tuberculin is not to be injected in its concentrated form but diluted so as to administer not more than 100 IU per dose.

01/2008:0535

TUBERCULIN PURIFIED PROTEIN DERIVATIVE, AVIAN

Tuberculini aviarii derivatum proteinosum purificatum

DEFINITION

Avian tuberculin purified protein derivative (avian tuberculin PPD) is a preparation obtained from the heat-treated products of growth and lysis of *Mycobacterium avium* capable of revealing a delayed hypersensitivity in an animal sensitised to micro-organisms of the same species.

PRODUCTION

It is obtained from the water-soluble fractions prepared by heating in free-flowing steam and subsequently filtering cultures of *M. avium* grown in a liquid synthetic medium. The active fraction of the filtrate, consisting mainly of protein, is isolated by precipitation, washed and re-dissolved. An antimicrobial preservative that does not give rise to false positive reactions, such as phenol, may be added. The final sterile preparation, free from mycobacteria, is distributed aseptically into sterile tamper-proof glass containers, which are then closed so as to prevent contamination. The preparation may be freeze-dried.

The identification, the tests and the determination of potency apply to the liquid form and to the freeze-dried form after reconstitution as stated on the label.

IDENTIFICATION

Inject a range of graded doses intradermally at different sites into suitably sensitised albino guinea-pigs, each weighing not less than 250 g. After 24-28 h, reactions appear in the form of oedematous swellings with erythema, with or without necrosis, at the points of injection. The size and severity of the reactions vary according to the dose. Unsensitised guinea-pigs show no reactions to similar injections.

TESTS

pH (*2.2.3*): 6.5 to 7.5.

Phenol (*2.5.15*): maximum 5 g/l, if the preparation to be examined contains phenol.

Sensitising effect. Use a group of 3 guinea-pigs that have not been treated with any material that will interfere with the test. On 3 occasions at intervals of 5 days, inject intradermally into each guinea-pig a dose of the preparation to be examined equivalent to 500 IU in 0.1 ml. 15-21 days after the 3rd injection, inject the same dose (500 IU) intradermally into these animals and into a control group of 3 guinea-pigs of the same mass, which have not previously received injections of tuberculin. 24-28 h after the last injections, the reactions of the 2 groups are not significantly different.

Toxicity. Use 2 guinea-pigs, each weighing not less than 250 g, that have not previously been treated with any material that will interfere with the test. Inject subcutaneously into each guinea-pig 0.5 ml of the preparation to be examined. Observe the animals for 7 days. No abnormal effects occur during the observation period.

Sterility. It complies with the test for sterility prescribed in the monograph *Vaccines for veterinary use (0062)*.

POTENCY

The potency of avian tuberculin purified protein derivative is determined by comparing the reactions produced in sensitised guinea-pigs by the intradermal injection of a series of dilutions of the preparation to be examined with those produced by known concentrations of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Sensitise not fewer than 8 albino guinea-pigs, each weighing 400-600 g, by the deep intramuscular injection of a suitable dose of inactivated or live *M. avium*. Not less than 4 weeks after the sensitisation of the guinea-pigs, shave their flanks to provide space for not more than 4 injection sites on each side. Prepare dilutions of the preparation to be examined and of the reference preparation using isotonic phosphate-buffered saline (pH 6.5-7.5) containing 0.005 g/l of *polysorbate 80 R*. Use not fewer than 3 doses of the reference preparation and not fewer than 3 doses of the preparation to be examined. Choose the doses such that the lesions produced have a diameter of not less than 8 mm and not more than 25 mm. Allocate the dilutions randomly to the sites, for example using a Latin square design. Inject each dose intradermally in a constant volume of 0.1 ml or 0.2 ml. Measure the diameters of the lesions after 24-28 h and calculate the results of the test using the usual statistical methods (for example, *5.3*) and assuming that the diameters of the lesions are directly proportional to the logarithm of the concentration of the tuberculins.

The test is not valid unless the confidence limits ($P = 0.95$) are not less than 50 per cent and not more than 200 per cent of the estimated potency. The estimated potency is not less than 75 per cent and not more than 133 per cent of the stated potency. The stated potency is not less than 20 000 IU/ml.

STORAGE

Protected from light, at a temperature of 5 ± 3 °C.

LABELLING

The label states:

- the potency in International Units per millilitre;
- the name and quantity of any added substance;
- for freeze-dried preparations:
  - the name and volume of the reconstituting liquid to be added;
  - that the product is to be used immediately after reconstitution.

01/2008:0536

TUBERCULIN PURIFIED PROTEIN DERIVATIVE, BOVINE

Tuberculini bovini derivatum proteinosum purificatum

DEFINITION

Bovine tuberculin purified protein derivative (bovine tuberculin PPD) is a preparation obtained from the heat-treated products of growth and lysis of *Mycobacterium bovis* capable of revealing a delayed hypersensitivity in an animal sensitised to micro-organisms of the same species.

PRODUCTION

It is obtained from the water-soluble fractions prepared by heating in free-flowing steam and subsequently filtering cultures of *M. bovis* grown in a liquid synthetic medium. The active fraction of the filtrate, consisting mainly of protein, is isolated by precipitation, washed and re-dissolved. An antimicrobial preservative that does not give rise to false positive reactions, such as phenol, may be added. The final sterile preparation, free from mycobacteria, is distributed aseptically into sterile, tamper-proof glass containers, which are then closed so as to prevent contamination. The preparation may be freeze-dried.

The identification, the tests and the determination of potency apply to the liquid form and to the freeze-dried form after reconstitution as stated on the label.

IDENTIFICATION

Inject a range of graded doses intradermally at different sites into suitably sensitised albino guinea-pigs, each weighing not less than 250 g. After 24-28 h, reactions appear in the form of oedematous swellings with erythema, with or without necrosis, at the points of injection. The size and severity of the reactions vary according to the dose. Unsensitised guinea-pigs show no reactions to similar injections.

TESTS

pH (*2.2.3*): 6.5 to 7.5.

Phenol (*2.5.15*): maximum 5 g/l, if the preparation to be examined contains phenol.

Sensitising effect. Use a group of 3 guinea-pigs that have not been treated with any material that will interfere with the test. On 3 occasions at intervals of 5 days, inject intradermally into each guinea-pig a dose of the preparation to be examined equivalent to 500 IU in 0.1 ml. 15-21 days after the 3rd injection, inject the same dose (500 IU) intradermally into these animals and into a control group of 3 guinea-pigs of the same mass, which have not previously received injections of tuberculin. 24-28 h after the last injections, the reactions of the 2 groups are not significantly different.

Toxicity. Use 2 guinea-pigs, each weighing not less than 250 g, that have not previously been treated with any material that will interfere with the test. Inject subcutaneously into each guinea-pig 0.5 ml of the preparation to be examined. Observe the animals for 7 days. No abnormal effects occur during the observation period.

Sterility. It complies with the test for sterility prescribed in the monograph *Vaccines for veterinary use (0062)*.

POTENCY

The potency of bovine tuberculin purified protein derivative is determined by comparing the reactions produced in sensitised guinea-pigs by the intradermal injection of a series of dilutions of the preparation to be examined with those produced by known concentrations of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Sensitise not fewer than 8 albino guinea-pigs, each weighing 400-600 g, by the deep intramuscular injection of 0.0001 mg of wet mass of living *M. bovis* of strain AN5 suspended in 0.5 ml of a 9 g/l solution of *sodium chloride R*. Not less than 4 weeks after the sensitisation of the guinea-pigs, shave their flanks to provide space for not more than 4 injection sites on each side. Prepare dilutions of the preparation to be examined and of the reference preparation using isotonic phosphate-buffered saline (pH 6.5-7.5) containing 0.005 g/l of *polysorbate 80 R*. Use not fewer than 3 doses of the reference preparation and not fewer than 3 doses of the preparation to be examined. Choose the doses such that the lesions produced have a diameter of not less than 8 mm and not more than 25 mm. Allocate the dilutions randomly to the sites, for example using a Latin square design. Inject each dose intradermally in a constant volume of 0.1 ml or 0.2 ml. Measure the diameters of the lesions after 24-28 h and calculate the results of the test using the usual statistical methods (for example, *5.3*) and assuming that the diameters of the lesions are directly proportional to the logarithm of the concentration of the tuberculins.

The test is not valid unless the confidence limits ($P = 0.95$) are not less than 50 per cent and not more than 200 per cent of the estimated potency. The estimated potency is not less than 66 per cent and not more than 150 per cent of the stated potency. The stated potency is not less than 20 000 IU/ml.

STORAGE

Protected from light, at a temperature of 5 ± 3 °C.

LABELLING

The label states:

- the potency in International Units per millilitre;
- the name and quantity of any added substance;
- for freeze-dried preparations:
  - the name and volume of the reconstituting liquid to be added;
  - that the product is to be used immediately after reconstitution.

01/2008:0151

TUBERCULIN PURIFIED PROTEIN DERIVATIVE FOR HUMAN USE

Tuberculini derivatum proteinosum purificatum ad usum humanum

DEFINITION

Tuberculin purified protein derivative (tuberculin PPD) for human use is a preparation obtained by precipitation from the heated products of the culture and lysis of

Mycobacterium bovis and/or *Mycobacterium tuberculosis* and capable of demonstrating a delayed hypersensitivity in an animal sensitised to micro-organisms of the same species.

Tuberculin PPD is a colourless or pale-yellow liquid; the diluted preparation may be a freeze-dried powder which upon dissolution gives a colourless or pale-yellow liquid.

PRODUCTION

GENERAL PROVISIONS

The production of tuberculin PPD is based on a seed-lot system. The production method shall have been shown to yield consistently tuberculin PPD of adequate potency and safety in man. A batch of tuberculin PPD, calibrated in International Units by method A described under Assay and for which adequate clinical information is available as to its activity in man, is set aside to serve as a reference preparation.

The International Unit is the activity of a stated quantity of the International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

SEED LOTS

The strains of mycobacteria used shall be identified by historical records that include information on their origin and subsequent manipulation.

The working seed lots used to inoculate the media for production of a concentrated harvest shall not have undergone more than 4 subcultures from the master seed lot.

Only seed lots that comply with the following requirements may be used for propagation.

Identification. The species of mycobacterium of the master and working seed lots is identified.

Bacterial and fungal contamination. Carry out the test for sterility (*2.6.1*), using 10 ml for each medium. The working seed lot complies with the test for sterility except for the presence of mycobacteria.

PROPAGATION AND HARVEST

The bacteria are grown in a liquid synthetic medium. Growth must be typical for the strain. The culture is inactivated by a suitable method such as treatment in an autoclave (121 °C for not less than 30 min) or in flowing steam at a temperature not less than 100 °C for at least 1 h and filtered. The active fraction of the filtrate, consisting mainly of protein, is isolated by precipitation, washed and re-dissolved. The preparation is free from mycobacteria. The concentrated harvest is shown to comply with the test for mycobacteria (*2.6.2*) before addition of any antimicrobial preservative or other substance that might interfere with the test. Phenol (5 g/l) or another suitable antimicrobial preservative that does not give rise to false positive reactions may be added; a suitable stabiliser intended to prevent adsorption on glass or plastic surfaces may be added. The concentrated harvest may be freeze-dried. Phenol is not added to preparations that are to be freeze-dried.

Only a concentrated harvest that complies with the following requirements may be used in the preparation of the final bulk tuberculin PPD.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than 85 per cent and not more than 115 per cent of the intended amount. If phenol has been used in the preparation, the concentration is not more than 5 g/l (*2.5.15*).

Sensitisation. Carry out the test described under Tests.

Sterility (*2.6.1*). The concentrated harvest, reconstituted if necessary, complies with the test for sterility, carried out using 10 ml for each medium.

Potency. Determine the potency as described under Assay.

FINAL BULK TUBERCULIN PPD

The concentrated harvest is diluted aseptically, after reconstitution if necessary.

Only a final bulk tuberculin PPD that complies with the following requirement may be used in the preparation of the final lot.

Sterility (*2.6.1*). The final bulk tuberculin PPD complies with the test for sterility, carried out using 10 ml for each medium.

FINAL LOT

The final bulk tuberculin PPD is distributed aseptically into sterile containers which are then closed so as to prevent contamination. It may be freeze-dried.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

The following tests may be omitted on the final lot if they have been carried out at the stages indicated:

- live mycobacteria: concentrated harvest
- sensitisation: concentrated harvest
- toxicity: concentrated harvest or final bulk tuberculin PPD
- antimicrobial preservative: final bulk tuberculin PPD.

IDENTIFICATION

Inject increasing doses of the preparation to be examined intradermally into healthy, white or pale-coloured guinea-pigs, specifically sensitised (for example as described under Assay). A reaction varying from erythema to necrosis is produced at the site of the injection. Similar injections administered to non-sensitised guinea-pigs do not stimulate a reaction. The assay may also serve as identification.

TESTS

Tuberculin purified protein derivative for human use in concentrated form (≥ 100 000 IU/ml) complies with each of the tests prescribed below; the diluted product complies with the tests for pH, antimicrobial preservative and sterility.

pH (*2.2.3*). The pH of the preparation, reconstituted if necessary as stated on the label, is 6.5 to 7.5.

Toxicity. Inject subcutaneously 50 000 IU of the preparation to be examined into each of two healthy guinea-pigs weighing 250 g to 350 g and which have not been subjected to any treatment likely to interfere with the test. Observe the animals for 7 days. No adverse effect is produced.

Sensitisation. Use 3 guinea-pigs that have not been subjected to any treatment likely to interfere with the test. On 3 occasions at intervals of 5 days, inject intradermally into each guinea-pig about 500 IU of the preparation to be examined in a volume of 0.1 ml. 2 to 3 weeks after the third injection, administer the same dose intradermally to the same animals and to a control group of three guinea-pigs of the same mass that have not previously received injections of tuberculin. After 24 h to 72 h, the reactions in the 2 groups of animals are not substantially different.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than the minimum amount shown to be effective and not more than 115 per cent of the amount stated on the label. If phenol has been used in the preparation, the concentration is not more than 5 g/l (*2.5.15*).

Live mycobacteria (*2.6.2*). It complies with the test for mycobacteria.

Sterility (*2.6.1*). It complies with the test for sterility.

ASSAY

Use method A or, where the preparation contains 1 IU to 2 IU, use method B.

METHOD A

The potency of tuberculin PPD is determined by comparing the reactions produced by the intradermal injection of increasing doses of the preparation to be examined into sensitised guinea-pigs with the reactions produced by known concentrations of the reference preparation.

Prepare a suspension containing a suitable amount (0.1 mg/ml to 0.4 mg/ml) of heat-inactivated, dried mycobacteria in mineral oil with or without emulsifier; use mycobacteria of a strain of the same species as that used in the preparation to be examined. Sensitise not fewer than six pale-coloured guinea-pigs weighing not less than 300 g by injecting intramuscularly or intradermally a total of about 0.5 ml of the suspension, divided between several sites if necessary. Carry out the test after the period of time required for optimal sensitisation which is usually 4 to 8 weeks after sensitisation. Depilate the flanks of the animals so that it is possible to make at least 3 injections on each side but not more than a total of 12 injection points per animal. Prepare dilutions of the preparation to be examined and of the reference preparation using isotonic phosphate-buffered saline (pH 6.5 to 7.5) containing 50 mg/l of *polysorbate 80 R*. If the preparation to be examined is freeze-dried and does not contain a stabiliser, reconstitute it using the liquid described above. Use at least 3 different doses of the reference preparation and at least 3 different doses of the preparation to be examined. For both preparations, use doses such that the highest dose is about 10 times the lowest dose. Choose the doses such that when they are injected the lesions produced have a diameter of not less than 8 mm and not more than 25 mm. In any given test, the order of the dilutions injected at each point is chosen at random in a Latin square design. Inject each dose intradermally in a constant volume of 0.1 ml or 0.2 ml. Measure the diameters of the lesions 24 h to 48 h later and calculate the results of the test by the usual statistical methods, assuming that the diameters of the lesions are directly proportional to the logarithm of the concentration of the preparation.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 64 per cent and not more than 156 per cent of the stated potency.

METHOD B

The potency of tuberculin PPD is determined by comparing the reactions produced by the intradermal injection of the preparation to be examined into sensitised guinea-pigs with the reactions produced by known concentrations of the reference preparation.

Prepare a suspension in mineral oil with or without emulsifier and containing a suitable amount (0.1 mg/ml to 0.4 mg/ml) of heat-inactivated, dried mycobacteria; use mycobacteria of a strain of the same species as that used in the preparation to be examined. Sensitise not fewer than 6 pale-coloured guinea-pigs weighing not less than 300 g by injecting intramuscularly or intradermally a total of about 0.5 ml of the suspension, divided between several sites if necessary. Carry out the test after the period of time required for optimal sensitisation which is usually 4 to 8 weeks after sensitisation. Depilate the flanks of the animals so that it is possible to make at least 3 injections on each side but not more than a total of 12 injection points per animal. Prepare dilutions of the reference preparation using isotonic phosphate-buffered saline (pH 6.5 to 7.5) containing 50 mg/l of *polysorbate 80 R*. Use at least 3 different doses of the reference preparation such that the highest dose is about 10 times the lowest dose and the median dose is the same as that of the preparation to be examined. In any given test, the order of the dilutions injected at each point is chosen at random in a Latin square design. Inject the preparation to be examined and each dilution of the reference preparation intradermally in a constant volume of 0.1 ml or 0.2 ml. Measure the diameters of the lesions 24 h to 48 h later and calculate the results of the test by the usual statistical methods, assuming that the areas of the lesions are directly proportional to the logarithm of the concentration of the preparation to be examined. (This dose relationship applies to this assay and not necessarily to other test systems.)

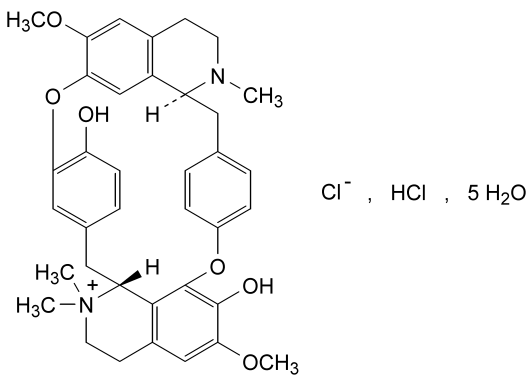
The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

Store protected from light.

LABELLING

The label states:



- the number of International Units per container,
- the species of mycobacteria used to prepare the product,
- the name and quantity of any antimicrobial preservative or other substance added to the preparation,
- the expiry date,
- for freeze-dried products, a statement that the product is to be reconstituted using the liquid provided by the manufacturer,
- where applicable, that tuberculin PPD is not to be injected in its concentrated form but diluted so as to administer not more than 100 IU per dose.

If the package does not contain a leaflet warning that the inhalation of concentrated tuberculin PPD may produce toxic effects, this warning must be shown on the label on the container together with a statement that the powder must be handled with care.

01/2008:0305

TUBOCURARINE CHLORIDE

Tubocurarini chloridum

$C_{37}H_{42}Cl_2N_2O_6,5H_2O$ M_r 772
[6989-98-6]

DEFINITION

Tubocurarine chloride contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (3a*R*,16a*S*)-8,23-dihydroxy-24,29-dimethoxy-3,3,16-trimethyl-2,3,3a,4,15,16,16a,17-octahydro-1*H*-11,13:18,21-dietheno-5,9-metheno-14*H*-pyrido[3′,2′:14,15][1,11]dioxacycloicosino[2,3,4-*ij*]isoquinolinium chloride hydrochloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, soluble in water and in alcohol, practically insoluble in acetone. It dissolves in solutions of alkali hydroxides.

It melts at about 270 °C, with decomposition.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E, F.

A. Dissolve 50.0 mg in *water R* and dilute to 1000.0 ml with the same solvent. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 280 nm and a minimum at 255 nm. The specific absorbance at the maximum is 113 to 123, calculated with reference to the anhydrous substance.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *tubocurarine chloride CRS*.

C. Dissolve about 25 mg in 1 ml of *water R*. Add 0.2 ml of *ferric chloride solution R2* and heat in a water-bath for 1 min. The solution is green. Carry out a blank test; after heating in a water-bath, the colour is brown.

D. To 1 ml of solution S (see Tests) add 1 ml of *nitric acid solution of mercury R*. A red colour develops slowly.

E. It gives reaction (a) of chlorides (*2.3.1*).

F. It gives the reaction of alkaloids (*2.3.1*).

TESTS

Solution S. Dissolve 0.25 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

pH (*2.2.3*). The pH of solution S is 4.0 to 6.0.

Specific optical rotation (*2.2.7*): + 210 to + 222, determined on solution S 3 h after preparation and calculated with reference to the anhydrous substance.

Chloroform-soluble substances. Dissolve 0.25 g in 150 ml of *water R*. Add 5 ml of a saturated solution of *sodium bicarbonate R* and shake with three quantities, each of 20 ml, of *chloroform R*. Wash the combined chloroform layers with 10 ml of *water R*, filter the chloroform solution into a tared beaker and wash the filter with two quantities, each of 5 ml, of *chloroform R*. Add the washings to the filtrate. Evaporate to dryness on a water-bath and dry at 100-105 °C for 1 h. The residue weighs not more than 5 mg. The residue does not dissolve in 10 ml of *water R*, but dissolves on the addition of 1 ml of *dilute hydrochloric acid R*.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.25 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1.5 ml of the test solution to 100 ml with *water R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *water R*.

Apply to the plate 5 µl of each solution. Develop in a non-saturated tank over a path of 15 cm using the lower layer of a mixture of equal volumes of *chloroform R*, *methanol R* and a 125 g/l solution of *trichloroacetic acid R*. Dry the plate in a current of cold air. Spray with a mixture of 1 volume of *potassium ferricyanide solution R*, 1 volume of *water R* and 2 volumes of *ferric chloride solution R1*, prepared immediately before use. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.5 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.75 per cent).

Water (*2.5.12*): 9.0 per cent to 12.0 per cent, determined on 0.30 g by the semi-micro determination of water.

Sulphated ash (*2.4.14*). Not more than 0.25 per cent, determined on 0.2 g.

ASSAY

Dissolve 25.0 mg in *water R* and dilute to 500.0 ml with the same solvent. In the same manner, prepare a reference solution using 25.0 mg of *tubocurarine chloride CRS*. Measure the absorbance (*2.2.25*) at the maximum at 280 nm.

Calculate the content of $C_{37}H_{42}Cl_2N_2O_6$ from the absorbances measured, the concentrations of the solutions and the declared content of anhydrous tubocurarine chloride in *tubocurarine chloride CRS*.

STORAGE

Store in an airtight container.

01/2008:1441

TURMERIC, JAVANESE

Curcumae xanthorrhizae rhizoma

DEFINITION

Dried rhizome, cut in slices, of *Curcuma xanthorrhiza* Roxb. (*C. xanthorrhiza* D. Dietrich).

Content:

– *essential oil*: minimum 50 ml/kg (anhydrous drug);

Monographs T-Z

– *dicinnamoyl methane derivatives, expressed as curcumin* ($C_{21}H_{20}O_6$; M_r 368.4): minimum 1.0 per cent (anhydrous drug).

CHARACTERS

Aromatic odour.

IDENTIFICATION

A. Orange-yellow or yellowish-brown or greyish-brown slices, mostly peeled 1.5-6 mm thick and 15-50 mm, more rarely up to 70 mm, in diameter. Fragments of the brownish-grey cork are sporadically present. The transverse surface is yellow with dark spots in the paler centre. The fracture is short and finely grained.

B. Reduce to a powder (355) (*2.9.12*). The powder is reddish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of colourless parenchyma with orange-yellow or yellowish-brown secretory cells; fragments of reticulate and other vessels; rare fragments of cork and epidermis and fragments of thick-walled unicellular acute trichomes. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous stratified, ovoid or irregular starch granules, about 30-50 µm long and about 10-30 µm wide, with an eccentric hilum and marked, concentric striations.

C. Thin-layer chromatography (*2.2.27*) as described in the test for *Curcuma domestica* with the following modifications.

Detection: spray with a freshly prepared 0.4 g/l solution of *dichloroquinonechlorimide R* in *2-propanol R*. Expose to ammonia vapour until the zone due to thymol becomes bluish-violet.

Results: the chromatogram obtained with the reference solution shows almost in the middle a bluish-violet zone (thymol) and in the lower part a yellow zone (fluorescein). The chromatogram obtained with the test solution shows a blue zone (xanthorrhizol) slightly above the zone due to thymol in the chromatogram obtained with the reference solution and 2 yellowish-brown or brown zones (curcumin and demethoxycurcumin) between the zones due to thymol and fluorescein in the chromatogram obtained with the reference solution.

TESTS

Curcuma domestica. Thin-layer chromatography (*2.2.27*).

Test solution. Shake 0.5 g of the freshly powdered drug (500) (*2.9.12*) with 5 ml of *methanol R* for 30 min and filter.

Reference solution. Dissolve 5 mg of *fluorescein R* and 10 mg of *thymol R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *glacial acetic acid R, toluene R* (20:80 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with a mixture of 1 volume of *sulphuric acid R* and 9 volumes of *acetic anhydride R*. Examine in ultraviolet light at 365 nm.

Results: in the chromatogram obtained with the test solution, no yellowish-red fluorescent zone (bisdemethoxycurcumin) appears slightly above the greenish-blue fluorescent zone due to fluorescein in the chromatogram obtained with the reference solution.

Water (*2.2.13*): maximum 120 ml/kg, determined on 20.0 g of the powdered drug (500) (*2.9.12*).

Total ash (*2.4.16*): maximum 8.0 per cent.

ASSAY

Essential oil. Carry out the determination of essential oils in herbal drugs (*2.8.12*). Use a 500 ml round-bottomed flask, 200 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Reduce the drug to a powder (500) (*2.9.12*) and immediately use 5.0 g for the determination. Distil at a rate of 3-4 ml/min for 3 h.

Dicinnamoyl methane derivatives. To 0.100 g of the powdered drug (180) (*2.9.12*) add 60 ml of *glacial acetic acid R* and heat in a water-bath at 90 °C for 60 min. Add 2.0 g of *boric acid R* and 2.0 g of *oxalic acid R* and heat in a water-bath at 90 °C for 10 min. Allow to cool, dilute to 100.0 ml with *glacial acetic acid R* and shake. Dilute 5.0 ml of the clear supernatant to 50.0 ml with *glacial acetic acid R*. Measure the absorbance (*2.2.25*) at 530 nm, using *glacial acetic acid R* as the compensation liquid.

Calculate the percentage content of dicinnamoyl methane derivatives, expressed as curcumin, using the following expression:

$$\frac{A \times 0.426}{m}$$

i.e. taking the specific absorbance of curcumin to be 2350.

A = absorbance at 530 nm,

m = mass of the drug to be examined, in grams.

01/2008:1627

TURPENTINE OIL, PINUS PINASTER TYPE

Terebinthinae aetheroleum a Pino pinastro

DEFINITION

Essential oil obtained by steam distillation, followed by rectification at a temperature below 180 °C, from the oleoresin obtained by tapping *Pinus pinaster* Aiton. A suitable antioxidant may be added.

CHARACTERS

Appearance: clear, colourless or pale yellow liquid.

It has a characteristic odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Mix 1 ml of the substance to be examined with *toluene R* and dilute to 10 ml with the same solvent.

Reference solution. Mix 10 µl of *β-pinene R* and 10 µl of *linalol R* with *toluene R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
———	———
β-Pinene: a pink zone	A pink zone (β-pinene)
	A pink zone
———	———
Linalol: a pinkish-grey zone	
	3 faint violet zones
	A faint yellow zone
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*): 0.856 to 0.872.

Refractive index (*2.2.6*): 1.465 to 1.475.

Optical rotation (*2.2.7*): – 40° to – 28°.

Acid value (*2.5.1*): maximum 1.0.

Peroxide value (*2.5.5, Method B*): maximum 20.

Fatty oils and resinified essential oils (*2.8.7*). It complies with the test for fatty oils and resinified essential oils.

Chromatographic profile. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. The substance to be examined.

Reference solution (a). Dissolve 30 µl of *α-pinene R*, 10 mg of *camphene R*, 20 µl of *β-pinene R*, 10 µl of *car-3-ene R*, 10 µl of *β-myrcene R*, 20 µl of *limonene R*, 10 µl of *longifolene R*, 10 µl of *β-caryophyllene R* and 10 mg of *caryophyllene oxide R* in 1 ml of *hexane R*.

Reference solution (b). Dissolve 5 µl of *β-caryophyllene R* in *hexane R* and dilute to 1 ml with the same solvent. Dilute 0.1 ml to 1 ml with *hexane R*.

Column:

– *material*: fused silica;
– *size*: *l* = 60 m, Ø = 0.25 mm;
– *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.0 ml/min.

Split ratio: 1:63.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 80	60 → 200
	80 - 120	200
Injection port		200
Detector		250

Detection: flame ionisation.

Injection: 0.5 µl.

Elution order: order indicated in the composition of the reference solution (a); record the retention times of these substances.

System suitability:

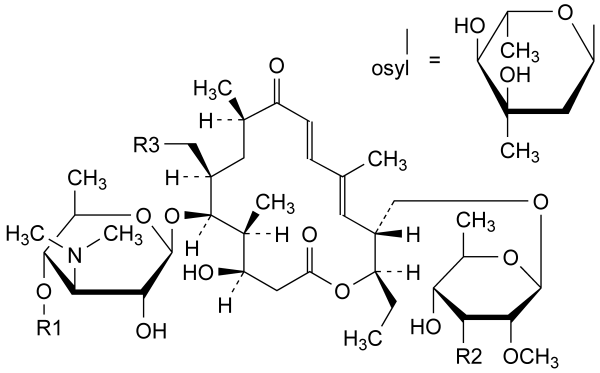
– *resolution*: minimum 1.5 between the peaks due to car-3-ene and β-myrcene in the chromatogram obtained with reference solution (a).

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Determine the percentage content of these components. The limits are within the following ranges:

– *α-pinene*: 70.0 per cent to 85.0 per cent;
– *camphene*: 0.5 per cent to 1.5 per cent;
– *β-pinene*: 11.0 per cent to 20.0 per cent;
– *car-3-ene*: maximum 1.0 per cent;
– *β-myrcene*: 0.4 per cent to 1.5 per cent;
– *limonene*: 1.0 per cent to 7.0 per cent;
– *longifolene*: 0.2 per cent to 2.5 per cent;
– *β-caryophyllene*: 0.1 per cent to 3.0 per cent;
– *caryophyllene oxide*: maximum 1.0 per cent;
– *disregard limit*: area of the peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Residue on evaporation (*2.8.9*): maximum 2.5 per cent.



STORAGE

In a well-filled, airtight container, protected from light and at a temperature not exceeding 25 °C.

01/2008:1273

TYLOSIN FOR VETERINARY USE

Tylosinum ad usum veterinarium

Name	Mol. Formula	R1	R2	R3
tylosin A	$C_{46}H_{77}NO_{17}$	osyl	OCH_3	CHO
tylosin B	$C_{39}H_{65}NO_{14}$	H	OCH_3	CHO
tylosin C	$C_{45}H_{75}NO_{17}$	osyl	OH	CHO
tylosin D	$C_{46}H_{79}NO_{17}$	osyl	OCH_3	CH_2OH

DEFINITION

Mixture of macrolide antibiotics produced by a strain of *Streptomyces fradiae* or by any other means. The main component of the mixture is (4*R*,5*S*,6*S*,7*R*,9*R*,11*E*,13*E*,15*R*,16*R*)-15-[[(6-deoxy-2,3-di-*O*-methyl-β-D-allopyranosyl)oxy]methyl]-6-[[3,6-dideoxy-4-*O*-(2,6-dideoxy-3-*C*-methyl-α-L-*ribo*-hexopyranosyl)-3-(dimethylamino)-β-D-

Monographs T-Z

glucopyranosyl]oxy]-16-ethyl-4-hydroxy-5,9,13-trimethyl-7-(2-oxoethyl)oxacyclohexadeca-11,13-diene-2,10-dione (tylosin A, M_r 916). Tylosin B (desmycosin, M_r 772), tylosin C (macrocin, M_r 902) and tylosin D (relomycin, M_r 918) may also be present. They contribute to the potency of the substance to be examined.

Potency: minimum 900 IU/mg (dried substance).

CHARACTERS

Appearance: almost white or slightly yellow powder.

Solubility: slightly soluble in water, freely soluble in anhydrous ethanol and in methylene chloride. It dissolves in dilute solutions of mineral acids.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *tylosin CRS*.

B. Examine the chromatograms obtained in the test for composition.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

C. Dissolve about 30 mg in a mixture of 0.15 ml of *water R*, 2.5 ml of *acetic anhydride R* and 7.5 ml of *pyridine R*. Allow to stand for about 10 min. No green colour develops.

TESTS

pH (*2.2.3*): 8.5 to 10.5.

Suspend 0.25 g in 10 ml of *carbon dioxide-free water R*.

Composition. Liquid chromatography (*2.2.29*): use the normalisation procedure. *Prepare the solutions immediately before use.*

Solvent mixture: *acetonitrile R, water R* (50:50 *V/V*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). Dissolve 2 mg of *tylosin phosphate for peak identification CRS* (containing tylosins A, B, C and D) in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (b). Dissolve 2 mg of *tylosin CRS* and 2 mg of *tylosin D CRS* in the solvent mixture and dilute to 10 ml with the solvent mixture.

Column:

- *size*: *l* = 0.20 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 35 °C.

Mobile phase: mix 40 volumes of *acetonitrile R* and 60 volumes of a 200 g/l solution of *sodium perchlorate R* previously adjusted to pH 2.5 using *1 M hydrochloric acid*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 290 nm.

Injection: 20 µl.

Retention time: tylosin A = about 12 min.

Identification of peaks: use the chromatogram supplied with *tylosin phosphate for peak identification CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to tylosins A, B, C and D.

System suitability: reference solution (b):

- *resolution*: minimum 2.0 between the peaks due to tylosins A and D.

Limits:

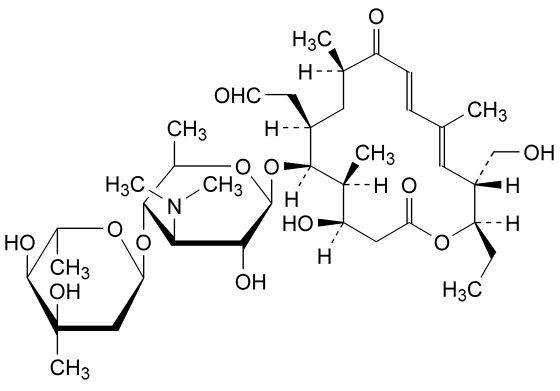
- *tylosin A*: minimum 80.0 per cent;
- *sum of tylosins A, B, C and D*: minimum 95.0 per cent.

Tyramine: maximum 0.35 per cent and maximum 0.15 per cent, if intended for use in the manufacture of parenteral dosage forms.

In a 25.0 ml volumetric flask, dissolve 50.0 mg in 5.0 ml of a 3.4 g/l solution of *phosphoric acid R*. Add 1.0 ml of *pyridine R* and 2.0 ml of a saturated solution of *ninhydrin R* (about 40 g/l). Close the flask with a piece of aluminium foil and heat in a water-bath at 85 °C for 30 min. Cool the solution rapidly and dilute to 25.0 ml with *water R*. Mix and measure immediately the absorbance (*2.2.25*) of the solution at 570 nm using a blank solution as the compensation liquid. The absorbance is not greater than that of a standard prepared at the same time and in the same manner using 5.0 ml of a 35 mg/l solution of *tyramine R* in a 3.4 g/l solution of *phosphoric acid R*. If intended for use in the manufacture of parenteral dosage forms, the absorbance is not greater than that of a standard prepared at the same time and in the same manner using 5.0 ml of a 15 mg/l solution of *tyramine R* in a 3.4 g/l solution of *phosphoric acid R*.

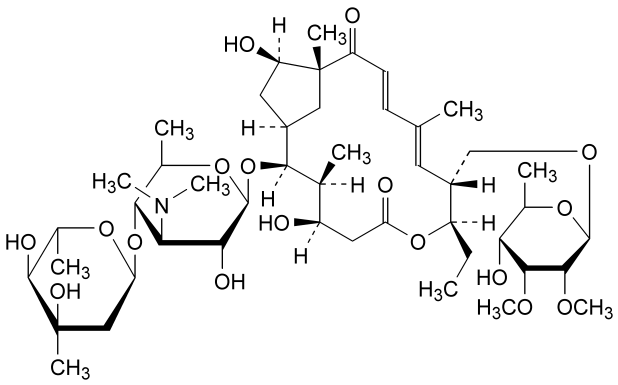
Loss on drying (*2.2.32*): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (*2.4.14*): maximum 3.0 per cent, determined on 1.0 g.



ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*). Use *tylosin CRS* as the chemical reference substance.

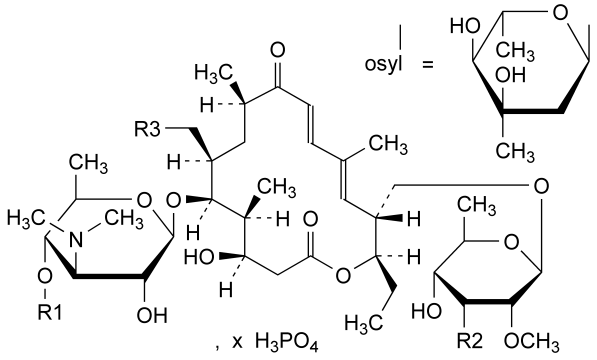


STORAGE

Protected from light.

IMPURITIES

A. desmycinosyltylosin,



B. tylosin A aldol.

01/2008:1661

TYLOSIN PHOSPHATE BULK SOLUTION FOR VETERINARY USE

Tylosini phosphatis solutio ad usum veterinarium

Tylosin	R1	R2	R3	Mol. Formula	M_r
A	osyl	OCH_3	CHO	$C_{46}H_{77}NO_{17}$	916
B	H	OCH_3	CHO	$C_{39}H_{65}NO_{14}$	772
C	osyl	OH	CHO	$C_{45}H_{75}NO_{17}$	902
D	osyl	OCH_3	CH_2OH	$C_{46}H_{79}NO_{17}$	918

DEFINITION

Solution of the dihydrogen phosphate of a mixture of macrolide antibiotics produced by a strain of *Streptomyces fradiae* or by any other means.

The main component is the phosphate of (4*R*,5*S*,6*S*,7*R*,9*R*,11*E*,13*E*,15*R*,16*R*)-15-[[(6-deoxy-2,3-di-*O*-methyl-β-D-allopyranosyl)oxy]methyl]-6-[[3,6-dideoxy-4-*O*-(2,6-dideoxy-3-*C*-methyl-α-L-*ribo*-hexopyranosyl)-3-(dimethylamino)-β-D-glucopyranosyl]oxy]-16-ethyl-4-hydroxy-5,9,13-trimethyl-7-(2-oxoethyl)oxacyclohexadeca-11,13-diene-2,10-dione (tylosin A phosphate). The phosphates of tylosin B (desmycosin phosphate), tylosin C (macrocin phosphate) and tylosin D (relomycin phosphate) may also be present. The solution also contains sodium dihydrogen phosphate.

Potency: minimum 800 IU per milligram of dry residue. Tylosins A, B, C and D contribute to the potency.

CHARACTERS

Appearance: yellow or brownish-yellow, viscous liquid.

Solubility: miscible with water.

IDENTIFICATION

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dilute an amount of the preparation to be examined equivalent to 400 000 IU of tylosin phosphate to 100.0 ml with *water R*. Dilute 1.0 ml of this solution to 100.0 ml with *water R*.

Spectral range: 230-350 nm.

Absorption maximum: at 290 nm.

Absorbance at the absorption maximum: minimum 0.70.

B. Examine the chromatograms obtained in the test for composition.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

C. Dilute an amount of the preparation to be examined equivalent to 400 000 IU of tylosin phosphate in 10 ml of *water R*. The solution gives reaction (a) of phosphates (*2.3.1*).

TESTS

pH (*2.2.3*): 5.5 to 6.5.

Dilute 1.0 g in 10 ml of *carbon dioxide-free water R*.

Composition. Liquid chromatography (*2.2.29*): use the normalisation procedure. *Prepare the solutions immediately before use.*

Test solution. Dilute an amount of the preparation to be examined equivalent to 50 000 IU of tylosin phosphate to 200 ml with a mixture of equal volumes of *acetonitrile R* and *water R*.

Reference solution (a). Dissolve 2 mg of *tylosin phosphate for peak identification CRS* (containing tylosins A, B, C and D) in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 2 mg of *tylosin CRS* and 2 mg of *tylosin D CRS* in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with a mixture of equal volumes of *acetonitrile R* and *water R*. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of equal volumes of *acetonitrile R* and *water R*.

Column:

– *size*: *l* = 0.20 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 μm);
– *temperature*: 35 °C.

Mobile phase: mix 40 volumes of *acetonitrile R* and 60 volumes of a 200 g/l solution of *sodium perchlorate R* previously adjusted to pH 2.5 using a 36.5 g/l solution of *hydrochloric acid R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 290 nm.

Injection: 20 μl.

Run time: 1.8 times the retention time of tylosin A.

Identification of tylosins: use the chromatogram supplied with *tylosin phosphate for peak identification CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to tylosins A, B, C and D.

Relative retention with reference to tylosin A (retention time = about 12 min): impurity A = about 0.35; tylosin C = about 0.5; tylosin B = about 0.6; tylosin D = about 0.85; impurity B = about 0.9.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to tylosin D and tylosin A.

Limits:

– *tylosin A*: minimum 80.0 per cent;

– *sum of the contents of tylosin A, tylosin B, tylosin C and tylosin D*: minimum 95.0 per cent;

– *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (c).

Tyramine. In a 25.0 ml volumetric flask, dissolve an amount of the preparation to be examined equivalent to 50 000 IU of tylosin phosphate in 5.0 ml of a 3.4 g/l solution of *phosphoric acid R*. Add 1.0 ml of *pyridine R* and 2.0 ml of a saturated solution of *ninhydrin R* (about 40 g/l). Close the flask with aluminium foil and heat in a water-bath at 85 °C for 20-30 min. Cool the solution rapidly and dilute to 25.0 ml with *water R*. Mix and measure immediately the absorbance (*2.2.25*) of the solution at 570 nm using a blank solution as the compensation liquid.

The absorbance is not greater than that of a standard prepared at the same time and in the same manner using 5.0 ml of a 35 mg/l solution of *tyramine R* in a 3.4 g/l solution of *phosphoric acid R*.

Phosphate: 8.5 per cent to 10.0 per cent of PO_4, calculated with reference to the dry residue (see Assay).

Test solution. Dissolve an amount of the preparation to be examined equivalent to 200 000 IU of tylosin phosphate in 50 ml of *water R*. Add 5.0 ml of *dilute sulphuric acid R* and dilute to 100.0 ml with *water R*. To 2.0 ml of this solution add successively, mixing after each addition, 10.0 ml of *water R*, 5.0 ml of *ammonium molybdate reagent R2*, 1.0 ml of *hydroquinone solution R* and 1.0 ml of a 200 g/l solution of *sodium metabisulphite R*. Allow to stand for at least 20 min and dilute to 50.0 ml with *water R*. Mix thoroughly.

Reference solution (a). To 1.0 ml of a standard solution containing 0.430 g/l of *potassium dihydrogen phosphate R* (corresponds to 300 ppm of PO_4) add successively, mixing after each addition, 10.0 ml of *water R*, 5.0 ml of *ammonium molybdate reagent R2*, 1.0 ml of *hydroquinone solution R* and 1.0 ml of a 200 g/l solution of *sodium metabisulphite R*. Allow to stand for at least 20 min and dilute to 50.0 ml with *water R*. Mix thoroughly.

Reference solution (b). Prepare as reference solution (a) but using 2.0 ml of the standard solution.

Reference solution (c). Prepare as reference solution (a) but using 5.0 ml of the standard solution.

Compensation liquid. Prepare as reference solution (a) but omitting the standard solution.

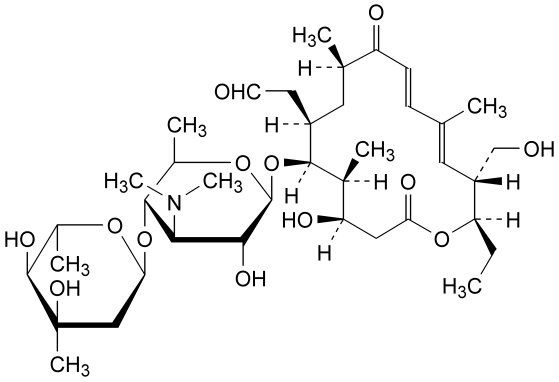
Measure the absorbance (*2.2.25*) of the test solution and of the reference solutions at 650 nm. Draw a calibration curve with the absorbances of the 3 reference solutions as a function of the quantity of phosphate in the solutions and read from the curve the quantity of phosphate in the test solution. Determine the percentage content of PO_4, calculated with reference to the dry residue (see Assay).

ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*).

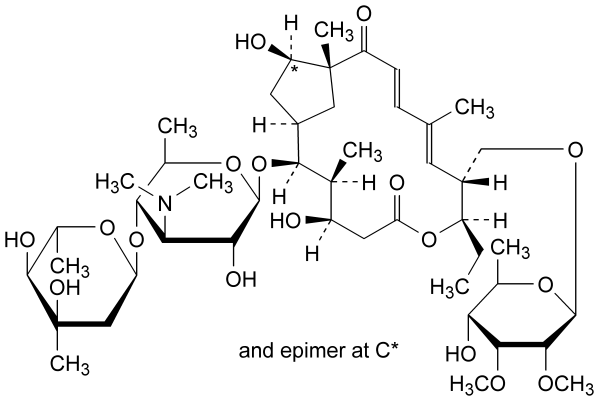
Use *tylosin CRS* as the reference substance. Calculate the potency from the mass of the dry residue and the activity of the solution.

Dry residue. Dry 3.0 g of the preparation to be examined *in vacuo* at 60 °C for 3 h and weigh.



STORAGE

Protected from light, at a temperature of 2 °C to 8 °C.

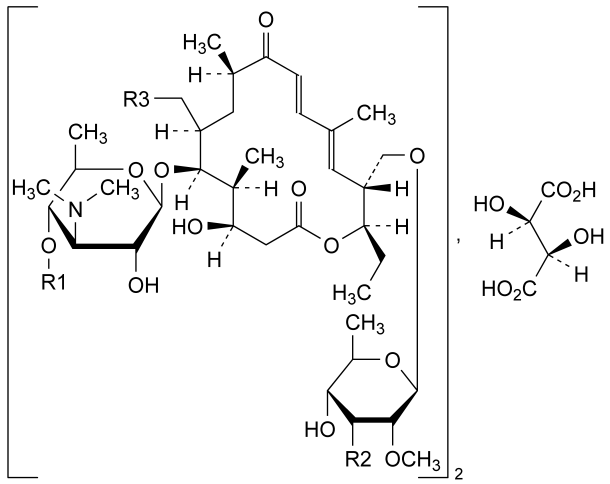


LABELLING

The label states the concentration of the solution in International Units per milligram of preparation.

IMPURITIES

A. desmycinosyltylosin A,



B. (1*R*,2*S*,3*S*,4*R*,8*R*,9*R*,10*E*,12*E*,15*R*,16*RS*)-9-[[(6-deoxy-2,3-di-*O*-methy-β-D-allopyranosyl)oxy]methyl]-2-[[3,6-dideoxy-4-*O*-(2,6-dideoxy-3-*C*-methyl-α-L-*ribo*-hexopyranosyl)-3-(dimethylamino)-β-D-glucopyranosyl]oxy]-8-ethyl-4,16-dihydroxy-3,11,15-trimethyl-7-oxabicyclo[13.2.1]octadeca-10,12-diene-6,14-dione (tylosin A aldol).

TYLOSIN TARTRATE FOR VETERINARY USE

Tylosini tartras ad usum veterinarium

Tylosin	Mol. Form.	R1	R2	R3
A	$C_{46}H_{77}NO_{17}$	osyl	OCH_3	CHO
B	$C_{39}H_{65}NO_{14}$	H	OCH_3	CHO
C	$C_{45}H_{75}NO_{17}$	osyl	OH	CHO
D	$C_{46}H_{79}NO_{17}$	osyl	OCH_3	CH_2OH

DEFINITION

Tartrate of a mixture of macrolide antibiotics produced by a strain of *Streptomyces fradiae* or by any other means. The main component of the mixture is (4*R*,5*S*,6*S*,7*R*,9*R*,11*E*,13*E*,15*R*,16*R*)-15-[[(6-deoxy-2,3-di-*O*-methyl-β-D-allopyranosyl)oxy]methyl]-6-[[3,6-dideoxy-4-*O*-(2,6-dideoxy-3-*C*-methyl-α-L-*ribo*-hexopyranosyl)-3-(dimethylamino)-β-D-glucopyranosyl]oxy]-16-ethyl-4-hydroxy-5,9,13-trimethyl-7-(2-oxoethyl)oxacyclohexadeca-11,13-diene-2,10-dione (tylosin A, tartrate M_r 1982). Tylosin B (desmycosin, tartrate M_r 1694), tylosin C (macrocin, tartrate M_r 1954) and tylosin D (relomycin, tartrate M_r 1986) may also be present. They contribute to the potency of the substance to be examined.

Potency: minimum 800 IU/mg (dried substance).

CHARACTERS

Appearance: almost white or slightly yellow, hygroscopic powder.

Solubility: freely soluble in water and in methylene chloride, slightly soluble in anhydrous ethanol. It dissolves in dilute solutions of mineral acids.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of tylosin tartrate.*

B. Examine the chromatograms obtained in the test for composition.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

C. Dissolve about 30 mg in a mixture of 0.15 ml of *water R*, 2.5 ml of *acetic anhydride R* and 7.5 ml of *pyridine R*. Allow to stand for about 10 min. A green colour is produced.

TESTS

pH (*2.2.3*): 5.0 to 7.2.

Dissolve 0.25 g in 10 ml of *carbon dioxide-free water R*.

Composition. Liquid chromatography (*2.2.29*): use the normalisation procedure. *Prepare the solutions immediately before use.*

Solvent mixture: *acetonitrile R, water R* (50:50 *V/V*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). Dissolve 2 mg of *tylosin phosphate for peak identification CRS* (containing tylosins A, B, C and D) in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (b). Dissolve 2 mg of *tylosin CRS* and 2 mg of *tylosin D CRS* in the solvent mixture and dilute to 10 ml with the solvent mixture.

Column:

– *size*: *l* = 0.20 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 35 °C.

Mobile phase: mix 40 volumes of *acetonitrile R* and 60 volumes of a 200 g/l solution of *sodium perchlorate R* previously adjusted to pH 2.5 using *1 M hydrochloric acid.*

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 290 nm.

Injection: 20 µl.

Retention time: tylosin A = about 12 min.

Identification of peaks: use the chromatogram supplied with *tylosin phosphate for peak identification CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to tylosins A, B, C and D.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to tylosins A and D.

Limits:

– *tylosin A*: minimum 80.0 per cent;

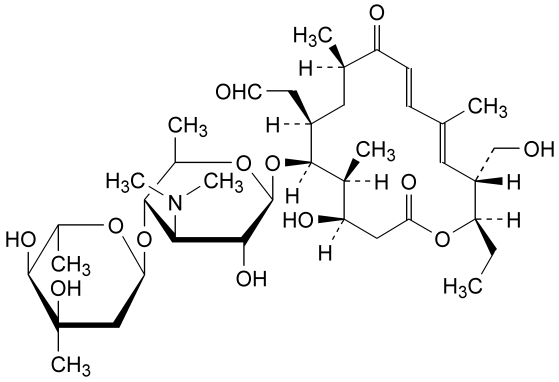
– *sum of tylosins A, B, C and D*: minimum 95.0 per cent.

Tyramine: maximum 0.35 per cent and maximum 0.15 per cent, if it is intended for use in the manufacture of parenteral dosage forms.

In a 25.0 ml volumetric flask, dissolve 50.0 mg in 5.0 ml of a 3.4 g/l solution of *phosphoric acid R*. Add 1.0 ml of *pyridine R* and 2.0 ml of a saturated solution of *ninhydrin R* (about 40 g/l). Close the flask with a piece of aluminium foil and heat in a water-bath at 85 °C for 30 min. Cool the solution rapidly and dilute to 25.0 ml with *water R*. Mix and measure immediately the absorbance (*2.2.25*) of the solution at 570 nm using a blank solution as the compensation liquid. The absorbance is not greater than that of a standard prepared at the same time and in the same manner using 5.0 ml of a 35 mg/l solution of *tyramine R* in a 3.4 g/l solution of *phosphoric acid R*. If intended for use in the manufacture of parenteral dosage forms, the absorbance is not greater than that of a standard prepared at the same time and in the same manner using 5.0 ml of a 15 mg/l solution of *tyramine R* in a 3.4 g/l solution of *phosphoric acid R*.

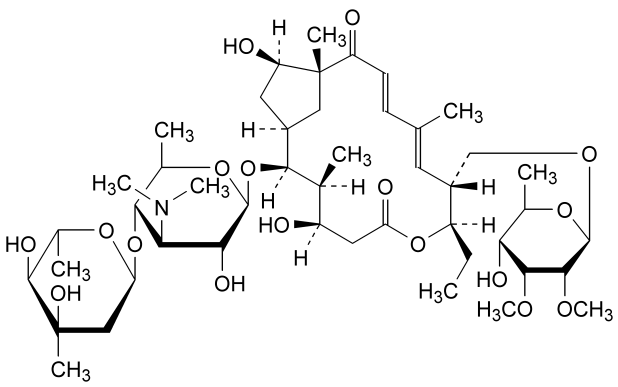
Loss on drying (*2.2.32*): maximum 4.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (*2.4.14*): maximum 2.5 per cent, determined on 1.0 g.



ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*). Use *tylosin CRS* as the chemical reference substance.

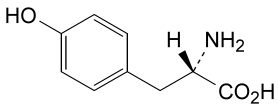


STORAGE

In an airtight container, protected from light.

IMPURITIES

A. desmycinosyltylosin,



B. tylosin A aldol.

01/2008:1161
corrected 6.0

TYROSINE

Tyrosinum

$C_9H_{11}NO_3$ M_r 181.2
[60-18-4]

DEFINITION

Tyrosine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (*S*)-2-amino-3-(4-hydroxyphenyl)propanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white crystalline powder or colourless crystals, very slightly soluble in water, practically insoluble in alcohol. It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D, E.

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *tyrosine CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To about 50 mg add 1 ml of *dilute nitric acid R*. A dark red colour is produced within 15 min.

E. Dissolve about 30 mg in 2 ml of *dilute sodium hydroxide solution R*. Add 3 ml of a freshly prepared mixture of equal volumes of a 100 g/l solution of *sodium nitrite R* and a solution of 0.5 g of *sulphanilic acid R* in a mixture of 6 ml of *hydrochloric acid R1* and 94 ml of *water R*. An orange-red colour is produced.

TESTS

Appearance of solution. Dissolve 0.5 g in *dilute hydrochloric acid R* and dilute to 20 ml with the same acid. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*). Dissolve 1.25 g in a mixture of equal volumes of *dilute hydrochloric acid R* and *water R* and dilute to 25.0 ml with the same mixture of solvents. The specific optical rotation is – 11.0 to – 12.3, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *dilute ammonia R2* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *tyrosine CRS* in 1 ml of *dilute ammonia R2* and dilute to 50 ml with *water R*.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *tyrosine CRS* and 10 mg of *phenylalanine CRS* in 1 ml of *dilute ammonia R2* and dilute to 25 ml with *water R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *concentrated ammonia R1* and 70 volumes of *propanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (*2.4.4*). Dissolve 0.25 g in 3 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides, without any further addition of nitric acid (200 ppm).

Sulphates (*2.4.13*). Dissolve with gentle heating, 0.5 g in 5 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (*2.4.1*). 0.10 g complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.2 ml of *ammonium standard solution (100 ppm NH_4) R*. Replace the *heavy magnesium oxide R* by 2.0 ml of *strong sodium hydroxide solution R*.

Iron (*2.4.9*). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (*2.4.8*). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

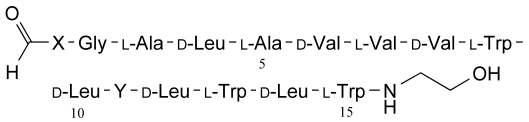
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 5 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 18.12 mg of $C_9H_{11}NO_3$.



STORAGE

Store protected from light.

01/2008:1662

TYROTHRICIN

Tyrothricinum

Gramicidin	Mol. formula	M_r	X	Y
A1	$C_{99}H_{140}N_{20}O_{17}$	1882	L-Val	L-Trp
A2	$C_{100}H_{142}N_{20}O_{17}$	1896	L-Ile	L-Trp
C1	$C_{97}H_{139}N_{19}O_{18}$	1859	L-Val	L-Tyr
C2	$C_{98}H_{141}N_{19}O_{18}$	1873	L-Ile	L-Tyr

Tyrocidin	Mol. formula	M_r	X	Y	Z
A	$C_{66}H_{88}N_{13}O_{13}$	1271	L-Phe	D-Phe	L-Tyr
B	$C_{68}H_{89}N_{14}O_{13}$	1311	L-Trp	D-Phe	L-Tyr
C	$C_{70}H_{90}N_{15}O_{13}$	1350	L-Trp	D-Trp	L-Tyr
D	$C_{72}H_{91}N_{16}O_{12}$	1373	L-Trp	D-Trp	L-Trp
E	$C_{66}H_{88}N_{13}O_{12}$	1255	L-Phe	D-Phe	L-Phe

DEFINITION

Mixture of antimicrobial linear and cyclic polypeptides, isolated from the fermentation broth of *Brevibacillus brevis* Dubos. It consists mainly of gramicidins and tyrocidins as described above; other related compounds may be present in smaller amounts.

Potency: 180 IU/mg to 280 IU/mg (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, soluble in ethanol (96 per cent) and in methanol.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 5 mg of the substance to be examined in 4.0 ml of *ethanol (96 per cent) R*.

Reference solution. Dissolve 5 mg of *tyrothricin CRS* in 4.0 ml of *ethanol (96 per cent) R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *methanol R, butanol R, water R, acetic acid R, butyl acetate R* (2.5:7.5:12:20:40 *V/V/V/V/V*).

Application: 1 µl.

Development: over 2/3 of the plate.

Drying: in a current of warm air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the principal spots or groups of principal spots in the chromatogram obtained with the test solution are similar in position and size to the principal spots or groups of principal spots in the chromatogram obtained with the reference solution. The upper group corresponds to gramicidins, the lower group to tyrocidins.

Detection B: spray with *dimethylaminobenzaldehyde solution R2*. Heat the plate in a current of warm air until the spots appear.

System suitability: reference solution:

– the chromatogram shows 2 clearly separated spots or groups of spots.

Results B: the principal spots or groups of principal spots in the chromatogram obtained with the test solution are similar in position, colour and size to the principal spots or groups of principal spots in the chromatogram obtained with the reference solution. The upper group corresponds to gramicidins, the lower group to tyrocidins.

B. It complies with the test for composition (see Tests).

TESTS

Composition. Liquid chromatography (*2.2.29*): use the normalisation procedure. *Prepare the solutions immediately before use.*

Test solution. Dissolve 5 mg of the substance to be examined in 2 ml of *methanol R* and dilute to 5.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *tyrothricin CRS* in 2 ml of *methanol R* and dilute to 5.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
– *temperature*: 60 °C.

Mobile phase: 0.79 g/l solution of *ammonium sulphate R*, *methanol R* (25:75 *V/V*).

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 25 µl.

Run time: 6 times the retention time of gramicidin A1. Use the chromatogram obtained with reference solution (a) and the chromatogram supplied with *tyrothricin CRS* to identify the peaks due to gramicidin A1, gramicidin A2 and the tyrocidins.

Relative retention with reference to gramicidin A1 (retention time = about 10 min): gramicidin C1 = about 0.8; gramicidin C2 = about 0.9; gramicidin A2 = about 1.1; tyrocidins = about 1.5 to 6.

System suitability: reference solution (a):

– *peak-to-valley ratio*: minimum 3.0, where H_p = height above the baseline of the peak due to gramicidin A2 and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to gramicidin A1.

Composition:

– *sum of gramicidins*: 25 per cent to 50 per cent,
– *sum of tyrocidins*: 50 per cent to 70 per cent,
– *total*: minimum 85 per cent,
– *disregard limit*: the sum of the areas of the peaks due to gramicidins in the chromatogram obtained with reference solution (b).

Loss on drying (*2.2.32*): maximum 4.0 per cent, determined on 1.000 g by drying under high vacuum at 60 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 1.5 per cent, determined on 1.0 g.

ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*) using the turbidimetric method. Use *gramicidin CRS* as the reference substance.

Test solution. Prepare a solution of tyrothricin containing about the same amount of gramicidin as the corresponding solution of *gramicidin CRS* i.e. 5 times more concentrated.

STORAGE

In an airtight container, protected from light.

UBIDECARENONE

Ubidecarenonum

$C_{59}H_{90}O_4$ M_r 863
[303-98-0]

DEFINITION

2-[(all-*E*)-3,7,11,15,19,23,27,31,35,39-Decamethyltetraconta-2,6,10,14,18,22,26,30,34,38-decaenyl]-5,6-dimethoxy-3-methylbenzene-1,4-dione.

Content: 97.0 per cent to 103.0 per cent.

CHARACTERS

Appearance: yellow or orange, crystalline powder.

Solubility: practically insoluble in water, soluble in acetone, very slightly soluble in ethanol.

It gradually decomposes and darkens on exposure to light.

mp: about 48 °C.

Carry out all operations avoiding exposure to light.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *ubidecarenone CRS*.

B. Examine the chromatograms obtained in the test for related substances.

Results: the retention time of the principal peak in the chromatogram obtained with the test solution is similar to that of the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in 25.0 ml of *ethanol R* by heating at about 50 °C for 2 min. Allow to cool.

Reference solution (a). Dissolve 5 mg of *ubidecarenone CRS* in 5 ml of *ethanol R* by heating at about 50 °C for 2 min. Allow to cool.

Reference solution (b). Dissolve 2 mg of *ubidecarenone impurity D CRS* in 2 ml of the test solution by heating at about 50 °C for 2 min. Allow to cool. Dilute 1 ml to 50 ml with *ethanol R*.

Reference solution (c). Dilute 1.0 ml of the test solution to 100.0 ml with *ethanol R*.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *ethanol R, methanol R2* (20:80 *V/V*).

Flow rate: 2 ml/min.

Detection: spectrophotometer at 275 nm.

Injection: 10 µl.

Run time: 2 times the retention time of ubidecarenone.

Relative retention with reference to ubidecarenone (retention time = about 12 min): impurity D = about 0.67.

System suitability: reference solution (b):

– *resolution*: minimum 6.5 between the peaks due to impurity D and to ubidecarenone.

Limits:

– *any impurity*: not more than half the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Impurity F. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in 25.0 ml of *hexane R*.

Reference solution (a). Dissolve the contents of a vial of *ubidecarenone for system suitability CRS* in 1 ml of *hexane R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *hexane R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm,
– *stationary phase*: *silica gel for chromatography R* (7 µm).

Mobile phase: *ethyl acetate R, hexane R* (3:97 *V/V*).

Flow rate: 2 ml/min.

Detection: spectrophotometer at 275 nm.

Injection: 20 µl.

Run time: 1.2 times the retention time of ubidecarenone.

Relative retention with reference to ubidecarenone (retention time = about 10 min): impurity F = about 0.85.

System suitability: reference solution (a):

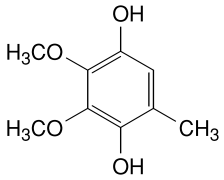
– *resolution*: minimum 1.5 between the peaks due to impurity F and to ubidecarenone.

Limit:

– *impurity F*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

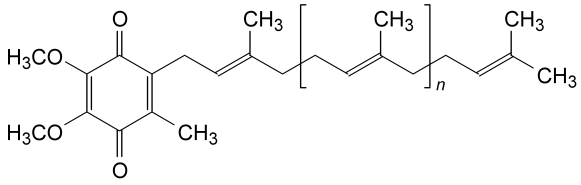
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 50.0 mg in 1.0 ml of *hexane R* and dilute to 50.0 ml with *ethanol R*. Dilute 2.0 ml of the solution to 50.0 ml with *ethanol R*. Measure the absorbance (*2.2.25*) at the maximum at 275 nm. Calculate the content of $C_{59}H_{90}O_4$ taking the specific absorbance to be 169.

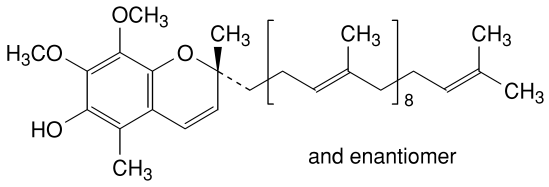
STORAGE



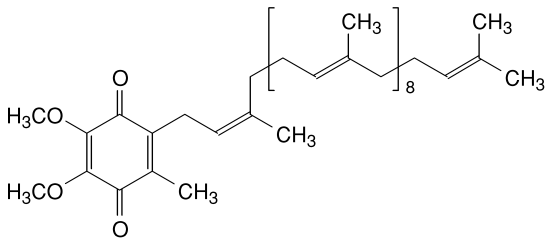
Store in an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F.



A. 2,3-dimethoxy-5-methylbenzene-1,4-diol,



B. *n* = 5: 2-[(all-*E*)-3,7,11,15,19,23,27-heptamethyloctadocosa-2,6,10,14,18,22,26-heptaenyl]-5,6-dimethoxy-3-methylbenzene-1,4-dione (ubiquinone-7),

C. *n* = 6: 5,6-dimethoxy-3-methyl-2-[(all-*E*)-3,7,11,15,19,23,27,31-octamethyldotriaconta-2,6,10,14,18,22,26,30-octaenyl]benzene-1,4-dione (ubiquinone-8),

D. *n* = 7: 5,6-dimethoxy-3-methyl-2-[(all-*E*)-3,7,11,15,19,23,27,31,35-nonamethylhexatriaconta-2,6,10,14,18,22,26,30,34-nonaenyl]benzene-1,4-dione (ubiquinone-9),

E. (2*RS*)-7,8-dimethoxy-2,5-dimethyl-2-[(all-*E*)-4,8,12,16,20,24,28,32,36-nonamethylheptatriaconta-3,7,11,15,19,23,27,31,35-nonaenyl]-2*H*-1-benzopyran-6-ol (ubicromenol),

F. 2-[(2*Z*,6*E*,10*E*,14*E*,18*E*,22*E*,26*E*,30*E*,34*E*,38*E*)-3,7,11,15,19,23,27,31,35,39-decamethyl-2,6,10,14,18,22,26,30,34,38-tetracontadecaenyl]-5,6-dimethoxy-3-methylbenzene-1,4-dione (ubidecarenone (*Z*)-isomer).

01/2008:0461

UNDECYLENIC ACID

Acidum undecylenicum

$C_{11}H_{20}O_2$ M_r 184.3
[112-38-9]

DEFINITION

Undec-10-enoic acid.

Content: 97.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: white or very pale yellow, crystalline mass or colourless or pale yellow liquid.

Solubility: practically insoluble in water, freely soluble in ethanol (96 per cent) and in fatty and essential oils.

IDENTIFICATION

A. Refractive index (*2.2.6*): 1.447 to 1.450, determined at 25 ± 0.5 °C.

B. Freezing point (*2.2.18*): 21 °C to 24 °C.

C. To 2.0 g add 2 ml of freshly distilled *aniline R* and boil under a reflux condenser for 10 min. Allow to cool and add 30 ml of *ether R*. Shake with 3 quantities, each of 20 ml, of *dilute hydrochloric acid R* and then with 20 ml of *water R*. Evaporate the organic layer to dryness on a water-bath. After recrystallising twice from *ethanol (70 per cent V/V) R* and drying *in vacuo* for 3 h, the residue melts (*2.2.14*) at 66 °C to 68 °C.

D. Dissolve 0.1 g in a mixture of 2 ml of *dilute sulphuric acid R* and 5 ml of *glacial acetic acid R*. Add dropwise 0.25 ml of *potassium permanganate solution R*. The colour of the potassium permanganate is discharged.

TESTS

Peroxide value (*2.5.5, Method A*): maximum 10.

Fixed and mineral oils. To 1.0 g add 5 ml of *sodium carbonate solution R* and 25 ml of *water R* and boil for 3 min. The hot solution is not more opalescent than reference suspension II (*2.2.1*).

Water-soluble acids. To 1.0 g add 20 ml of *water R* heated to 35-45 °C and shake for 2 min. Cool and filter the aqueous layer through a moistened filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R*. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Degree of unsaturation. Dissolve 85.0 mg in a mixture of 5 ml of *dilute hydrochloric acid R* and 30 ml of *glacial acetic acid R*. Using 0.05 ml of *indigo carmine solution R1* as

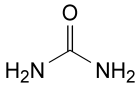
indicator, added towards the end of the titration, titrate with *0.0167 M bromide-bromate* until the colour changes from blue to yellow. 8.9 ml to 9.4 ml of *0.0167 M bromide-bromate* is required. Carry out a blank titration.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 0.50 g.

ASSAY

Dissolve 0.750 g in 10 ml of *ethanol (96 per cent) R*. Titrate with *0.5 M sodium hydroxide* using 0.1 ml of *phenolphthalein solution R* as indicator, until a pink colour is obtained.

1 ml of *0.5 M sodium hydroxide* is equivalent to 92.14 mg of $C_{11}H_{20}O_2$.



STORAGE

In a non-metallic container, protected from light.

01/2008:0743
corrected 6.0

UREA

Ureum

CH_4N_2O M_r 60.1
[57-13-6]

DEFINITION

Carbamide.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or transparent crystals, slightly hygroscopic.

Solubility: very soluble in water, soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 132 °C to 135 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *urea CRS*.

C. Dissolve 0.1 g in 1 ml of *water R*. Add 1 ml of *nitric acid R*. A white, crystalline precipitate is formed.

D. Heat 0.5 g in a test tube until it liquefies and the liquid becomes turbid. Cool, dissolve in a mixture of 1 ml of *dilute sodium hydroxide solution R* and 10 ml of *water R* and add 0.05 ml of *copper sulphate solution R*. A reddish-violet colour is produced.

TESTS

Solution S. Dissolve 10.0 g in *water R* and dilute to 50 ml with the same solvent.

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

To 2.5 ml of solution S add 7.5 ml of *water R*.

Alkalinity. To 2.5 ml of solution S add 7.5 ml of *water R*, 0.1 ml of *methyl red solution R* and 0.4 ml of *0.01 M hydrochloric acid*. The solution is red to orange.

Biuret: maximum 0.1 per cent.

To 10 ml of solution S add 5 ml of *water R*, 0.5 ml of a 5 g/l solution of *copper sulphate R* and 0.5 ml of *strong sodium hydroxide solution R*. Allow to stand for 5 min. Any reddish-violet colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using 10 ml of a 0.2 g/l solution of *biuret R*.

Ammonium (*2.4.1*): maximum 500 ppm, determined on 0.1 ml of solution S.

Heavy metals (*2.4.8*): maximum 10 ppm.

Dilute 10 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 1 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.2000 g in *water R* and dilute to 50.0 ml with the same solvent. Introduce 1.0 ml of this solution into a combustion flask. Add 4 g of a powdered mixture of 100 g of *dipotassium sulphate R*, 5 g of *copper sulphate R* and 2.5 g of *selenium R*, and 3 glass beads. Wash any adhering particles from the neck into the flask with 5 ml of *sulphuric acid R*, allowing it to run down the sides of the flask, and mix the contents by rotation. Close the mouth of the flask loosely, for example by means of a glass bulb with a short stem, to avoid excessive loss of sulphuric acid. Heat gradually at first, then increase the temperature until there is vigorous boiling with condensation of sulphuric acid in the neck of the flask; take precautions to prevent the upper part of the flask from becoming overheated. Continue the heating for 30 min. Cool, dissolve the solid material by cautiously adding to the mixture 25 ml of *water R*, cool again and place in a steam-distillation apparatus. Add 30 ml of *strong sodium hydroxide solution R* and distil immediately by passing steam through the mixture. Collect the distillate in 15 ml of a 40 g/l solution of *boric acid R* to which has been added 0.2 ml of *methyl red mixed solution R* and enough *water R* to cover the tip of the condenser. Towards the end of the distillation, lower the receiver so that the tip of the condenser is above the surface of the acid. Take precautions to prevent any water on the outer surface of the condenser from reaching the contents of the receiver. Titrate the distillate with *0.01 M sulphuric acid*.

1 ml of *0.01 M sulphuric acid* is equivalent to 0.6006 mg of CH_4N_2O.

STORAGE

In an airtight container.

01/2008:0958

UROFOLLITROPIN

Urofollitropinum

[97048-13-0]

DEFINITION

Urofollitropin is a dry preparation containing menopausal gonadotrophin obtained from the urine of post-menopausal women. It has follicle-stimulating activity and no or virtually no luteinising activity. The potency is not less than 90 International Units of follicle-stimulating hormone (hFSH) per milligram. The ratio of units of luteinising hormone (interstitial-cell-stimulating hormone) [hLH(ICSH)] to units of follicle-stimulating hormone is not more than 1/60.

PRODUCTION

It may be prepared by a suitable fractionation procedure followed by immunoaffinity chromatography.

CHARACTERS

Appearance: almost white or slightly yellowish powder.

Solubility: soluble in water.

IDENTIFICATION

When administered as prescribed in the assay it causes enlargement of the ovaries of immature female rats.

TESTS

Hepatitis virus antigens. Examined by a suitably sensitive immunochemical method (*2.7.1*), hepatitis virus antigens are not detected.

HIV antigen. Examined by a suitably sensitive immunochemical method (*2.7.1*), HIV antigen is not detected.

Residual luteinising activity. The International Units of FSH and LH are the activities contained in stated amounts of the International Standard of human urinary follicle-stimulating hormone and luteinising hormone (interstitial-cell-stimulating hormone) which consists of a mixture of a freeze-dried extract of urine of post-menopausal women with lactose. The equivalence in International Units of the International Standard is stated by the World Health Organisation. Use immature female rats approximately 21 days old and having masses such that the difference between the heaviest and the lightest rat is not more than 10 g. Assign the rats at random to 4 equal groups of at least 6 animals. If sets of 4 litter mates are available, assign one litter mate at random from each set to each group and mark according to litter.

Inject subcutaneously into each rat 50 IU of *serum gonadotrophin R* on the first day and 25 IU of *chorionic gonadotrophin R* on the fourth day, each in 0.5 ml of *phosphate-albumin buffered saline pH 7.2 R*.

Choose 3 doses of the reference preparation such that the smallest dose produces a depletion of the ovarian ascorbic acid content in all the rats and the largest dose does not produce a maximal depletion in all the rats. Use doses in geometric progression; as an initial approximation, total doses of 0.5 IU, 1.0 IU and 2.0 IU may be tried although the dose to be used will depend on the sensitivity of the animals.

Choose a dose of the preparation to be examined expected to contain 60*X* IU of follicle-stimulating hormone (hFSH), in which *X* = the number of IU of hLH in the middle dose of the reference preparation.

Dissolve separately the total quantities of the preparation to be examined and of the reference preparation in 1.0 ml of *phosphate-albumin buffered saline pH 7.2 R*. Inject into a tail vein to each separate group of rats 6 days after the injection of chorionic gonadotrophin. Exactly 4 h after the injection, euthanise the rats and remove the ovaries from each animal. Remove any extraneous fluid and tissue from the ovaries and weigh the ovaries immediately.

Treat the combined ovaries from each rat separately, as follows. Crush and homogenise within 2 min in a freshly prepared 25 g/l solution of *metaphosphoric acid R* at a temperature of 4 °C and dilute to 7 ml with the same solution. Allow the homogenate to stand for 30 min at 4 °C and centrifuge at 4 °C at approximately 2500 *g*. Filter the supernatant liquid, if necessary, through a 0.22 µm filter.

Prepare a fresh solution consisting of a mixture of 2 ml of a 45.3 g/l solution of *sodium acetate R* adjusted to pH 7 with *acetic acid R*, 3 ml of *water R* and 2 ml of *dichlorophenolindophenol standard solution R*. Mix 2 ml of this solution with 2 ml of the clear supernatant liquid. 30 s after mixing, measure the absorbance (*2.2.25*) of the solution at the maximum at about 520 nm. Use as reference a solution with a known content of *ascorbic acid CRS* in a 25 g/l solution of *metaphosphoric acid R*, treated by the same process.

Calculate the amount of ascorbic acid from the ascorbic acid standard curve obtained and express in milligrams per 0.1 g of ovary to obtain the ascorbic acid content of the ovaries. Calculate the mean and its variance of the ascorbic acid content of the ovaries of the rats treated with the preparation to be examined.

For each dose-group of the reference preparation, plot the mean ascorbic acid content of the ovaries as a function of the logarithm of the dose and analyse the regression of the ascorbic acid content on the logarithm of the dose injected, using standard methods of analysis (the method of least squares).

The test is not valid unless:

- the slope constant *b* is significant at the 5 per cent level of significance,
- for the groups treated with the reference preparation, the sum of squares due to linear regression is equal to at least 95 per cent of the total sum of squares of the ascorbic acid content,
- the within-group variance of the ascorbic acid content of the group receiving the preparation to be examined is not significantly different at the 5 per cent level of significance from the within-group variance of the ascorbic acid content of the groups receiving the reference preparation.

The mean ascorbic acid content of the ovaries of the rats treated with the preparation to be examined is not significantly lower than that of the rats treated with the middle dose of the reference preparation (calculated from the regression equation) at the 5 per cent level of significance.

Water (*2.5.32*): maximum 5.0 per cent.

Bacterial endotoxins (*2.6.14, Method C*): less than 0.40 IU per IU of urofollitropin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

The follicle-stimulating activity of urofollitropin is estimated by comparing under given conditions its effect in enlarging the ovaries of immature rats treated with chorionic gonadotrophin with the same effect of the International Standard preparation of human urinary

follicle-stimulating hormone and luteinising hormone or of a reference preparation calibrated in International Units. The International Units of FSH and LH are the activities contained in stated amounts of the International Standard of human urinary follicle-stimulating hormone and luteinising hormone (interstitial-cell-stimulating hormone) which consists of a mixture of a freeze-dried extract of urine of post-menopausal women with lactose. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Use immature female rats of the same strain, 19 to 28 days old, differing in age by not more than 3 days and having masses such that the difference between the heaviest and the lightest rat is not more than 10 g. Assign the rats at random to 6 equal groups of at least 5 animals. If sets of 6 litter mates are available, assign one litter mate from each set to each group and mark according to litter.

Choose 3 doses of the reference preparation and 3 doses of the preparation to be examined such that the smallest dose produces a positive response in some of the rats and the largest dose does not produce a maximal response in all the rats. Use doses in geometric progression and as an initial approximation total doses of 1.5 IU, 3.0 IU and 6.0 IU may be tried although the dose will depend on the sensitivity of the animals used, which may vary widely.

Dissolve separately the total quantities of the preparation to be examined and of the reference preparation corresponding to the daily doses to be used in sufficient *phosphate-albumin buffered saline pH 7.2 R* such that the daily dose is administered in a volume of about 0.5 ml. The buffer solution shall contain in the daily dose not less than 14 IU of chorionic gonadotrophin to ensure complete luteinisation. Add a suitable antimicrobial preservative such as 4 g/l of phenol or 0.02 g/l of thiomersal. Store the solutions at 5 ± 3 °C.

Inject subcutaneously into each rat the daily dose allocated to its group. Repeat the injection of each dose 24 h and 48 h after the first injection. About 24 h after the last injection, euthanise the rats and remove the ovaries from each animal. Remove any extraneous fluid and tissue from the ovaries and weigh the 2 combined ovaries of each animal immediately. Calculate the results by the usual statistical methods, using the mass of the 2 combined ovaries as the response. (The precision of the assay may be improved by a suitable correction of the organ mass with reference to the mass of the animal from which it was taken; an analysis of covariance may be used).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

In an airtight, tamper-proof container, protected from light, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the activity expressed in International Units of follicle-stimulating hormone per container,
- the potency expressed in International Units of follicle-stimulating hormone per milligram.

01/2008:0695

UROKINASE

Urokinasum

[9039-53-6]

DEFINITION

Urokinase is an enzyme, obtained from human urine, that activates plasminogen. It consists of a mixture of low-molecular-mass (LMM) (M_r 33 000) and high-molecular-mass (HMM) (M_r 54 000) forms, the high-molecular-mass form being predominant. The potency is not less than 70 000 International Units per milligram of protein.

PRODUCTION

It is produced by validated methods of manufacturing designed to minimise or eliminate vasoactive substances.

CHARACTERS

A white or almost white, amorphous powder, soluble in water.

IDENTIFICATION

A. Place separately in two haemolysis tubes 0.5 ml of citrated human plasma and 0.5 ml of citrated bovine plasma and maintain in a water-bath at 37 °C. To each tube add 0.1 ml of a solution containing a quantity of the substance to be examined equivalent to 1000 IU/ml in *phosphate buffer solution pH 7.4 R* and 0.1 ml of a solution containing a quantity of *humanthrombin R* equivalent to 20 IU/ml in *phosphate buffer solution pH 7.4 R*. Shake immediately. In both tubes, a clot forms and lyses within 30 min.

B. Carry out identification by a suitable immunodiffusion test.

TESTS

Appearance of solution. Dissolve 10 mg in 10 ml of *water R*. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Hepatitis B surface antigen. Examine by a suitably sensitive method such as radio-immunoassay. Hepatitis B surface antigen is not detected.

Thromboplastic contaminants

Test solutions. Dissolve suitable quantities of the substance to be examined in *barbital buffer solution pH 7.4 R* to obtain solutions with activities of 5000 IU/ml, 2500 IU/ml, 1250 IU/ml, 625 IU/ml and 312 IU/ml.

To each of six haemolysis tubes 1 cm in internal diameter add 0.1 ml of *citrated rabbit plasma R*. Allocate the test solutions one to each of five of the tubes; add to each tube 0.1 ml of the solution allocated to it and to the sixth tube add 0.1 ml of *barbital buffer solution pH 7.4 R* (blank). Incubate the tubes at 25 ± 0.5 °C for 5 min and add 0.1 ml of a 3.675 g/l solution of *calcium chloride R*. Measure with a stop-watch the coagulation time for each tube. Plot the shortening of the recalcification time (clotting time of the blank minus clotting time measured) against log concentration in International Units. Extrapolate the best-fitting straight line through the five points until it reaches the log-concentration axis. The urokinase activity at the intersection point, which represents the limit concentration for coagulant activity (zero coagulant activity), is not less than 150 IU/ml.

Molecular fractions. Examine by size-exclusion chromatography (*2.2.30*).

Test solution. Dissolve about 1 mg of the substance to be examined in 1.0 ml of *0.02 M phosphate buffer pH 8.0 R*. Prepare immediately before use.

The chromatographic procedure may be carried out using:

– a column 0.9 m long and 16 mm in internal diameter packed with *cross-linked dextran for chromatography R3*,
– as mobile phase at a flow rate of 6 ml/h a 17.5 g/l solution of *sodium chloride R* in *0.02 M phosphate buffer solution pH 8.0 R*,

equilibrating the column and operating at 5 °C. Apply the test solution to the head of the column rinsing twice with 0.5 ml portions of the buffer and carry out the elution. The eluate may be collected in fractions of 1 ml. Measure the absorbance (*2.2.25*) of the eluate at the maximum at 280 nm and plot the individual values on a graph. Draw perpendicular lines towards the axis of the abscissae from the minima before the HMM peak, between the HMM and the LMM peaks, and after the LMM peak, thus identifying the fractions to be considered in calculating the HMM/LMM activity ratio. Pool the HMM fractions and, separately, the LMM fractions. Determine separately the urokinase activity in International Units of each of the fraction pools by the method prescribed under Assay. The ratio of the urokinase activity in the HMM fraction pool to that in the LMM fraction pool is not less than 2.0.

Total protein. Determine the nitrogen content, using 10 mg, by the method of sulphuric acid digestion (*2.5.9*) and calculate the quantity of protein by multiplying by 6.25.

Pyrogens (*2.6.8*). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of pyrogen, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1.0 ml of a sterile 9 g/l solution of *sodium chloride R* containing a quantity of the substance to be examined equivalent to 20 000 IU/ml.

ASSAY

The potency of urokinase is determined by comparing its capacity to activate plasminogen to form plasmin with the same capacity of a reference preparation of urokinase calibrated in International Units; the formation of plasmin is measured by the determination of the lysis time of a fibrin clot in given conditions.

The International Unit is the activity contained in a stated amount of the International Reference Preparation, which consists of freeze-dried urokinase with lactose. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organisation.

Unless otherwise prescribed, use *phosphate buffer solution pH 7.4 R* containing 30 g/l of *bovine albumin R* for the preparation of the solutions and dilutions used in the assay.

Test solution. Prepare a solution of the substance to be examined expected to have an activity of 1000 IU/ml.

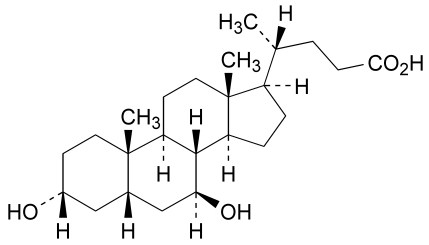
Reference solution. Prepare a solution of a reference preparation having an activity of 1000 IU/ml.

Keep the test solution and the reference solution in iced water and use within 6 h. Prepare three serial 1.5-fold dilutions of the reference preparation such that the longest clot-lysis time is less than 20 min and the shortest clot-lysis time is greater than 3 min. Prepare three similar dilutions of the test solution. Keep the solutions in iced water and use within 1 h. Use twenty-four tubes 8 mm in diameter. Label the tubes T_1, T_2 and T_3 for the dilutions of the test solution and S_1, S_2 and S_3 for the dilutions of the reference solution, allocating four tubes to each dilution. Place the tubes in iced water. Into each tube, introduce 0.2 ml of the appropriate dilution, 0.2 ml of *phosphate buffer solution pH 7.4 R* containing 30 g/l of *bovine albumin R* and 0.1 ml of a solution of *humanthrombin R* having an activity of not less than 20 IU/ml. Place the tubes in a water-bath at 37 °C and allow to stand for 2 min to attain temperature equilibrium. Using an automatic pipette, introduce into the bottom of the first tube 0.5 ml of a 10 g/l solution of *bovine euglobulins R*, ensuring mixing. At intervals of 5 s, introduce successively into the remaining tubes 0.5 ml of a 10 g/l solution of *bovine euglobulins R*. Using a stop-watch, measure for each tube the time in seconds that elapses between the addition of the euglobulins solution and the lysis of the clot. Plot the logarithms of the lysis times for the substance to be examined and for the reference preparation against the logarithms of the concentration and calculate the activity of the substance to be examined using the usual statistical methods.

The estimated potency is not less than 90 per cent and not more than 111 per cent of the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent of the stated potency.

STORAGE

Store in an airtight container, protected from light, at a temperature not exceeding 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.



LABELLING

The label states the potency in International Units per milligram of protein.

01/2008:1275
corrected 6.0

URSODEOXYCHOLIC ACID

Acidum ursodeoxycholicum

$C_{24}H_{40}O_4$ M_r 392.6
[128-13-2]

DEFINITION

Ursodeoxycholic acid contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 3α,7β-dihydroxy-5β-cholan-24-oic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in ethanol (96 per cent), slightly soluble in acetone, practically insoluble in methylene chloride.

It melts at about 202 °C.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *ursodeoxycholic acid CRS*. Examine the substances as discs prepared using *potassium bromide R*.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve about 10 mg in 1 ml of *sulphuric acid R*. Add 0.1 ml of *formaldehyde solution R* and allow to stand for 5 min. Add 5 ml of *water R*. The suspension obtained is greenish-blue.

TESTS

Specific optical rotation (*2.2.7*). Dissolve 0.500 g in *anhydrous ethanol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 58.0 to + 62.0, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using a suitable silica gel as the coating substance.

Test solution (a). Dissolve 0.40 g of the substance to be examined in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 10 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 1 volume of *water R* and 9 volumes of *acetone R*.

Reference solution (a). Dissolve 40 mg of *ursodeoxycholic acid CRS* in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 20 mg of *lithocholic acid CRS* in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 10 ml with the same mixture of solvents. Dilute 2 ml of this solution to 100 ml with a mixture of 1 volume of *water R* and 9 volumes of *acetone R*.

Reference solution (c). Dissolve 20 mg of *chenodeoxycholic acid CRS* in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 50 ml with the same mixture of solvents.

Reference solution (d). Dissolve 20 mg of *cholic acid CRS* in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 100 ml with the same mixture of solvents.

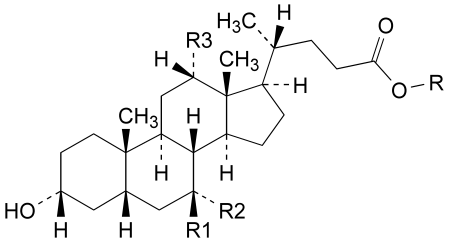
Reference solution (e). Dilute 0.5 ml of test solution (a) to 20 ml with a mixture of 1 volume of *water R* and 9 volumes of *acetone R*. Dilute 1 ml of this solution to 10 ml with a mixture of 1 volume of *water R* and 9 volumes of *acetone R*.

Reference solution (f). Dissolve 10 mg of *ursodeoxycholic acid CRS* in reference solution (c) and dilute to 25 ml with the same solution.

Apply 5 µl of each solution to the plate. Develop in an unsaturated tank over a path of 15 cm using a mixture of 1 volume of *glacial acetic acid R*, 30 volumes of *acetone R* and 60 volumes of *methylene chloride R*. Dry the plate at 120 °C for 10 min. Spray the plate immediately with a 47.6 g/l solution of *phosphomolybdic acid R* in a mixture of 1 volume of *sulphuric acid R* and 20 volumes of *glacial acetic acid R* and heat again at 120 °C until blue spots appear on a lighter background. In the chromatogram obtained with test solution (a): any spot corresponding to lithocholic acid is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.1 per cent); any spot corresponding to chenodeoxycholic acid is not more intense than the principal spot in the chromatogram obtained with reference solution (c) (1 per cent); any spot corresponding to cholic acid is not more intense than the principal spot in the chromatogram obtained with reference solution (d) (0.5 per cent); any spot, apart from the principal spot and any spots corresponding to lithocholic acid, chenodeoxycholic acid and cholic acid, is not more intense than the principal spot in the chromatogram obtained with reference solution (e) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (f) shows two clearly separated principal spots.

Heavy metals (*2.4.8*). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.



Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 50 ml of *ethanol (96 per cent) R*, previously neutralised to 0.2 ml of *phenolphthalein solution R*. Add 50 ml of *water R* and titrate with *0.1 M sodium hydroxide* until a pink colour is obtained.

1 ml of *0.1 M sodium hydroxide* is equivalent to 39.26 mg of $C_{24}H_{40}O_4$.

IMPURITIES

A. R = R1 = R3 = H, R2 = OH: chenodeoxycholic acid,

B. R = R1 = H, R2 = R3 = OH: 3α,7α,12α-trihydroxy-5β-cholan-24-oic acid (cholic acid),

C. R = R1 = R2 = R3 = H: 3α-hydroxy-5β-cholan-24-oic acid (lithocholic acid),

D. R = R2 = H, R1 = R3 = OH: 3α,7β,12α-trihydroxy-5β-cholan-24-oic acid (ursocholic acid),

E. R = R1 = R2 = H, R3 = OH: 3α,12α-dihydroxy-5β-cholan-24-oic acid (deoxycholic acid),

F. R = R3 = H, R1+R2 = O: 3α-hydroxy-7-oxo-5β-cholan-24-oic acid,

G. R = CH_3, R1 = OH, R2 = R3 = H: methyl 3α,7β-dihydroxy-5β-cholan-24-oate.

VALERIAN DRY HYDROALCOHOLIC EXTRACT

Valerianae extractum hydroalcoholicum siccum

DEFINITION

Extract produced from *Valerian root (0453)*.

Content: minimum 0.25 per cent *m/m* of sesquiterpenic acids, expressed as valerenic acid ($C_{15}H_{22}O_2$; M_r 234.3) (dried extract).

PRODUCTION

The extract is produced from the drug using ethanol (45 to 80 per cent *V/V*) or methanol (40 to 55 per cent *V/V*) by an appropriate procedure.

CHARACTERS

Appearance: brown, hygroscopic powder.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. Suspend 1 g of the extract to be examined in 10 ml of *methanol R* and sonicate for 10 min. Filter the supernatant through a membrane filter (0.45 µm). Use the filtrate as the test solution.

Reference solution. Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 ml of *methanol R*.

Plate: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase: *glacial acetic acid R, ethyl acetate R, cyclohexane R* (2:38:60 *V/V/V*).

Application: 20 µl [or 5 µl] as bands.

Development: over a path of 10 cm [or 6 cm].

Drying: in air.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
———	———
Valerenic acid: a violet zone	A violet zone (valerenic acid)
Acetoxyvalerenic acid: a violet zone	A violet zone (acetoxyvalerenic acid)
———	———
	2 faint or very faint violet zones
Reference solution	**Test solution**

TESTS

Loss on drying (*2.8.17*): maximum 6.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Suspend 1.00 g of the extract to be examined in 50.0 ml of *methanol R1*, sonicate for 10 min and filter.

Reference solution. Dissolve an amount of *valerian standardised dry extract CRS* corresponding to 1.0 mg of valerenic acid in *methanol R1* and dilute to 10.0 ml with the same solvent.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: *acetonitrile R1*, 5 g/l solution of *phosphoric acid R* (20:80 *V/V*);

– *mobile phase B*: 5 g/l solution of *phosphoric acid R*, *acetonitrile R1* (20:80 *V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	55	45
5 - 18	55 → 20	45 → 80
18 - 20	20	80

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl.

Peak identification: use the chromatogram supplied with *valerian standardised dry extract CRS* and the chromatogram obtained with the reference solution to identify the peaks due to acetoxyvalerenic acid and valerenic acid.

System suitability: reference solution:

– *relative retention* with reference to valerenic acid (retention time = about 21 min): acetoxyvalerenic acid = about 0.5.

Calculate the percentage content of sesquiterpenic acids, expressed as valerenic acid, using the following expression:

$$\frac{(A_1 + A_2) \times m_2 \times p \times 5}{A_3 \times m_1}$$

A_1 = area of the peak due to acetoxyvalerenic acid in the chromatogram obtained with the test solution;

A_2 = area of the peak due to valerenic acid in the chromatogram obtained with the test solution;

A_3 = area of the peak due to valerenic acid in the chromatogram obtained with the reference solution;

m_1 = mass of the dried extract to be examined, in grams;

m_2 = mass of *valerian standardised dry extract CRS* used to prepare the reference solution, in grams;

p = percentage content of valerenic acid in *valerian standardised dry extract CRS*.

corrected 6.0

VALERIAN ROOT

Valerianae radix

DEFINITION

Dried, whole or fragmented underground parts of *Valeriana officinalis* L. *s.l.*, including the rhizome surrounded by the roots and stolons.

Content:

– *whole or fragmented drug*:
  – *essential oil*: minimum 4 ml/kg (dried drug);
  – *sesquiterpenic acids*: minimum 0.17 per cent *m/m*, expressed as valerenic acid ($C_{15}H_{22}O_2$; M_r 234.3) (dried drug);
– *cut drug:*
  – *essential oil*: minimum 3 ml/kg (dried drug);
  – *sesquiterpenic acids*: minimum 0.10 per cent *m/m* expressed as valerenic acid ($C_{15}H_{22}O_2$; M_r 234.3) (dried drug).

IDENTIFICATION

A. The rhizome is yellowish-grey or pale brownish-grey, obconical to cylindrical, up to about 50 mm long and 30 mm in diameter; the base is elongated or compressed, usually entirely covered by numerous roots. The apex usually exhibits a cup-shaped scar from the aerial parts; stem bases are rarely present. When cut longitudinally, the pith exhibits a central cavity transversed by septa. The roots are numerous, almost cylindrical, of the same colour as the rhizome, 1-3 mm in diameter and sometimes more than 100 mm long. A few filiform fragile secondary roots are present. The fracture is short. The stolons show prominent nodes separated by longitudinally striated internodes, each 20-50 mm long, with a fibrous fracture.

B. Reduce to a powder (355) (*2.9.12*). The powder is pale yellowish-grey or pale greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: cells containing a pale brown resin or droplets of essential oil; groups of small, rectangular sclereids with thick walls and a narrow, channelled branched lumen; occasional groups of larger, thinner-walled sclereids from the stem bases; lignified, reticulately-thickened vessels, singly or in small groups; thin-walled, elongated cells of the piliferous layer, some with root hairs; occasional fragments of cork. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows abundant starch granules, mainly compound with up to 4-6 components but frequently separated to form single granules, rounded to irregular and up to about 15 µm in diameter; most of the granules show a rather indistinct cleft or radiate hilum.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Suspend 1 g of the powdered drug (355) (*2.9.12*) in 10 ml of *methanol R* and sonicate for 10 min. Filter the supernatant through a membrane filter (0.45 µm). Use the filtrate as the test solution.

Reference solution. Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 ml of *methanol R*.

Plate: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase: *glacial acetic acid R, ethyl acetate R, cyclohexane R* (2:38:60 *V/V/V*).

Application: 20 µl [or 5 µl] as bands.

Development: over a path of 10 cm [or 6 cm].

Drying: in air.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the chromatogram obtained with the test solution.

Top of the plate

Valerenic acid: a violet zone	A violet zone (valerenic acid)
Acetoxyvalerenic acid: a violet zone	A violet zone (acetoxyvalerenic acid)
———	———
	2 faint or very faint violet zones
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 5 per cent of stem bases and maximum 2 per cent of other foreign matter.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of well homogenised powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 12.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 5.0 per cent.

ASSAY

Essential oil (*2.8.12*). Use 40.0 g of freshly powdered drug (500) (*2.9.12*), a 2000 ml flask, 500 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 3-4 ml/min for 4 h.

Sesquiterpenic acids. Liquid chromatography (*2.2.29*).

Test solution. Place 1.50 g of the powdered drug (710) (*2.9.12*) in a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *methanol R1*. Mix and heat on a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Place the filter with the residue in the 100 ml round-bottomed flask. Add 20 ml of *methanol R1* and heat on a water-bath under the reflux condenser for 15 min. Allow to cool and filter. Combine the filtrates and dilute to 50.0 ml with *methanol R1*, rinsing the round-bottomed flask and the filter.

Reference solution. Dissolve an amount of *valerian standardised dry extract CRS* corresponding to 1.0 mg of valerenic acid in *methanol R1* and dilute to 10.0 ml with the same solvent.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: *acetonitrile R1*, 5 g/l solution of *phosphoric acid R* (20:80 *V/V*);
– *mobile phase B*: 5 g/l solution of *phosphoric acid R, acetonitrile R1* (20:80 *V/V*);

Monographs T-Z

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)

m_2 = mass of *valerian standardised dry extract CRS*, used to prepare the reference solution, in grams;

p = percentage content of valerenic acid in *valerian standardised dry extract CRS*.

01/2008:1899

VALERIAN TINCTURE

Valerianae tinctura

DEFINITION

Tincture produced from *Valerian root (0453)*.

Content: minimum 0.015 per cent *m/m* of sesquiterpenic acids, expressed as valerenic acid ($C_{15}H_{22}O_2$; M_r 234.3).

PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (60 to 80 per cent *V/V*) by an appropriate procedure.

CHARACTERS

Appearance: brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. Dilute 5 ml of the tincture to be examined with 5 ml of *ethanol (70 per cent V/V) R*.

Reference solution. Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 ml of *methanol R*.

Plate: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase: *glacial acetic acid R, ethyl acetate R, cyclohexane R* (2:38:60 *V/V/V*).

Application: 20 µl [or 5 µl] as bands.

Development: over a path of 10 cm [or 6 cm].

Drying: in air.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the chromatogram obtained with the test solution.

Acetoxyvalerenic acid: a violet zone	A violet zone (acetoxyvalerenic acid)
———	———
	2 faint or very faint violet zones
Reference solution	**Test solution**

TESTS

Ethanol (*2.9.10*): 95 per cent to 105 per cent of the quantity stated on the label.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Dilute 10.0 g of the tincture to be examined to 50.0 ml with *methanol R1*.

Reference solution. Dissolve an amount of *valerian standardised dry extract CRS* corresponding to 1.0 mg of valerenic acid in *methanol R1* and dilute to 10.0 ml with the same solvent.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: *acetonitrile R1*, 5 g/l solution of *phosphoric acid R* (20:80 *V/V*);

– *mobile phase B*: 5 g/l solution of *phosphoric acid R, acetonitrile R1* (20:80 *V/V*);

corrected 6.0

VALINE

Valinum

$C_5H_{11}NO_2$ M_r 117.1
[72-18-4]

DEFINITION

Valine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*S*)-2-amino-3-methylbutanoic acid, calculated with reference to the dried substance.

CHARACTERS

White or almost white, crystalline powder or colourless crystals, soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *valine CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dissolve 2.5 g in *water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*). Dissolve 2.00 g in *hydrochloric acid R1* and dilute to 25.0 ml with the same acid. The specific optical rotation is + 26.5 to + 29.0, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *dilute hydrochloric acid R* and dilute to 10 ml with the same acid.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *valine CRS* in *0.1 M hydrochloric acid* and dilute to 50 ml with the same acid.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *phenylalanine CRS* and 10 mg of *valine CRS* in *0.1 M hydrochloric acid* and dilute to 25 ml with the same acid.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (*2.4.4*). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (*2.4.13*). Dissolve 0.5 g in *distilled water R* and dilute to 15 ml with the same solvent. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (*2.4.1*). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (*2.4.9*). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (*2.4.8*). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

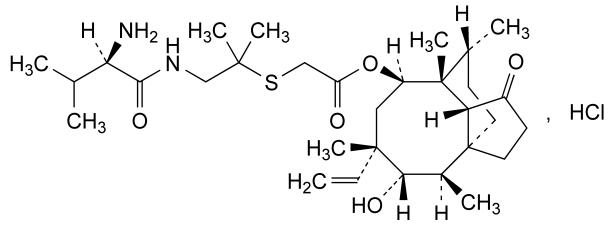
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 3 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Using 0.1 ml of *naphtholbenzein solution R* as indicator, titrate with *0.1 M perchloric acid* until the colour changes from brownish-yellow to green.

1 ml of *0.1 M perchloric acid* is equivalent to 11.71 mg of $C_5H_{11}NO_2$.



STORAGE

Store protected from light.

01/2008:2137

VALNEMULIN HYDROCHLORIDE FOR VETERINARY USE

Valnemulini hydrochloridum ad usum veterinarium

$C_{31}H_{53}ClN_2O_5S$ M_r 601
[133868-46-9]

DEFINITION

(3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-Ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopenta[8]annulen-8-yl [[2-[[(2*R*)-2-amino-3-methylbutanoyl]amino]-1,1-dimethylethyl]sulphanyl]acetate hydrochloride.

Semi-synthetic product derived from a fermentation product

Content: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or yellowish, amorphous powder, hygroscopic.

Solubility: freely soluble in water and in anhydrous ethanol, practically insoluble in *tert*-butyl methyl ether.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *valnemulin hydrochloride CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

pH (*2.2.3*): 3.0 to 6.0.

Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Specific optical rotation (*2.2.7*): + 15.5 to + 18.0 (anhydrous substance).

Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Phosphate buffer solution pH 2.5. Dissolve 8.0 g of *disodium hydrogen phosphate R* and 3.0 g of *potassium dihydrogen phosphate R* in *water for chromatography R* and dilute to 1000.0 ml with the same solvent. Adjust to pH 2.5 with *phosphoric acid R*.

Solvent mixture. Mix equal volumes of *acetonitrile R1* and *water for chromatography R*.

Test solution. Dissolve 0.100 g of the substance to be examined in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dissolve 5 mg of *valnemulin impurity E CRS* and 5 mg of the substance to be examined in the solvent mixture and dilute to 25 ml with the solvent mixture.

Reference solution (c). Dissolve the contents of a vial of *valnemulin for peak identification CRS* (containing impurities A, B and C) in 1 ml of the solvent mixture.

Column:
- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm);
- *temperature*: 50 °C.

Mobile phase:

10 - 13	0	100
13 - 14	0 → 95	100 → 5
14 - 20	95	5

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 200 nm.

Injection: 5 µl.

Identification of impurities: use the chromatogram supplied with *valnemulin for peak identification CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, B and C.

Relative retention with reference to valnemulin (retention time = about 7 min): impurity D = about 0.2; impurity A = about 0.7; impurity B = about 0.85; impurity E = about 0.9; impurity C = about 1.1.

System suitability: reference solution (b):
- *resolution*: minimum 1.5 between the peaks due to impurity E and valnemulin.

Limits:
- *correction factors*: for the calculation of content multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 3.2; impurity E = 4.2;
- *impurity A*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *impurity B*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent);
- *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
- *any other impurity*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent);
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); disregard the peak due to the chloride ion.

Water (*2.5.12*): maximum 4.0 per cent, determined on 0.500 g.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Dissolve 40.0 mg of the substance to be examined in a mixture of equal volumes of *acetonitrile R1* and *water R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution. Dissolve 50.0 mg of *valnemulin hydrogen tartrate CRS* in a mixture of equal volumes of *acetonitrile R1* and *water R* and dilute to 50.0 ml with the same mixture of solvents.

Column:

– *size*: *l* = 0.125 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm);
– *temperature*: 45 °C.

Mobile phase: mix 43 volumes of *acetonitrile R1* and 57 volumes of a solution containing 0.94 g/l of *disodium hydrogen phosphate R* and 8.7 g/l of *potassium dihydrogen phosphate R* previously adjusted to pH 2.5 with *phosphoric acid R*.

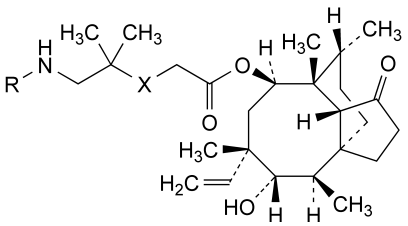
Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 5 µl.

Run time: 3 times the retention time of valnemulin (retention time = about 2.4 min).

Calculate the percentage content of $C_{31}H_{53}ClN_2O_5S$, using the declared content of *valnemulin hydrogen tartrate CRS* and by multiplying by 0.841.

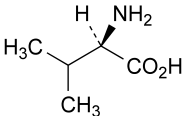


STORAGE

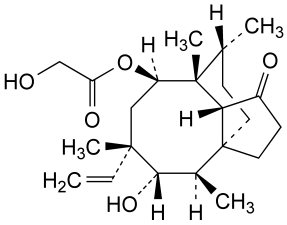
In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C.



Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *D, E.*

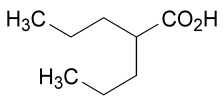


A. R = D-Val, X = SO: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopenta[8]annulen-8-yl [[2-[[(2*R*)-2-amino-3-methylbutanoyl]amino]-1,1-dimethylethyl]sulphinyl]acetate (valnemulin sulphoxide),

B. R = H, X = S: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopenta[8]annulen-8-yl [(2-amino-1,1-dimethylethyl]sulphanyl]acetate (dimethyl cysteaminyl pleuromulin),

C. R = D-Val-D-Val, X = S: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopenta[8]annulen-8-yl [[2-[[(2*R*)-2-[[(2*R*)-2-amino-3-methylbutanoyl]amino]-3-methylbutanoyl]amino]-1,1-dimethylethyl]sulphanyl]acetate (valyl-valneumulin),

D. (2*R*)-2-amino-3-methylbutanoic acid (D-valine),



E. (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopenta[8]annulen-8-yl 2-hydroxyacetate (pleuromulin).

01/2008:1378

VALPROIC ACID

Acidum valproicum

$C_8H_{16}O_2$ M_r 144.2
[99-66-1]

DEFINITION

2-Propylpentanoic acid.

Content: 99.0 per cent to 101.0 per cent.

CHARACTERS

Appearance: colourless or very slightly yellow, clear liquid, slightly viscous.

Solubility: very slightly soluble in water, miscible with ethanol (96 per cent) and with methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Refractive index (*2.2.5*): 1.422 to 1.425.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *valproic acid CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 50 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 50 mg of *valproic acid CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *ether R, methylene chloride R* (50:50 *V/V*).

Application: 2 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *bromocresol green solution R*.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. To 1 ml add 3 ml of *dilute sodium hydroxide solution R*. Add 3 ml of *water R* and 1 ml of a 100 g/l solution of *cobalt nitrate R*. A violet precipitate is formed. Filter. The precipitate dissolves in *methylene chloride R*.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_5 (*2.2.2, Method II*).

Dissolve 2.0 g in *dilute sodium hydroxide solution R* and dilute to 10 ml with the same alkaline solution.

Related substances. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 10 mg of *butyric acid R* in *heptane R* and dilute to 200 ml with the same solvent.

Test solution. Dissolve 0.250 g of the substance to be examined in the internal standard solution and dilute to 5.0 ml with the internal standard solution. Dilute 1.0 ml of this solution to 10.0 ml with *heptane R*.

Reference solution. Dissolve 20 mg of the substance to be examined and 20 mg of *2-(1-methylethyl)pentanoic acid CRS* (impurity C) in *heptane R* and dilute to 10 ml with the same solvent. Dilute 1 ml of this solution to 10 ml with *heptane R*.

Column:

– *material*: wide-bore fused silica;

– *size*: *l* = 30 m, Ø = 0.53 mm;

– *stationary phase*: *macrogol 20 000 2-nitroterephthalate R* (film thickness 0.5 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 8 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	130
	10 - 30	130 → 190
Injection port		220
Detector		220

Detection: flame ionisation.

Injection: 1 µl.

System suitability: reference solution:

– *resolution*: minimum 3.0 between the peaks due to impurity C and valproic acid.

Limits:

– *any impurity*: for each impurity, not more than the area of the peak due to the internal standard (0.1 per cent);

– *total*: not more than 3 times the area of the peak due to the internal standard (0.3 per cent);

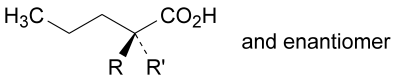
– *disregard limit*: 0.1 times the area of the peak due to the internal standard (0.01 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

Dissolve 2.0 g in *ethanol (80 per cent V/V) R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with test B. Prepare the reference solution using lead standard solution (2 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with *ethanol (80 per cent V/V) R*.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



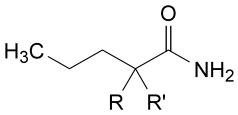
Dissolve 0.100 g in 25 ml of *ethanol (96 per cent) R*. Add 2 ml of *water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M sodium hydroxide* is equivalent to 14.42 mg of $C_8H_{16}O_2$.

STORAGE

In an airtight container.

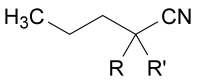
IMPURITIES



A. R = R′ = H: pentanoic acid (valeric acid),

B. R = H, R′ = CH_2-CH_3: (2*RS*)-2-ethylpentanoic acid,

C. R = H, R′ = $CH(CH_3)_2$: (2*RS*)-2-(1-methylethyl)pentanoic acid,



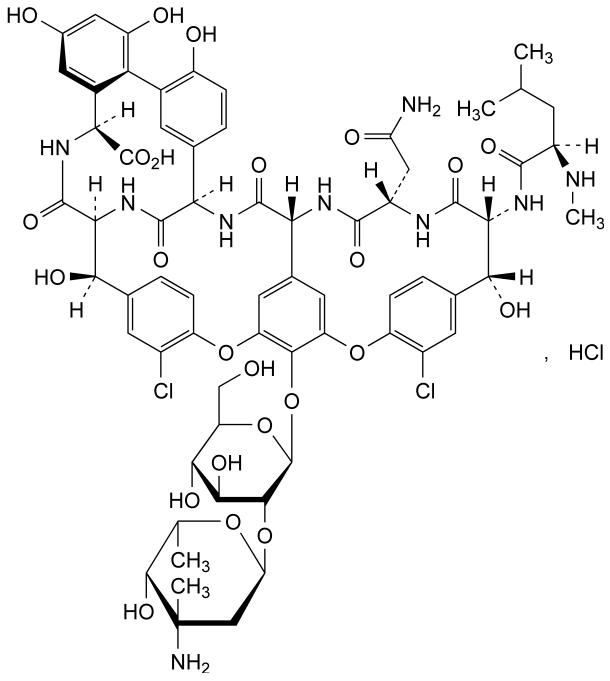
D. R = R′ = CH_2-CH_2-CH_3: 2,2-dipropylpentanoic acid,

E. R = R′ = H: pentanamide (valeramide),

F. R = H, R′ = CH_2-CH_2-CH_3: 2-propylpentanamide,

G. R = R′ = CH_2-CH_2-CH_3: 2,2-dipropylpentanamide,

H. R = R′ = H: pentanenitrile (valeronitrile),



I. R = H, R′ = CH_2-CH_2-CH_3: 2-propylpentanenitrile,

J. R = R′ = CH_2-CH_2-CH_3: 2,2-dipropylpentanenitrile.

VANCOMYCIN HYDROCHLORIDE

Vancomycini hydrochloridum

$C_{66}H_{76}Cl_3N_9O_{24}$ M_r 1486

DEFINITION

Hydrochloride of a mixture of related glycopeptides, consisting principally of the monohydrochloride of (3*S*,6*R*,7*R*,22*R*,23*S*,26*S*,30a*S*$_a$,36*R*,38a*R*)-3-(2-amino-2-oxoethyl)-44-[[2-*O*-(3-amino-2,3,6-trideoxy-3-*C*-methyl-α-L-*lyxo*-hexopyranosyl)-β-D-glucopyranosyl]oxy]-10,19-dichloro-7,22,28,30,32-pentahydroxy-6-[[(2*R*)-4-methyl-2-(methylamino)pentanoyl]amino]-2,5,24,38,39-pentaoxo-2,3,4,5,6,7,23,24,25,26,36,37,38,38a-tetradecahydro-22*H*-8,11:18,21-dietheno-23,36-(iminomethano)-13,16:31,35-dimetheno-1*H*,13*H*-[1,6,9]oxadiazacyclohexadecino[4,5-*m*][10,2,16]benzoxadiazacyclotetracosine-26-carboxylic acid (vancomycin B).

Substance produced by certain strains of *Amycolatopsis orientalis* or obtained by any other means.

Potency: minimum 1050 IU/mg (anhydrous substance).

CHARACTERS

Appearance: white or almost white, hygroscopic powder.

Solubility: freely soluble in water, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Examine the chromatograms obtained in the test for vancomycin B.

Results: the principal peak in the chromatogram obtained with test solution (a) is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and its absorbance (*2.2.25*) at 450 nm is not greater than 0.10.

Dissolve 2.50 g in *water R* and dilute to 25.0 ml with the same solvent.

pH (*2.2.3*): 2.5 to 4.5.

Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Vancomycin B. Liquid chromatography (*2.2.29*). *Use the solutions within 4 h of preparation.*

Test solution (a). Dissolve 10.0 mg of the substance to be examined in mobile phase A and dilute to 5.0 ml with mobile phase A.

Test solution (b). Dilute 2.0 ml of test solution (a) to 50.0 ml with mobile phase A.

Test solution (c). Dilute 0.5 ml of test solution (b) to 20.0 ml with mobile phase A.

Reference solution. Dissolve the contents of a vial of *vancomycin hydrochloride CRS* in *water R* and dilute with the same solvent to obtain a solution containing 0.5 mg/ml. Heat at 65 °C for 24 h. Allow to cool.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 μm).

Mobile phase:

– *mobile phase A*: to 4 ml of *triethylamine R* add 1996 ml of *water R* and adjust to pH 3.2 with *phosphoric acid R*; to 920 ml of this solution add 10 ml of *tetrahydrofuran R* and 70 ml of *acetonitrile R*;

– *mobile phase B*: to 4 ml of *triethylamine R* add 1996 ml of *water R* and adjust to pH 3.2 with *phosphoric acid R*; to 700 ml of this solution add 10 ml of *tetrahydrofuran R* and 290 ml of *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 13	100	0
13 - 22	100 → 0	0 → 100
22 - 26	0	100

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl.

System suitability:

– *resolution*: minimum 5.0 between the 2 principal peaks in the chromatogram obtained with the reference solution;

– *signal-to-noise ratio*: minimum 5 for the principal peak in the chromatogram obtained with test solution (c);

– *symmetry factor*: maximum 1.6 for the peak due to vancomycin in the chromatogram obtained with test solution (b).

Calculate the percentage content of vancomycin B hydrochloride using the following expression:

$$\frac{A_b \times 100}{A_b + \left(\frac{A_t}{25}\right)}$$

A_b = area of the peak due to vancomycin B in the chromatogram obtained with test solution (b);

A_t = sum of the areas of the peaks due to impurities in the chromatogram obtained with test solution (a).

Limit:

– *vancomycin B*: minimum 93.0 per cent.

Related substances. Liquid chromatography (*2.2.29*) as described in the test for vancomycin B with the following modifications.

Injection: test solution (a), (b) and (c).

Calculate the percentage content of each impurity using the following expression:

$$\frac{\left(\frac{A_i}{25}\right) \times 100}{A_b + \left(\frac{A_t}{25}\right)}$$

A_i = area of the peak due to an impurity in the chromatogram obtained with test solution (a);

A_b = area of the peak due to vancomycin B in the chromatogram obtained with test solution (b);

A_t = sum of the areas of the peaks due to impurities in the chromatogram obtained with test solution (a).

Limits:

– *any impurity*: for each impurity, maximum 4.0 per cent;

– *total*: maximum 7.0 per cent;

– *disregard limit*: the area of the principal peak in the chromatogram obtained with test solution (c) (0.1 per cent).

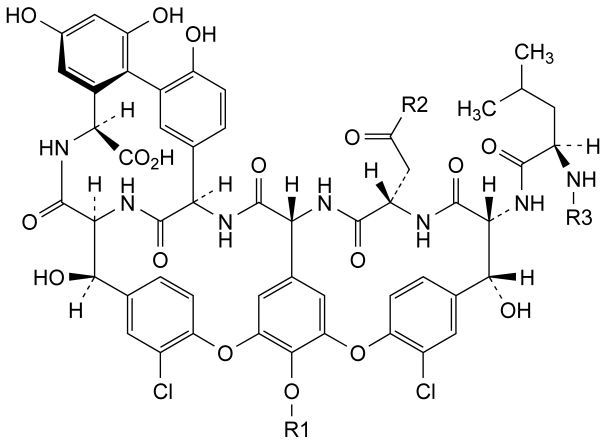
Heavy metals (*2.4.8*): maximum 30 ppm.

1.0 g complies with test C. Prepare the reference solution using 3.0 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 5.0 per cent, determined on 0.500 g.

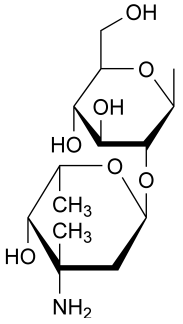
Sulphated ash (*2.4.14*): maximum 1.0 per cent, determined on 1.00 g.

Bacterial endotoxins (*2.6.14*): less than 0.25 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.



ASSAY

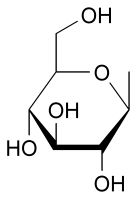
Carry out the microbiological assay of antibiotics (*2.7.2*). Use *vancomycin hydrochloride CRS* as the chemical reference substance.



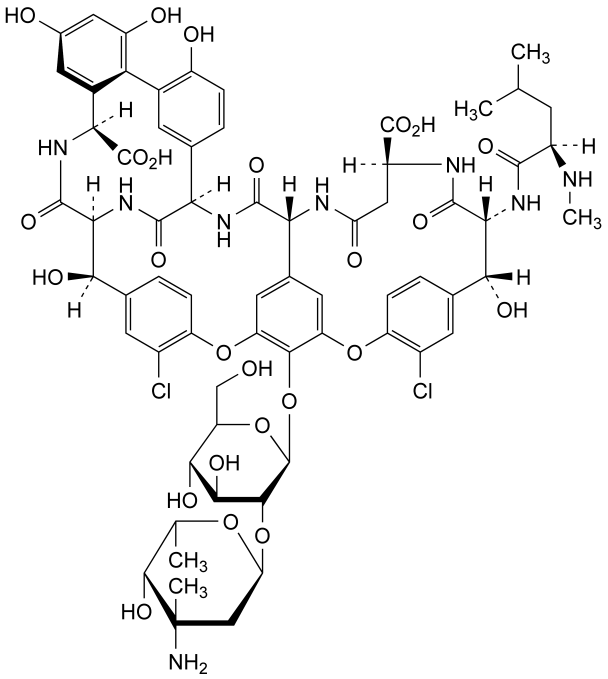
STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

IMPURITIES



R1 =

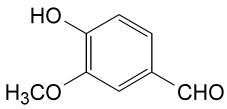


A. R2 = NH_2, R3 = H: *N*-demethylvancomycin B,

C. R1 = H, R2 = NH_2, R3 = CH_3: aglucovancomycin B,

R1 =

D. R2 = NH_2, R3 = CH_3: desvancosaminylvancomycin B,



B. (4*S*,7*R*,8*R*,23*R*,24*S*,27*S*,31aS_a,37*R*,39a*R*)-45-[[2-*O*-(3-amino-2,3,6-trideoxy-3-*C*-methyl-α-L-*lyxo*-hexopyranosyl)-β-D-glucopyranosyl]oxy]-11,20-dichloro-8,23,29,31,33-pentahydroxy-7-[[(2*R*)-4-methyl-2-(methylamino)pentanoyl]amino]-2,6,25,39,40-pentaoxo-1,2,3,4,5,6,7,8,24,25,26,27,37,38,39,39a-hexadecahydro-23*H*-9,12:19,22-dietheno-24,37-(iminomethano)-14,17:32,36-dimetheno-14*H*-[1,6,10]oxadiazacycloheptadecino[4,5-*m*][10,2,16]benzoxadiazacyclotetracosine-4,27-dicarboxylic acid ([β Asp^3]vancomycin B).

01/2008:0747

VANILLIN

Vanillinum

$C_8H_8O_3$ M_r 152.1
[121-33-5]

DEFINITION

Vanillin contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-hydroxy-3-methoxybenzaldehyde, calculated with reference to the dried substance.

CHARACTERS

White or slightly yellowish, crystalline powder or needles, slightly soluble in water, freely soluble in alcohol and in methanol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 81 °C to 84 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *vanillin CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in the test for related substances in daylight after spraying. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To 5 ml of a saturated solution of the substance to be examined add 0.2 ml of *ferric chloride solution R1*. A blue colour is produced. Heat to 80 °C. The solution becomes brown. On cooling, a white precipitate is formed.

TESTS

Appearance of solution. Dissolve 1.0 g in *alcohol R* and dilute to 20 ml with the same solvent. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution B_6 (*2.2.2, Method II*).

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution (a). Dissolve 0.1 g of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 10 mg of *vanillin CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100 ml with *methanol R*.

Apply to the plate 5 µl of each solution. Develop in an unsaturated tank over a path of 10 cm using a mixture of 0.5 volumes of *anhydrous acetic acid R*, 1 volume of *methanol R* and 98.5 volumes of *methylene chloride R*. Dry the plate in a current of cold air. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). Spray with *dinitrophenylhydrazine-aceto-hydrochloric solution R* and examine in daylight. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Reaction with sulphuric acid. Dissolve 50 mg in 5 ml of *sulphuric acid R*. After 5 min, the solution is not more intensely coloured than a mixture of 4.9 ml of yellow primary solution and 0.1 ml of red primary solution or a mixture of 4.9 ml of yellow primary solution and 0.1 ml of blue primary solution (*2.2.2, Method I*).

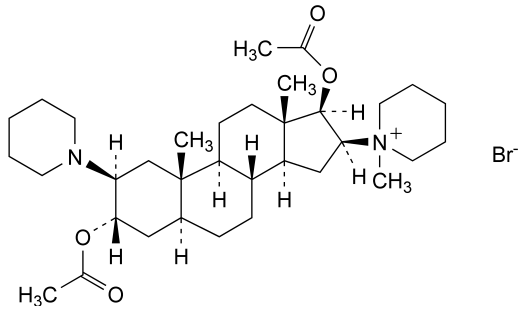
Loss on drying (*2.2.32*). Not more than 1.0 per cent, determined on 1.000 g by drying in a desiccator for 4 h.

Sulphated ash (*2.4.14*). Not more than 0.05 per cent, determined on 2.0 g.

ASSAY

Dissolve 0.120 g in 20 ml of *alcohol R* and add 60 ml of *carbon dioxide-free water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M sodium hydroxide* is equivalent to 15.21 mg of $C_8H_8O_3$.



STORAGE

Store protected from light.

01/2008:1769

VECURONIUM BROMIDE

Vecuronii bromidum

$C_{34}H_{57}BrN_2O_4$ M_r 638
[50700-72-6]

DEFINITION

1-[3α,17β-Bis(acetyloxy)-2β-(piperidin-1-yl)-5α-androstan-16β-yl]-1-methylpiperidinium bromide.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white crystals or crystalline powder.

Solubility: slightly soluble in water, freely soluble in methylene chloride, sparingly soluble in acetonitrile and in anhydrous ethanol.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *vecuronium bromide CRS*.

C. It gives reaction (a) of bromides (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

Dissolve 0.1 g in *water R* and dilute to 10 ml with the same solvent.

Specific optical rotation (*2.2.7*): + 30.5 to + 35.0 (anhydrous substance).

Dissolve 0.250 g in *0.05 M hydrochloric acid* and dilute to 25.0 ml with the same solvent.

Impurity B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.10 g of the substance to be examined in *methylene chloride R* and dilute to 5.0 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of the substance to be examined and 5 mg of *pancuronium bromide CRS* (impurity B) in *methylene chloride R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 5.0 mg of *pancuronium bromide CRS* (impurity B) in *methylene chloride R* and dilute to 100.0 ml with the same solvent.

Stationary phase: *TLC silica gel plate R* (2-10 μm).

Mobile phase: dissolve 1 g of *sodium bromide R* in 5 ml of *water R*. Add 85 ml of *2-propanol R*, then 10 ml of *acetonitrile R*.

Application: 1 μl.

Development: in an unsaturated tank, over 2/3 of the plate.

Drying: in air for 30 min.

Detection: spray with a 2.5 g/l solution of *iodine R* in a mixture of equal volumes of *methanol R* and *methylene chloride R*.

System suitability: reference solution (a):

– the chromatogram obtained shows 2 clearly separated spots.

Limit:

– *impurity B*: any spot due to impurity B is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent).

Related substances. Liquid chromatography (*2.2.29*). *Use freshly prepared solutions.*

Test solution. Dissolve 40.0 mg of the substance to be examined in a 0.2 g/l solution of *hydrochloric acid R* in *methanol R* and dilute to 20.0 ml with the same solution.

Reference solution (a). Dissolve 4 mg of *vecuronium for peak identification CRS* (containing impurities A, C, D and E) in a 0.2 g/l solution of *hydrochloric acid R* in *methanol R* and dilute to 2 ml with the same solution.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with a 0.2 g/l solution of *hydrochloric acid R* in *methanol R*. Dilute 5.0 ml of this solution to 100.0 ml with a 0.2 g/l solution of *hydrochloric acid R* in *methanol R*.

Reference solution (c). Dilute 10.0 ml of reference solution (b) to 50.0 ml with a 0.2 g/l solution of *hydrochloric acid R* in *methanol R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 μm);

– *temperature*: 40 °C.

Mobile phase: mix 50 volumes of a 18.0 g/l solution of *tetramethylammonium hydroxide R* adjusted to pH 6.5 with *phosphoric acid R*, 250 volumes of *methanol R* and 700 volumes of *acetonitrile R*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 μl.

Run time: 2.5 times the retention time of vecuronium.

Identification of impurities: use the chromatogram supplied with *vecuronium for peak identification CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A, C, D and E. The elution order may vary, but the quantity of each impurity in the CRS is different so that a clear identification of the impurities is possible.

Relative retention with reference to vecuronium (retention time = about 5 min): impurity C = about 0.8; impurity D = about 0.9; impurity E = about 1.2; impurity A = about 1.3.

System suitability: reference solution (a):

– *peak-to-valley ratio*: minimum 2.0, where H_p = height above the baseline of the peak due to impurity D and H_v = height above the baseline of the lowest point of the curve separating this peak from the principal peak; if necessary, increase the volume of the buffer solution while simultaneously decreasing the volume of acetonitrile in the mobile phase; do not change the volume of methanol;

– *symmetry factor*: maximum 3.5 for the principal peak.

Limits:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.6; impurity C = 1.4;
- *impurities A, C, D, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent);
- *unspecified impurities*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.10 per cent);
- *total*: not more than 2.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent);
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

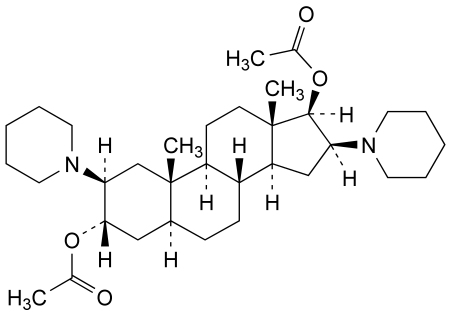
Water (*2.5.12*): maximum 4.0 per cent, determined on 0.300 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.450 g in 50 ml of *glacial acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

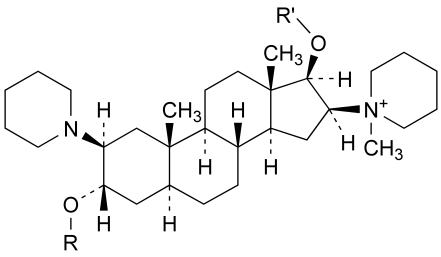
1 ml of *0.1 M perchloric acid* is equivalent to 63.8 mg of $C_{34}H_{57}BrN_2O_4$.



STORAGE

In an airtight container, protected from light and moisture.

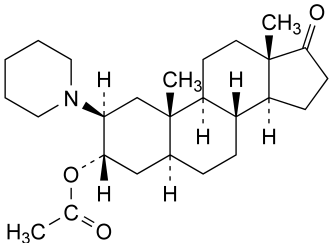
IMPURITIES



Specified impurities: A, B, C, D, E.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F.*

A. 2β,16β-bis(piperidin-1-yl)-5α-androstane-3α,17β-diyl diacetate,

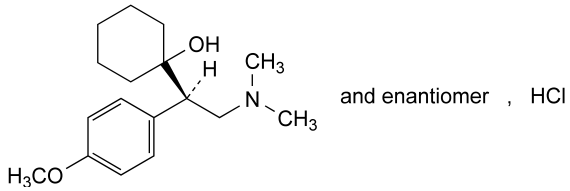


B. pancuronium,

C. R = H, R′ = CO-CH_3: 1-[17β-(acetyloxy)-3α-hydroxy-2β-(piperidin-1-yl)-5α-androstan-16β-yl]-1-methylpiperidinium,

D. R = R′ = H: 1-[3α,17β-dihydroxy-2β-(piperidin-1-yl)-5α-androstan-16β-yl]-1-methylpiperidinium,

E. R = CO-CH_3, R′ = H: 1-[3α-(acetyloxy)-17β-hydroxy-2β-(piperidin-1-yl)-5α-androstan-16β-yl]-1-methylpiperidinium,



F. 2β-(piperidin-1-yl)-17-oxo-5α-androstan-3α-yl acetate.

VENLAFAXINE HYDROCHLORIDE

Venlafaxini hydrochloridum

$C_{17}H_{28}ClNO_2$ M_r 313.9
[99300-78-4]

DEFINITION

1-[(1*RS*)-2-(Dimethylamino)-1-(4-methoxyphenyl)ethyl]cyclohexanol hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water and in methanol, soluble in anhydrous ethanol, slightly soluble or practically insoluble in acetone.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *venlafaxine hydrochloride CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *2-propanol R*, evaporate to dryness and record new spectra using the residues.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Acidity or alkalinity. Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. Add 0.05 ml of *methyl red solution R* and 0.1 ml of *0.01 M hydrochloric acid*. The solution is pink. Not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to yellow.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve the contents of a vial of *venlafaxine for system suitability CRS* (containing impurities D and F) in 1.0 ml of the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *end-capped octylsilyl silica gel for chromatography R* (5 µm) with a pore size of 10 nm.

Mobile phase: mix 510 volumes of *acetonitrile R* and 1490 volumes of a solution prepared as follows: dissolve 17 g of *ammonium dihydrogen phosphate R* in 1490 ml of *water R* and adjust to pH 4.4 using *phosphoric acid R*.

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 225 nm.

Injection: 20 µl.

Run time: 10 times the retention time of venlafaxine.

Relative retention with reference to venlafaxine (retention time = about 9 min): impurity D = about 0.9; impurity F = about 3.4.

System suitability: reference solution (b):

– *resolution*: minimum 1.5 between the peaks due to impurity D and venlafaxine.

Limits:

– *impurity F*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

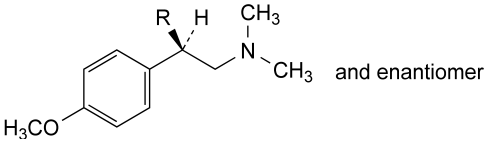
Heavy metals (*2.4.8*): maximum 20 ppm.

Dissolve 1.0 g in 20 ml of *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 80 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

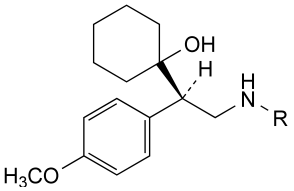


Dissolve 0.250 g in a mixture of 5.0 ml of *0.01 M hydrochloric acid* and 50 ml of *ethanol (96 per cent) R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 31.39 mg of $C_{17}H_{28}ClNO_2$.

IMPURITIES

Specified impurities: F.



Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, B, C, D, E, G, H.*

and enantiomer

corrected 6.0

VERAPAMIL HYDROCHLORIDE

Verapamili hydrochloridum

$C_{27}H_{39}ClN_2O_4$ M_r 491.1
[152-11-4]

DEFINITION

(2*RS*)-2-(3,4-Dimethoxyphenyl)-5-[[2-(3,4-dimethoxyphenyl)-ethyl](methyl)amino]-2-(1-methylethyl)pentanenitrile hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water, freely soluble in methanol, sparingly soluble in ethanol (96 per cent).

mp: about 144 °C.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 20.0 mg in *0.01 M hydrochloric acid* and dilute to 100.0 ml with the same acid. Dilute 5.0 ml of this solution to 50.0 ml with *0.01 M hydrochloric acid.*

Spectral range: 210-340 nm.

Absorption maxima: at 229 nm and 278 nm.

Shoulder: at 282 nm.

Absorbance ratio: A_{278}/A_{229} = 0.35 to 0.39.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *verapamil hydrochloride CRS.*

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *verapamil hydrochloride CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *papaverine hydrochloride CRS* in reference solution (a) and dilute to 5 ml with reference solution (a).

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *diethylamine R, cyclohexane R* (15:85 *V/V*).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. It gives reaction (b) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* while gently heating and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 4.5 to 6.0 for solution S.

Optical rotation (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in the initial mobile phase composition and dilute to 10.0 ml with the initial mobile phase composition.

Reference solution (a). Dissolve 5 mg of *verapamil hydrochloride CRS*, 5 mg of *verapamil impurity I CRS* and 5 mg of *verapamil impurity M CRS* in the initial mobile phase composition and dilute to 20 ml with the initial mobile phase composition. Dilute 1 ml of this solution to 10 ml with the initial mobile phase composition.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the initial mobile phase composition. Dilute 1.0 ml of this solution to 10.0 ml with the initial mobile phase composition.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *end-capped palmitamidopropylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: 6.97 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 7.20 with *phosphoric acid R*;

– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 22	63	37
22 - 27	63 → 35	37 → 65
27 - 35	35	65
35 - 36	35 → 63	65 → 37
36 - 50	63	37

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 278 nm.

Monographs T-Z

Equilibration: with the mobile phase at the initial composition for about 60 min.

Injection: 10 µl.

Retention time: verapamil = about 16 min; impurity I = about 21 min; impurity M eluting as a doublet = about 32 min.

System suitability: reference solution (a):

– *resolution*: minimum 5.0 between the peaks due to verapamil and impurity I;

– impurity M elutes from the column.

Limits:

– *any impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

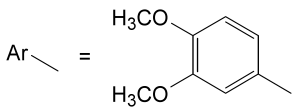
Heavy metals (*2.4.8*): maximum 10 ppm.

1.0 g complies with test C. Prepare the reference solution using 1 ml of *lead standard solution (10 ppm Pb) R*.

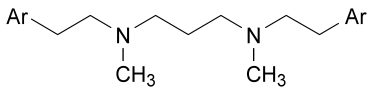
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

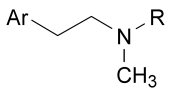


Dissolve 0.400 g in 50 ml of *anhydrous ethanol R* and add 5.0 ml of *0.01 M hydrochloric acid*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*). Measure the volume added between the 2 points of inflexion.



1 ml of *0.1 M sodium hydroxide* is equivalent to 49.11 mg of $C_{27}H_{39}ClN_2O_4$.

STORAGE



Protected from light.

IMPURITIES

A. *N,N′*-bis[2-(3,4-dimethoxyphenyl)ethyl]-*N,N′*-dimethylpropane-1,3-diamine,

01/2008:1854 corrected 6.0

VERBENA HERB

Verbenae herba

DEFINITION

Whole or fragmented, dried aerial parts of *Verbena officinalis* L. collected during flowering.

Content: minimum 1.5 per cent of verbenalin ($C_{17}H_{24}O_{10}$; M_r 388.4) (dried drug).

IDENTIFICATION

A. The stem is greenish-brown, quadrangular, longitudinally grooved and roughly hairy, especially on the angles. The larger leaves are petiolate and deeply pinnately lobed, with bluntly dentate margins, the smaller leaves are sessile, not lobed, with crenate to dentate margins; the surfaces are rough and covered with bristly hairs, particularly over the veins which are prominent on the lower surface. The flowers are numerous, arranged in a slender pike in the axils of leaf-like bracts; the tubular calyx has 5 acutely pointed lobes with the pale pink to lilac corolla forming a tube about twice as long as the calyx.

B. Reduce to a powder (355) (*2.9.12*). The powder is greenish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: long, polygonal to rectangular epidermal cells of the stems with thickened outer walls; fragments of the leaves in surface view showing sinuous-walled epidermal cells with anomocytic or anisocytic stomata (*2.8.3*), more numerous on the lower epidermis; covering trichomes short, unicellular, thick-walled, up to 500 µm long, wide at the base and arising from the centre of a single ring of domed, spherical epidermal cells; occasional glandular trichomes of 2 types: (a) multicellular stalk with a flattened, 4- to 8-celled head about 25 µm in diameter and (b) unicellular stalk and an enlarged ovate head about 65 µm in diameter composed of 8 radiating cells; fragments of the fibrous layer of the anther with well-marked thickenings; triangular to ovoid or rounded pollen grains about 30 µm in diameter, with 3 pores and a smooth exine; abundant groups of fibres, bordered-pitted vessels and parenchymatous tissue from the stems.

C. Examine the chromatograms obtained in test B for *Aloysia citrodora*.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
———	———
	A brown or green zone
Arbutin: a blue or brown zone	
	An intense brownish-grey zone
Rutin: a dark brownish-yellow zone	
———	———
Reference solution	**Test solution**

TESTS

Aloysia citrodora

A. A lemon-like odour indicates the presence of *Aloysia citrodora*.

B. Thin-layer chromatography (*2.2.27*).

Test solution. To 0.50 g of the powdered drug (710) (*2.9.12*) add 5 ml of *methanol R*. Heat in a water-bath at 60 °C for 10 min. Cool and filter.

Reference solution. Dissolve 10 mg of *arbutin R* and 10 mg of *rutin R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase: *anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R* (11:11:27:100 *V/V/V/V*).

Application: 20 µl [or 5 µl] as bands.

Development: over a path of 12 cm [or 6 cm].

Drying: in air.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C for about 10 min. Examine in daylight.

Results: the chromatogram obtained with the test solution shows no intense blue or violet zone approximately at the position of rutin in the chromatogram obtained with the reference solution.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 10.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 2.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

Internal standard solution. Dissolve 10.0 mg of *ferulic acid R* in *ethanol (60 per cent V/V) R* and dilute to 100.0 ml with the same solvent.

Test solution. To 1.00 g of the powdered drug (710) (*2.9.12*) add 50.0 ml of the internal standard solution and stir with a magnetic stirrer for 2 h. Centrifuge for 15 min and filter the supernatant using a membrane filter of 0.45 µm pore size.

Reference solution. Dissolve the contents of a vial of *verbenalin CRS* in the internal standard solution and dilute to 5.0 ml with the same solution.

Precolumn:

– *size*: *l* = 0.01 m, Ø = 4.0 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 20 °C.

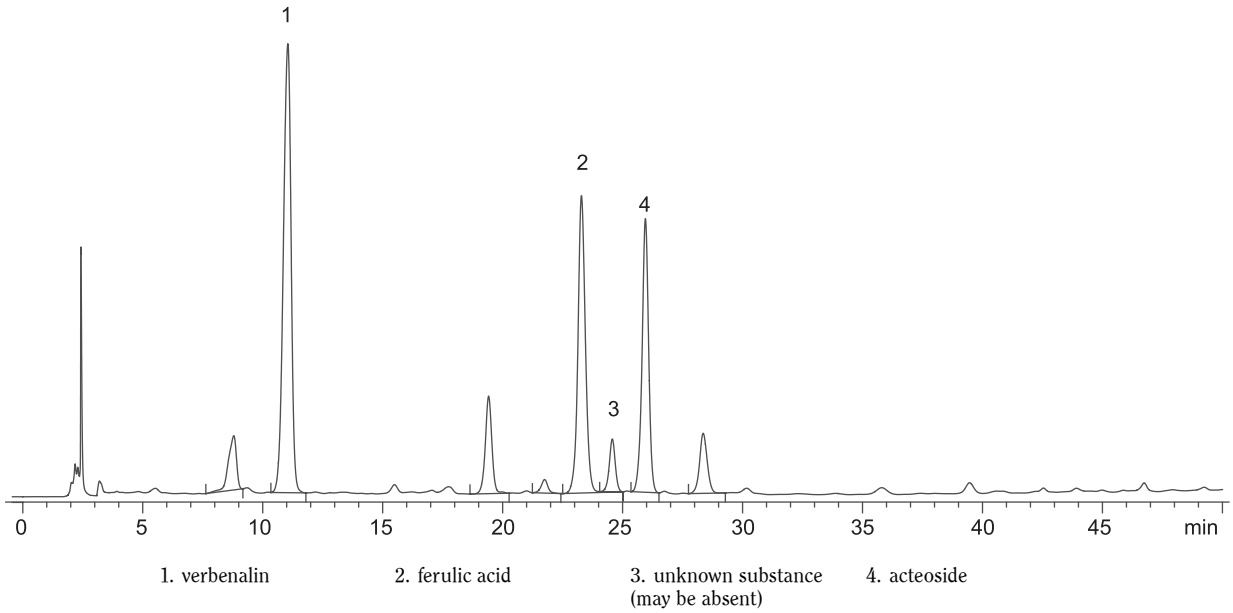

Figure 1854.-1. – *Chromatogram for the assay of verbena herb: test solution*

Mobile phase:

– *mobile phase A*: 0.3 per cent *V/V* solution of *phosphoric acid R*;

– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 20	93 → 83	7 → 17
20 - 30	83	17
30 - 35	83 → 75	17 → 25
35 - 40	75 → 20	25 → 80
40 - 45	20 → 93	80 → 7

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 20 µl.

System suitability: test solution:

– the chromatogram obtained is similar to the chromatogram shown in Figure 1854.-1;

– *resolution*: minimum 3.5 between the peaks due to ferulic acid and acteoside.

Calculate the percentage content of verbenalin from the following expression:

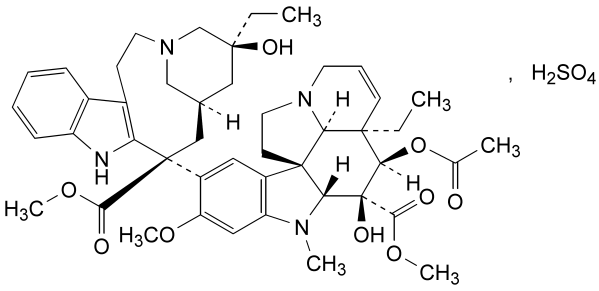
$$\frac{A_1 \times A_4 \times m_2 \times 10}{A_2 \times A_3 \times m_1}$$

A_1 = area of the peak due to verbenalin in the chromatogram obtained with the test solution;

A_2 = area of the peak due to verbenalin in the chromatogram obtained with the reference solution;

A_3 = area of the peak due to ferulic acid in the chromatogram obtained with the test solution;

A_4 = area of the peak due to ferulic acid in the chromatogram obtained with the reference solution;



m_1 = mass of the drug used to prepare the test solution, in grams;

m_2 = mass of verbenalin in the reference solution, in grams.

01/2008:0748

VINBLASTINE SULPHATE

Vinblastini sulfas

$C_{46}H_{60}N_4O_{13}S$ M_r 909

[143-67-9]

DEFINITION

Vinblastine sulphate contains not less than 95.0 per cent and not more than the equivalent of 104.0 per cent of methyl (3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-4-(acetyloxy)-3a-ethyl-9-[(5*S*,7*R*,9*S*)-5-ethyl-5-hydroxy-9-(methoxycarbonyl)-1,4,5,6,7,8,9,10-octahydro-2*H*-3,7-methanoazacycloundecino[5,4-*b*]indol-9-yl]-5-hydroxy-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate sulphate, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, very hygroscopic, freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the *Ph. Eur. reference spectrum of vinblastine sulphate*.

B. Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution is similar in position and approximate size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dissolve 50.0 mg in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method I*).

pH (*2.2.3*). Dilute 3 ml of solution S to 10 ml with *carbon dioxide-free water R*. The pH of this solution is 3.5 to 5.0.

Related substances. Examine the chromatograms obtained in the assay. In the chromatogram obtained with the test solution, the area of any peak apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent) and the sum of the areas of any such peaks is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (5.0 per cent). Disregard any peak with an area less than that of the peak in the chromatogram obtained with reference solution (d).

Loss on drying. Not more than 15.0 per cent, determined on 3 mg by thermogravimetry (*2.2.34*). Heat to 200 °C at a rate of 5 °C/min, under a stream of *nitrogen for chromatography R*, at a flow rate of 40 ml/min.

ASSAY

Examine by liquid chromatography (*2.2.29*).

Keep the solutions in iced water before use.

Test solution. Dilute 1.0 ml of solution S (see Tests) to 5.0 ml with *water R*.

Reference solution (a). Dissolve the contents of a vial of *vinblastine sulphate CRS* in 5.0 ml of *water R* to obtain a concentration of 1.0 mg/ml.

Reference solution (b). Dissolve 1.0 mg of *vincristine sulphate CRS* in 1.0 ml of reference solution (a).

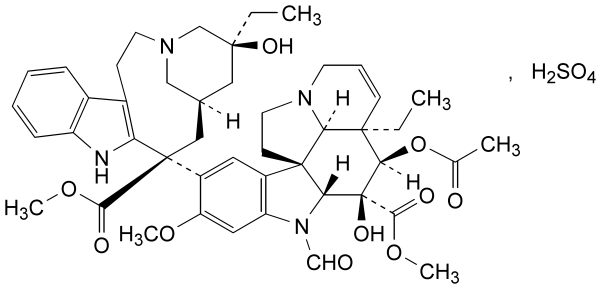
Reference solution (c). Dilute 1.0 ml of reference solution (a) to 50.0 ml with *water R*.

Reference solution (d). Dilute 1.0 ml of reference solution (c) to 20.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm). Place between the injector and the column a guard column packed with suitable silica gel,
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 38 volumes of a 1.5 per cent *V/V* solution of *diethylamine R* adjusted to pH 7.5 with *phosphoric acid R*, 12 volumes of *acetonitrile R* and 50 volumes of *methanol R*,
- as detector a spectrophotometer set at 262 nm,
- a loop injector.

Inject 10 µl of each solution and record the chromatograms for three times the retention time of the peak corresponding to vinblastine. The assay is not valid unless: in the chromatogram obtained with reference solution (b) the resolution between the peaks corresponding to vincristine and vinblastine is not less than four; the peak in the chromatogram obtained with reference solution (d) has a signal-to-noise ratio not less than five. Calculate the percentage content of $C_{46}H_{60}N_4O_{13}S$ from the area of the principal peak in each of the chromatograms obtained with the test solution and reference solution (a) and from the declared content of *vinblastine sulphate CRS*.



STORAGE

Store in an airtight, glass container, protected from light, at a temperature not exceeding – 20 °C. If the substance is sterile, store in an sterile, airtight, tamper-proof glass container.

01/2008:0749

VINCRISTINE SULPHATE

Vincristini sulfas

$C_{46}H_{58}N_4O_{14}S$ M_r 923

[2068-78-2]

DEFINITION

Methyl (3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-4-(acetyloxy)-3a-ethyl-9-[(5*S*,7*R*,9*S*)-5-ethyl-5-hydroxy-9-(methoxycarbonyl)-1,4,5,6,7,8,9,10-octahydro-2*H*-3,7-methanoazacycloundecino[5,4-*b*]indol-9-yl]-6-formyl-5-hydroxy-8-methoxy-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate sulphate.

Content: 95.0 per cent to 104.0 per cent (dried substance).

CHARACTERS

Appearance: white or slightly yellowish, crystalline powder, very hygroscopic.

Solubility: freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of vincristine sulphate.*

TESTS

Solution S. Dissolve 50.0 mg in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent. *Keep the solution in iced water to carry out the test for related substances.*

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method I*).

pH (*2.2.3*): 3.5 to 4.5.

Dilute 2 ml of solution S to 10 ml with *carbon dioxide-free water R*.

Related substances. Liquid chromatography (*2.2.29*). *Keep the solutions in iced water before use.*

Test solution. Dilute 1.0 ml of solution S to 5.0 ml with *water R*.

Reference solution (a). Dissolve the contents of a vial of *vincristine sulphate CRS* in 5.0 ml of *water R* to obtain a concentration of 1.0 mg/ml.

Reference solution (b). Dissolve 1.0 mg of *vinblastine sulphate CRS* in 1.0 ml of reference solution (a).

Reference solution (c). Dilute 1.0 ml of the test solution to 50.0 ml with *water R*.

Reference solution (d). Dilute 1.0 ml of reference solution (c) to 20.0 ml with *water R*.

Precolumn:

– *stationary phase*: *octylsilyl silica gel for chromatography R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: 1.5 per cent *V/V* solution of *diethylamine R* adjusted to pH 7.5 with *phosphoric acid R*,

– *mobile phase B*: *methanol R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 12	38	62
12 - 27	38 → 8	62 → 92
27 - 29	8 → 38	92 → 62
29 - 34	38	62

Flow rate: 2 ml/min.

Detection: spectrophotometer at 297 nm.

Injection: 20 µl.

System suitability: reference solution (b):

– *resolution*: minimum 4 between the peaks due to vincristine and vinblastine.

Limits:

– *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent),

– *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (5.0 per cent),

– *disregard limit*: area of the peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

Loss on drying: maximum 12.0 per cent, determined on 3 mg by thermogravimetry (*2.2.34*). Heat the substance to be examined to 200 °C increasing the temperature by 5 °C/min, under a current of *nitrogen for chromatography R*, at a flow rate of 40 ml/min.

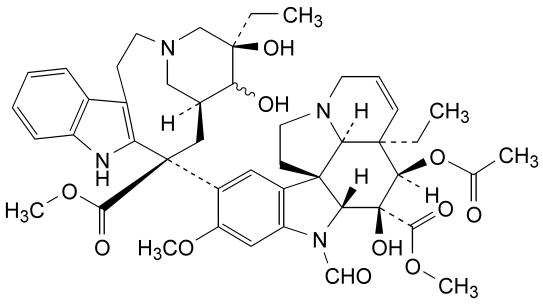
ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances, with the following modifications.

Mobile phase: mix 30 volumes of a 1.5 per cent *V/V* solution of *diethylamine R* adjusted to pH 7.5 with *phosphoric acid R* and 70 volumes of *methanol R*.

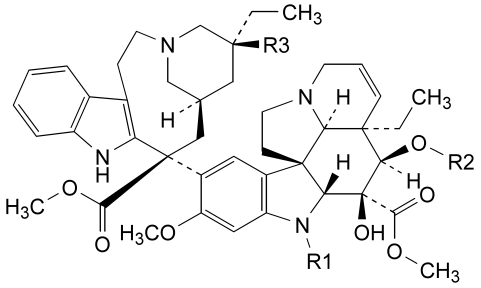
Flow rate: 1.0 ml/min.

Calculate the percentage content of $C_{46}H_{58}N_4O_{14}S$ using the chromatogram obtained with reference solution (a) and the declared content of *vincristine sulphate CRS*.



STORAGE

In an airtight, glass container, protected from light, at a temperature not exceeding – 20 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof glass container.

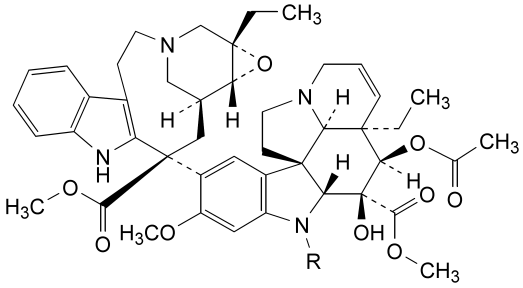


IMPURITIES

Specified impurities: *A, B, C, D, H.*

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E, F, G.*

A. methyl (3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-4-(acetyloxy)-3a-ethyl-9-[(5*R*,7*S*,9*S*)-5-ethyl-5,6-dihydroxy-9-(methoxycarbonyl)-1,4,5,6,7,8,9,10-octahydro-2*H*-3,7-methanoazacycloundecino[5,4-b]indol-9-yl]-6-formyl-5-hydroxy-8-methoxy-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate (3'-hydroxy-VCR),



B. R1 = CHO, R2 = CO-CH_3, R3 = H: methyl (3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-4-(acetyloxy)-3a-ethyl-9-[(5*R*,7*S*,9*S*)-5-ethyl-9-(methoxycarbonyl)-1,4,5,6,7,8,9,10-octahydro-2*H*-3,7-methanoazacycloundecino[5,4-*b*]indol-9-yl]-6-formyl-5-hydroxy-8-methoxy-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate (4′-deoxyvincristine),

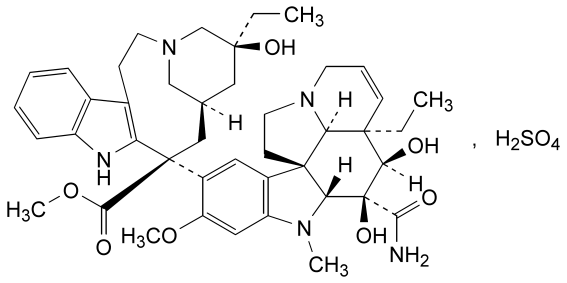
C. H. R1 = CH_3, R2 = CO-CH_3, R3 = OH: vinblastine,



F. R = CH_3: methyl (3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-4-(acetyloxy)-3a-ethyl-9-[(1a*S*,11*S*,13*S*,13a*R*)-1a-ethyl-11-(methoxycarbonyl)-1a,4,5,10,11,12,13,13a-octahydro-2*H*-3,13-methano-oxireno[9,10]azacycloundecino[5,4-*b*]indol-11-yl]-5-hydroxy-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate (leurosine),

G. R = CHO: methyl (3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-4-(acetyloxy)-3a-ethyl-9-[(1a*S*,11*S*,13*S*,13a*R*)-1a-ethyl-11-(methoxycarbonyl)-1a,4,5,10,11,12,13,13a-octahydro-2*H*-3,13-methano-oxireno[9,10]azacycloundecino[5,4-*b*]indol-11-yl]-6-formyl-5-hydroxy-8-methoxy-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate (formylleurosine).

01/2008:1276

VINDESINE SULPHATE

Vindesini sulfas

$C_{43}H_{57}N_5O_{11}S$ M_r 852

[59917-39-4]

DEFINITION

Methyl (5*S*,7*R*,9*S*)-9-[(3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-5-carbamoyl-3a-ethyl-4,5-dihydroxy-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazol-9-yl]-5-ethyl-5-hydroxy-1,4,5,6,7,8,9,10-octahydro-2*H*-3,7-methanoazacycloundecino[4,5-*b*]indole-9-carboxylate sulphate.

Content: 96.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, amorphous, hygroscopic substance.

Solubility: freely soluble in water and in methanol, practically insoluble in cyclohexane.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of vindesine sulphate.*

TESTS

Solution S. Dissolve 50 mg in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method I*).

pH (*2.2.3*): 3.5 to 5.5 for solution S.

Related substances. Liquid chromatography (*2.2.29*). *Keep the solutions in iced water before use.*

Test solution. Dissolve 10.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with *water R.*

Reference solution (b). Dissolve 1.0 mg of *desacetylvinblastine CRS* in *water R,* add 1.0 ml of the test solution and dilute to 50.0 ml with *water R.*

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 200.0 ml with *water R.*

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: 1.5 per cent *V/V* solution of *diethylamine R* adjusted to pH 7.4 with *phosphoric acid R*;

– *mobile phase B*: *methanol R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 40	49	51
40 - 49	49 → 30	51 → 70
49 - end	30	70

Flow rate: 2 ml/min.

Detection: spectrophotometer at 270 nm.

Injection: 200 µl.

Run time: twice the retention time of vindesine.

System suitability: reference solution (b):

– the retention time of vindesine is less than 40 min;

– *resolution*: minimum 2.0 between the peaks due to vindesine and desacetylvinblastine;

– *symmetry factor*: maximum 2.0 for the peak due to vindesine.

Limits:

– *impurities A, B, C*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent);

– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (2 per cent);

– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.01 per cent).

Acetonitrile. Gas chromatography (*2.2.28*).

Internal standard solution (a). Dilute 0.500 g of *propanol R* to 100 ml with *water R*.

Internal standard solution (b). Dilute 10.0 ml of internal standard solution (a) to 50.0 ml with *water R*.

Reference solution. Dilute 10.0 g of *acetonitrile R* to 1000 ml with *water R*. To 3.0 ml of this solution add 10.0 ml of internal standard solution (a) and dilute to 50.0 ml with *water R*.

Test solution. Dissolve 40 mg of the substance to be examined in 1.0 ml of internal standard solution (b).

Column:

– *material*: glass;

– *size*: *l* = 1.25 m, Ø = 3 mm;

– *stationary phase*: *ethylvinylbenzene-divinylbenzene copolymer R*.

Carrier gas: *helium for chromatography R*.

Flow rate: 60 ml/min.

Temperature:

– *column*: 170 °C;

– *injection port and detector*: 250 °C.

Detection: flame ionisation.

Injection: 3 µl.

System suitability: reference solution:

– *resolution*: minimum 1.5 between the peaks due to acetonitrile and propanol;

– *symmetry factor*: maximum 1.6 for the peak due to acetonitrile.

Limit:

– *acetonitrile*: maximum 1.5 per cent *m/m*.

Loss on drying: maximum 10.0 per cent, determined on 9.00 mg by thermogravimetry (*2.2.34*). Heat to 200 °C at a rate of 5 °C/min, under a stream of *nitrogen for chromatography R* at a flow rate of 40 ml/min.

ASSAY

Liquid chromatography (*2.2.29*). *Keep the solutions in iced water before use.*

Test solution. Dissolve 5.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve and dilute the entire contents of a vial of *vindesine sulphate CRS* with *water R* to yield a concentration of approximately 0.50 mg/ml.

Reference solution (b). Add 1.0 mg of *desacetylvinblastine CRS* to 2.0 ml of reference solution (a).

Column:

– *size*: *l* = 0.15 m, 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 38 volumes of a 1.5 per cent *V/V* solution of *diethylamine R*, previously adjusted to pH 7.4 with *phosphoric acid R*, and 62 volumes of *methanol R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 270 nm.

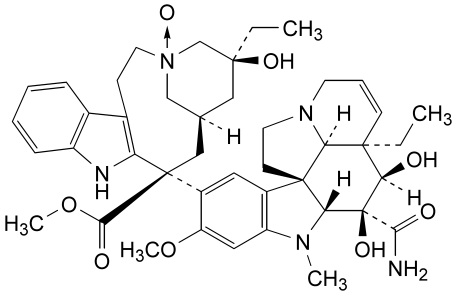
Injection: 20 µl.

System suitability: reference solution (b):

– *resolution*: minimum 1.5 between the peaks due to vindesine and desacetylvinblastine;

– *symmetry factor*: maximum 2.0 for the peak due to vindesine;

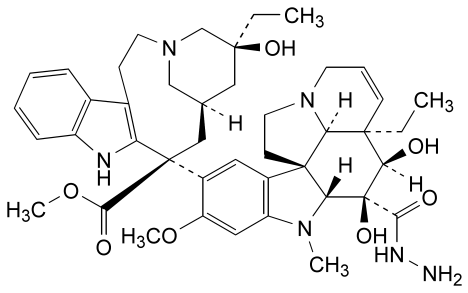
– *repeatability*: maximum relative standard deviation of 1.5 per cent for the peak due to vindesine after 5 injections.



Calculate the percentage content of $C_{43}H_{57}N_5O_{11}S$ from the declared content of *vindesine sulphate CRS*.

STORAGE

In an airtight polypropylene container with a polypropylene cap, at a temperature of –50 °C or below. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

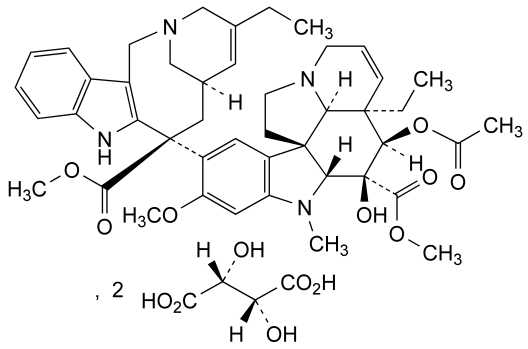


IMPURITIES

Specified impurities: A, B, C.

A. vindesine 3′-*N*-oxide,

B. vinblastine,



C. desacetylvinblastine hydrazide.

01/2008:2107
corrected 6.0

VINORELBINE TARTRATE

Vinorelbini tartras

$C_{53}H_{66}N_4O_{20}$ M_r 1079
[125317-39-7]

DEFINITION

Methyl (3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-4-(acetyloxy)-3a-ethyl-9-[(6*R*,8*S*)-4-ethyl-8-(methoxycarbonyl)-1,3,6,7,8,9-hexahydro-2,6-methano-2*H*-azacyclodecino[4,3-*b*]indol-8-yl]-5-hydroxy-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate dihydrogen bis[(2*R*,3*R*)-2,3-dihydroxybutanedioate].

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: freely soluble in water and in methanol, practically insoluble in hexane.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: dissolve 10 mg in 5 ml of *water R*. Add 0.5 ml of *sodium hydroxide solution R*. Extract with 5 ml of *methylene chloride R*. Dry the organic layer over *anhydrous sodium sulphate R*, filter and reduce its volume to about 0.5 ml by evaporation and apply to a disc of *potassium bromide R*. Evaporate and record the spectrum.

Comparison: *vinorelbine tartrate CRS*, treated as described above.

B. It gives reaction (b) of tartrates (*2.3.1*).

TESTS

Solution S. Dissolve a quantity equivalent to 0.140 g of the anhydrous substance in *water R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and its absorbance (*2.2.25*) at 420 nm is not greater than 0.030.

pH (*2.2.3*): 3.3 to 3.8 for solution S.

Related substances. Liquid chromatography (*2.2.29*): use the normalisation procedure.

Test solution. Dissolve 35.0 mg of the substance to be examined in the mobile phase and dilute to 25 ml with the mobile phase.

Reference solution (a). Dissolve 7 mg of *vinorelbine impurity B CRS* in *water R* and dilute to 50 ml with the same solvent. To 1 ml of this solution add 14 mg of *vinorelbine tartrate CRS*, dissolve in *water R* and dilute to 10 ml with the same solvent. Expose this solution for 1 h to a xenon lamp apparatus at a wavelength of 310-880 nm, supplying a dose of 1600 kJ/m^2 at a fluence rate of 500 W/m^2 in order to generate impurity A.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with *water R*. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 3.9 mm,
– *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 125 m^2/g, a pore size of 30 nm and a carbon loading of 7 per cent,
– *temperature*: 35 ± 5 °C.

Mobile phase: dissolve 1.22 g of *sodium decanesulphonate R* in 620 ml of *methanol R* and add 380 ml of a 7.80 g/l solution of *sodium dihydrogen phosphate R* previously adjusted to pH 4.2 with *dilute phosphoric acid R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 267 nm.

Injection: 20 µl.

Run time: twice the retention time of vinorelbine.

Relative retention with reference to vinorelbine (retention time = about 14 min): impurity A = about 0.8; impurity B = about 1.2.

System suitability:

– *peak-to-valley ratio*: minimum 4, where H_p = height above the baseline of the peak due to impurity B and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to vinorelbine in the chromatogram obtained with reference solution (a),
– *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (b).

Limits:

– *impurity A*: maximum 0.3 per cent,
– *any other impurity*: for each impurity, maximum 0.2 per cent,
– *sum of impurities other than A*: maximum 0.7 per cent,
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b).

Boron: maximum 50 ppm.

Test solution. Dissolve 0.10 g of the substance to be examined in 2 ml of *water R*. Slowly add 10.0 ml of *sulphuric acid R* while cooling in iced water. Stir and allow to warm to room temperature. Add 10.0 ml of a 0.5 g/l solution of *carminic acid R* in *sulphuric acid R*.

Reference solution. Dilute 2.5 ml of a 0.572 g/l solution of *boric acid R* to 100.0 ml with *water R*. To 2.0 ml of this solution slowly add 10.0 ml of *sulphuric acid R* while cooling

in iced water. Stir and allow to warm to room temperature. Add 10.0 ml of a 0.5 g/l solution of *carminic acid R* in *sulphuric acid R*.

Blank solution. To 2.0 ml of *water R* slowly add 10.0 ml of *sulphuric acid R* while cooling in iced water. Stir and allow to warm to room temperature. Add 10.0 ml of a 0.5 g/l solution of *carminic acid R* in *sulphuric acid R*.

After 45 min, measure the absorbance (*2.2.25*) of the test solution and the reference solution, between 560 nm and 650 nm, using the blank solution as compensation liquid. The maximum absorbance value of the test solution is not greater than that of the reference solution.

Fluorides: maximum 50 ppm.

Potentiometry (*2.2.36, Method I*) using a fluoride-selective indicator electrode and a silver-silver chloride reference electrode.

Test solution. Dissolve 0.19 g of the substance to be examined in 20 ml of *water R*. Add 5.0 ml of *total-ionic-strength-adjustment buffer R* and dilute to 50 ml with *water R*.

Reference solutions. To 0.6 ml, 0.8 ml, 1.0 ml, 1.2 ml and 1.4 ml of *fluoride standard solution (10 ppm F) R*, add 5.0 ml of *total-ionic-strength-adjustment buffer R* and dilute to 50 ml with *water R*.

Introduce the electrodes into the reference solutions and allow to stand for 5 min. Determine the potential difference between the electrodes after 1 min of stabilisation. Using semi-logarithmic paper plot the potential difference obtained for each reference solution as a function of concentration of fluoride. Using exactly the same conditions, determine the potential difference obtained with the test solution and calculate the content of fluoride.

Silver: maximum 5.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 0.500 g of the substance to be examined in 10.0 ml of *water R*.

Reference solutions. Prepare the reference solutions using *silver standard solution (5 ppm Ag) R* and diluting with a 6.5 per cent *V/V* solution of *lead-free nitric acid R*.

Source: silver hollow-cathode lamp.

Wavelength: 328.1 nm.

Atomisation device: air-acetylene flame.

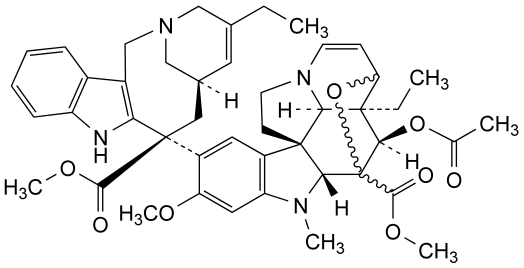
Water (*2.5.12*): maximum 4.0 per cent, determined on 0.250 g.

Bacterial endotoxins (*2.6.14*): less than 2 IU/mg (expressed as vinorelbine base), if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

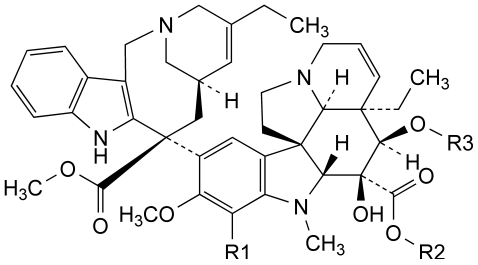
Dissolve 0.350 g in 40 ml of *glacial acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 53.96 mg of $C_{53}H_{66}N_4O_{20}$.



STORAGE

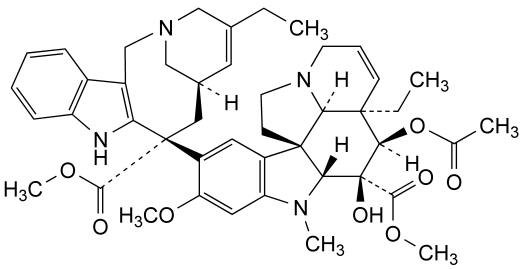
Under an inert gas, protected from light, at a temperature not exceeding – 15 °C.



IMPURITIES

Specified impurities: *A*.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, E, F, G, H, I, J*.



A. methyl (3a*S*,4*R*,5a*R*,10b*R*,13a*R*)-4-(acetyloxy)-3,5-epoxy-3a-ethyl-9-[(6*R*,8*S*)-4-ethyl-8-(methoxycarbonyl)-1,3,6,7,8,9-hexahydro-2,6-methano-2*H*-azacyclodecino[4,3-*b*]indol-8-yl]-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-3*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate,

VINPOCETINE

Vinpocetinum

$C_{22}H_{26}N_2O_2$ M_r 350.5
[42971-09-5]

DEFINITION

Ethyl (13a*S*,13b*S*)-13a-ethyl-2,3,5,6,13a,13b-hexahydro-1*H*-indolo[3,2,1-*de*]pyrido[3,2,1-*ij*][1,5]naphthyridine-12-carboxylate.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or slightly yellow, crystalline powder.

Solubility: practically insoluble in water, soluble in methylene chloride, slightly soluble in anhydrous ethanol.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *vinpocetine CRS*.

TESTS

Specific optical rotation (*2.2.7*): + 127 to + 134 (dried substance).

Dissolve 0.25 g in *dimethylformamide R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *vinpocetine impurity B CRS*, 6.0 mg of *vinpocetine impurity A CRS*, 5.0 mg of *vinpocetine impurity C CRS* and 5.0 mg of *vinpocetine impurity D CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (a) and 1.0 ml of reference solution (b) to 20.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl end-capped silica gel for chromatography R* (5 µm).

Mobile phase: 15.4 g/l solution of *ammonium acetate R*, *acetonitrile R* (45:55 *V/V*).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 15 µl.

Run time: 3 times the retention time of vinpocetine.

Relative retention with reference to vinpocetine (retention time = about 16 min): impurity A = about 0.4; impurity D = about 0.68; impurity B = about 0.75; impurity C = about 0.83.

System suitability: reference solution (c):

– *resolution*: minimum 2.0 between the peaks due to impurities B and D.

Limits:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.6 per cent);

– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.5 per cent);

– *impurity C*: not more than 0.6 times the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.3 per cent);

– *impurity D*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.5 per cent);

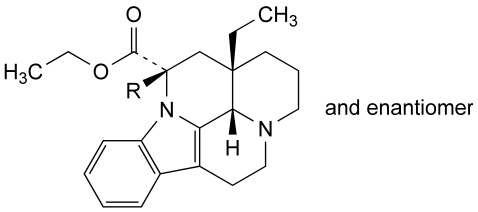
– *unspecified impurities*: for each impurity, not more than the area of the peak due to vinpocetine in the chromatogram obtained with reference solution (c) (0.10 per cent);

– *total*: not more than 10 times the area of the peak due to vinpocetine in the chromatogram obtained with reference solution (c) (1.0 per cent);

– *disregard limit*: 0.5 times the area of the peak due to vinpocetine in the chromatogram obtained with reference solution (c) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* in an oven at 100 °C for 3 h.

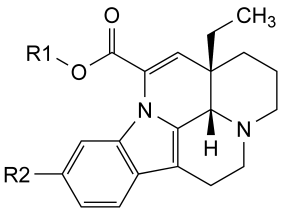
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.



ASSAY

Dissolve 0.300 g in 50 ml of a mixture of equal volumes of *acetic anhydride R* and *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 35.05 mg of $C_{22}H_{26}N_2O_2$.



IMPURITIES

Specified impurities: *A, B, C, D.*

A. R = OH: ethyl (12*RS*,13a*SR*,13b*SR*)-13a-ethyl-12-hydroxy-2,3,5,6,12,13,13a,13b-octahydro-1*H*-indolo[3,2,1-*de*]pyrido[3,2,1-*ij*][1,5]naphthyridine-12-carboxylate (ethyl vincaminate),

D. R = H: ethyl (12*RS*,13a*RS*,13b*RS*)-13a-ethyl-2,3,5,6,12,13,13a,13b-octahydro-1*H*-indolo[3,2,1-*de*]pyrido[3,2,1-*ij*][1,5]naphthyridine-12-carboxylate (dihydrovinpocetine),

B. R1 = CH_3, R2 = H: methyl (13a*S*,13b*S*)-13a-ethyl-2,3,5,6,13a,13b-hexahydro-1*H*-indolo[3,2,1-*de*]pyrido[3,2,1-*ij*][1,5]naphthyridine-12-carboxylate (apovincamine),

C. R1 = C_2H_5, R2 = OCH_3: ethyl (13a*S*,13b*S*)-13a-ethyl-9-methoxy-2,3,5,6,13a,13b-hexahydro-1*H*-indolo[3,2,1-*de*]pyrido[3,2,1-*ij*][1,5]naphthyridine-12-carboxylate (methoxyvinpocetine).

corrected 6.0

VISCOSE WADDING, ABSORBENT

Lanugo cellulosi absorbens

DEFINITION

Absorbent viscose wadding consists of bleached, carefully carded, new fibres of regenerated cellulose obtained by the viscose process, with or without the addition of titanium dioxide, of linear density 1.0 dtex to 8.9 dtex (dtex = mass of 10 000 m of fibre, expressed in grams) and cut to a suitable staple length. It does not contain any compensatory colouring matter.

CHARACTERS

It is white or very slightly yellow, has a lustrous or matt appearance, and is soft to the touch.

IDENTIFICATION

A. Viscose rayon fibres may be solid or hollow; hollow fibres may have a continuous lumen or be compartmented. The fibres have an average length of 25 mm to 80 mm and when examined under a microscope in the dry state, or when mounted in *alcohol R* and *water R*, the following characters are observed. They are usually of a more or less uniform width, with many longitudinal parallel lines distributed unequally over the width. The

ends are cut more or less straight. Matt fibres contain numerous granular particles of approximately 1 µm average diameter.

Solid fibres. In longitudinal view, the surface of the fibres may be uneven or crenate. Fibres having an approximately circular or elliptical cross section have a diameter of about 10 µm to 20 µm and those that are flattened and twisted ribbons vary in width from 15 µm to 20 µm as the twisting of the filament reveals first the major axis and then the minor axis. They are about 4 µm in thickness. Other solid cross sections are Y-shaped and have protruding limbs with the major axis 5 µm to 25 µm in length and the minor axis 2 µm to 8 µm wide.

Hollow fibres. Fibres with a continuous, hollow lumen have a diameter of up to about 30 µm; they are thin-walled, with a wall thickness of about 5 µm. When mounted in *alcohol R* and *water R*, the lumen is clearly indicated in many fibres by the presence of many entrapped air bubbles.

Compartmented fibres. These fibres may have a diameter of up to 80 µm; they are hollow, having a central lumen which is divided up into several compartments. Individual compartments vary in size but typically may be up to about 60 µm in length and there may be more than one compartment across the width of each fibre. Some compartments show entrapped air bubbles when the fibres are mounted in *alcohol R* and *water R*.

B. When treated with *iodinated zinc chloride solution R*, the fibres become violet.

C. To 0.1 g add 10 ml of *zinc chloride-formic acid solution R*. Heat to 40 °C and allow to stand for 2 h 30 min, shaking occasionally. It dissolves completely except for the matt variety where titanium dioxide particles remain.

D. Dissolve the residue obtained in the test for sulphated ash by warming gently with 5 ml of *sulphuric acid R*. Allow to cool and add 0.2 ml of *dilute hydrogen peroxide solution R*. The solution obtained from the lustrous variety undergoes no change in colour; that from the matt variety shows an orange-yellow colour, the intensity of which depends on the quantity of titanium dioxide present.

TESTS

Solution S. Place 15.0 g in a suitable vessel, add 150 ml of *water R*, close the vessel and allow to macerate for 2 h. Decant the solution, squeeze the residual liquid carefully from the sample with a glass rod and mix. Reserve 10 ml of the solution for the test for surface-active substances and filter the remainder.

Acidity or alkalinity. To 25 ml of solution S add 0.1 ml of *phenolphthalein solution R* and to another 25 ml add 0.05 ml of *methyl orange solution R*. Neither solution is pink.

Foreign fibres. Examined under a microscope, it is seen to consist exclusively of viscose fibres, except that occasionally a few isolated foreign fibres may be present.

Fluorescence. Examine a layer about 5 mm in thickness under ultraviolet light at 365 nm. It displays only a slight brownish-violet fluorescence. It shows no intense blue fluorescence, apart from that which may be shown by a few isolated fibres.

Absorbency

Apparatus. A dry cylindrical copper-wire basket 8.0 cm high and 5.0 cm in diameter. The wire of which the basket is constructed is about 0.4 mm in diameter, the mesh is 1.5 cm to 2.0 cm wide and the mass of the basket is 2.7 ± 0.3 g.

Sinking time. Not more than 10 s. Weigh the basket to the nearest centigram (m_1). Take a total of 5.00 g in approximately equal quantities from 5 different places in the product to be examined, place loosely in the basket and weigh the filled basket to the nearest centigram (m_2). Fill a beaker 11 cm to 12 cm in diameter to a depth of 10 cm with water at about 20 °C. Hold the basket horizontally and drop it from a height of about 10 mm into the water. Measure with a stopwatch the time taken for the basket to sink below the surface of the water. Calculate the result as the average of 3 tests.

Water-holding capacity. Not less than 18.0 g of water per gram. After the sinking time has been measured, remove the basket from the water, allow it to drain for exactly 30 s suspended in a horizontal position over the beaker, transfer it to a tared beaker (m_3) and weigh to the nearest centigram (m_4). Calculate the water-holding capacity per gram of absorbent viscose wadding using the following expression:

$$\frac{m_4 - (m_2 + m_3)}{m_2 - m_1}$$

Calculate the result as the average of 3 tests.

Ether-soluble substances. Not more than 0.30 per cent. In an extraction apparatus, extract 5.00 g with *ether R* for 4 h at a rate of at least 4 extractions per hour. Evaporate the ether extract and dry the residue to constant mass at 100 °C to 105 °C.

Extractable colouring matter. In a narrow percolator, slowly extract 10.0 g with *alcohol R* until 50 ml of extract is obtained. The liquid obtained is not more intensely coloured (*2.2.2, Method II*) than reference solution Y_5, GY_6 or a reference solution prepared as follows: to 3.0 ml of blue primary solution add 7.0 ml of hydrochloric acid (10 g/l HCl) and dilute 0.5 ml of this solution to 10.0 ml with hydrochloric acid (10 g/l HCl).

Surface-active substances. Introduce the 10 ml portion of solution S reserved before filtration into a 25 ml graduated ground-glass-stoppered cylinder with an external diameter of 20 mm and a wall thickness of not greater than 1.5 mm, previously rinsed 3 times with *sulphuric acid R* and then with *water R*. Shake vigorously 30 times in 10 s, allow to stand for 1 min and repeat the shaking. After 5 min, any foam present does not cover the entire surface of the liquid.

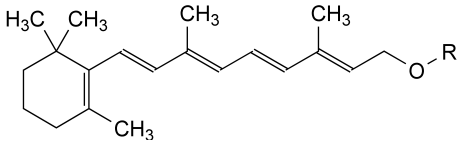
Water-soluble substances. Not more than 0.70 per cent. Boil 5.00 g in 500 ml of *water R* for 30 min, stirring frequently. Replace the water lost by evaporation. Decant the liquid, squeeze the residual liquid carefully from the sample with a glass rod and mix. Filter the liquid whilst hot. Evaporate 400 ml of the filtrate (corresponding to 4/5 of the mass of the sample taken) and dry the residue to constant mass at 100 °C to 105 °C.

Hydrogen sulphide. To 10 ml of solution S add 1.9 ml of *water R*, 0.15 ml of *dilute acetic acid R* and 1 ml of *lead acetate solution R*. After 2 min, the solution is not more intensely coloured than a reference solution prepared at the same time using 0.15 ml of *dilute acetic acid R*, 1.2 ml of *thioacetamide reagent R*, 1.7 ml of *lead standard solution (10 ppm Pb) R* and 10 ml of solution S.

Loss on drying (*2.2.32*). Not more than 13.0 per cent, determined on 5.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.45 per cent for the lustrous variety and not more than 1.7 per cent for the matt variety. Introduce 5.00 g into a previously heated and cooled, tared crucible. Heat cautiously over a naked flame and then carefully to dull redness at 600 °C. Allow to cool, add a few drops of *dilute sulphuric acid R*, then heat and

incinerate until all the black particles have disappeared. Allow to cool. Add a few drops of *ammonium carbonate solution R*. Evaporate and incinerate carefully, allow to cool and weigh again. Repeat the incineration for periods of 5 min to constant mass.



STORAGE

Store in a dust-proof package in a dry place.

01/2008:0217

VITAMIN A

Vitaminum A

Substance	R	Molecular formula	M_r
all-(*E*)-retinol	H	$C_{20}H_{30}O$	286.5
all-(*E*)-retinol acetate	CO-CH_3	$C_{22}H_{32}O_2$	328.5
all-(*E*)-retinol propionate	CO-C_2H_5	$C_{23}H_{34}O_2$	342.5
all-(*E*)-retinol palmitate	CO-$C_{15}H_{31}$	$C_{36}H_{60}O_2$	524.9

DEFINITION

Vitamin A refers to a number of substances of very similar structure (including (*Z*)-isomers) found in animal tissues and possessing similar activity. The principal and biologically most active substance is all-(*E*)-retinol (all-(*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraen-1-ol; $C_{20}H_{30}O$). Vitamin A is generally used in the form of esters such as the acetate, propionate and palmitate.

Synthetic retinol ester refers to an ester (acetate, propionate or palmitate) or a mixture of synthetic retinol esters.

The activity of vitamin A is expressed in retinol equivalents (R.E.). 1 mg R.E. corresponds to the activity of 1 mg of all-(*E*)-retinol. The activity of the other retinol esters is calculated stoichiometrically, so that 1 mg R.E. of vitamin A corresponds to the activity of:

- 1.147 mg of all-(*E*)-retinol acetate,
- 1.195 mg of all-(*E*)-retinol propionate,
- 1.832 mg of all-(*E*)-retinol palmitate.

International Units (IU) are also used to express the activity of vitamin A. 1 IU of vitamin A is equivalent to the activity of 0.300 µg of all-(*E*)-retinol. The activity of the other retinol esters is calculated stoichiometrically, so that 1 IU of vitamin A is equivalent to the activity of:

- 0.344 µg of all-(*E*)-retinol acetate,
- 0.359 µg of all-(*E*)-retinol propionate,
- 0.550 µg of all-(*E*)-retinol palmitate,

1 mg of retinol equivalent is equivalent to 3333 IU.

CHARACTERS

Appearance:

Retinol acetate: pale-yellow crystals (mp: about 60 °C). Once melted retinol acetate tends to yield a supercooled melt.

Retinol propionate: reddish-brown oily liquid.

Retinol palmitate: a fat-like, light yellow solid or a yellow oily liquid, if melted (mp: about 26 °C).

Solubility: all retinol esters are practically insoluble in water, soluble or partly soluble in anhydrous ethanol and miscible with organic solvents.

Vitamin A and its esters are very sensitive to the action of air, oxidising agents, acids, light and heat.

Carry out the assay and all tests as rapidly as possible, avoiding exposure to actinic light and air, oxidising agents, oxidation catalysts (e.g. copper, iron), acids and heat; use freshly prepared solutions.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Prepare a solution containing about 3.3 IU of vitamin A per microlitre in *cyclohexane R* containing 1 g/l of *butylhydroxytoluene R*.

Reference solution. Prepare a 10 mg/ml solution of *retinol esters CRS* (i.e. 3.3 IU of each ester per microlitre) in *cyclohexane R* containing 1 g/l of *butylhydroxytoluene R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *ether R, cyclohexane R* (20:80 *V/V*).

Application: 3 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution:

- the chromatogram shows the individual spots of the corresponding esters. The elution order from bottom to top is: retinol acetate, retinol propionate and retinol palmitate.

Results: the composition of esters is confirmed by the correspondence of the principal spot or spots of the test solution with those obtained with the reference solution.

B. It complies with the test for related substances.

TESTS

Retinol. Thin-layer chromatography (*2.2.27*).

Test solution. Prepare a solution in *cyclohexane R*, stabilised with a solution containing 1 g/l of *butylhydroxytoluene R*, containing about 330 IU of vitamin A per microlitre.

Reference solution. Shake 1 ml of the test solution with 20 ml of *0.1 M tetrabutylammonium hydroxide in 2-propanol* for 2 min and dilute to 100 ml with *cyclohexane R*, stabilised with a solution containg 1 g/l of *butylhydroxytoluene R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *ether R, cyclohexane R* (20:80 *V/V*).

Application: 3 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution:

- in the chromatogram obtained no or only traces of the retinol esters are seen.

Limit: any spot corresponding to retinol in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (1.0 per cent).

Related substances. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. The solution described under Activity.

Absorption maximum: at 325 nm to 327 nm.

Absorbance ratios:

- A_{300}/A_{326} = maximum 0.60;

– A_{350}/A_{326} = maximum 0.54;

– A_{370}/A_{326} = maximum 0.14.

The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

ACTIVITY

The activity of the substance is determined in order to be taken into account for the production of concentrates.

Dissolve 25-100 mg, weighed with an accuracy of 0.1 per cent, in 5 ml of *pentane R* and dilute with *2-propanol R1* to a presumed concentration of 10 IU/ml to 15 IU/ml. Measure the absorbance (*2.2.25*) at the absorption maximum at 326 nm. Calculate the activity of vitamin A in International Units per gram from the expression:

$$\frac{A_{326} \times V \times 1900}{100 \times m}$$

A_{326} = absorbance at 326 nm,

m = mass of the substance to be examined, in grams,

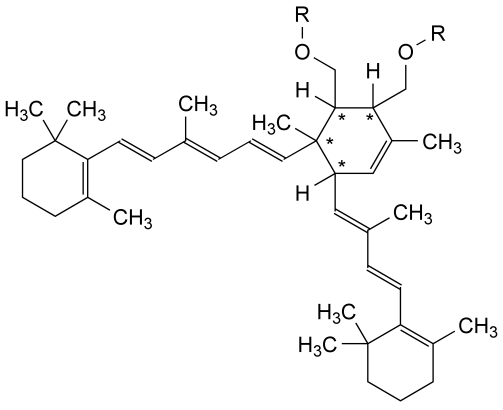
V = total volume to which the substance to be examined is diluted to give 10 IU/ml to 15 IU/ml,

1900 = factor to convert the specific absorbance of esters of retinol into International Units per gram.

STORAGE

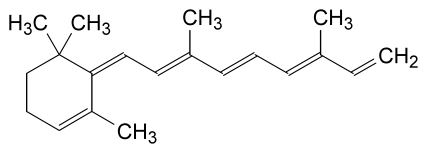
In an airtight container, protected from light.

Once the container has been opened, its contents are to be used as soon as possible; any part of the contents not used at once should be protected by an atmosphere of inert gas.



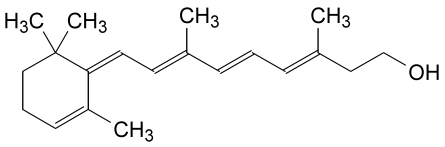
LABELLING

The label states:



– the number of International Units per gram,

– the name of the ester or esters.



IMPURITIES

A. R = H, CO-CH_3: kitols (Diels-Alder dimers of vitamin A),

B. (3*E*,5*E*,7*E*)-3,7-dimethyl-9-[(1*Z*)-2,6,6-trimethylcyclohex-2-enylidene]nona-1,3,5,7-tetraene (anhydro-vitamin A),

C. (3*E*,5*E*,7*E*)-3,7-dimethyl-9-[(1*Z*)-2,6,6-trimethylcyclohex-2-enylidene]nona-3,5,7-trien-1-ol (*retro*-vitamin A),

D. oxidation products of vitamin A.

01/2008:0219

VITAMIN A CONCENTRATE (OILY FORM), SYNTHETIC

Vitaminum A syntheticum densatum oleosum

DEFINITION

Oily concentrate prepared from synthetic retinol ester (*0217*) as is or by dilution with a suitable vegetable fatty oil.

Content: 95.0 per cent to 110.0 per cent of the vitamin A content stated on the label, which is not less than 500 000 IU/g.

It may contain suitable stabilisers such as antioxidants.

CHARACTERS

Appearance: yellow or brownish-yellow, oily liquid.

Solubility: practically insoluble in water, soluble or partly soluble in anhydrous ethanol, miscible with organic solvents.

Partial crystallisation may occur in highly concentrated solutions.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. Prepare a solution containing about 3.3 IU of vitamin A per microlitre in *cyclohexane R* containing 1 g/l of *butylhydroxytoluene R*.

Reference solution. Prepare a 10 mg/ml solution of *retinol esters CRS* (i.e. 3.3 IU of each ester per microlitre) in *cyclohexane R* containing 1 g/l of *butylhydroxytoluene R*.

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *ether R, cyclohexane R* (20:80 *V/V*).

Application: 3 µl.

Development: immediately, over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution:

– the chromatogram shows the individual spots of the corresponding esters. The elution order from bottom to top is: retinol acetate, retinol propionate and retinol palmitate.

Results: the composition of the test solution is confirmed by the correspondence of the principal spot or spots with those obtained with the reference solution.

TESTS

Acid value (*2.5.1*): maximum 2.0, determined on 2.0 g.

Peroxide value (*2.5.5, Method A*): maximum 10.0.

Related substances. The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

ASSAY

Carry out the assay as rapidly as possible, avoiding exposure to actinic light, air, oxidising agents, oxidation catalysts (e.g. copper, iron), acids and prolonged heat; use freshly prepared solutions. If partial crystallisation has occurred, homogenise the material at a temperature of about 65 °C, but avoid prolonged heating.

Carry out the assay according to Method A. If the assay is not shown to be valid, use Method B.

Method A. Ultraviolet absorption spectrophotometry (*2.2.25*).

Dissolve 25-100 mg, weighed with an accuracy of 0.1 per cent, in 5 ml of *pentane R* and dilute with *2-propanol R1* to a presumed concentration of 10-15 IU/ml.

Verify that the absorption maximum of the solution lies between 325 nm and 327 nm and measure the absorbances at 300 nm, 326 nm, 350 nm and 370 nm. Repeat the readings at each wavelength and take the mean values. Calculate the ratio A_λ/A_{326} for each wavelength.

If the ratios do not exceed: 0.60 at 300 nm, 0.54 at 350 nm, 0.14 at 370 nm, calculate the content of vitamin A in International Units per gram using the following expression:

$$\frac{A_{326} \times V \times 1900}{100 \times m}$$

A_{326} = absorbance at 326 nm,

m = mass of the preparation to be examined, in grams,

V = total volume to which the preparation to be examined is diluted to give 10-15 IU/ml,

1900 = factor to convert the specific absorbance of esters of retinol into International Units per gram.

If one or more of the ratios A_λ/A_{326} exceeds the values given, or if the wavelength of the absorption maximum does not lie between 325 nm and 327 nm, use Method B.

Method B. Liquid chromatography (*2.2.29*).

Test solution (a). Introduce 0.100 g of the preparation to be examined into a 100 ml volumetric flask and dissolve immediately in 5 ml of *pentane R*. Add 40 ml of *0.1 M tetrabutylammonium hydroxide in 2-propanol*. Swirl gently and let the mixture react for 10 minutes at 60-65 °C for hydrolysis, swirling occasionally. Allow to cool to room temperature, dilute to 100.0 ml with *2-propanol R* containing 1 g/l *butylhydroxytoluene R*, and homogenise carefully to avoid air-bubbles.

Test solution (b). Dilute test solution (a) with *2-propanol R* to a final concentration of 100 IU/ml.

Reference solution (a). Introduce about 0.100 g of *retinol acetate CRS* into a 100 ml volumetric flask and proceed as described for test solution (a).

Reference solution (b). Introduce into a 50 ml volumetric flask 5.0 ml of reference solution (a) and dilute to 50.0 ml with *2-propanol R*. Homogenise carefully to avoid air-bubbles.

Column:

– *size*: *l* = 0.125 m, Ø = 4 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *water R, methanol R* (5:95 *V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 325 nm.

Injection: 10 µl of test solution (b) and reference solution (b).

Run time: 1.5 times the retention time of retinol.

Retention time: retinol = about 3 min.

Calculate the content of vitamin A in International Units per gram using the following expression:

$$\frac{A_1 \times C \times m_2}{A_2 \times m_1}$$

A_1 = area of the peak due to retinol in the chromatogram obtained with test solution (b),

A_2 = area of the peak due to retinol in the chromatogram obtained with reference solution (b),

C = concentration of *retinol acetate CRS* in International Units per gram, determined by method A; the absorption ratios A_λ/A_{326} must conform,

m_1 = mass of the substance to be examined in test solution (a), in milligrams,

m_2 = mass of *retinol acetate CRS* in reference solution (a), in milligrams.

STORAGE

In an airtight container, protected from light.

Once the container has been opened, its contents are to be used as soon as possible; any part of the contents not used at once should be protected by an atmosphere of inert gas.

LABELLING

The label states:

– the number of International Units per gram,

– the name of the ester or esters,

– the name of any added stabilisers,

– the method of restoring the solution if partial crystallisation has occurred.

01/2008:0218

VITAMIN A CONCENTRATE (POWDER FORM), SYNTHETIC

Vitamini synthetici densati A pulvis

DEFINITION

Powder concentrate obtained by dispersing a synthetic retinol ester (*0217*) in a matrix of *Gelatin (0330)* or *Acacia (0307)* or other suitable material.

Content: 95.0 per cent to 115.0 per cent of the vitamin A content stated on the label, which is not less than 250 000 IU/g.

It may contain suitable stabilisers such as antioxidants.

CHARACTERS

Appearance: yellowish powder usually in the form of particles of almost uniform size.

Solubility: practically insoluble in water, swells or forms an emulsion, depending on the formulation.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. Introduce a quantity of the preparation to be examined containing about the equivalent of 17 000 IU of vitamin A into a 20 ml glass-stoppered test tube. Add about 20 mg of *bromelains R*, 2 ml of *water R* and about 150 µl of *2-propanol R*, swirling gently for 2-5 min in a water-bath at 60-65 °C. Cool to below 30 °C and add 5 ml of *2-propanol R* containing 1 g/l of *butylhydroxytoluene R*. Shake vigorously for 1 min, allow to stand for a few minutes and use the supernatant solution.

Reference solution. Prepare a 10 mg/ml solution of *retinol esters CRS* (i.e. 3.3 IU of each ester per microlitre) in *2-propanol R* containing 1 g/l of *butylhydroxytoluene R*.

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *ether R, cyclohexane R* (20:80 *V/V*).

Application: 3 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution:

– the chromatogram shows the individual spots of the corresponding esters. The elution order from bottom to top is: retinol acetate, retinol propionate and retinol palmitate.

Results: the composition of the test solution is confirmed by the correspondence of the principal spot or spots with those obtained with the reference solution.

TESTS

Related substances. The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

ASSAY

Carry out the assay as rapidly as possible, avoiding exposure to actinic light, air, oxidising agents, oxidation catalysts (e.g. copper, iron), acids and prolonged heat.

Liquid chromatography (*2.2.29*).

Test solution (a). Introduce 0.200 g of the preparation to be examined into a 100 ml volumetric flask. Add 20-30 mg of *bromelains R*, 5.0 ml of *water R* and 0.15 ml of *2-propanol R*. Heat gently in a water-bath at 60 °C for about 5 min, swirling occasionally. Add 40 ml of *0.1 M tetrabutylammonium hydroxide in 2-propanol.* Swirl gently and let the mixture react for 10 min at 60-65 °C for hydrolysis, swirling occasionally. Ensure that all sample material is wetted. Allow to cool to room temperature, dilute to 100.0 ml with *2-propanol R* containing 1 g/l *butylhydroxytoluene R*, and homogenise carefully to avoid air-bubbles. The solution may be turbid.

Test solution (b). Dilute test solution (a) with *2-propanol R* to a final concentration of 100 IU/ml. Filter before injection.

Reference solution (a). Introduce about 0.100 g of *retinol acetate CRS* into a 100 ml volumetric flask and dissolve immediately in 5 ml of *pentane R*. Add 40 ml of *0.1 M tetrabutylammonium hydroxide in 2-propanol.* Swirl gently and let the mixture react for 10 min at 60-65 °C for hydrolysis, swirling occasionally. Allow to cool to room temperature, dilute to 100.0 ml with *2-propanol R* containing 1 g/l *butylhydroxytoluene R*, and homogenise carefully to avoid air-bubbles.

Reference solution (b). Introduce into a 50 ml volumetric flask 5.0 ml of reference solution (a) and dilute to 50.0 ml with *2-propanol R*. Homogenise carefully to avoid air-bubbles.

Column:

– *size*: *l* = 0.125 m, Ø = 4 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *water R, methanol R* (5:95 *V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 325 nm.

Injection: 10 µl of test solution (b) and reference solution (b).

Run time: 1.5 times the retention time of retinol.

Retention time: retinol = about 3 min.

Calculate the content of vitamin A using the following expression:

$$\frac{A_1 \times C \times m_2}{A_2 \times m_1}$$

A_1 = area of the peak due to retinol in the chromatogram obtained with test solution (b),

A_2 = area of the peak due to retinol in the chromatogram obtained with reference solution (b),

C = concentration of *retinol acetate CRS* in International Units per gram, determined by the method below,

m_1 = mass of the substance to be examined in test solution (a), in milligrams,

m_2 = mass of *retinol acetate CRS* in reference solution (a), in milligrams.

The exact concentration of *retinol acetate CRS* is assessed by ultraviolet absorption spectrophotometry (*2.2.25*). Dissolve 25-100 mg of *retinol acetate CRS*, weighed with an accuracy of 0.1 per cent, in 5 ml of *pentane R* and dilute with *2-propanol R1* to a presumed concentration of 10-15 IU/ml.

Verify that the absorption maximum of the solution lies between 325 nm and 327 nm and measure the absorbances at 300 nm, 326 nm, 350 nm and 370 nm. Repeat the readings at each wavelength and take the mean values. Calculate the ratio A_λ/A_{326} for each wavelength.

If the ratios do not exceed: 0.60 at 300 nm, 0.54 at 350 nm, 0.14 at 370 nm, calculate the content of vitamin A in International Units per gram using the following expression:

$$\frac{A_{326} \times V \times 1900}{100 \times m}$$

A_{326} = absorbance at 326 nm,

m = mass of *retinol acetate CRS*, in grams,

V = total volume to which the *retinol acetate CRS* is diluted to give 10-15 IU/ml,

1900 = factor to convert the specific absorbance of esters of retinol into International Units per gram.

The absorbance ratios A_λ/A_{326} must conform.

STORAGE

In an airtight container, protected from light.

Once the container has been opened, its contents are to be used as soon as possible; any part of the contents not used at once should be protected by an atmosphere of inert gas.

LABELLING

The label states:

– the number of International Units per gram,
– the name of the ester or esters,
– the name of the principal excipient or excipients used and the name of any added stabilisers.

01/2008:0220

VITAMIN A CONCENTRATE (SOLUBILISATE/EMULSION), SYNTHETIC

Vitaminum A syntheticum, solubilisatum densatum in aqua dispergibile

DEFINITION

Liquid concentrate (water is generally used as solvent) of a synthetic retinol ester (*0217*) and a suitable solubiliser.

Content: 95.0 per cent to 115.0 per cent of the vitamin A content stated on the label, which is not less than 100 000 IU/g.

It may contain suitable stabilisers such as antimicrobial preservatives and antioxidants.

CHARACTERS

Appearance: yellow or yellowish liquid of variable opalescence and viscosity. Highly concentrated solutions may become cloudy at low temperature or take the form of a gel.

A mixture of 1 g with 10 ml of *water R* previously warmed to 50 °C gives, after cooling to 20 °C, a uniform, slightly opalescent and slightly yellow dispersion.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. Introduce a quantity of the preparation to be examined containing about the equivalent of 17 000 IU of vitamin A into a 20 ml glass-stoppered test-tube. Add 5 ml of *2-propanol R* containing 1 g/l of *butylhydroxytoluene R* and mix thoroughly.

Reference solution. Prepare a 10 mg/ml solution of *retinol esters CRS* (i.e. 3.3 IU of each ester per microlitre) in *2-propanol R* containing 1 g/l of *butylhydroxytoluene R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *ether R, cyclohexane R* (20:80 *V/V*).

Application: 3 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution:

– the chromatogram shows the individual spots of the corresponding esters. The elution order from bottom to top is: retinol acetate, retinol propionate and retinol palmitate.

Results: the composition of the test solution is confirmed by the correspondence of the principal spot or spots with those obtained with the reference solution.

TESTS

Related substances. The thresholds indicated under Related substances (Table 2034.-1) in the general monograph *Substances for pharmaceutical use (2034)* do not apply.

ASSAY

Carry out the assay as rapidly as possible, avoiding exposure to actinic light, air, oxidising agents, oxidation catalysts (e.g. copper, iron), acids and prolonged heat.

Liquid chromatography (*2.2.29*).

Test solution (a). Introduce 0.200 g of the preparation to be examined into a 100 ml volumetric flask. Add 40 ml of *0.1 M tetrabutylammonium hydroxide in 2-propanol*. Swirl into dispersion and let the mixture react for 10 min at 60-65 °C for hydrolysis, swirling occasionally. Ensure that all sample material is wetted. Allow to cool to room temperature, dilute to 100.0 ml with *2-propanol R* containing 1 g/l *butylhydroxytoluene R* and homogenise carefully to avoid air-bubbles. Residue of the matrix may make the solution more or less cloudy.

Test solution (b). Dilute test solution (a) with *2-propanol R* to a final concentration of 100 IU/ml. Filter before injection.

Reference solution (a). Introduce about 0.100 g of *retinol acetate CRS* into a 100 ml volumetric flask and dissolve immediately in 5 ml of *pentane R*. Add 40 ml of *0.1 M tetrabutylammonium hydroxide in 2-propanol*. Swirl gently and let the mixture react for 10 min at 60-65 °C for hydrolysis, swirling occasionally. Allow to cool to room temperature, dilute to 100.0 ml with *2-propanol R* containing 1 g/l *butylhydroxytoluene R*, and homogenise carefully to avoid air-bubbles.

Reference solution (b). Introduce into a 50 ml volumetric flask 5.0 ml of reference solution (a) and dilute to 50.0 ml with *2-propanol R*. Homogenise carefully to avoid air-bubbles.

Column:

– *size*: *l* = 0.125 m, Ø = 4 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *water R, methanol R* (5:95 *V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 325 nm.

Injection: 10 µl of test solution (b) and reference solution (b).

Run time: 1.5 times the retention time of retinol.

Retention time: retinol = about 3 min.

Calculate the content of vitamin A using the following expression:

$$\frac{A_1 \times C \times m_2}{A_2 \times m_1}$$

A_1 = area of the peak due to retinol in the chromatogram obtained with test solution (b),

A_2 = area of the peak due to retinol in the chromatogram obtained with reference solution (b),

C = concentration of *retinol acetate CRS* in International Units per gram, determined by the method below,

m_1 = mass of the substance to be examined in test solution (a), in milligrams,

m_2 = mass of *retinol acetate CRS* in reference solution (a), in milligrams.

The exact concentration of *retinol acetate CRS* is assessed by ultraviolet absorption spectrophotometry (*2.2.25*). Dissolve 25-100 mg of *retinol acetate CRS*, weighed with an accuracy of 0.1 per cent, in 5 ml of *pentane R* and dilute with *2-propanol R1* to a presumed concentration of 10-15 IU/ml.

Verify that the absorption maximum of the solution lies between 325 nm and 327 nm and measure the absorbances at 300 nm, 326 nm, 350 nm and 370 nm. Repeat the readings at each wavelength and take the mean values. Calculate the ratio A_λ/A_{326} for each wavelength.

If the ratios do not exceed: 0.60 at 300 nm, 0.54 at 350 nm, 0.14 at 370 nm, calculate the content of vitamin A in International Units per gram using the following expression:

$$\frac{A_{326} \times V \times 1900}{100 \times m}$$

A_{326} = absorbance at 326 nm,

m = mass of *retinol acetate CRS*, in grams,

V = total volume to which the *retinol acetate CRS* is diluted to give 10-15 IU/ml,

1900 = factor to convert the specific absorbance of esters of retinol into International Units per gram.

The absorbance ratios A_λ/A_{326} must conform.

STORAGE

In an airtight container, protected from light, at the temperature stated on the label.

Once the container has been opened, its contents are to be used as soon as possible; any part of the contents not used at once should be protected by an atmosphere of inert gas.

LABELLING

The label states:

- the number of International Units per gram,
- the name of the ester or esters,
- the name of the principal solubiliser or solubilisers used and the name of any added stabilisers,
- the storage temperature.

WARFARIN SODIUM

Warfarinum natricum

and enantiomer

$C_{19}H_{15}NaO_4$ M_r 330.3
[129-06-6]

DEFINITION

Sodium 2-oxo-3-[(1*RS*)-3-oxo-1-phenylbutyl]-2*H*-1-benzopyran-4-olate.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, hygroscopic, amorphous powder.

Solubility: very soluble in water and in ethanol (96 per cent), soluble in acetone, very slightly soluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *warfarin sodium CRS*.

B. Dissolve 1 g in 10 ml of *water R*, add 5 ml of *nitric acid R* and filter. To the filtrate add 2 ml of *potassium dichromate solution R1* and shake for 5 min. Allow to stand for 20 min. The solution is not greenish-blue when compared with a blank.

C. It gives reaction (b) of sodium (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 1.0 g in *water R* and dilute to 20 ml with the same solvent.

pH (*2.2.3*): 7.6 to 8.6.

Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Solvent mixture: *methanol R, water R* (25:75 *V/V*).

Test solution. Dissolve 40.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 2 mg of *4-hydroxycoumarin R* (impurity B) and 2 mg of *benzalacetone R* (impurity C) in 25 ml of *methanol R* and dilute to 100 ml with *water R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;
– *stationary phase*: spherical *nitrile silica gel for chromatography R* (5 µm);
– *temperature*: 30 °C.

Mobile phase: *glacial acetic acid R, acetonitrile R, water R* (1:25:75 *V/V/V*).

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 260 nm.

Injection: 20 µl.

Run time: twice the retention time of warfarin.

Relative retention with reference to warfarin (retention time = about 9 min): impurity B = about 0.4; impurity C = about 0.6.

System suitability: reference solution (a):

– *resolution*: minimum 2.0 between the peaks due to impurities B and C.

Limits:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.5; impurity C = 0.4;
– *impurities B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

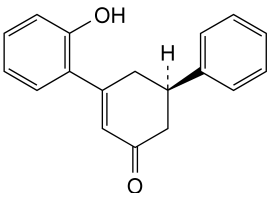
Phenolic ketones. Dissolve 1.25 g in a 20 g/l solution of *sodium hydroxide R* and dilute to 10.0 ml with the same solvent. The absorbance (*2.2.25*) is maximum 0.20 measured at 385 nm within 15 min of preparing the solution.

Water (*2.5.12*): maximum 4.0 per cent, determined on 0.750 g.

ASSAY

Dissolve 0.100 g in *0.01 M sodium hydroxide* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *0.01 M sodium hydroxide*. Dilute 10.0 ml of this solution to 100.0 ml with *0.01 M sodium hydroxide*. Measure the absorbance (*2.2.25*) at the absorption maximum at 308 nm.

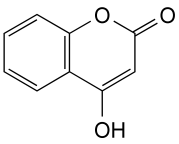
Calculate the percentage content of $C_{19}H_{15}NaO_4$ taking the specific absorbance to be 431.



STORAGE

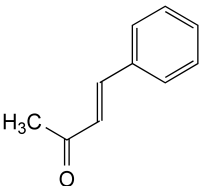
In an airtight container, protected from light.

IMPURITIES



Specified impurities: B, C.

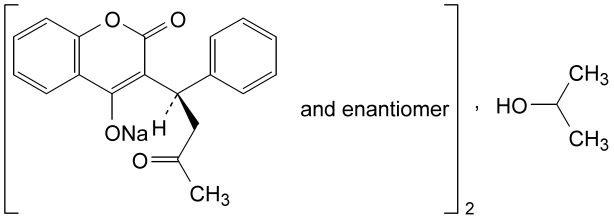
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A.*



and enantiomer

A. (5*RS*)-3-(2-hydroxyphenyl)-5-phenylcyclohex-2-enone,

B. 4-hydroxy-2*H*-1-benzopyran-2-one (4-hydroxycoumarin),



C. (3*E*)-4-phenylbut-3-en-2-one (benzalacetone).

01/2008:0699

WARFARIN SODIUM CLATHRATE

Warfarinum natricum clathratum

DEFINITION

Mixture, in the form of a clathrate, of warfarin sodium (sodium 2-oxo-3-[(1*RS*)-3-oxo-1-phenylbutyl]-2*H*-1-benzopyran-4-olate) and propan-2-ol in molecular proportions 2:1 (equivalent to about 92 per cent of warfarin sodium).

Content:

– *warfarin sodium*: 98.0 per cent to 102.0 per cent (anhydrous and propan-2-ol-free substance);
– *propan-2-ol*: 8.0 per cent to 8.5 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very soluble in water, freely soluble in ethanol (96 per cent), soluble in acetone, very slightly soluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *warfarin sodium clathrate CRS*.

B. Dissolve 1 g in 10 ml of *water R*, add 5 ml of *nitric acid R* and filter. To the filtrate add 2 ml of *potassium dichromate solution R1* and shake for 5 min. Allow to stand for 20 min. The solution is greenish-blue when compared with a blank.

C. It gives reaction (b) of sodium (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 1.0 g in *water R* and dilute to 20 ml with the same solvent.

pH (*2.2.3*): 7.6 to 8.6.

Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Solvent mixture: *methanol R, water R* (25:75 *V/V*).

Test solution. Dissolve 40.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 2 mg of *4-hydroxycoumarin R* (warfarin impurity B) and 2 mg of *benzalacetone R* (warfarin impurity C) in 25 ml of *methanol R* and dilute to 100 ml with *water R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;
– *stationary phase*: spherical *nitrile silica gel for chromatography R* (5 µm);
– *temperature*: 30 °C.

Mobile phase: *glacial acetic acid R, acetonitrile R, water R* (1:25:75 *V/V/V*).

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 260 nm.

Injection: 20 µl.

Run time: twice the retention time of warfarin.

Relative retention with reference to warfarin (retention time = about 9 min): impurity B = about 0.4; impurity C = about 0.6.

System suitability: reference solution (a):

– *resolution*: minimum 2.0 between the peaks due to impurities B and C.

Limits:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.5; impurity C = 0.4;
– *impurities B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Phenolic ketones: the absorbance (*2.2.25*) is maximum 0.20 measured at 385 nm within 15 min of preparing the solution.

Dissolve 1.25 g in a 20 g/l solution of *sodium hydroxide R* and dilute to 10.0 ml with the same solvent.

Propan-2-ol. Gas chromatography (*2.2.28*).

Internal standard solution. Dilute 1.0 ml of *propanol R* to 200.0 ml with *water R*.

Test solution (a). Dissolve 0.250 g of the substance to be examined in *water R* and dilute to 5.0 ml with the same solvent.

Test solution (b). Dissolve 0.50 g of the substance to be examined in the internal standard solution and dilute to 10.0 ml with the internal standard solution.

Reference solution. Dilute 0.50 ml of *2-propanol R* to 100.0 ml with the internal standard solution.

Column:

– *size*: *l* = 1.5 m, Ø = 4 mm;

– *stationary phase*: *ethylvinylbenzene-divinylbenzene copolymer R* (125-150 µm).

Carrier gas: *nitrogen for chromatography R.*

Flow rate: 40 ml/min.

Temperature:

– *column*: 150 °C;

– *injection port*: 180 °C;

– *detector*: 200 °C.

Detection: flame ionisation.

Injection: the chosen volume of the test solutions and the reference solution.

Calculate the content of propan-2-ol taking its density at 20 °C to be 0.785 g/ml.

Limit:

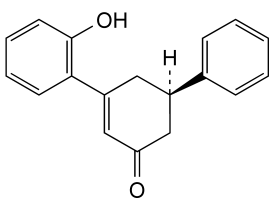
– *propan-2-ol*: 8.0 per cent to 8.5 per cent.

Water (*2.5.12*): maximum 0.3 per cent, determined on 2.500 g.

ASSAY

Dissolve 0.100 g in *0.01 M sodium hydroxide* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *0.01 M sodium hydroxide*. Dilute 10.0 ml of this solution to 100.0 ml with *0.01 M sodium hydroxide*. Measure the absorbance (*2.2.25*) at the absorption maximum at 308 nm.

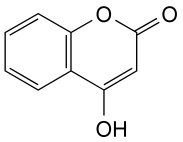
Calculate the percentage content of warfarin sodium ($C_{19}H_{15}NaO_4$) taking the specific absorbance to be 431.



STORAGE

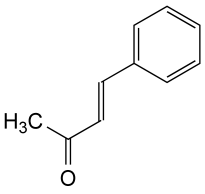
In an airtight container, protected from light.

IMPURITIES



Specified impurities: B, C.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A.*



and enantiomer

A. (5*RS*)-3-(2-hydroxyphenyl)-5-phenylcyclohex-2-enone,

B. 4-hydroxy-2*H*-1-benzopyran-2-one (4-hydroxycoumarin),

C. (3*E*)-4-phenylbut-3-en-2-one (benzalacetone).

01/2008:0169

WATER FOR INJECTIONS

Aqua ad iniectabilia

H_2O M_r 18.02
[7732-18-5]

DEFINITION

Water for the preparation of medicines for parenteral administration when water is used as vehicle (water for injections in bulk) and for dissolving or diluting substances or preparations for parenteral administration (sterilised water for injections).

Water for injections in bulk

PRODUCTION

Water for injections in bulk is obtained from water that complies with the regulations on water intended for human consumption laid down by the competent authority or from purified water by distillation in an apparatus of which the parts in contact with the water are of neutral glass, quartz or suitable metal and which is fitted with an effective device to prevent the entrainment of droplets. The correct maintenance of the apparatus is essential. The first portion of the distillate obtained when the apparatus begins to function is discarded and the distillate is collected.

During production and subsequent storage, appropriate measures are taken to ensure that the total viable aerobic count is adequately controlled and monitored. Appropriate alert and action limits are set so as to detect adverse trends. Under normal conditions, an appropriate action limit is a total viable aerobic count (*2.6.12*) of 10 micro-organisms per 100 ml when determined by membrane filtration, using agar medium S, using at least 200 ml of water for injections in bulk and incubating at 30-35 °C for 5 days. For aseptic processing, stricter alert limits may need to be applied.

Total organic carbon (*2.2.44*): maximum 0.5 mg/l.

Conductivity. Determine the conductivity off-line or in-line under the following conditions.

EQUIPMENT

Conductivity cell:

– electrodes of a suitable material such as stainless steel;

– cell constant: within 2 per cent of the given value determined using a certified reference solution with a conductivity less than 1500 µS·cm^{-1}.

Conductometer: resolution 0.1 µS·cm^{-1} on the lowest range.

System calibration (conductivity cell and conductometer):

– against one or more suitable certified standard solutions;

– accuracy: within 3 per cent of the measured conductivity plus 0.1 μS·cm^{-1}.

Conductometer calibration: by means of precision resistors or equivalent devices, after disconnecting the conductivity cell, for all ranges used for conductivity measurement and cell calibration (with an accuracy within 0.1 per cent of the stated value, traceable to the official standard).

If in-line conductivity cells cannot be dismantled, system calibration may be performed against a calibrated conductivity cell placed close to the cell to be calibrated in the water flow.

PROCEDURE

Stage 1

1. Measure the conductivity without temperature compensation, recording simultaneously the temperature. Temperature-compensated measurement may be performed after suitable validation.

2. Using Table 0169.-1, find the closest temperature value that is not greater than the measured temperature. The corresponding conductivity value is the limit at that temperature.

3. If the measured conductivity is not greater than the value in Table 0169.-1, the water to be examined meets the requirements of the test for conductivity. If the conductivity is higher than the value in Table 0169.-1, proceed with stage 2.

Table 0169.-1. – *Stage 1 - Temperature and conductivity requirements (for non-temperature-compensated conductivity measurements)*

Temperature (°C)	Conductivity (μS·cm^{-1})
0	0.6
5	0.8
10	0.9
15	1.0
20	1.1
25	1.3
30	1.4
35	1.5
40	1.7
45	1.8
50	1.9
55	2.1
60	2.2
65	2.4
70	2.5
75	2.7
80	2.7
85	2.7
90	2.7
95	2.9
100	3.1

Stage 2

4. Transfer a sufficient amount of the water to be examined (100 ml or more) to a suitable container, and stir the test sample. Adjust the temperature, if necessary, and while maintaining it at 25 ± 1 °C, begin vigorously agitating the test sample while periodically observing the conductivity. When the change in conductivity (due to uptake of atmospheric carbon dioxide) is less than 0.1 μS.cm^{-1} per 5 min, note the conductivity.

5. If the conductivity is not greater than 2.1 μS.cm^{-1}, the water to be examined meets the requirements of the test for conductivity. If the conductivity is greater than 2.1 μS.cm^{-1}, proceed with stage 3.

Stage 3

6. Perform this test within approximately 5 min of the conductivity determination in step 5 under stage 2, while maintaining the sample temperature at 25 ± 1 °C. Add a recently prepared saturated solution of *potassium chloride R* to the test sample (0.3 ml per 100 ml of the test sample), and determine the pH (*2.2.3*) to the nearest 0.1 pH unit.

7. Using Table 0169.-2, determine the conductivity limit at the measured pH value in step 6. If the measured conductivity in step 4 under stage 2 is not greater than the conductivity requirements for the pH determined, the water to be examined meets the requirements of the test for conductivity. If either the measured conductivity is greater than this value or the pH is outside the range of 5.0-7.0, the water to be examined does not meet the requirements of the test for conductivity.

Table 0169.-2. – *Stage 3 - pH and conductivity requirements (for atmosphere and temperature equilibrated samples)*

pH	Conductivity (μS·cm^{-1})
5.0	4.7
5.1	4.1
5.2	3.6
5.3	3.3
5.4	3.0
5.5	2.8
5.6	2.6
5.7	2.5
5.8	2.4
5.9	2.4
6.0	2.4
6.1	2.4
6.2	2.5
6.3	2.4
6.4	2.3
6.5	2.2
6.6	2.1
6.7	2.6
6.8	3.1
6.9	3.8
7.0	4.6

In order to ensure the appropriate quality of the water, validated procedures and in-process-monitoring of the electrical conductivity and regular microbial monitoring are applied.

Water for injections in bulk is stored and distributed in conditions designed to prevent growth of micro-organisms and to avoid any other contamination.

CHARACTERS

Appearance: clear and colourless liquid.

TESTS

Nitrates: maximum 0.2 ppm.

Place 5 ml in a test-tube immersed in iced water, add 0.4 ml of a 100 g/l solution of *potassium chloride R*, 0.1 ml of *diphenylamine solution R* and, dropwise with shaking, 5 ml of *nitrogen-free sulphuric acid R*. Transfer the tube to a water-bath at 50 °C. After 15 min, any blue colour in the solution is not more intense than that in a reference solution prepared at the same time in the same manner using a mixture of 4.5 ml of *nitrate-free water R* and 0.5 ml of *nitrate standard solution (2 ppm NO_3) R*.

Aluminium (*2.4.17*): maximum 10 ppb, if intended for use in the manufacture of dialysis solutions.

Prescribed solution. To 400 ml of the water to be examined add 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Reference solution. Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *distilled water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Heavy metals (*2.4.8*): maximum 0.1 ppm.

Heat 200 ml in a glass evaporating dish on a water-bath until the volume is reduced to 20 ml. 12 ml of the concentrated solution complies with limit test A. Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Bacterial endotoxins (*2.6.14*): less than 0.25 IU/ml.

Sterilised water for injections

DEFINITION

Water for injections in bulk that has been distributed into suitable containers, closed and sterilised by heat in conditions which ensure that the product still complies with the test for bacterial endotoxins. Sterilised water for injections is free from any added substances.

Examined in suitable conditions of visibility, it is clear and colourless.

Each container contains a sufficient quantity of water for injections to permit the nominal volume to be withdrawn.

TESTS

Acidity or alkalinity. To 20 ml add 0.05 ml of *phenol red solution R*. If the solution is yellow, it becomes red on the addition of 0.1 ml of *0.01 M sodium hydroxide*; if red, it becomes yellow on the addition of 0.15 ml of *0.01 M hydrochloric acid*.

Conductivity: maximum 25 $\mu S \cdot cm^{-1}$ for containers with a nominal volume of 10 ml or less; maximum 5 $\mu S \cdot cm^{-1}$ for containers with a nominal volume greater than 10 ml.

Use equipment and the calibration procedure as defined under Water for injections in bulk, maintaining the sample temperature at 25 ± 1 °C.

Oxidisable substances. Boil 100 ml with 10 ml of *dilute sulphuric acid R*. Add 0.2 ml of *0.02 M potassium permanganate* and boil for 5 min. The solution remains faintly pink.

Chlorides (*2.4.4*): maximum 0.5 ppm for containers with a nominal volume of 100 ml or less.

15 ml complies with the limit test for chlorides. Prepare the standard using a mixture of 1.5 ml of *chloride standard solution (5 ppm Cl) R* and 13.5 ml of *water R*. Examine the solutions down the vertical axes of the tubes.

For containers with a nominal volume greater than 100 ml, use the following test: to 10 ml add 1 ml of *dilute nitric acid R* and 0.2 ml of *silver nitrate solution R2*. The solution shows no change in appearance for at least 15 min.

Nitrates: maximum 0.2 ppm.

Place 5 ml in a test-tube immersed in iced water, add 0.4 ml of a 100 g/l solution of *potassium chloride R*, 0.1 ml of *diphenylamine solution R* and, dropwise with shaking, 5 ml of *nitrogen-free sulphuric acid R*. Transfer the tube to a water-bath at 50 °C. After 15 min, any blue colour in the solution is not more intense than that in a reference solution prepared at the same time in the same manner using a mixture of 4.5 ml of *nitrate-free water R* and 0.5 ml of *nitrate standard solution (2 ppm NO_3) R*.

Sulphates. To 10 ml add 0.1 ml of *dilute hydrochloric acid R* and 0.1 ml of *barium chloride solution R1*. The solution shows no change in appearance for at least 1 h.

Aluminium (*2.4.17*): maximum 10 ppb, if intended for use in the manufacture of dialysis solutions.

Prescribed solution. To 400 ml of the water to be examined add 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Reference solution. Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *distilled water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Ammonium: maximum 0.2 ppm.

To 20 ml add 1 ml of *alkaline potassium tetraiodomercurate solution R*. After 5 min, examine the solution down the vertical axis of the tube. The solution is not more intensely coloured than a standard prepared at the same time by adding 1 ml of *alkaline potassium tetraiodomercurate solution R* to a mixture of 4 ml of *ammonium standard solution (1 ppm NH_4) R* and 16 ml of *ammonium-free water R*.

Calcium and magnesium. To 100 ml add 2 ml of *ammonium chloride buffer solution pH 10.0 R*, 50 mg of *mordant black 11 triturate R* and 0.5 ml of *0.01 M sodium edetate*. A pure blue colour is produced.

Heavy metals (*2.4.8*): maximum 0.1 ppm.

Heat 200 ml in a glass evaporating dish on a water-bath until the volume is reduced to 20 ml. 12 ml of the concentrated solution complies with limit test A. Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Residue on evaporation: maximum 4 mg (0.004 per cent) for containers with a nominal volume of 10 ml or less; maximum 3 mg (0.003 per cent) for containers with a nominal volume greater than 10 ml.

Evaporate 100 ml to dryness on a water-bath and dry in an oven at 100-105 °C.

Particulate contamination: sub-visible particles (*2.9.19*). It complies with test A or test B, as appropriate.

Sterility (*2.6.1*). It complies with the test for sterility.

Bacterial endotoxins (*2.6.14*): less than 0.25 IU/ml.

01/2008:1927

WATER, HIGHLY PURIFIED

Aqua valde purificata

H_2O M_r 18.02
[7732-18-5]

DEFINITION

Water intended for use in the preparation of medicinal products where water of high biological quality is needed, except where *Water for injections (0169)* is required.

PRODUCTION

Highly purified water is obtained from water that complies with the regulations on water intended for human consumption laid down by the competent authority.

Current production methods include for example double-pass reverse osmosis coupled with other suitable techniques such as ultrafiltration and deionisation. Correct operation and maintenance of the system is essential.

During production and subsequent storage, appropriate measures are taken to ensure that the total viable aerobic count is adequately controlled and monitored. Appropriate alert and action limits are set so as to detect adverse trends. Under normal conditions, an appropriate action limit is a total viable aerobic count (*2.6.12*) of 10 micro-organisms per 100 ml when determined by membrane filtration, using agar medium S, at least 200 ml of highly purified water and incubating at 30-35 °C for 5 days.

Total organic carbon (*2.2.44*): maximum 0.5 mg/l.

Conductivity. Determine the conductivity off-line or in-line under the following conditions.

EQUIPMENT

Conductivity cell:

- electrodes of a suitable material such as stainless steel;
- cell constant: within 2 per cent of the given value determined using a certified reference solution with a conductivity less than 1500 $\mu S \cdot cm^{-1}$.

Conductometer: resolution 0.1 $\mu S \cdot cm^{-1}$ on the lowest range.

System calibration (conductivity cell and conductometer):

- against one or more suitable certified standard solutions;
- accuracy: within 3 per cent of the measured conductivity plus 0.1 $\mu S \cdot cm^{-1}$.

Conductometer calibration: by means of precision resistors or equivalent devices after disconnecting the conductivity cell, for all ranges used for conductivity measurement and cell calibration (with an accuracy within 0.1 per cent of the stated value, traceable to the official standard).

If in-line conductivity cells cannot be dismantled, system calibration may be performed against a calibrated conductivity cell placed close to the cell to be calibrated in the water flow.

PROCEDURE

Stage 1

1. Measure the conductivity without temperature compensation, recording simultaneously the temperature. Temperature-compensated measurement may be performed after suitable validation.
2. Using Table 1927.-1, find the closest temperature value that is not greater than the measured temperature. The corresponding conductivity value is the limit at that temperature.
3. If the measured conductivity is not greater than the value in Table 1927.-1, the water to be examined meets the requirements of the test for conductivity. If the conductivity is higher than the value in Table 1927.-1, proceed with stage 2.

Table 1927.-1. – *Stage 1 - Temperature and conductivity requirements (for non-temperature-compensated conductivity measurements)*

Temperature (°C)	Conductivity ($\mu S \cdot cm^{-1}$)
0	0.6
5	0.8
10	0.9

Stage 2

4. Transfer a sufficient amount of the water to be examined (100 ml or more) to a suitable container, and stir the test sample. Adjust the temperature, if necessary, and while maintaining it at 25 ± 1 °C, begin vigorously agitating the test sample while periodically observing the conductivity. When the change in conductivity (due to uptake of atmospheric carbon dioxide) is less than 0.1 $\mu S \cdot cm^{-1}$ per 5 min, note the conductivity.
5. If the conductivity is not greater than 2.1 $\mu S \cdot cm^{-1}$, the water to be examined meets the requirements of the test for conductivity. If the conductivity is greater than 2.1 $\mu S \cdot cm^{-1}$, proceed with stage 3.

Stage 3

6. Perform this test within approximately 5 min of the conductivity determination in step 5 under stage 2, while maintaining the sample temperature at 25 ± 1 °C. Add a recently prepared saturated solution of *potassium chloride R* to the test sample (0.3 ml per 100 ml of the test sample), and determine the pH (*2.2.3*) to the nearest 0.1 pH unit.

7. Using Table 1927.-2, determine the conductivity limit at the measured pH value in step 6. If the measured conductivity in step 4 under stage 2 is not greater than the conductivity requirements for the pH determined, the water to be examined meets the requirements of the test for conductivity. If either the measured conductivity is greater than this value or the pH is outside the range of 5.0-7.0, the water to be examined does not meet the requirements of the test for conductivity.

In order to ensure the appropriate quality of the water, validated procedures and in-process monitoring of the electrical conductivity and regular microbial monitoring are applied.

Highly purified water is stored in bulk and distributed in conditions designed to prevent growth of micro-organisms and to avoid any other contamination.

The label states, where applicable, that the substance is suitable for use in the manufacture of dialysis solutions.

01/2008:0008

WATER, PURIFIED

Aqua purificata

H_2O M_r 18.02
[7732-18-5]

DEFINITION

Water for the preparation of medicines other than those that are required to be both sterile and apyrogenic, unless otherwise justified and authorised.

Purified water in bulk

PRODUCTION

Purified water in bulk is prepared by distillation, by ion exchange, by reverse osmosis or by any other suitable method from water that complies with the regulations on water intended for human consumption laid down by the competent authority.

During production and subsequent storage, appropriate measures are taken to ensure that the total viable aerobic count is adequately controlled and monitored. Appropriate alert and action limits are set so as to detect adverse trends. Under normal conditions, an appropriate action limit is a total viable aerobic count (*2.6.12*) of 100 micro-organisms per millilitre, determined by membrane filtration, using agar medium S and incubating at 30-35 °C for 5 days. The size of the sample is to be chosen in relation to the expected result.

In addition, the test for total organic carbon (*2.2.44*) with a limit of 0.5 mg/l or alternatively the following test for oxidisable substances is carried out: to 100 ml add 10 ml of *dilute sulphuric acid R* and 0.1 ml of *0.02 M potassium permanganate* and boil for 5 min; the solution remains faintly pink.

Conductivity. Determine the conductivity off-line or in-line under the following conditions.

EQUIPMENT

Conductivity cell:

– electrodes of a suitable material such as stainless steel;

– cell constant: within 2 per cent of the given value determined using a certified reference solution with a conductivity less than 1500 µS·cm^{-1}.

Conductometer: resolution 0.1 µS·cm^{-1} on the lowest range.

System calibration (conductivity cell and conductometer):

– against one or more suitable certified standard solutions;
– accuracy: within 3 per cent of the measured conductivity plus 0.1 µS·cm^{-1}.

Conductometer calibration: by means of precision resistors or equivalent devices, after disconnecting the conductivity cell, for all ranges used for conductivity measurement and cell calibration (with an accuracy within 0.1 per cent of the stated value, traceable to the official standard).

If in-line conductivity cells cannot be dismantled, system calibration may be performed against a calibrated conductivity cell placed close to the cell to be calibrated in the water flow.

PROCEDURE

Measure the conductivity without temperature compensation, recording simultaneously the temperature. Temperature-compensated measurement may be performed after suitable validation.

The water to be examined meets the requirements if the measured conductivity at the recorded temperature is not greater than the value in Table 0008.-1.

Table 0008.-1. – *Temperature and conductivity requirements*

Temperature (°C)	Conductivity (µS·cm^{-1})
0	2.4
10	3.6
20	4.3
25	5.1
30	5.4
40	6.5
50	7.1
60	8.1
70	9.1
75	9.7
80	9.7
90	9.7
100	10.2

For temperatures not listed in Table 0008.-1, calculate the maximal permitted conductivity by interpolation between the next lower and next higher data points in the table.

Purified water in bulk is stored and distributed in conditions designed to prevent growth of micro-organisms and to avoid any other contamination.

CHARACTERS

Appearance: clear and colourless liquid.

TESTS

Nitrates: maximum 0.2 ppm.

Place 5 ml in a test-tube immersed in iced water, add 0.4 ml of a 100 g/l solution of *potassium chloride R*, 0.1 ml of *diphenylamine solution R* and, dropwise with shaking, 5 ml of *nitrogen-free sulphuric acid R*. Transfer the tube to a water-bath at 50 °C. After 15 min, any blue colour in the solution is not more intense than that in a reference solution prepared at the same time in the same manner using a mixture of 4.5 ml of *nitrate-free water R* and 0.5 ml of *nitrate standard solution (2 ppm NO_3) R*.

Aluminium (*2.4.17*): maximum 10 ppb, if intended for use in the manufacture of dialysis solutions.

Prescribed solution. To 400 ml of the water to be examined add 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Reference solution. Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *distilled water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Heavy metals (*2.4.8*): maximum 0.1 ppm.

Heat 200 ml in a glass evaporating dish on a water-bath until the volume is reduced to 20 ml. 12 ml of the concentrated solution complies with limit test A. Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Bacterial endotoxins (*2.6.14*): less than 0.25 IU/ml, if intended for use in the manufacture of dialysis solutions without a further appropriate procedure for removal of bacterial endotoxins.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of dialysis solutions.

Purified water in containers

DEFINITION

Purified water in bulk that has been filled and stored in conditions designed to assure the required microbiological quality. It is free from any added substances.

CHARACTERS

Appearance: clear and colourless liquid.

TESTS

It complies with the tests prescribed in the section on Purified water in bulk and with the following additional tests.

Acidity or alkalinity. To 10 ml, freshly boiled and cooled in a borosilicate glass flask, add 0.05 ml of *methyl red solution R*. The solution is not coloured red.

To 10 ml add 0.1 ml of *bromothymol blue solution R1*. The solution is not coloured blue.

Oxidisable substances. To 100 ml add 10 ml of *dilute sulphuric acid R* and 0.1 ml of *0.02 M potassium permanganate* and boil for 5 min. The solution remains faintly pink.

Chlorides. To 10 ml add 1 ml of *dilute nitric acid R* and 0.2 ml of *silver nitrate solution R2*. The solution shows no change in appearance for at least 15 min.

Sulphates. To 10 ml add 0.1 ml of *dilute hydrochloric acid R* and 0.1 ml of *barium chloride solution R1*. The solution shows no change in appearance for at least 1 h.

Ammonium: maximum 0.2 ppm.

To 20 ml add 1 ml of *alkaline potassium tetraiodomercurate solution R*. After 5 min, examine the solution down the vertical axis of the tube. The solution is not more intensely coloured than a standard prepared at the same time by adding 1 ml of *alkaline potassium tetraiodomercurate solution R* to a mixture of 4 ml of *ammonium standard solution (1 ppm NH_4) R* and 16 ml of *ammonium-free water R*.

Calcium and magnesium. To 100 ml add 2 ml of *ammonium chloride buffer solution pH 10.0 R*, 50 mg of *mordant black 11 triturate R* and 0.5 ml of *0.01 M sodium edetate*. A pure blue colour is produced.

Residue on evaporation: maximum 0.001 per cent.

Evaporate 100 ml on a water-bath and dry in an oven at 100-105 °C. The residue weighs a maximum of 1 mg.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^2 micro-organisms per millilitre, determined by membrane filtration, using agar medium B.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of dialysis solutions.

corrected 6.0

WHEAT STARCH

Tritici amylum

DEFINITION

Wheat starch is obtained from the caryopsis of *Triticum aestivum* L. (*T. vulgare* Vill.).

CHARACTERS

Appearance: very fine, white or almost white powder which creaks when pressed between the fingers.

Solubility: practically insoluble in cold water and in alcohol.

Wheat starch does not contain starch grains of any other origin. It may contain a minute quantity, if any, of tissue fragments of the original plant.

IDENTIFICATION

A. Examined under a microscope using equal volumes of *glycerol R* and *water R*, it presents large and small granules, and, very rarely, intermediate sizes. The large granules, 10 µm to 60 µm in diameter, are discoid or, more rarely, reniform when seen face-on. The central hilum and striations are invisible or barely visible and the granules sometimes show cracks on the edges. Seen in profile, the granules are elliptical and fusiform and the hilum appears as a slit along the main axis. The small granules, rounded or polyhedral, are 2 µm to 10 µm in diameter. Between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum.

B. Suspend 1 g in 50 ml of *water R*, boil for 1 min and cool. A thin, cloudy mucilage is formed.

C. To 1 ml of the mucilage obtained in identification test B, add 0.05 ml of *iodine solution R1*. A dark blue colour is produced which disappears on heating.

TESTS

pH (*2.2.3*): 4.5 to 7.0.

Shake 5.0 g with 25.0 ml of *carbon dioxide-free water R* for 60 s. Allow to stand for 15 min.

Foreign matter. Examined under a microscope using a mixture of equal volumes of *glycerol R* and *water R*, not more than traces of matter other than starch granules are present. No starch grains of any other origin are present.

Total protein: maximum 0.3 per cent of total protein (corresponding to 0.048 per cent N_2, conversion factor: 6.25), determined on 6.0 g by sulphuric acid digestion (*2.5.9*) modified as follows: wash any adhering particles from the neck into the flask with 25 ml of *sulphuric acid R*; continue the heating until a clear solution is obtained; add 45 ml of *strong sodium hydroxide solution R*.

Oxidising substances (*2.5.30*): maximum 20 ppm, calculated as H_2O_2.

Sulphur dioxide (*2.5.29*): maximum 50 ppm.

Iron (*2.4.9*): maximum 10 ppm.

Shake 1.5 g with 15 ml of *dilute hydrochloric acid R*. Filter. The filtrate complies with the limit test for iron.

Loss on drying (*2.2.32*): maximum 15.0 per cent, determined on 1.000 g by drying in an oven at 130 °C for 90 min.

Sulphated ash (*2.4.14*): maximum 0.6 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 bacteria and not more than 10^2 fungi per gram, determined by plate count. It complies with the test for *Escherichia coli* (*2.6.13*).

01/2008:1379

WHEAT-GERM OIL, REFINED

Tritici aestivi oleum raffinatum

DEFINITION

Fatty oil obtained from the germ of the grain of *Triticum aestivum* L. by cold expression or by other suitable mechanical means and/or by extraction. It is then refined. A suitable antioxidant may be added.

CHARACTERS

Appearance: clear, light yellow liquid.

Solubility: practically insoluble in water and in alcohol, miscible with light petroleum (40 °C to 60 °C).

Relative density: about 0.925.

Refractive index: about 1.475.

IDENTIFICATION

A. Identification of fatty oils by thin-layer chromatography (*2.3.2*). The chromatogram obtained is similar to the type chromatogram for wheat-germ oil.

B. It complies with the test for composition of fatty acids (see Tests).

TESTS

Acid value (*2.5.1*): maximum 0.9. If intended for use in the manufacture of parenteral dosage forms: maximum 0.3.

Peroxide value (*2.5.5*): maximum 10.0. If intended for use in the manufacture of parenteral dosage forms: maximum 5.0.

Unsaponifiable matter (*2.5.7*): maximum 5.0 per cent, determined on 5.0 g.

Alkaline impurities (*2.4.19*). It complies with the test for alkaline impurities in fatty oils.

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*). Use the mixture of calibrating substances in Table 2.4.22.-3.

Composition of the fatty-acid fraction of the oil:

- *palmitic acid*: 14.0 per cent to 19.0 per cent,
- *stearic acid*: maximum 2.0 per cent,
- *oleic acid*: 12.0 per cent to 23.0 per cent,
- *linoleic acid*: 52.0 per cent to 59.0 per cent,
- *linolenic acid*: 3.0 per cent to 10.0 per cent,
- *eicosenoic acid*: maximum 2.0 per cent.

Brassicasterol (*2.4.23*): maximum 0.3 per cent of brassicasterol in the sterol fraction of the oil.

Water (*2.5.32*). If intended for use in the manufacture of parenteral dosage forms: maximum 0.1 per cent, determined on 5.00 g. Use a mixture of equal volumes of *methanol R* and *methylene chloride R* as solvent.

STORAGE

In an airtight, well-filled container, protected from light.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- whether the oil is obtained by mechanical means, by extraction or by a combination of the two.

01/2008:1480

WHEAT-GERM OIL, VIRGIN

Tritici aestivi oleum virginale

DEFINITION

Virgin wheat-germ oil is the fatty oil obtained from the germ of the grain of *Triticum aestivum* L. by cold expression or other suitable mechanical means.

CHARACTERS

A clear, light yellow or golden-yellow liquid, practically insoluble in water and in alcohol, miscible with light petroleum (40 °C to 60 °C).

It has a relative density of about 0.925 and a refractive index of about 1.475.

IDENTIFICATION

A. Carry out the identification of fatty oils by thin-layer chromatography (*2.3.2*). The chromatogram obtained is comparable with the typical chromatogram for wheat-germ oil.

B. It complies with test for composition of fatty acids (see Tests).

TESTS

Acid value (*2.5.1*). Not more than 20.0, determined on 10.0 g.

Peroxide value (*2.5.5*). Not more than 15.0.

Unsaponifiable matter (*2.5.7*). Not more than 5.0 per cent, determined on 5.0 g.

Composition of fatty acids (*2.4.22, Method C*). The fatty-acid fraction of the oil has the following composition:

- *palmitic acid*: 14.0 per cent to 19.0 per cent,
- *stearic acid*: not more than 2.0 per cent,
- *oleic acid*: 12.0 per cent to 23.0 per cent,
- *linoleic acid*: 52.0 per cent to 59.0 per cent,
- *linolenic acid*: 3.0 per cent to 10.0 per cent,
- *eicosenoic acid*: not more than 2.0 per cent.

Brassicasterol (*2.4.23*). The sterol fraction of the oil contains not more than 0.3 per cent of brassicasterol.

Water (*2.5.32*). Not more than 0.1 per cent, determined on 5.00 g by the micro-determination of water. Use a mixture of equal volumes of *methanol R* and *methylene chloride R* as solvent.

STORAGE

Store in an airtight, well-filled container, protected from light.

corrected 6.0

WHITE HOREHOUND

Marrubii herba

DEFINITION

Whole or fragmented dried flowering aerial parts of *Marrubium vulgare* L.

Content: minimum 0.7 per cent of marrubiin ($C_{20}H_{28}O_4$; M_r 332.4) (dried drug).

CHARACTERS

Bitter taste.

IDENTIFICATION

A. The stems are up to 50 cm long, quadrangular, up to 7 mm wide, young stems are densely covered with whitish downy hairs, older stems are greenish-grey and less hairy. The lower leaves are broadly ovate to almost orbicular, upper leaves less broadly ovate, both petiolate; lamina 1.5-4 cm long, 1-3.5 cm wide, apex sub-acute, base tapering or somewhat cordate, margin dentate to crenate, petiole up to 3 cm long; venation pinnate, prominent on the lower surface, distinctly depressed on the upper surface. Both leaf surfaces are densely covered with fine, white, woolly hairs, older leaves having fewer hairs on the dark greyish-green upper surface. The flowers are small, sessile in dense axillary clusters. The calyx is 5 mm long, persistent, with 5 long and 5 short, alternating, hooked, recurved fringing spines; throat of calyx with an internal ring of long silky hairs; corolla 7 mm long, dull white, 4-lobed, upper lobe 2-lipped, lower-lobe 3-lipped; 4 short stamens; style with bifid stigma.

B. Reduce to a powder (710) (*2.9.12*). The powder is greyish-green. Examine under a microscope under *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of leaves with sinuous, polygonal epidermal cells, diacytic stomata (*2.8.3*), more numerous on the lower surface and cells of the mesophyll with small needles and cluster crystals of calcium oxalate; covering trichomes very numerous, twisted or coiled, 100-200 µm long, unicellular or multicellular and unseriate with 2-6 cells, enlarged at the joints; stellate trichomes of 2 types, one with 15-20 branches arising from a short unicellular stalk and the other with fewer branches arising from a sessile base; 8-celled secretory trichomes of lamiaceous type; glandular trichomes with 1 or 2 celled stalk and 1 to 4 celled head; the covering trichomes on the inner surface of the calyx are up to 1000 µm long with 2 to 3 cells, strongly thickened at the swollen joint and with the upper cell elongated; pollen grains spherical, about 25 µm in diameter with smooth exine; fragments of vascular tissue from the stems and veins.

C. Thin-layer chromatography (*2.2.27*).

Test solution (a). To 1.0 g of the powdered drug (710) (*2.9.12*) add 2 ml of *dilute hydrochloric acid R* and 8 ml of *methanol R*. Heat under a reflux condenser for 30 min, cool and filter.

Test solution (b). To 1.0 g of the powdered drug (710) (*2.9.12*) add 10 ml of *methanol R*. Heat under a reflux condenser for 30 min, cool and filter.

Reference solution. Dissolve 10 mg of *cholesterol R* and 10 mg of *guaiazulene R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase: *methanol R, toluene R* (5:95 *V/V*).

Application: 20 µl [or 5 µl] of test solutions (a) and (b) and 10 µl [or 2 µl] of the reference solution, as bands.

Development: over a path of 10 cm [or 6 cm].

Drying: in air.

Detection: spray with a 5 g/l solution of *vanillin R* in a mixture of 20 volumes of *ethanol (96 per cent) R* and 80 volumes of *sulphuric acid R* and examine in daylight immediately after heating at 130 °C for 5-10 min.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and test solutions (a) and (b). Further zones in the chromatograms obtained with test solutions (a) and (b) may be present. The zone due to marrubiin in the chromatogram obtained with test solution (a) is more intense than that in the chromatogram obtained with test solution (b). During extraction with hydrochloric acid and methanol, conversion of pre-marrubiin to marrubiin takes place which leads to an increase in intensity of the zone.

TESTS

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 15.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 3.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Reduce 50 g of the drug to a powder (250) (*2.9.12*) and homogenise. To 1.00 g of the powdered drug in a 50 ml round-bottomed flask add 15 ml of a mixture of 2 volumes of *dilute hydrochloric acid R* and 8 volumes of *methanol R*. Heat in a water bath at 80 °C under a reflux condenser for 30 min. Allow to cool at room temperature and filter through a plug of adsorbent cotton into a 25 ml volumetric flask. Dilute to 25.0 ml with *methanol R* by rinsing the round-bottomed flask and the filter.

Reference solution. Dissolve 2.0 mg of *marrubiin R* in 10.0 ml of *methanol R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm,
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: *acetonitrile R*,
– *mobile phase B*: dilute 0.5 ml of *phosphoric acid R* to 1000 ml with *water R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 → 15	40 → 90	60 → 10
15 → 20	90 → 40	10 → 60
20 → 25	40	60

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 217 nm.

Injection: 20 µl.

Locate the peak due to marrubiin by comparison with the chromatogram obtained with the reference solution.

Calculate the percentage content of marrubiin from the following expression:

$$\frac{A_1 \times m_2 \times p \times 2.5}{A_2 \times m_1}$$

A_1 = area of the peak due to marrubiin in the chromatogram obtained with the test solution,

A_2 = area of the peak due to marrubiin in the chromatogram obtained with the reference solution,

m_1 = mass of the drug to be examined, in milligrams,

m_2 = mass of *marrubiin R*, in milligrams,

p = percentage content of marrubiin in *marrubiin R*.

corrected 6.0

WILD PANSY (FLOWERING AERIAL PARTS)

Violae herba cum flore

DEFINITION

Dried flowering aerial parts of *Viola arvensis* Murray and/or *Viola tricolor* L.

Content: minimum 1.5 per cent of flavonoids, expressed as violanthin ($C_{27}H_{30}O_{14}$; M_r 578.5) (dried drug).

IDENTIFICATION

A. The stem is angular and hollow. The leaves are oval, petiolate, with a cordate base or elongated and obtuse, with lyrate stipules, divided in the middle. The flowers, with a long peduncle, are zygomorphic, with 5 oval, lanceolate sepals, an appendage pointed outwards and 5 petals of which the lower one bears a spur; in *Viola arvensis*, the petals are shorter than the calyx, the lower petal is cream coloured, with black lines, the 4 upper petals may be cream coloured or violet blue; in *Viola tricolor*, the petals are longer than the calyx and violet coloured, more or less tinged with yellow. The androecium consisting of 5 stamens bears at the apex a membranous connective appendage with 2 spurs. The trilocular ovary shows a short style and globular stigmata. The fruit are navicular capsules, three-lobed, yellowish brown, 5 mm to 10 mm long. The pale yellow, pyriform seeds are about 1 mm long, bearing a caruncle.

B. Reduce to a powder (355) (*2.9.12*). The powder is greenish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epidermis of the leaves in surface view with wavy-walled cells and

anomocytic stomata (*2.8.3*); conical unicellular covering trichomes, widened at the base and sharply pointed at the apex, with a striated cuticle; glandular trichomes with a multicellular head, and a short, multicellular stalk in the indentations of the leaf margins; cluster crystals of calcium oxalate, sometimes included in parenchyma; fragments of the corolla with wavy-walled epidermal cells, those from the mid-region papillose and with some extended to form flask or bottle-shaped projections, those from the base of the petals with covering trichomes up to about 300 µm long with characteristic hump-like swellings along their length; spherical or polyhedral pollen grains, 60 µm to 80 µm in diameter, with finely pitted exines and 5 pores (*Viola arvensis*) or 4 pores (*Viola tricolor*); occasional fragments of spiral and reticulate vessels and groups of fibres from the stem.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Heat in a water-bath at 65 °C for 5 min, with frequent stirring, 2.0 g of the powdered drug (355) (*2.9.12*) in 10 ml of *alcohol (70 per cent V/V) R*. Cool and filter.

Reference solution. Dissolve 2.5 mg of *rutin R*, 2.5 mg of *hyperoside R* and 1.0 mg of *caffeic acid R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, acetic acid R, water R, ethyl acetate R* (11:11:27:100 *V/V/V/V*).

Application: 10 µl, as bands.

Development: over a path of 12 cm.

Drying: at 100-105 °C.

Detection: spray with a solution containing 10 g/l of *diphenylboric acid aminoethyl ester R* and 50 g/l of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min. Examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate

TESTS

Foreign matter (*2.8.2*): maximum 3 per cent.

Swelling index (*2.8.4*): minimum 9, determined on the powdered drug (355) (*2.9.12*).

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 15.0 per cent.

ASSAY

Stock solution. In a 200 ml flask, introduce 0.300 g of the powdered drug (250) (*2.9.12*) and 40 ml of *alcohol (60 per cent V/V) R*. Heat in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter through a plug of absorbent cotton into a 100 ml volumetric flask. Transfer the absorbent cotton with the drug residue back into the 200 ml flask, add 40 ml of *alcohol (60 per cent V/V) R* and heat again in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter into the same 100 ml volumetric flask as used previously. Rinse the 200 ml flask with a further quantity of *alcohol (60 per cent V/V) R*, filter and transfer to the same 100 ml volumetric flask. Dilute to volume with *alcohol (60 per cent V/V) R* and filter.

Test solution. Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 ml volumetric flask as used previously. Add 10.0 ml of a solution containing 25.0 g/l of *boric acid R* and 20.0 g/l of *oxalic acid R* in *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Compensation liquid. Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 ml volumetric flask as used previously. Add 10.0 ml of *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Measure the absorbance (*2.2.25*) of the test solution at 405 nm after 30 min.

Calculate the percentage content of total flavonoids, expressed as violanthin from the expression:

$$\frac{A \times 1.25}{m}$$

taking the specific absorbance of violanthin to be 400.

A = measured absorbance at 405 nm,

m = mass of the drug to be examined, in grams.

corrected 6.0

WILD THYME

Serpylli herba

DEFINITION

Whole or cut, dried, flowering aerial parts of *Thymus serpyllum* L.s.l.

Content: minimum 3.0 ml/kg of essential oil (dried drug).

IDENTIFICATION

A. The stem is much branched, up to about 1.5 mm in diameter, cylindrical or indistinctly quadrangular, green, reddish or purplish, the older stems brown and woody, the younger stems pubescent. The leaves are opposite, 3 mm to 12 mm long and up to 4 mm wide, elliptical to ovate-lanceolate with an obtuse apex, cuneate and shortly petiolate at the base; the margin is entire and markedly ciliate, especially near the base; both surfaces are more or less glabrous but distinctly punctate. The inflorescence is composed of about 6 to 12 flowers in rounded to ovoid, terminal heads. The calyx is tubular, two-lipped with the upper lip dividing to form 3 teeth, the lower lip with 2 teeth, edged with long hairs; inner surfaces strongly pubescent, the hairs forming a closed tube after flowering. The corolla is purplish-violet to red, two-lipped, the lower lip with 3 lobes, upper lip notched, inner surface strongly pubescent; stamens 4, epipetalous, projecting from the corolla tube.

B. Reduce to a powder (355) (*2.9.12*). The powder is greyish-green to brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the leaf epidermises with sinuous, slightly thickened anticlinical walls and stomata of the diacytic type (*2.8.3*); numerous covering trichomes on both epidermises and along the leaf margins, the majority short, conical, unicellular, with thickened and warty walls, fewer long, uniseriate, composed of up to 8 cells, slightly swollen at the joints, with moderately thickened walls; abundant glandular trichomes, mostly multicellular with a small, rounded, unicellular stalk and a large globular head composed of a number of indistinct, radiating cells containing brown secretion, others smaller, capitate, with unicellular stalk and a unicellular, globoid or ovoid head; purplish-violet fragments of the corolla, the outer epidermis with numerous covering and glandular trichomes, inner epidermis papillose; pollen grains spherical to elliptical, 30 µm to 40 µm in diameter, with a finely grained exine and 6 germinal pores.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 5 ml of *methylene chloride R* and shake for 3 min. Filter through about 2 g of *anhydrous sodium sulphate R*.

Reference solution. Dissolve 5 mg of *thymol R* and 10 µl of *carvacrol R* in 10 ml of *methylene chloride R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *methylene chloride R*.

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
———	———
	A prominent quenching zone
Thymol: a quenching zone	A quenching zone (thymol)

TESTS

Foreign matter (*2.8.2*): maximum 3 per cent, determined on 30 g.

Foreign matter may also consist of acicular to linear-lanceolate leaves with a strongly bent margin, the adaxial surface showing covering trichomes shaped as pointed teeth with warty walls, the abaxial surface showing many types of warty covering trichomes: unicellular, straight or slightly curved, bicellular or tricellular, often elbow-shaped, and bicellular or tricellular, more or less straight (*Thymus vulgaris, Thymus zygis*).

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 10.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 3.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs (*2.8.12*). Use 50.0 g of the cut drug, a 1000 ml round-bottomed flask and 500 ml of *water R* as the distillation liquid. Distil at a rate of 2-3 ml/min for 2 h without *xylene R* in the graduated tube.

01/2008:1583
corrected 6.0

WILLOW BARK

Salicis cortex

DEFINITION

Willow bark consists of the whole or fragmented dried bark of young branches or whole dried pieces of current year twigs of various species of genus *Salix* including *S. purpurea* L., *S. daphnoides* Vill. and *S. fragilis* L. The drug contains not less than 1.5 per cent of total salicylic derivatives, expressed as salicin ($C_{13}H_{18}O_7$; M_r 286.3), calculated with reference to the dried drug.

CHARACTERS

Markedly bitter.

IDENTIFICATION

A. The bark is 1 mm to 2 mm thick and occurs in flexible, elongated, quilled or curved pieces. The outer surface is smooth or slightly wrinkled longitudinally and greenish-yellow to brownish-grey. The inner surface is smooth or finely striated longitudinally and white, pale yellow or reddish-brown, depending on the species. The fracture is short in the outer part and coarsely fibrous in the inner region. The diameter of current year twigs is not more than 10 mm. The wood is white or pale yellow.

B. Reduce to a powder (355) (*2.9.12*). The powder is pale yellow, greenish-yellow or light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows: bundles of narrow fibres, up to about 600 µm long, with very thick walls and surrounded by a crystal sheath containing prism crystals of calcium oxalate; parenchyma of the cortex with thick, pitted and deeply beaded walls, and containing large cluster crystals of calcium oxalate; uniseriate medullary rays; thickened and suberised cork cells. Groups of brownish collenchyma from the bud may be present. Twigs show, additionally, fragments of lignified fibres and vessels from the xylem.

C. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution (a). To 1.0 g of the powdered drug (500) (*2.9.12*) add 20 ml of *methanol R*; heat in a water-bath at about 50 °C, with frequent shaking, for 10 min. Cool and filter.

Test solution (b). To 5.0 ml of test solution (a) add 1.0 ml of a 50 g/l solution of *anhydrous sodium carbonate R* and heat in a water-bath at about 60 °C for 10 min. Cool and filter if necessary.

Reference solution. Dissolve 2.0 mg of *salicin R* in 1.0 ml of *methanol R*.

Apply to the plate as bands 20 µl of each. Develop over a path of 15 cm using a mixture of 8 volumes of *water R*, 15 volumes of *methanol R* and 77 volumes of *ethyl acetate R*. Allow the plate to dry in air. Spray with a mixture of 5 volumes of *sulphuric acid R* and 95 volumes of *methanol R*. Heat at 100 °C to 105 °C for 5 min and examine in daylight. The chromatogram obtained with the reference solution shows in the middle third a reddish-violet zone due to salicin. In the chromatogram obtained with test solution (a), the zone due to salicin appears with only slight to moderate intensity. In the chromatogram obtained with test solution (b) the zone due to salicin is clearly more intense and there are, above the zone due to salicin, one (salicortin or 2′-*O*-acetylsalicortin, or possibly two tremulacin) faint reddish-violet zones Other blue, yellow or brown zones can occur in both chromatograms.

TESTS

Foreign matter (*2.8.2*). Not more than 3 per cent of twigs with a diameter greater than 10 mm, and not more than 2 per cent of other foreign matter.

Loss on drying (*2.2.32*). Not more than 11 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*), by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*). Not more than 10 per cent.

ASSAY

Examine by liquid chromatography (*2.2.29*), using *resorcinol R* as the internal standard.

Internal standard solution. Dissolve 50 mg of *resorcinol R* in 10 ml of *methanol R*.

Test solution. To 0.5 g of the powdered drug (355) (*2.9.12*) add 50 ml of *methanol R* and heat under a reflux condenser for 30 min. Cool and filter. Take up the residue with 50 ml of *methanol R*. Proceed as above. Combine the filtrates and evaporate under reduced pressure. Take up the residue with 5.0 ml of *methanol R*, add 5.0 ml of *0.1 M sodium hydroxide* and heat in a water-bath at about 60 °C under a reflux condenser, with frequent shaking for about 1 h. After cooling, add 0.5 ml of *1 M hydrochloric acid*. Dilute the solution to 20.0 ml with a mixture of 50 volumes of *methanol R* and 50 volumes of *water R*. Add 1.0 ml of the internal standard solution to 10.0 ml of this solution. Filter through a membrane filter.

Reference solution (a). Dissolve 18.5 mg of *salicin R* in 10.0 ml of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R* and add 1.0 ml of the internal standard solution.

Reference solution (b). Dissolve 1.0 mg of *picein R* in 1.0 ml of reference solution (a).

The chromatographic procedure may be carried out using:

– a stainless steel column, 0.10 m long and 3 mm or 4 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (3 µm),

– as mobile phase at a flow rate of 1.0 ml/min a mixture of 1.8 volumes of *tetrahydrofuran R* and 98.2 volumes of *water R*, containing 0.5 per cent *V/V* of *phosphoric acid R*,

– as detector a spectrophotometer set at 270 nm,

– a loop injector.

Inject 10 µl of reference solution (b). The assay is not valid unless the resolution between the peaks corresponding to salicin and picein and between the peaks corresponding to picein and resorcinol is at least 1.5.

Inject five times 10 µl of reference solution (a).

Inject three times 10 µl of the test solution. Continue the chromatography for four times the retention time of the peak corresponding to salicin.

Calculate the percentage content of total salicylic derivatives, expressed as salicin, from the expression:

$$\frac{S_1 \times S_4 \times m_2 \times p \times 2}{S_2 \times S_3 \times m_1}$$

S_1 = area of the peak due to salicin in the chromatogram obtained with the test solution,

S_2 = area of the peak due to resorcinol in the chromatogram obtained with the test solution,

S_3 = area of the peak due to salicin in the chromatogram obtained with reference solution (a),

S_4 = area of the peak due to resorcinol in the chromatogram obtained with reference solution (a),

m_1 = mass of the drug in the test solution, in milligrams,

m_2 = mass of salicin in reference solution (a), in milligrams,

p = percentage content of salicin in the reference substance

corrected 6.0

WOOL ALCOHOLS

Alcoholes adipis lanae

DEFINITION

Mixture of sterols and higher aliphatic alcohols from wool fat. It may contain not more than 200 ppm of butylhydroxytoluene.

Content: minimum 30.0 per cent of cholesterol.

CHARACTERS

Appearance: pale-yellow or brownish-yellow, brittle mass becoming plastic on heating.

Solubility: practically insoluble in water, soluble in methylene chloride and in boiling ethanol, slightly soluble in alcohol (90 per cent *V/V*).

IDENTIFICATION

Dissolve 50 mg in 5 ml of *methylene chloride R* and add 1 ml of *acetic anhydride R* and 0.1 ml of *sulphuric acid R*. Within a few seconds, a green colour develops.

TESTS

Appearance of solution. To 1.0 g add 10 ml of *light petroleum R1* and shake while warming in a water-bath. The substance dissolves completely. After cooling, the solution is clear (*2.2.1*).

Alkalinity. Dissolve 2.0 g in 25 ml of hot *alcohol (90 per cent V/V) R* and add 0.5 ml of *phenolphthalein solution R1*. No red colour develops.

Melting point (*2.2.15*): minimum 58 °C.

Melt the substance to be examined by heating in a water-bath at a temperature which exceeds the expected melting point by not more than 10 °C; introduce the substance to be examined into the capillary tubes and allow to stand at 15-17 °C for not less than 16 h.

Acid value (*2.5.1*): maximum 2.0.

If necessary, heat in a water-bath under a reflux condenser to dissolve the substance to be examined.

Hydroxyl value (*2.5.3, Method A*): 120 to 180.

Peroxide value (*2.5.5, Method A*): maximum 15.

Take from the substance to be examined wedge-shaped pieces whose base consists of part of the surface. Melt the pieces before carrying out the determination. Before adding 0.5 ml of *saturated potassium iodide solution R*, cool the solution obtained to room temperature.

Saponification value (*2.5.6*): maximum 12.0, determined on 2.00 g. Heat under reflux for 4 h.

Butylhydroxytoluene. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 0.20 g of *methyl decanoate R* in *carbon disulphide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *carbon disulphide R*.

Test solution (a). Dissolve 1.0 g of the substance to be examined in *carbon disulphide R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 1.0 g of the substance to be examined in *carbon disulphide R*, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *carbon disulphide R*.

Reference solution. Dissolve 0.20 g of *butylhydroxytoluene R* in *carbon disulphide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *carbon disulphide R*. To 1.0 ml of this solution add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *carbon disulphide R*.

Precolumn: column filled with silanised glass wool.

Column:

– *size*: *l* = 1.5 m, Ø = 4 mm,

– *stationary phase*: *silanised diatomaceous earth for gas chromatography R* impregnated with 10 per cent *m/m* of *poly(dimethyl)siloxane R*.

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 40 ml/min.

Temperature:

– *column*: 150 °C,

– *injection port*: 180 °C,

– *detector*: 300 °C.

Detection: flame ionisation.

Limit:

– *butylhydroxytoluene*: maximum 200 ppm.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 2.000 g by drying in an oven at 105 °C.

Total ash (*2.4.16*): maximum 0.1 per cent.

Water-absorption capacity. Place 0.6 g of the substance to be examined and 9.4 g of *white soft paraffin R* in a mortar and melt on a water-bath. Allow to cool and incorporate 20 ml of *water R*, added in portions. Within 24 h no water is released from the almost white, ointment-like emulsion.

ASSAY

Dissolve 0.1000 g in 12 ml of hot *alcohol (90 per cent V/V) R*. Allow to stand for 18 h, filter through a sintered-glass filter (16) (*2.1.2*) and wash the filter with 2 quantities, each of 15 ml, of *alcohol (90 per cent V/V) R*. Combine the filtrate and washings, add 20 ml of a freshly prepared 10 g/l solution of *digitonin R* in *alcohol (90 per cent V/V) R* and heat to about 60 °C. Allow to cool, filter through a sintered-glass filter (16) (*2.1.2*), wash the residue with 10 ml of *alcohol (90 per cent V/V) R* and dry to constant mass at 100-105 °C.

1 g of residue is equivalent to 0.239 g of cholesterol.

STORAGE

In a well-filled container, protected from light.

LABELLING

The label states, where applicable, the concentration of any added butylhydroxytoluene.

01/2008:0134
corrected 6.0

WOOL FAT

Adeps lanae

DEFINITION

Purified, anhydrous, waxy substance obtained from the wool of sheep (*Ovis aries*). It may contain not more than 200 ppm of butylhydroxytoluene.

CHARACTERS

Appearance: yellow, unctuous substance. When melted, it is a clear or almost clear, yellow liquid. A solution in light petroleum is opalescent.

Solubility: practically insoluble in water, slightly soluble in boiling anhydrous ethanol.

It has a characteristic odour.

IDENTIFICATION

A. In a test-tube, dissolve 0.5 g in 5 ml of *methylene chloride R* and add 1 ml of *acetic anhydride R* and 0.1 ml of *sulphuric acid R*. A green colour develops.

B. Dissolve 50 mg in 5 ml of *methylene chloride R*, add 5 ml of *sulphuric acid R* and shake. A red colour develops and an intense green fluorescence appears in the lower layer when examined in daylight, with illumination from the rear of the observer.

TESTS

Water-soluble acid or alkaline substances. Melt 5.0 g on a water-bath and shake vigorously for 2 min with 75 ml of *water R* previously heated to 90-95 °C. Allow to cool and filter through filter paper previously rinsed with *water R*. To 60 ml of the filtrate (which may not be clear) add 0.25 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of *0.02 M hydrochloric acid* or 0.15 ml of *0.02 M sodium hydroxide* is required to change the colour of the indicator.

Drop point (*2.2.17*): 38 °C to 44 °C.

To fill the metal cup, melt the wool fat on a water-bath, cool to about 50 °C, pour into the cup and allow to stand at 15-20 °C for 24 h.

Water-absorption capacity. Place 10 g of molten wool fat in a mortar and allow to cool to room temperature. Weigh the mortar. Add *water R* in portions of 0.2-0.5 ml from a burette, stirring vigorously after each addition to incorporate the *water R*. Instead of a pestle, use a high-density polypropylene cylindrical rod (120 mm long and 10 mm in diameter, for example). The end-point is reached when visible droplets remain which cannot be incorporated. Weigh the mortar again and determine the amount of water absorbed by weight difference. Not less than 20 g of *water R* is absorbed.

Acid value (*2.5.1*): maximum 1.0, determined on 5.0 g dissolved in 25 ml of the prescribed mixture of solvents.

Peroxide value (*2.5.5, Method A*): maximum 20.

Before adding 0.5 ml of *saturated potassium iodide solution R*, cool the solution obtained to room temperature.

Saponification value (*2.5.6*): 90 to 105, determined on 2.00 g while heating under reflux for 4 h.

Water-soluble oxidisable substances. To 10 ml of the filtrate obtained in the test for water-soluble acid or alkaline substances add 1 ml of *dilute sulphuric acid R* and 0.1 ml of *0.02 M potassium permanganate*. After 10 min, the solution is not completely decolourised.

Butylhydroxytoluene. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 0.2 g of *methyl decanoate R* in *carbon disulphide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *carbon disulphide R*.

Test solution (a). Dissolve 1.0 g of the substance to be examined in *carbon disulphide R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 1.0 g of the substance to be examined in *carbon disulphide R*, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *carbon disulphide R*.

Reference solution. Dissolve 0.2 g of *butylhydroxytoluene R* in *carbon disulphide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *carbon disulphide R*. To 1.0 ml of this solution add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *carbon disulphide R*.

Column:

– *size*: *l* = 1.5 m, Ø = 4 mm;
– *stationary phase*: *silanised diatomaceous earth for gas chromatography R* impregnated with 10 per cent *m/m* of *poly(dimethyl)siloxane R*.

The column is preceded by a column containing silanised glass wool.

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 40 ml/min.

Temperature:

– *column*: 150 °C;
– *injection port*: 180 °C;
– *detector*: 300 °C.

Detection: flame ionisation.

Limit:

– *butylhydroxytoluene*: maximum 200 ppm.

Paraffins: maximum 1.0 per cent.

The tap and cotton plugs used must be free from grease. Prepare a column of anhydrous aluminium oxide 0.23 m long and 20 mm in diameter by adding a slurry of *anhydrous aluminium oxide R* and *light petroleum R1* to a glass tube fitted with a tap and containing *light petroleum R1* (before use, dehydrate the anhydrous aluminium oxide by heating it in an oven at 600 °C for 3 h). Allow to settle and reduce the depth of the layer of solvent above the column to about 40 mm. Dissolve 3.0 g of the substance to be examined in 50 ml of warm *light petroleum R1*, cool, pass the solution through the column at a flow rate of 3 ml/min and wash with 250 ml of *light petroleum R1*. Concentrate the combined eluate and washings to low bulk by distillation, evaporate to dryness on a water-bath and heat the residue at 105 °C for periods of 10 min until 2 successive weighings do not differ by more than 1 mg. The residue weighs a maximum of 30 mg.

Pesticide residues: maximum 0.05 ppm for each organochlorine pesticide, 0.5 ppm for each other pesticide and 1 ppm for the sum of all the pesticides.

All glassware used is thoroughly washed using phosphate-free detergent as follows. The glassware is immersed in a bath of detergent solution (5 per cent in deionised water) and allowed to soak for 24 h. The detergent is washed off with copious amounts of acetone

and hexane for pesticide analysis. It is important to keep glassware specifically for pesticide analyses, it must not be mixed up with glassware used for other applications. The glassware used must be free of chlorinated solvents, plastics and rubber materials, in particular phthalate plasticisers, oxygenated compounds and nitrogenated solvents such as acetonitrile. Use hexane, toluene and acetone for pesticide analysis. Use HPLC grade reagents for ethyl acetate, cyclohexane and water.

The test consists of the isolation of pesticide residues by size-exclusion chromatography (*2.2.30*) followed by solid phase extraction and identification by gas chromatography coupled with an electron capture detector or a thermionic detector.

ISOLATION OF THE PESTICIDE RESIDUES. As detector, use a UV-visible spectrophotometer set at a wavelength of 254 nm to calibrate the chromatographic column for gel permeation.

Calibration is extremely important in gel permeation chromatography to check that the pressure, solvent flow rate, solvent ratio, temperature and column conditions remain constant. The gel permeation column is to be calibrated at regular intervals using a standard mixture prepared as follows: into a 1000 ml volumetric flask, introduce 50.00 g of *maize oil R*, 2.00 g of *di(2-ethylhexyl) phthalate R*, 0.20 g of *methoxychlor R*, 50.0 mg of *perylene R*, 50.0 mg of *naphthalene R*, and 80.0 mg of *sulphur R*. Dilute to 1000.0 ml with a mixture of equal volumes of *cyclohexane R* and *ethyl acetate R*.

To calibrate the column, set the mobile phase at a flow rate of 5 ml/min with a mixture of equal volumes of *cyclohexane R* and *ethyl acetate R*. Inject 5 ml of the standard mixture and record the resulting chromatogram. The retention times for the analytes must not vary by more than ± 5 per cent between calibrations. If the retention time shift is greater than ± 5 per cent, take corrective action. Excessive retention time shifts may be caused by:

- poor laboratory temperature control;
- the pump containing air; this can be verified by measuring the flow rate: collect 25 ml of column eluate in a volumetric flask and record the time (300 ± 5 s);
- a leak in the system.

Changes in pressure, in mobile phase flow rate or in column temperature conditions, as well as column contamination, can affect pesticide retention times and are to be monitored. If the flow rate or column pressure are outside desired bands the guard column or column is to be replaced.

Test solution. In a volumetric flask, dissolve 1 g of wool fat, accurately weighed, in a mixture of 1 volume of *ethyl acetate R* and 7 volumes of *cyclohexane R*. Add 1 ml of an internal standard (2 ppm) either *isodrin R* or *ditalimphos R* and dilute to 20 ml. *The internal standard solutions are used to establish that recoveries of the pesticides from the GPC purification stage, evaporation and solid phase extraction stage are at acceptable levels. Recovery levels of the internal standard solutions from the wool fat are determined by comparing the peak areas of the wool fat extracts with peak areas of solutions of the internal standards.*

Guard column:

- *size*: *l* = 0.075 m, Ø = 21.2 mm;
- *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm).

Gel permeation column:

- *size*: *l* = 0.3 m, Ø = 21.2 mm;
- *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm).

Mobile phase: *ethyl acetate R, cyclohexane R* (1:7 *V/V*).

Flow rate: 5 ml/min.

Detection: spectrophotometer at 254 nm.

Inject 5 ml of the test solution. Discard the first 95 ml (19 min) of eluate containing the substance to be examined. Collect the next 155 ml of eluate (31 min) containing any pesticide residues in an evaporating vessel.

Place the 155 ml of the eluate collected from the gel permeation chromatography column into an evaporating vessel. Place this vessel in an autoevaporator setting the water-bath temperature at 45 °C and the nitrogen pressure at 55 kPa. Evaporate the eluate down to 0.5 ml.

To prepare the solid phase extraction cartridges take some *magnesium silicate for pesticide residue analysis R* and heat it in a muffle furnace at 700 °C for 4 h to remove moisture and polychlorinated biphenyls. Subsequently allow the magnesium silicate to cool for 2 h and transfer it directly to an oven at 100-105 °C, and allow to stand for 30 min. Transfer the magnesium silicate to a stoppered glass jar and allow to equilibrate for 48 h. This material may be used for up to 2 weeks. After that period the magnesium silicate is to be reactivated, by heating at 600 °C for 2 h in a muffle furnace. Remove the magnesium silicate from the furnace, cool and store in a stoppered glass jar. The magnesium silicate is deactivated by adding 1 per cent of *water R*. After the water has been added, shake the magnesium silicate intermittently over 15 min just prior to use. The deactivated magnesium silicate is suitable for use for up to 1 week. It is essential that only deactivated magnesium silicate is used.

Take a 6 ml empty solid phase extraction cartridge and weigh into the cartridge 1 g of the deactivated magnesium silicate.

At this stage the GPC fraction still contains about 10 per cent of the substance to be examined, so further clean-up is necessary. A separate isolation procedure is carried out a) for organochlorine and synthetic pyrethroid pesticides and b) for organophosphorus pesticides. Place a preconditioned solid phase extraction cartridge containing l g of deactivated *magnesium silicate for pesticide residue analysis R* onto a vacuum manifold.

Condition the cartridge by adding 10 ml of *toluene R* and allowing the solvent to elute through the cartridge. Place the 0.5 ml of the solvent fraction from the evaporating vessel on the preconditioned cartridge. Elute the pesticide fractions from the cartridges using 20 ml of either of the 2 different solvent systems shown below:

a) for determination of the organochlorine and synthetic pyrethroid pesticides: *toluene R*; a very small amount of the substance to be examined is co-eluted;

b) for determination of the organophosphorus pesticides: a mixture of 2 volumes of *acetone R* and 98 volumes of *toluene R*; this solvent system is used to elute all the pesticides including the more polar organophosphorus pesticides; unfortunately, some of the substance to be examined is co-eluted with this solvent system, which can interfere with the electron capture detector.

Collect the eluate from the extraction cartridges in 25 ml glass vials. Quantitatively transfer the eluate to an evaporating vessel, washing the vial with 3 quantities, each of 10 ml, of *hexane R*.

Place the evaporating vessel on the autoevaporator and evaporate the solid phase extraction fractions down to 0.5 ml. The water-bath temperature is set at 45 °C and the nitrogen pressure is 55 kPa.

Examine the residues by gas chromatography (*2.2.28*) using electron capture and thermionic detectors as described below.

Recovery. Calculate the recovery correction factor (R_{cf}) of the internal standards (*ditalimphos R* or *isodrin R*) added to the test solution using the following expression:

$$\frac{A_2}{A_1} \times 100$$

A_1 = peak area of an internal standard 1 ppm in solution;

A_2 = peak area of internal standard extracted from the test solution.

5 ml of the 20 ml test solution containing 1 ml of 2 ppm internal standard concentrated to 0.5 ml is equivalent to 1 ppm of the internal standard in the solution.

If the recovery of the internal standards falls outside the range of 70 per cent to 110 per cent the test is not valid.

Table 0134.-1. – *Composition of the reference solutions*

Reference solution A (0.5 ppm or 0.5 mg/l) (organochlorine and synthetic pyrethroid pesticides)	**Reference solution B (0.5 ppm or 0.5 mg/l) (organochlorine and synthetic pyrethroid pesticides)**
Cyhalothrin R	*Aldrin R*
Cypermethrin R	*o,p'-DDT R*
o,p'-DDE R	*o,p'-DDD R*
p,p'-DDE R	*p,p'-DDD R*
p,p'-DDT R	*Dieldrin R*
Deltamethrin R	*α-Endosulphan R*
Endrin R	*β-Endosulphan R*
Heptachlor R	*Fenvalerate R*
Heptachlor epoxide R	*α-Hexachlorocyclohexane R*
Hexachlorobenzene R	*β-Hexachlorocyclohexane R*
Lindane R	*δ-Hexachlorocyclohexane R*
Tecnazene R	*Methoxychlor R*
	Permethrin R
Reference solution C (0.5 ppm or 0.5 mg/l) (organophosphorus pesticides)	**Reference solution D (0.5 ppm or 0.5 mg/l) (organophosphorus pesticides)**
Bromophos-ethyl R	*Bromophos R*
Carbophenothion R	*Chlorpyriphos R*
Chlorfenvinphos R	*Chlorpyriphos-methyl R*
Diazinon R	*Coumaphos R*
Dichlofenthion R	*Phosalone R*
Ethion R	*Pirimiphos-ethyl R*
Fenchlorphos R	*Tetrachlorovinphos R*
Malathion R	
Propetamphos R	
Reference solution E (electron capture detector calibration mixture)	**Reference solution F (thermionic detector calibration mixture)**
Aldrin R (0.01 mg/l)	*Chlorfenvinphos R* (0.05 mg/l)
Cypermethrin R (0.1 mg/l)	*Diazinon R* (0.05 mg/l)
o,p'-DDD R (0.01 mg/l)	*Ethion R* (0.05 mg/l)
Deltamethrin R (0.1 mg/l)	*Fenchlorphos R* (0.05 mg/l)
Endrin R (0.01 mg/l)	*Propetamphos R* (0.05 mg/l)
β-Hexachlorocyclohexane R (0.01 mg/l)	
Reference solution G (internal standard organophosphorus pesticide)	**Reference solution H (internal standard organochlorine pesticide)**
Ditalimphos R (2 ppm or 2.0 mg/l)	*Isodrin R* (2 ppm or 2.0 mg/l)
Ditalimphos R (1 ppm or 1.0 mg/l)	*Isodrin R* (1 ppm or 1.0 mg/l)

Reference solutions. Prepare reference solutions of pesticides using the pesticides standards at a concentration of 0.5 ppm (see composition of reference solutions A to D in Table 0134.-1). Commercially available pesticides may be purchased. The individual standards have a concentration of 10 ppm.

At the same time prepare solutions of pesticides equivalent to the limit of detection of the method (see recommended compositions in Table 0134.-1). These reference solutions are used to optimise the electron capture detector and thermionic detector to achieve the detection limits of the method (reference solutions E and F).

To prepare the reference solutions at the different concentrations use a calibrated pipette and volumetric flasks. To prepare the internal standard solutions G and H use a four-place analytical balance, pipette and volumetric flasks.

IDENTIFICATION AND QUANTIFICATION OF THE PESTICIDE RESIDUES. To identify any pesticide residues compare the chromatograms obtained with chromatograms obtained with reference solutions A to D.

The identity of the pesticides can be confirmed by spiking samples or overlaying chromatograms using an integration package on a computer. The interpretation of pesticides in trace residue analyses is extremely complex. The detectors, particularly the electron capture detector, are prone to interference, both from the substance to be examined itself, and from solvents, reagents and apparatus used in the extraction. These peaks can easily be misinterpreted or quoted as a false positive. Confirmation of pesticides can be achieved by running samples and standards on different capillary columns (see chromatographic systems A or B described below). The peaks can be identified by using the information in Table 0134.-2.

A knowledge of the different responses the pesticides have with the 2 detectors is useful in identification of unknown peaks.

Once the pesticides have been identified, calculate the content of each pesticide using the following expression:

$$C_P = \frac{P_P \times D \times C_e}{P_e} \times \frac{100}{R_{cf}}$$

C_p = concentration of identified pesticide (ppm);

P_p = peak area of the individual pesticide in the test sample obtained;

C_e = concentration of the individual pesticide in the external standard (ppm);

P_e = peak area of the individual pesticide in the external standard;

D = dilution factor;

R_{cf} = recovery correction factor.

The dilution factor (D) can be defined as follows:

$$\frac{V_1}{m \times \frac{V_2}{V_3}}$$

V_1 = volume of sample obtained after the 2nd evaporation stage;

m = sample weight;

V_2 = GPC injection volume;

V_3 = sample volumetric flask volume.

Table 0134.-2. – *Elution order of the pesticides on chromatographic systems A and B*

Chromatographic system A	Chromatographic system B
Tecnazene	Tecnazene
α-Hexachlorocyclohexane	Hexachlorobenzene
Hexachlorobenzene	α-Hexachlorocyclohexane
β-Hexachlorocyclohexane	Diazinon
Lindane	Lindane
Propetamphos	Propetamphos
δ-Hexachlorocyclohexane	Heptachlor
Diazinon	Dichlofenthion
Dichlofenthion	Aldrin
Chlorpyriphos-methyl	Chlorpyriphos-methyl
Heptachlor	Fenchlorphos
Fenchlorphos	β-Hexachlorocyclohexane
Aldrin	δ-Hexachlorocyclohexane
Malathion	Pirimiphos-ethyl
Chlorpyriphos	Chlorpyriphos
Bromophos	Bromophos
Pirimiphos-ethyl	Malathion
Heptachlor epoxide	Heptachlor epoxide
Chlorfenvinphos (*E*)	*o,p'*-DDE
Chlorfenvinphos (*Z*)	Chlorfenvinphos (*E*)

Deltamethrin	Deltamethrin

Chromatographic system A:

Guard column:

– *material*: deactivated silica;

– *size*: *l* = 4.5 m, Ø = 0.53 mm.

Column:

– *material*: fused silica;

– *size*: *l* = 60 m, Ø = 0.25 mm;

– *stationary phase*: *poly(dimethyl)(diphenyl)siloxane R* (film thickness 0.25 μm).

Carrier gas: *helium for chromatography R.*

Linear velocity: 25 cm/s.

Pressure: 180 kPa.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	75
	1 - 5	75 → 175
	5 - 30	175 → 275
	30 - 40	275 → 285
	40 - 55	285
Injection port		300
Detector		350

Detection: electron capture or thermionic specific detector.

Injection: 2 μl.

Chromatographic system B which may be used for confirmation analysis:

Guard column:

– *material*: deactivated silica;

– *size*: *l* = 4.5 m, Ø = 0.53 mm.

Column:

– *material*: fused silica;

– *size*: *l* = 60 m, Ø = 0.25 mm;

– *stationary phase*: *poly(cyanopropyl)(7)(phenyl)(7)(methyl)(86)siloxane R* (film thickness 0.25 μm).

Carrier gas: *helium for chromatography R.*

Linear velocity: 25 cm/s.

Pressure: 180 kPa.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	75
	1 - 5	75 → 175
	5 - 30	175 → 275
	30 - 40	275 → 285
	40 - 55	285
Injection port		300
Detector		350

Detection: electron capture or thermionic specific detector.

Injection: 2 μl.

Chlorides: maximum 150 ppm.

Boil 1.0 g with 20 ml of *ethanol (90 per cent V/V) R* in a round-bottomed flask fitted with a reflux condenser for 5 min. Cool, add 40 ml of *water R* and 0.5 ml of *nitric acid R* and filter. To the filtrate add 0.15 ml of a 10 g/l solution of *silver nitrate R* in *ethanol (90 per cent V/V) R*. Allow to stand for 5 min protected from light. Any opalescence in the solution is not more intense than that in a standard prepared at the same time by adding 0.15 ml of a 10 g/l solution of *silver nitrate R* in *ethanol (90 per cent V/V) R* to a mixture of 0.2 ml of *0.02 M hydrochloric acid*, 20 ml of *ethanol (90 per cent V/V) R*, 40 ml of *water R* and 0.5 ml of *nitric acid R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 1 h.

Sulphated ash (*2.4.14*): maximum 0.15 per cent.

Ignite 5.0 g and use the residue to determine the sulphated ash.

STORAGE

At a temperature not exceeding 25 °C.

LABELLING

The label states, where applicable, the concentration of added butylhydroxytoluene.

01/2008:0969
corrected 6.0

WOOL FAT, HYDROGENATED

Adeps lanae hydrogenatus

DEFINITION

Mixture of higher aliphatic alcohols and sterols obtained from the direct, high-pressure, high-temperature hydrogenation of *wool fat (0134)* during which the esters and acids present are reduced to the corresponding alcohols. It may contain butylhydroxytoluene.

CHARACTERS

Appearance: white or pale yellow, unctuous substance.

Solubility: practically insoluble in water, soluble in boiling alcohol and in light petroleum.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. It complies with the test for melting point (see Tests).

B. Examine the chromatograms obtained in the test for fatty alcohols and sterols.

Results: the principal peaks in the chromatogram obtained with the test solution are similar in retention time and size to the principal peaks in the chromatogram obtained with reference solution (a).

C. Dissolve 50 mg in 5 ml of *methylene chloride R* and add 1 ml of *acetic anhydride R* and 0.1 ml of *sulphuric acid R*. A green colour is produced.

TESTS

Melting point (*2.2.15*): 45 °C to 55 °C. Allow to stand at 20 °C for 16 h.

Acid value (*2.5.1*): maximum 1.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*): 140 to 180.

Saponification value (*2.5.6*): maximum 8.0. Heat under reflux for 4 h.

Fatty alcohols and sterols. Gas chromatography (*2.2.28*).

Test solution. Dissolve 0.25 g of the substance to be examined in 60 ml of *ethanol R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 0.25 g of *hydrogenated wool fat CRS* in 60 ml of *ethanol R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dissolve 50 mg of *cetyl alcohol CRS* and 50 mg of *stearyl alcohol CRS* in 60 ml of *ethanol R* and dilute to 100.0 ml with the same solvent.

Column:

– *material*: fused silica,

– *size*: *l* = 30 m, Ø = 0.25 mm,

– *stationary phase*: *poly(dimethyl)siloxane R* or another non-polar phase (film thickness: 0.25 µm).

Carrier gas: *helium for chromatography R* at a pressure of 100 kPa

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	100
	5 - 45	100 → 300
	45 - 60	300
Injection port		325
Detector		350

Detection: flame ionisation.

Injection: 1 µl.

The chromatogram obtained with the test solution does not differ significantly from the chromatogram obtained with reference solution (a) (Figure 0969.-1) and it does not show enhanced peaks with retention times corresponding to cetyl alcohol and stearyl alcohol present in the chromatogram obtained with reference solution (b).

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 3.0 per cent, determined on 2.000 g by drying in an oven at 105 °C for 1 h.

Total ash (*2.4.16*): maximum 0.1 per cent, determined on 5.0 g.

STORAGE

In a well-filled container, protected from light.

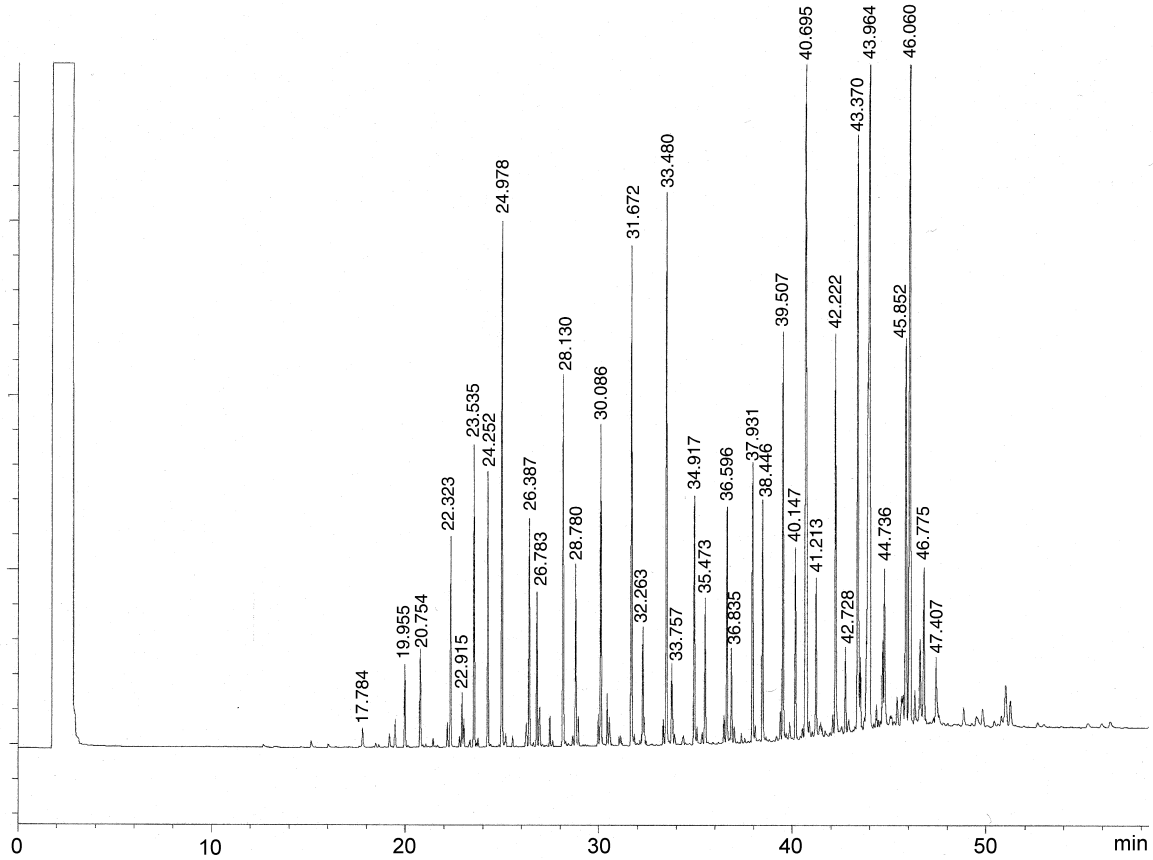

Figure 0969.-1. – *Chromatogram for the test for fatty alcohols and sterols (reference solution (a)) in hydrogenated wool fat*

01/2008:0135

WOOL FAT, HYDROUS

Adeps lanae cum aqua

DEFINITION

Mixture of 75 per cent *m/m* of wool fat and 25 per cent *m/m* of water. It is obtained by the gradual addition of water to melted wool fat with continuous stirring. It may contain not more than 150 ppm of butylhydroxytoluene.

CHARACTERS

Appearance: pale yellow, unctuous substance.

IDENTIFICATION

A. In a test-tube, dissolve 0.5 g in 5 ml of *chloroform R* and add 1 ml of *acetic anhydride R* and 0.1 ml of *sulphuric acid R*. A green colour develops.

B. Dissolve 50 mg in 5 ml of *chloroform R*, add 5 ml of *sulphuric acid R* and shake. A red colour develops and an intense green fluorescence appears in the lower layer.

TESTS

Water-soluble acid or alkaline substances. Melt 6.7 g on a water-bath and shake vigorously for 2 min with 75 ml of *water R* previously heated to 90-95 °C. Allow to cool and filter through filter paper previously rinsed with *water R*. To 60 ml of the filtrate (which may not be clear) add 0.25 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of *0.02 M hydrochloric acid* or 0.15 ml of *0.02 M sodium hydroxide* is required to change the colour of the indicator.

Drop point (*2.2.17*): 38 °C to 44 °C.

To fill the metal cup, melt the residue obtained in the test for wool-fat content on a water-bath, cool to about 50 °C, pour into the cup and allow to stand at 15-20 °C for 24 h.

Water-absorption capacity. Place 10 g of the residue obtained in the test for wool-fat content in a mortar. Add *water R* in portions of 0.2-0.5 ml from a burette, stirring vigorously after each addition to incorporate the *water R*. The end-point is reached when visible droplets remain which cannot be incorporated. Not less than 20 ml of *water R* is absorbed.

Acid value (*2.5.1*): maximum 0.8, determined on 5.0 g dissolved in 25 ml of the prescribed mixture of solvents.

Peroxide value (*2.5.5, Method A*): maximum 15.

Saponification value (*2.5.6*): 67 to 79, determined on 2.00 g while heating under reflux for 4 h.

Water-soluble oxidisable substances. To 10 ml of the filtrate obtained in the test for water-soluble acid or alkaline substances add 1 ml of *dilute sulphuric acid R* and 0.1 ml of *0.02 M potassium permanganate*. After 10 min, the solution is not completely decolourised.

Butylhydroxytoluene. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 0.2 g of *methyl decanoate R* in *carbon disulphide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 10.0 ml with *carbon disulphide R*.

Test solution (a). Dissolve 1.0 g of the residue obtained in the test for wool-fat content in *carbon disulphide R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 1.0 g of the residue obtained in the test for wool-fat content in *carbon disulphide R*, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *carbon disulphide R*.

Reference solution. Dissolve 0.2 g of *butylhydroxytoluene R* in *carbon disulphide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *carbon*

disulphide R. To 1.0 ml of this solution add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *carbon disulphide R*.

Column:

– *size*: *l* = 1.5 m, Ø = 4 mm;

– *stationary phase*: *silanised diatomaceous earth for gas chromatography R* impregnated with 10 per cent *m/m* of *poly(dimethyl)siloxane R*.

The column is preceded by a column containing silanised glass wool.

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 40 ml/min.

Temperature:

– *column*: 150 °C;

– *injection port*: 180 °C;

– *detector*: 300 °C.

Detection: flame ionisation.

Limit:

– *butylhydroxytoluene*: maximum 150 ppm.

Paraffins: maximum 1.0 per cent.

The tap and cotton plugs used must be free from grease. Prepare a column of anhydrous aluminium oxide 230 mm long and 20 mm in diameter by adding a slurry of *anhydrous aluminium oxide R* and *light petroleum R1* to a glass tube fitted with a tap and containing *light petroleum R1*. Allow to settle and reduce the depth of the layer of solvent above the column to about 40 mm. Dissolve 3.0 g of the residue obtained in the test for wool-fat content in 50 ml of warm *light petroleum R1*, cool, pass the solution through the column at a rate of 3 ml/min and wash with 250 ml of *light petroleum R1*. Concentrate the combined eluate and washings to low bulk by distillation, evaporate to dryness on a water-bath and heat the residue at 105 °C for periods of 10 min until 2 successive weighings do not differ by more than 1 mg. The residue weighs a maximum of 30 mg.

Chlorides: maximum 115 ppm.

Boil 1.3 g with 20 ml of *ethanol (90 per cent V/V) R* under a reflux condenser for 5 min. Cool, add 40 ml of *water R* and 0.5 ml of *nitric acid R* and filter. To the filtrate add 0.15 ml of a 10 g/l solution of *silver nitrate R* in *ethanol (90 per cent V/V) R*. Allow to stand for 5 min, protected from light. Any opalescence in the solution is not more intense than that in a standard prepared at the same time by adding 0.15 ml of a 10 g/l solution of *silver nitrate R* in *ethanol (90 per cent V/V) R* to a mixture of 0.2 ml of *0.02 M hydrochloric acid*, 20 ml of *ethanol (90 per cent V/V) R*, 40 ml of *water R* and 0.5 ml of *nitric acid R*.

Sulphated ash (*2.4.14*): maximum 0.1 per cent.

Ignite 5.0 g and use the residue.

Wool-fat content: 72.5 per cent to 77.5 per cent.

In a suitable tared dish containing a glass rod, heat 30.0 g to constant mass on a water-bath, stirring continuously. Weigh the residue.

STORAGE

At a temperature not exceeding 25 °C.

LABELLING

The label states, where applicable, the concentration of added butylhydroxytoluene.

01/2008:1380
corrected 6.0

WORMWOOD

Absinthii herba

DEFINITION

Basal leaves or slightly leafy, flowering tops, or mixture of these dried, whole or cut organs of *Artemisia absinthium* L.

Content: minimum 2 ml/kg of essential oil (dried drug).

IDENTIFICATION

A. The leaves are greyish or greenish, densely tomentose on both surfaces. The basal leaves, with long petioles, have triangular or oval bipinnatisect or tripinnatisect lamina, with rounded or lanceolate segments. The cauline leaves are less segmented and the apical leaves are lanceolate. The stem of the flower-bearing region is greenish-grey, tomentose, up to 2.5 mm in diameter and usually with 5 flattened longitudinal grooves. The capitula are arranged as loose, axillary panicles, inserted at the level of the lanceolate to slightly pinnatisect leaves; they are spherical to flattened hemispherical, 2-4 mm in diameter and consist of a grey, tomentose involucre, the outer bracts linear, inner layer ovate, blunt at the apices with scarious margins, a receptacle with very long paleae up to 1 mm or more long, numerous yellow, tubular, hermaphroditic florets about 2 mm long and few yellow, ray florets.

B. Reduce to a powder (355) (*2.9.12*). The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: many T-shaped trichomes with a short uniseriate stalk consisting of 1-5 small cells, perpendicularly capped by a very long, undulating terminal cell tapering at the ends; fragments of epidermises with sinuous or wavy walls, anomocytic stomata (*2.8.3*) and secretory trichomes each with a short, biseriate, 2 celled stalk and a biseriate head with 2-4 cells; fragments of the tubular and ray florets, some containing small cluster crystals of calcium oxalate; numerous paleae each composed of a small cell forming a stalk and a very long, cylindrical and thin-walled terminal cell about 1-1.5 mm long; spheroidal pollen grains, about 30 µm in diameter, with 3 pores and a finely warty exine; groups of fibres, small vessels with spiral and annular thickening, larger vessels with bordered pits and parenchyma with moderately thickened and pitted walls, from the stem.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Place 2 g of the powdered drug (355) (*2.9.12*) in 50 ml of boiling *water R* and allow to stand for 5 min, shaking the flask several times. After cooling, add 5 ml of a 100 g/l solution of *lead acetate R*. Mix and filter. Rinse the flask and the residue on the filter with 20 ml of *water R*. Shake the filter with 50 ml of *methylene chloride R*. Separate the organic layer, dry over *anhydrous sodium sulphate R*, filter and evaporate the filtrate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *ethanol (96 per cent) R*.

Reference solution. Dissolve 2 mg of *methyl red R* and 2 mg of *resorcinol R* in 10.0 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *acetone R, glacial acetic acid R, toluene R, methylene chloride R* (10:10:30:50 *V/V/V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection A: spray with *acetic anhydride-sulphuric acid solution R* and examine in daylight.

Results A: the chromatogram obtained with the test solution shows a blue zone due to artabsin shortly above a red zone due to methyl red in the chromatogram obtained with the reference solution.

Detection B: examine in daylight while heating at 100-105 °C for 5 min.

Results B: the chromatogram obtained with the reference solution shows in the middle third a red zone due to methyl red and below it a light pink zone due to resorcinol. The chromatogram obtained with the test solution shows an intense red or brownish-red zone due to absinthin with a similar R_F value to that of the zone due to resorcinol in the chromatogram obtained with the reference solution. Other zones are visible, but less intense than that due to absinthin.

TESTS

Foreign matter (*2.8.2*): maximum 5 per cent of stems with a diameter greater than 4 mm and maximum 2 per cent of other foreign matter.

Bitterness value (*2.8.15*): minimum 10 000.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 12.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 1.0 per cent.

ASSAY

Carry out the determination of essential oil in herbal drugs (*2.8.12*). Use 50.0 g of the cut drug, a 1000 ml round-bottomed flask and 500 ml of *water R* as the distillation liquid. Add 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for not less than 3 h.

XANTHAN GUM

Xanthani gummi

DEFINITION

High-molecular-mass anionic polysaccharide produced by fermentation of carbohydrates with *Xanthomonas campestris*. It consists of a principal chain of β(1→4)-linked D-glucose units with trisaccharide side chains, on alternating anhydroglucose units, consisting of 1 glucuronic acid unit included between 2 mannose units. Most of the terminal units contain a pyruvate moiety and the mannose unit adjacent to the principal chain may be acetylated at C-6.

Xanthan gum has a relative molecular mass of approximately 1×10^6. It exists as the sodium, potassium or calcium salt.

Content: minimum 1.5 per cent of pyruvoyl groups ($C_3H_3O_2$; M_r 71.1) (dried substance).

CHARACTERS

Appearance: white or yellowish-white, free-flowing powder.

Solubility: soluble in water giving a highly viscous solution, practically insoluble in organic solvents.

IDENTIFICATION

A. In a flask, suspend 1 g in 15 ml of *0.1 M hydrochloric acid*. Close the flask with a fermentation bulb containing *barium hydroxide solution R* and heat carefully for 5 min. The barium hydroxide solution shows a white turbidity.

B. To 300 ml of *water R*, previously heated to 80 °C and stirred rapidly with a mechanical stirrer in a 400 ml beaker, add, at the point of maximum agitation, a dry blend of 1.5 g of *carob bean gum R* and 1.5 g of the substance to be examined. Stir until the mixture forms a solution, and then continue stirring for 30 min or longer. Do not allow the water temperature to drop below 60 °C during stirring. Discontinue stirring and allow the mixture to stand for at least 2 h. A firm rubbery gel forms after the temperature drops below 40 °C but no such gel forms in a 1 per cent control solution of the sample prepared in the same manner but omitting the carob bean gum.

TESTS

pH (*2.2.3*): 6.0 to 8.0 for a 10.0 g/l solution.

Viscosity (*2.2.10*): minimum 600 mPa·s.

Add 3.0 g within 45-90 s into 250 ml of a 12 g/l solution of *potassium chloride R* in a 500 ml beaker stirring with a low-pitch propeller-type stirrer rotating at 800 r/min. When adding the substance take care that agglomerates are destroyed. Add an additional quantity of 44 ml of *water R*, to rinse any adhering residue from the walls of the beaker. Stir the preparation at 800 r/min for 2 h whilst maintaining the temperature at 24 ± 1 °C. Determine the viscosity within 15 min at 24 ± 1 °C using a rotating viscosimeter set at 60 r/min and equipped with a rotating spindle 12.7 mm in diameter and 1.6 mm high which is attached to a shaft 3.2 mm in diameter. The distance from the top of the cylinder to the lower tip of the shaft being 25.4 mm, and the immersion depth being 50.0 mm.

2-Propanol. Gas chromatography (*2.2.28*).

Internal standard solution. Dilute 0.50 g of *2-methyl-2-propanol R* to 500 ml with *water R*.

Test solution. To 200 ml of *water R* in a 1000 ml round-bottomed flask, add 5.0 g of the substance to be examined and 1 ml of a 10 g/l emulsion of *dimeticone R* in *liquid paraffin R*, stopper the flask and shake for 1 h. Distil about 90.0 ml, mix the distillate with 4.0 ml of the internal standard solution and dilute to 100.0 ml with *water R*.

Reference solution. Dilute a suitable quantity of *2-propanol R*, accurately weighed, with *water R* to obtain a solution having a known concentration of 2-propanol of about 1 mg/ml. To 4.0 ml of this solution add 4.0 ml of the internal standard solution and dilute to 100.0 ml with *water R*.

Column:

– *size*: *l* = 1.8 m, Ø = 4.0 mm;

– *stationary phase*: *styrene-divinylbenzene copolymer R*.

Carrier gas: *helium for chromatography R*.

Flow rate: 30 ml/min.

Temperature:

– *column*: 165 °C;

– *injection port and detector*: 200 °C.

Detection: flame ionisation.

Injection: 5 µl.

Relative retention with reference to 2-propanol: 2-methyl-2-propanol = about 1.5.

Limit:

– *2-propanol*: maximum 750 ppm.

Other polysaccharides. Thin-layer chromatography (*2.2.27*).

Test solution. To 10 mg of the substance to be examined in a thick-walled centrifuge test tube add 2 ml of a 230 g/l solution of *trifluoroacetic acid R*, shake vigorously to dissolve the forming gel, stopper the test tube, and heat the mixture at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant liquid carefully into a 50 ml flask, add 10 ml of *water R* and evaporate the solution to dryness under reduced pressure. Take up the residue thus obtained in 10 ml of *water R* and evaporate to dryness under reduced pressure. Wash 3 times with 20 ml of *methanol R* and evaporate under reduced pressure. To the resulting clear film which has no odour of acetic acid, add 0.1 ml of *water R* and 1 ml of *methanol R*. Centrifuge to separate the amorphous precipitate. Dilute the supernatant liquid, if necessary, to 1 ml with *methanol R*.

Reference solution. Dissolve 10 mg of *glucose R* and 10 mg of *mannose R* in 2 ml of *water R* and dilute to 10 ml with *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: 16 g/l solution of *sodium dihydrogen phosphate R, butanol R, acetone R* (10:40:50 *V/V/V*).

Application: 5 µl, as bands.

Development: over a path of 15 cm.

Detection: spray with a solution of 0.5 g of *diphenylamine R* in 25 ml of *methanol R* to which 0.5 ml of *aniline R* and 2.5 ml of *phosphoric acid R* have been added. Heat for 5 min at 120 °C and examine in daylight.

System suitability: reference solution:

– the chromatogram shows 2 clearly separated greyish-brown zones due to glucose and mannose in the middle third.

Results: the chromatogram obtained with the test solution shows 2 zones corresponding to the zones due to glucose and mannose in the chromatogram obtained with the reference solution. In addition, 1 weak reddish and 2 faint

bluish-grey bands may be visible just above the starting line. 1 or 2 bluish-grey bands may also be seen in the upper quarter of the chromatogram. No other bands are visible.

Loss on drying (*2.2.32*): maximum 15.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2.5 h.

Total ash (*2.4.16*): 6.5 per cent to 16.0 per cent.

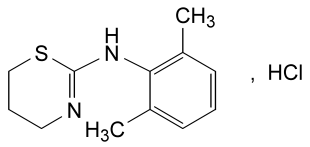
Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 bacteria and 10^2 fungi per gram, determined by plate count. It complies with the test for *Escherichia coli* (*2.6.13*).

ASSAY

Test solution. Dissolve a quantity of the substance to be examined corresponding to 120.0 mg of the dried substance in *water R* and dilute to 20.0 ml with the same solvent.

Reference solution. Dissolve 45.0 mg of *pyruvic acid R* in *water R* and dilute to 500.0 ml with the same solvent.

Place 10.0 ml of the test solution in a 50 ml round-bottomed flask, add 20.0 ml of *0.1 M hydrochloric acid* and weigh. Boil on a water-bath under a reflux condenser for 3 h. Weigh and adjust to the initial mass with *water R*. In a separating funnel mix 2.0 ml of the solution with 1.0 ml of *dinitrophenylhydrazine-hydrochloric solution R*. Allow to stand for 5 min and add 5.0 ml of *ethyl acetate R*. Shake and allow the solids to settle. Collect the upper layer and shake with 3 quantities, each of 5.0 ml, of *sodium carbonate solution R*. Combine the aqueous layers and dilute to 50.0 ml with *sodium carbonate solution R*. Mix. Treat 10.0 ml of the reference solution at the same time and in the same manner as for the test solution.



Immediately measure the absorbance (*2.2.25*) of the 2 solutions at 375 nm, using *sodium carbonate solution R* as the compensation liquid.

The absorbance of the test solution is not less than that of the reference solution, which corresponds to a content of pyruvic acid of not less than 1.5 per cent.

corrected 6.0

XYLAZINE HYDROCHLORIDE FOR VETERINARY USE

Xylazini hydrochloridum ad usum veterinarium

$C_{12}H_{17}ClN_2S$ M_r 256.8
[23076-35-9]

DEFINITION

N-(2,6-Dimethylphenyl)-5,6-dihydro-4*H*-1,3-thiazin-2-amine hydrochloride.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder, hygroscopic.

Solubility: freely soluble in water, very soluble in methanol, freely soluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *xylazine hydrochloride CRS*.

B. It gives reaction (b) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R*, heating at 60 °C if necessary; allow to cool and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (*2.2.1*) and is colourless (*2.2.2, Method II*).

pH (*2.2.3*): 4.0 to 5.5 for solution S.

Impurity A: maximum 100 ppm.

Solution A. Dissolve 0.25 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent. This solution is used to prepare the test solution.

Solution B. Dissolve 50 mg of *2,6-dimethylaniline R* in *methanol R* and dilute to 100 ml with the same solvent. Dilute 1 ml of the solution to 100 ml with *methanol R*. This solution is used to prepare the reference solution.

Using 2 flat-bottomed tubes with an inner diameter of about 10 mm, place in the first tube 2 ml of solution A, and in the second tube 1 ml of solution B and 1 ml of *methanol R*. To each tube add 1 ml of a freshly prepared 10 g/l solution of *dimethylaminobenzaldehyde R* in *methanol R* and 2 ml of *glacial acetic acid R* and allow to stand at room temperature for 10 min. Compare the colours in diffused daylight, viewing vertically against a white background. Any yellow colour in the test solution is not more intense than that in the reference solution.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Solvent mixture. Mix 8 volumes of *acetonitrile R*, 30 volumes of *methanol R* and 62 volumes of a 2.72 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 7.2 with *dilute sodium hydroxide solution R*.

Test solution. Dissolve 0.100 g of the substance to be examined in the solvent mixture and dilute to 20.0 ml with the solvent mixture.

Reference solution. Dissolve 5.0 mg of the substance to be examined, 5.0 mg of *2,6-dimethylaniline R*, 5.0 mg of *xylazine impurity C CRS* and 5.0 mg of *xylazine impurity E CRS* in *acetonitrile R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.15 m, Ø = 3.9 mm,
– *stationary phase*: *end-capped octylsilyl silica gel for chromatography with polar incorporated groups R* (5 µm),
– *temperature*: 40 °C.

Mobile phase:

– *mobile phase A*: mix 30 volumes of *methanol R* and 70 volumes of a 2.72 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 7.2 with *dilute sodium hydroxide solution R*,
– *mobile phase B*: *methanol R, acetonitrile R* (30:70 *V/V*),

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	89 → 28	11 → 72
15 - 21	28	72
21 - 22	28 → 89	72 → 11
22 - 33	89	11

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 230 nm.

Equilibration: for at least 30 min with a mixture of 28 volumes of mobile phase A and 72 volumes of mobile phase B.

Injection: 20 µl.

Relative retention with reference to xylazine (retention time = about 7.5 min): impurity A = about 0.8; impurity E = about 1.6; impurity C = about 2.2.

System suitability: reference solution:

– *resolution*: minimum 4.0 between the peaks due to impurity A and xylazine.

Limits:

– *impurities C, E*: for each impurity, not more than twice the area of the corresponding peak in the chromatogram obtained with the reference solution (0.2 per cent),

– *impurities B, D*: for each impurity, not more than twice the area of the peak due to xylazine in the chromatogram obtained with the reference solution (0.2 per cent),

– *any other impurity*: for each impurity, not more than twice the area of the peak due to xylazine in the chromatogram obtained with the reference solution (0.2 per cent),

– *total of impurities other than B, C, D and E*: not more than twice the area of the peak due to xylazine in the chromatogram obtained with the reference solution (0.2 per cent),

– *disregard limit*: 0.5 times the area of the peak due to xylazine in the chromatogram obtained with the reference solution (0.05 per cent); disregard any peak due to the blank.

Heavy metals (*2.4.8*): maximum 10 ppm.

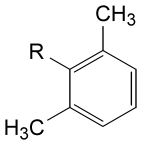
12 ml of solution S complies with limit test A. Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 25 ml of *alcohol R*. Add 25 ml of *water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).



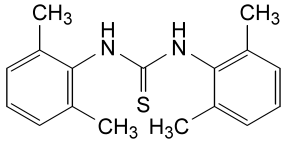
1 ml of *0.1 M sodium hydroxide* is equivalent to 25.68 mg of $C_{12}H_{17}ClN_2S$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.

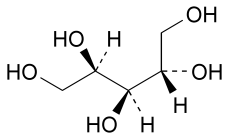


A. R = NH_2: 2,6-dimethylaniline (2,6-xylidine),

C. R = N=C=S: 2,6-dimethylphenyl isothiocyanate,

D. R = NH-CS-NH-$[CH_2]_3$-OH: *N*-(2,6-dimethylphenyl)-*N'*-(3-hydroxypropyl)thiourea,

E. R = NH-CS-S-CH_3: methyl (2,6-dimethylphenyl)carbamodithioate,



B. *N,N'*-bis(2,6-dimethylphenyl)thiourea.

01/2008:1381

XYLITOL

Xylitolum

$C_5H_{12}O_5$ M_r 152.1
[87-99-0]

DEFINITION

Xylitol contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of *meso*-xylitol, calculated with reference to the anhydrous substance.

CHARACTERS

White or almost white, crystalline powder or crystals, very soluble in water, sparingly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Melting point (*2.2.14*): 92 °C to 96 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *xylitol CRS*. Examine the substance prepared as a mull in *liquid paraffin R*.

C. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel G plate R*.

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 5.0 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *xylitol CRS* in *water R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dissolve 25 mg of *mannitol CRS* and 25 mg of *xylitol CRS* in *water R* and dilute to 5 ml with the same solvent.

Apply to the plate 2 µl of each solution. Develop over a path of 17 cm using a mixture of 10 volumes of *water R*, 20 volumes of *ethyl acetate R* and 70 volumes of *propanol R*. Allow the plate to dry in air and spray with *4-aminobenzoic acid solution R*. Dry the plate in a current of cold air until the acetone is removed. Heat the plate at 100 °C for 15 min. Allow to cool and spray with a 2 g/l solution of *sodium periodate R*. Dry the plate in a current of cold air. Heat the plate at 100 °C for 15 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

TESTS

Appearance of solution. Dissolve 2.5 g in *water R* and dilute to 50.0 ml with the same solvent. The solution is not more opalescent than reference suspension IV (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

Conductivity (*2.2.38*). Not more than 20 $\mu S \cdot cm^{-1}$.

Dissolve 20.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent. Measure the conductivity of the solution while gently stirring with a magnetic stirrer.

Reducing sugars. Dissolve 5.0 g in 6 ml of *water R* with the aid of gentle heat. Cool and add 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R* and, when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required (0.2 per cent, calculated as glucose equivalent).

Related substances. Examine by gas chromatography (*2.2.28*) as described under Assay. The sum of the percentage contents of the related substances in the chromatogram obtained with test solution (a) is not greater than 2.0 per cent.

Lead (*2.4.10*). It complies with the limit test for lead in sugars (0.5 ppm). Dissolve the substance to be examined in 150.0 ml of the prescribed mixture of solvents.

Nickel (*2.4.15*). It complies with the limit test for nickel in polyols (1 ppm). Dissolve the substance to be examined in 150.0 ml of the prescribed mixture of solvents.

Water (*2.5.12*). Not more than 1.0 per cent, determined on 1.00 g.

Bacterial endotoxins (*2.6.14*): if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins, less than 4 IU/g for parenteral dosage forms having a concentration of less than 100 g/l of xylitol and less than 2.5 IU/g for parenteral dosage forms having a concentration of 100 g/l or more of xylitol.

ASSAY

Examine by gas chromatography (*2.2.28*), using erythritol as the internal standard.

Internal standard solution. Dissolve 5 mg of *erythritol R* in *water R* and dilute to 25.0 ml with the same solvent.

Test solution (a). Dissolve 5.000 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *water R*.

Reference solution (a). Dissolve 5.0 mg each of *L-arabinitol CRS*, *galactitol CRS*, *mannitol CRS* and *sorbitol CRS* in *water R* and dilute to 20.0 ml with the same solvent.

Reference solution (b). Dissolve 50.0 mg of *xylitol CRS* in *water R* and dilute to 10.0 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a stainless steel column 2 m long and 2 mm in internal diameter packed with acid washed *silanised diatomaceous earth for gas chromatography R* (150-180 µm) and impregnated with 3 per cent *m/m* of *poly[(cyanopropyl)(methyl)][(phenyl)(methyl)]siloxane R*,
- *nitrogen R* as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 170 °C for 1 min, then raising the temperature at a rate of 6 °C/min to 200 °C and maintaining the temperature of the injection port and of the detector at 250 °C.

Pipet 1.0 ml of reference solutions (a) and (b) and test solutions (a) and (b) into 4 separate 100 ml round-bottomed flasks. Add 1.0 ml of the internal standard solution separately to the flasks with test solution (a) and reference solution (a) and 5.0 ml of the internal standard solution separately to the flasks with test solution (b) and reference solution (b). Evaporate the respective mixtures to dryness in a water-bath at 60 °C with the aid of a rotary evaporator. Dissolve each dry residue in 1 ml of *anhydrous pyridine R* and add 1 ml of *acetic anhydride R* to each flask and boil each solution under reflux for 1 h to complete acetylation.

Inject 1 µl of each of the solutions obtained from the reference solutions and the test solutions.

When the chromatograms are recorded in the prescribed conditions, the relative retentions calculated with reference to xylitol are: erythritol about 0.3, arabinitol about 0.7, mannitol about 1.8, galactitol about 2.0 and sorbitol about 2.2.

Calculate the percentage content of $C_5H_{12}O_5$ from the expression:

$$T \times \frac{m_t}{m_v} \times \frac{R_v}{R_t}$$

- T = declared content of *xylitol CRS* in percentage;
- m_t = mass of *xylitol CRS* in 1 ml of reference solution (b), in milligrams;
- m_v = mass of the substance to be examined in 1 ml of test solution (b), in milligrams;
- R_t = ratio of the areas of the derivatised xylitol peak to the derivatised erythritol peak in the chromatogram obtained with reference solution (b);
- R_v = ratio of the areas of the derivatised xylitol peak to the derivatised erythritol peak in the chromatogram obtained with test solution (b).

Calculate the percentage content of each related substance in the substance to be examined from the expression:

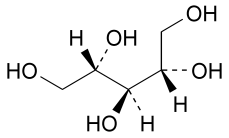
$$100 \times \frac{m_s}{m_u} \times \frac{R_u}{R_s}$$

m_s = mass of the respective component in 1 ml of reference solution (a), in milligrams;

m_u = mass of the substance to be examined in 1 ml of test solution (a), in milligrams;

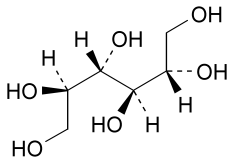
R_s = ratio of the areas of the derivatised component peak to the derivatised erythritol peak in the chromatogram obtained with reference solution (a);

R_u = ratio of the areas of the derivatised component peak to the derivatised erythritol peak in the chromatogram obtained with test solution (a).



LABELLING

The label states:



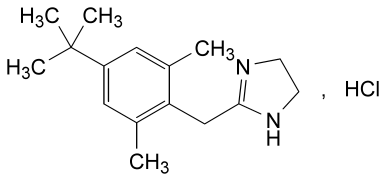
– where applicable, the maximum concentration of bacterial endotoxins,

– where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

IMPURITIES

A. L-arabinitol,

B. *meso*-galactitol,



C. mannitol,

D. sorbitol.

corrected 6.0

XYLOMETAZOLINE HYDROCHLORIDE

Xylometazolini hydrochloridum

$C_{16}H_{25}ClN_2$ M_r 280.8
[1218-35-5]

DEFINITION

2-[4-(1,1-Dimethylethyl)-2,6-dimethylbenzyl]-4,5-dihydro-1*H*-imidazole hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, in ethanol (96 per cent) and in methanol.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *xylometazoline hydrochloride CRS.*

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 20 mg of *xylometazoline hydrochloride CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: *concentrated ammonia R, methanol R* (5:100 *V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in air.

Chlorine treatment: at the bottom of a chromatography tank place a beaker containing a mixture of 1 volume of *hydrochloric acid R1,* 1 volume of *water R* and 2 volumes of a 15 g/l solution of *potassium permanganate R.* Close the tank and allow to stand for 15 min. Place the dried plate in the tank and reclose the tank. Leave the plate in contact with the chlorine vapour for 5 min. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed and an area of the coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution R.*

Detection: spray with *potassium iodide and starch solution R.*

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. Dissolve about 0.5 mg in 1 ml of *methanol R.* Add 0.5 ml of a freshly prepared 50 g/l solution of *sodium nitroprusside R* and 0.5 ml of a 20 g/l solution of *sodium hydroxide R.* Allow to stand for 10 min and add 1 ml of an 80 g/l solution of *sodium bicarbonate R.* A violet colour develops.

D. Dissolve 0.2 g in 1 ml of *water R,* add 2.5 ml of *ethanol (96 per cent) R* and 2 ml of *1 M sodium hydroxide.* Mix thoroughly and examine in ultraviolet light at 365 nm. The solution shows no fluorescence or at most the same fluorescence as a blank solution prepared in the same manner. The identification is not valid unless a solution prepared in the same manner using *naphazoline hydrochloride CRS* instead of the substance to be examined shows a distinct bluish fluorescence.

E. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Dissolve 2.5 g in *water R* and dilute to 50.0 ml with the same solvent.

Acidity or alkalinity. Dissolve 0.25 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent. Add 0.1 ml of *methyl red solution R* and 0.1 ml of *0.01 M*

hydrochloric acid. The solution is red. Not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to yellow.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent. Allow to stand for 1 h before injection.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with *water R*. Dilute 2.0 ml of this solution to 100.0 ml with *water R*.

Reference solution (b). Dissolve 5.0 mg of *xylometazoline impurity A CRS* and 5 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent. Dilute 10.0 ml of this solution to 50.0 ml with *water R*.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 50.0 ml with *water R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography with polar incorporated groups R* (5 µm).

Mobile phase:

– *mobile phase A*: 1.36 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 3.0 with *phosphoric acid R*;

– *mobile phase B*: *acetonitrile R1*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	70	30
5 - 20	70 → 15	30 → 85
20 - 35	15	85
35 - 37	15 → 70	85 → 30
37 - 47	70	30

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 10 µl.

Relative retention with reference to xylometazoline (retention time = about 7.2 min): impurity A = about 0.79.

System suitability: reference solution (b):

– *resolution*: minimum 2.5 between the peaks due to impurity A and xylometazoline.

Limits:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.2 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

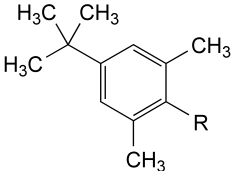
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 25 ml of *anhydrous acetic acid R* and add 10 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 28.08 mg of $C_{16}H_{25}ClN_2$.



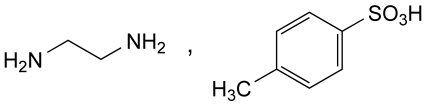
STORAGE

Protected from light.

IMPURITIES

Specified impurities: A.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, E, F.*



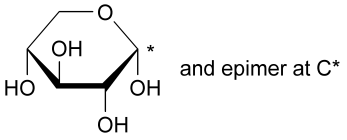
A. R = CH_2-CO-NH-CH_2-CH_2-NH_2: *N*-(2-aminoethyl)-2-[4-(1,1-dimethylethyl)-2,6-dimethylphenyl]acetamide,

B. R = CH_2-Cl: 2-(chloromethyl)-5-(1,1-dimethylethyl)-1,3-dimethylbenzene,

C. R = CH_2-CN: [4-(1,1-dimethylethyl)-2,6-dimethylphenyl]acetonitrile,

D. R = H: 1-(1,1-dimethylethyl)-3,5-dimethylbenzene,

F. CH_2-CO_2H: [4-(1,1-dimethylethyl)-2,6-dimethylphenyl]acetic acid,



E. ethane-1,2-diamine mono(4-methylbenzenesulphonate).

XYLOSE

Xylosum

$C_5H_{10}O_5$ M_r 150.1
[58-86-6]

DEFINITION

(+)-D-Xylopyranose.

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless needles.

Solubility: freely soluble in water, soluble in hot ethanol (96 per cent).

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *xylose CRS*.

B. Thin-layer chromatography (*2.2.27*).

Solvent mixture: *water R, methanol R* (2:3 *V/V*).

Test solution. Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (a). Dissolve 10 mg of *xylose CRS* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (b). Dissolve 10 mg of *fructose R*, 10 mg of *glucose R* and 10 mg of *xylose R* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Plate: *TLC silica gel plate R*.

Mobile phase: *water R, methanol R, anhydrous acetic acid R, ethylene chloride R* (10:15:25:50 *V/V/V/V*); measure the volumes accurately since a slight excess of water produces cloudiness.

Application: 2 µl; thoroughly dry the starting points.

Development: over a path of 15 cm.

Drying: in a current of warm air.

Detection: spray with a 5 g/l solution of *thymol R* in a mixture of 5 volumes of *sulphuric acid R* and 95 volumes of *ethanol (96 per cent) R*. Heat in an oven at 130 °C for 10 min.

System suitability: reference solution (b):

– the chromatogram shows 3 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in 10 ml of *water R*. Add 3 ml of *cupri-tartaric solution R* and heat. An orange or red precipitate is formed.

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 50 ml of solution S add 0.3 ml of *phenolphthalein solution R1*. The solution is colourless. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to pink.

Specific optical rotation (*2.2.7*): + 18.5 to + 19.5 (dried substance).

Dissolve 10.0 g in 80 ml of *water R*, add 1 ml of *dilute ammonia R2* and dilute to 100.0 ml with *water R*. Allow to stand for 30 min.

Chlorides (*2.4.4*): maximum 330 ppm.

Dilute 1.5 ml of solution S to 15 ml with *water R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C at a pressure not exceeding 0.7 kPa.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

Y

Yarrow.....3243 Yohimbine hydrochloride.....3244

01/2008:1382
corrected 6.0

YARROW

Millefolii herba

DEFINITION

Whole or cut, dried flowering tops of *Achillea millefolium* L.

Content:

– *essential oil*: minimum 2 ml/kg (dried drug);
– *proazulenes, expressed as chamazulene* ($C_{14}H_{16}$; M_r 184.3): minimum 0.02 per cent (dried drug).

IDENTIFICATION

A. The leaves are green or greyish-green, faintly pubescent on the upper surface and more pubescent on the lower surface, 2-3 pinnately divided with linear lobes and a finely pointed whitish tip. The capitula are arranged in a corymb at the end of the stem. Each capitulum, 3-5 mm in diameter, consists of the receptacle, usually 4-5 ligulate ray-florets and 3-20 tubular disk-florets. The involucre consists of 3 rows of imbricate lanceolate, pubescent green bracts arranged with a brownish or whitish, membranous margin. The receptacle is slightly convex and, in the axillae of paleae, bears a ligulate ray floret with a three-lobed, whitish or reddish ligule and tubular disk-florets with a radial, five-lobed, yellowish or light brownish corolla. The pubescent green, partly brown or violet stems are longitudinally furrowed, up to 3 mm thick with a light-coloured medulla.

B. Reduce to a powder (355) (*2.9.12*). The powder is green or greyish-green. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the stems, leaves and bracts bearing very rare glandular trichomes with a short stalk and a head formed of 2 rows of 3-5 cells enclosed in a bladder-like membrane and uniseriate covering trichomes consisting of 4-6 small, more or less isodiametric cells at the base and a thick-walled, often somewhat tortuous terminal cell, about 400 µm to greater than 1000 µm long; fragments of the ligulate corolla with papillary epidermal cells; small-celled parenchyma from the corolla tubes containing cluster crystals of calcium oxalate; groups of lignified and pitted cells from the bracts; spherical pollen grains, about 30 µm in diameter, with 3 germinal pores and spiny exine; groups of sclerenchymatous fibres and small vessels with spiral or annular thickening, from the stem.

C. To 2.0 g of the powdered drug (710) (*2.9.12*) add 25 ml of *ethyl acetate R*, shake for 5 min and filter. Evaporate to dryness on a water-bath and dissolve the residue in 0.5 ml of *toluene R* (solution A). To 0.1 ml of this solution add 2.5 ml of *dimethylaminobenzaldehyde solution R8* and heat on a water-bath for 2 min. Allow to cool. Add 5 ml of *light petroleum R* and shake the mixture vigorously. The aqueous layer shows a blue or greenish-blue colour.

D. Thin-layer chromatography (*2.2.27*).

Test solution. Use solution A prepared in identification test C.

Reference solution. Dissolve 10 mg of *cineole R* and 10 mg of *guaiazulene R* in 20 ml of *toluene R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 20 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min and examine in daylight.

Results: the chromatogram obtained with the reference solution shows in the upper part a red zone (guaiazulene) and in the middle part a blue or greyish-blue zone (cineole). The chromatogram obtained with the test solution shows a violet zone a little above the zone due to guaiazulene in the chromatogram obtained with the reference solution; below this zone a reddish-violet zone; below which, 1-2 not clearly separated greyish-violet or greyish zones (which changes to greenish-grey after a few hours) and a reddish-violet zone a little above the zone due to cineole in the chromatogram obtained with the reference solution. Further faint zones are present.

TESTS

Foreign matter (*2.8.2*): maximum 5 per cent of stems with a diameter greater than 3 mm and maximum 2 per cent of other foreign matter.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 0.500 g of powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 10.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 2.5 per cent.

ASSAY

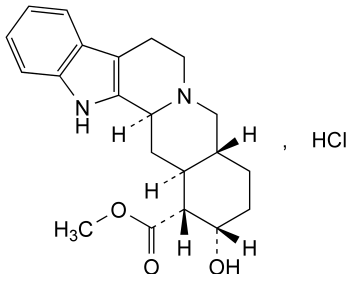
Essential oil. Carry out the determination of essential oils in herbal drugs (*2.8.12*). Use 20.0 g of cut drug, a 1000 ml round-bottomed flask and 500 ml of a mixture of 1 volume of *water R* and 9 volumes of *ethylene glycol R* as the distillation liquid. Add 0.2 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

Stop cooling at the end of distillation and continue distilling until the blue, steam-volatile components have reached the lower end of the cooler. Immediately start cooling again, taking care to avoid warming the separation space. Stop the distillation after 5 min. Replace the 1000 ml round-bottomed flask by a 250 ml round-bottomed flask containing a mixture of 0.4 ml of *xylene R* and 50 ml of *water R*. Distil for 15 min. After 10 min read the total volume. To determine the blank value, use 0.2 ml of *xylene R* in the graduated tube and distil a mixture of 0.4 ml of *xylene R* and 50 ml of *water R* for 15 min.

Proazulenes. To ensure that as little water as possible is transferred, transfer the blue essential oil-xylene mixture obtained in the assay of essential oil into a 50 ml volumetric flask with the aid of small portions of *xylene R*, rinsing the graduated tube of the apparatus with *xylene R* and dilute to 50.0 ml with the same solvent. Measure the absorbance (*2.2.25*) at 608 nm using *xylene R* as the compensation liquid.

Calculate the percentage content of proazulenes, expressed as chamazulene, using the following expression:

$$\frac{A \times 2.1}{m}$$



i.e. taking the specific absorbance of chamazulene to be 23.8.

A = absorbance at 608 nm;
m = mass of the drug to be examined, in grams.

01/2008:2172

YOHIMBINE HYDROCHLORIDE

Yohimbini hydrochloridum

$C_{21}H_{27}ClN_2O_3$ M_r 390.9
[65-19-0]

DEFINITION

Methyl 17α-hydroxyyohimban-16α-carboxylate hydrochloride.

Content: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or slightly yellowish, crystalline powder.

Solubility: sparingly soluble in water, practically insoluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *yohimbine hydrochloride CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 0.500 g in *carbon dioxide-free water R* with heating, allow to cool to room temperature and dilute to 50.0 ml with the same solvent.

pH (*2.2.3*): 3.5 to 5.5 for solution S.

Specific optical rotation (*2.2.7*): + 101.0 to + 105.0 (dried substance), determined on solution S.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions protected from light.*

Test solution. Dissolve 10.0 mg of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *yohimbine hydrochloride CRS* (containing impurities A, F and G) in *methanol R* and dilute to 25.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol R*.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with *methanol R*.

Column:

- *size*: *l* = 0.125 m, Ø = 4.0 mm;
- *stationary phase*: *octylsilyl silica gel for chromatography R* (4 µm);
- *temperature*: 40 °C.

Mobile phase: mix 50 ml of a 9.08 g/l solution of *potassium dihydrogen phosphate R*, 100 ml of an 11.88 g/l solution of *disodium hydrogen phosphate dihydrate R*, 285 ml of *acetonitrile R*, 4.0 g of *sodium laurilsulfate R* and 355 ml of *water R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 229 nm.

Injection: 10 µl.

Run time: 3 times the retention time of yohimbine.

Relative retention with reference to yohimbine (retention time = about 7 min): impurity F = about 0.65; impurity G = about 0.70; impurity A = about 0.75.

System suitability: reference solution (a):

- *peak-to-valley ratio*: minimum 1.3, where H_p = height above the baseline of the peak due to impurity G and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity A; and minimum 1.3, where H_p = height above the baseline of the peak due to impurity G and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity F.

Limits:

- *sum of impurities A and G*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
- *impurity F*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.4 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.10 per cent);
- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

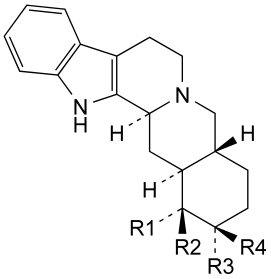
ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{21}H_{27}ClN_2O_3$ from the declared content of *yohimbine hydrochloride CRS*.

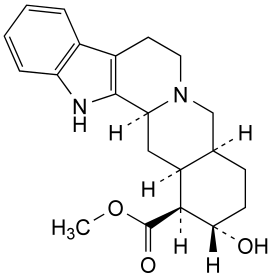
STORAGE



In an airtight container, protected from light.

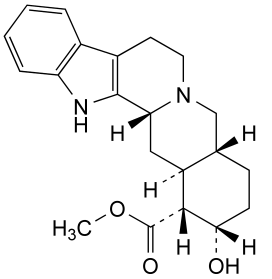
IMPURITIES

Specified impurities: *A, F, G*.

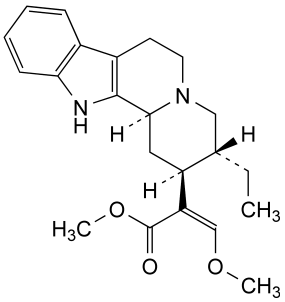


Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, E*.

Monographs T-Z



A. R1 = CO-OCH_3, R2 = R3 = H, R4 = OH: methyl 17β-hydroxyyohimban-16α-carboxylate (β-yohimbine),



C. R1 = R4 = H, R2 = CO-OCH_3, R3 = OH: methyl 17α-hydroxyyohimban-16β-carboxylate (corynantheine),

B. methyl 17α-hydroxy-20α-yohimban-16β-carboxylate (α-yohimbine),

D. methyl 17α-hydroxy-3β-yohimban-16α-carboxylate (pseudo-yohimbine),

E. methyl (2*Z*)-2-[(2*S*,3*R*,12b*S*)-3-ethyl-1,2,3,4,6,7,12,12b-octahydroindolo[2,3-*a*]quinolizin-2-yl]-3-methoxyprop-2-enoate,

F. unknown structure,

G. unknown structure.

ZIDOVUDINE

Zidovudinum

$C_{10}H_{13}N_5O_4$ M_r 267.2
[30516-87-1]

DEFINITION

1-(3-Azido-2,3-dideoxy-β-D-*erythro*-pentofuranosyl)-5-methylpyrimidine-2,4(1*H*,3*H*)-dione.

Content: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or brownish powder.

Solubility: sparingly soluble in water, soluble in anhydrous ethanol.

mp: about 124 °C.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *zidovudine CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *water R*, evaporate to dryness in a desiccator, under high vacuum over *diphosphorus pentoxide R* and record new spectra using the residues.

TESTS

Appearance of solution. The solution is not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

Dissolve 0.5 g in 50 ml of *water R*, heating if necessary.

Specific optical rotation (*2.2.7*): + 60.5 to + 63.0 (dried substance).

Dissolve 0.50 g in *anhydrous ethanol R* and dilute to 50.0 ml with the same solvent. Carry out the determination at 25 °C.

Related substances

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *thymine R* (impurity C), 5 mg of *zidovudine impurity A CRS* and 5 mg of *triphenylmethanol R* (impurity D) in *methanol R*, add 0.25 ml of the test solution and dilute to 25 ml with *methanol R*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 10 ml with *methanol R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *methanol R, methylene chloride R* (10:90 *V/V*).

Application: 10 µl.

Development: over a path of 12 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Limits:

– *impurity A*: any spot due to impurity A is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *any other impurity*: any other spot apart from the principal spot and any spot due to impurity C (which is limited by liquid chromatography) is not more intense than the spot due to zidovudine in the chromatogram obtained with reference solution (b) (0.5 per cent).

Detection B: spray with a 10 g/l solution of *vanillin R* in *sulphuric acid R*.

Limit:

– *impurity D*: any spot due to impurity D is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

System suitability: reference solution (a):

– the chromatogram shows 4 clearly separated spots, due to impurity C, impurity A, zidovudine and impurity D, in order of increasing R_F value.

B. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Test solution (b). Dilute 10.0 ml of test solution (a) to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *zidovudine CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *thymine R* (impurity C) in *methanol R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 5 mg of *zidovudine impurity B CRS* in 25.0 ml of reference solution (a) and dilute to 50.0 ml with the mobile phase.

Reference solution (d). Dilute 5.0 ml of reference solution (c) to 50.0 ml with the mobile phase.

Reference solution (e). Dilute 0.25 ml of test solution (a) to 50.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *methanol R, water R* (20:80 *V/V*).

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 265 nm.

Equilibration: with the mobile phase for about 45 min.

Injection: 10 µl of test solution (a) and reference solutions (b), (c), (d) and (e).

Run time: 1.5 times the retention time of zidovudine.

Elution order: impurity C, zidovudine, impurity B.

System suitability: reference solution (c):

– *resolution*: minimum 1.0 between the peaks due to zidovudine and impurity B.

Limits:

- *impurity C*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (2 per cent);
- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (1 per cent);
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (e) (0.5 per cent);
- *total*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (e) (3.0 per cent);
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (e) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.00 g complies with test D. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

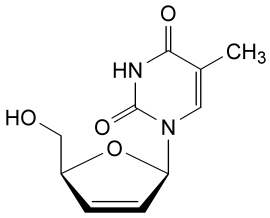
Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.25 per cent, determined on 1.00 g.

ASSAY

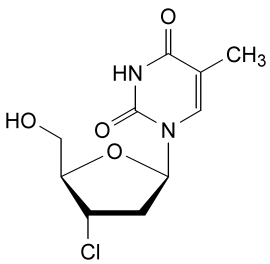
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution (b) and reference solution (a).



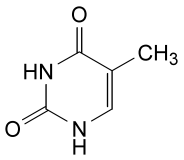
Calculate the content of $C_{10}H_{13}N_5O_4$ from the declared content of *zidovudine CRS*.

STORAGE

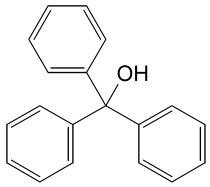


Protected from light.

IMPURITIES



Specified impurities: A, B, C, D.



A. 1-[(2*R*,5*S*)-5-(hydroxymethyl)-2,5-dihydrofuran-2-yl)-5-methylpyrimidine-2,4(1*H*,3*H*)-dione,

B. 1-(3-chloro-2,3-dideoxy-β-D-*erythro*-pentofuranosyl)-5-methylpyrimidine-2,4(1*H*,3*H*)-dione,

C. 5-methylpyrimidine-2,4(1*H*,3*H*)-dione (thymine),

D. triphenylmethanol.

ZINC ACETATE DIHYDRATE

Zinci acetas dihydricus

$C_4H_6O_4Zn,2H_2O$ M_r 219.5
[5970-45-6]

DEFINITION

Content: 99.0 per cent to 101.0 per cent of $C_4H_6O_4Zn,2H_2O$.

CHARACTERS

Appearance: white or almost white crystalline powder or flakes.

Solubility: freely soluble in water, soluble in ethanol (96 per cent).

IDENTIFICATION

A. It gives reaction (a) of acetates (*2.3.1*).

B. It gives the reaction of zinc (*2.3.1*).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 5.8 to 7.0.

Dilute 10 ml of solution S to 20 ml with *carbon dioxide-free water R*.

Reducing substances. Boil for 5 min a mixture of 10 ml of solution S, 90 ml of *water R*, 5 ml of *dilute sulphuric acid R* and 1.5 ml of a 0.3 g/l solution of *potassium permanganate R*. The pink colour of the solution remains.

Chlorides (*2.4.4*): maximum 50 ppm.

Dilute 10 ml of solution S with 15 ml of *water R*.

Sulphates (*2.4.13*): maximum 100 ppm, determined on solution S.

Aluminium: maximum 5.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 2.50 g in 20 ml of a 200 g/l solution of *cadmium- and lead-free nitric acid R* and dilute to 25.0 ml with the same acidic solution.

Reference solutions. Prepare the reference solutions using *aluminium standard solution (200 ppm Al) R*, diluted with a 200 g/l solution of *cadmium- and lead-free nitric acid R*.

Source: aluminium hollow-cathode lamp.

Wavelength: 309.3 nm.

Atomisation device: air-acetylene or acetylene-nitrous oxide flame.

Arsenic (*2.4.2, Method A*): maximum 2 ppm, determined on 0.5 g.

Cadmium: maximum 2.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Use the solution described in the test for aluminium.

Reference solutions. Prepare the reference solutions using *cadmium standard solution (0.1 per cent Cd) R*, diluted with a 200 g/l solution of *cadmium- and lead-free nitric acid R*.

Source: cadmium hollow-cathode lamp.

Wavelength: 228.8 nm.

Atomisation device: air-acetylene flame.

Copper: maximum 50.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Use the solution described in the test for iron.

Reference solutions. Prepare the reference solutions using *copper standard solution (10 ppm Cu) R*, diluted with a 200 g/l solution of *cadmium- and lead-free nitric acid R*.

Source: copper hollow-cathode lamp.

Wavelength: 324.8 nm.

Atomisation device: air-acetylene flame.

Iron: maximum 50.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 1.25 g in 20 ml of a 200 g/l solution of *cadmium- and lead-free nitric acid R* and dilute to 25.0 ml with the same acid solution.

Reference solutions. Prepare the reference solutions using *iron standard solution (20 ppm Fe) R*, diluted with a 200 g/l solution of *cadmium- and lead-free nitric acid R*.

Source: iron hollow-cathode lamp.

Wavelength: 248.3 nm.

Atomisation device: air-acetylene flame.

Lead: maximum 10.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 5.00 g in 20 ml of a 200 g/l solution of *cadmium- and lead-free nitric acid R* and dilute to 25.0 ml with the same acid solution.

Reference solutions. Prepare the reference solutions using *lead standard solution (0.1 per cent of Pb) R*, diluting with a 200 g/l solution of *cadmium- and lead-free nitric acid R*.

Source: lead hollow-cathode lamp.

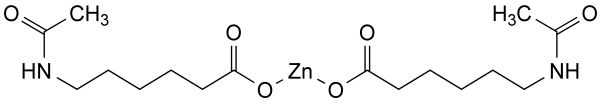
Wavelength: 283.3 nm.

Atomisation device: air-acetylene flame.

ASSAY

Dissolve 0.200 g in 5 ml of *dilute acetic acid R*. Carry out the complexometric titration of zinc (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 21.95 mg of $C_4H_6O_4Zn,2H_2O$.



STORAGE

In a non-metallic container.

01/2008:1279
corrected 6.0

ZINC ACEXAMATE

Zinci acexamas

$C_{16}H_{28}N_2O_6Zn$ M_r 409.8
[70020-71-2]

DEFINITION

Zinc 6-(acetylamino)hexanoate.

Content: 97.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water, practically insoluble in acetone and in ethanol (96 per cent). It dissolves in dilute nitric acid.

mp: about 198 °C.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Preparation: discs.
Comparison: *zinc acexamate CRS*.

B. 5 ml of solution S (see Tests) gives the reaction of zinc (*2.3.1*).

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension IV (*2.2.1*) and is colourless (*2.2.2, Method II*).

pH (*2.2.3*): 5.0 to 7.0 for solution S.

Impurity B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.30 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 15 mg of *6-aminohexanoic acid R* (impurity B) in *water R* and dilute to 10 ml with the same solvent. Dilute 1 ml of this solution to 10 ml with *water R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ammonia R, water R, ethanol (96 per cent) R* (2:30:68 *V/V/V*).

Application: 5 µl; allow to dry in air.

Development: over a path of 15 cm.

Drying: in a current of warm air.

Detection: spray with *ninhydrin solution R* and heat at 100-105 °C for 15 min.

Limit:

– *impurity B*: any spot due to impurity B is not more intense than the corresponding spot in the chromatogram obtained with the reference solution (0.5 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 0.50 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Test solution (b). To 20.0 ml of test solution (a), add 20 ml of the mobile phase and 0.4 ml of a 100 g/l solution of *phosphoric acid R*, then dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 40 mg of *N-acetyl-ε-caprolactam R* (impurity C) in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with *water R*.

Reference solution (c). Dissolve 20 mg of *zinc acexamate impurity A CRS* in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (d). Dissolve 40 mg of *ε-caprolactam R* (impurity D) in *water R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *water R*.

Reference solution (e). To 20.0 ml of test solution (a), add 5.0 ml of reference solution (b), 5.0 ml of reference solution (c), 5.0 ml of reference solution (d) and 0.4 ml of a 100 g/l solution of *phosphoric acid R*, then dilute to 50.0 ml with the mobile phase.

Reference solution (f). To 5.0 ml of reference solution (c), add 5.0 ml of reference solution (b), 5.0 ml of reference solution (d) and 0.4 ml of a 100 g/l solution of *phosphoric acid R*, then dilute to 50.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 0.2 volumes of *phosphoric acid R*, 8 volumes of *acetonitrile R* and 92 volumes of *water R*, then adjust to pH 4.5 with *dilute ammonia R1*.

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl of test solution (b) and reference solutions (e) and (f).

Run time: 8 times the retention time of zinc acexamate.

Elution order: zinc acexamate, impurity D, impurity A, impurity C.

System suitability: reference solution (e):

– *resolution*: minimum 3.0 between the peaks due to zinc acexamate and impurity D; if necessary, adjust the mobile phase to pH 4.7 with *dilute ammonia R1*.

Limits:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (2 per cent);

– *impurities C, D*: for each impurity, not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.1 per cent);

– *sum of impurities other than A*: not more than 5 times the area of the peak due to impurity C in the chromatogram obtained with reference solution (f) (0.5 per cent);

– *disregard limit*: 0.5 times the area of the peak due to impurity C in the chromatogram obtained with reference solution (f) (0.05 per cent).

Arsenic (*2.4.2, Method A*): maximum 2 ppm, determined on 0.5 g.

Cadmium: maximum 2.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 2.50 g in 20 ml of a 200 g/l solution of *cadmium- and lead-free nitric acid R* and dilute to 25.0 ml with the same acidic solution.

Reference solutions. Prepare the reference solutions using *cadmium standard solution (0.1 per cent Cd) R*, diluting with a 200 g/l solution of *cadmium- and lead-free nitric acid R*.

Source: cadmium hollow-cathode lamp.

Wavelength: 228.8 nm.

Atomisation device: air-acetylene flame.

Iron: maximum 50.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 1.25 g in 20 ml of a 200 g/l solution of *cadmium- and lead-free nitric acid R* and dilute to 25.0 ml with the same acidic solution.

Reference solutions. Prepare the reference solutions using *iron standard solution (20 ppm Fe) R*, diluting with a 200 g/l solution of *cadmium- and lead-free nitric acid R*.

Source: iron hollow-cathode lamp.

Wavelength: 248.3 nm.

Atomisation device: air-acetylene flame.

Lead: maximum 10.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 5.00 g in 20 ml of a 200 g/l solution of *cadmium- and lead-free nitric acid R* and dilute to 25.0 ml with the same acidic solution.

Reference solutions. Prepare the reference solutions using *lead standard solution (0.1 per cent Pb) R*, diluting with a 200 g/l solution of *cadmium- and lead-free nitric acid R*.

Source: lead hollow-cathode lamp.

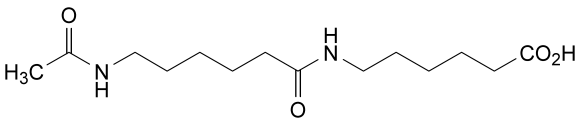
Wavelength: 283.3 nm.

Atomisation device: air-acetylene flame.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

ASSAY

Dissolve 0.400 g in 10 ml of *dilute acetic acid R*. Carry out the complexometric titration of zinc (*2.5.11*).

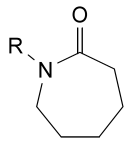


1 ml of *0.1 M sodium edetate* is equivalent to 40.98 mg of $C_{16}H_{28}N_2O_6Zn$.

STORAGE

In a non-metallic container.

IMPURITIES



Specified impurities: A, B, C, D.

A. 6-[[6-(acetylamino)hexanoyl]amino]hexanoic acid,

B. 6-aminohexanoic acid (6-aminocaproic acid),

C. R = CO-CH_3: 1-acetylhexahydro-2*H*-azepin-2-one (*N*-acetyl-ε-caprolactam),

D. R = H: hexahydro-2*H*-azepin-2-one (ε−caprolactam).

ZINC CHLORIDE

Zinci chloridum

$ZnCl_2$ M_r 136.3
[7646-85-7]

DEFINITION

Content: 95.0 per cent to 100.5 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder or cast in white or almost white sticks, deliquescent.

Solubility: very soluble in water, freely soluble in ethanol (96 per cent) and in glycerol.

IDENTIFICATION

A. Dissolve 0.5 g in *dilute nitric acid R* and dilute to 10 ml with the same acid. The solution gives reaction (a) of chlorides (*2.3.1*).

B. 5 ml of solution S (see Tests) gives the reaction of zinc (*2.3.1*).

TESTS

Solution S. To 2.0 g add 38 ml of *carbon dioxide-free water R* prepared from *distilled water R* and add *dilute hydrochloric acid R* dropwise until dissolution is complete. Dilute to 40 ml with *carbon dioxide-free water R* prepared from *distilled water R*.

pH (*2.2.3*): 4.6 to 5.5.

Dissolve 1.0 g in 9 ml of *carbon dioxide-free water R*, ignoring any slight turbidity.

Oxychlorides. Dissolve 1.5 g in 1.5 ml of *carbon dioxide-free water R*. The solution is not more opalescent than reference suspension II (*2.2.1*). Add 7.5 ml of *ethanol (96 per cent) R*. The solution may become cloudy within 10 min. Any cloudiness disappears on the addition of 0.2 ml of *dilute hydrochloric acid R*.

Sulphates (*2.4.13*): maximum 200 ppm.

Dilute 5 ml of solution S to 15 ml with *distilled water R*. Prepare the standard using a mixture of 5 ml of *sulphate standard solution (10 ppm SO_4) R* and 10 ml of *distilled water R*.

Aluminium, calcium, heavy metals, iron, magnesium. To 8 ml of solution S add 2 ml of *concentrated ammonia R* and shake. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*). Add 1 ml of *disodium hydrogen phosphate solution R*. The solution remains clear for at least 5 min. Add 0.2 ml of *sodium sulphide solution R*. A white precipitate is formed and the supernatant liquid remains colourless.

Ammonium (*2.4.1*): maximum 400 ppm.

Dilute 0.5 ml of solution S to 15 ml with *water R*.

ASSAY

Dissolve 0.250 g in 5 ml of *dilute acetic acid R*. Carry out the complexometric titration of zinc (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 13.63 mg of $ZnCl_2$.

STORAGE

In a non-metallic container.

01/2008:0252
corrected 6.0

ZINC OXIDE

Zinci oxidum

ZnO M_r 81.4
[1314-13-2]

DEFINITION

Content: 99.0 per cent to 100.5 per cent (ignited substance).

CHARACTERS

Appearance: soft, white or faintly yellowish-white, amorphous powder, free from gritty particles.

Solubility: practically insoluble in water and in ethanol (96 per cent). It dissolves in dilute mineral acids.

IDENTIFICATION

A. It becomes yellow when strongly heated; the yellow colour disappears on cooling.

B. Dissolve 0.1 g in 1.5 ml of *dilute hydrochloric acid R* and dilute to 5 ml with *water R*. The solution gives the reaction of zinc (*2.3.1*).

TESTS

Alkalinity. Shake 1.0 g with 10 ml of boiling *water R*. Add 0.1 ml of *phenolphthalein solution R* and filter. If the filtrate is red, not more than 0.3 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator.

Carbonates and substances insoluble in acids. Dissolve 1.0 g in 15 ml of *dilute hydrochloric acid R*. It dissolves without effervescence and the solution is not more opalescent than reference suspension II (*2.2.1*) and is colourless (*2.2.2, Method II*).

Arsenic (*2.4.2, Method A*): maximum 5 ppm, determined on 0.2 g.

Cadmium: maximum 10.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Dissolve 2.0 g in 14 ml of a mixture of equal volumes of *water R* and *cadmium- and lead-free nitric acid R*, boil for 1 min, cool and dilute to 100.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *cadmium standard solution (0.1 per cent Cd) R* and diluting with a 3.5 per cent *V/V* solution of *cadmium- and lead-free nitric acid R*.

Source: cadmium hollow-cathode lamp.

Wavelength: 228.8 nm.

Atomisation device: air-acetylene or air-propane flame.

Iron (*2.4.9*): maximum 200 ppm.

Dissolve 50 mg in 1 ml of *dilute hydrochloric acid R* and dilute to 10 ml with *water R*. Use in this test 0.5 ml of *thioglycollic acid R*.

Lead: maximum 50.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Dissolve 5.0 g in 24 ml of a mixture of equal volumes of *water R* and *cadmium- and lead-free nitric acid R*, boil for 1 min, cool and dilute to 100.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *lead standard solution (0.1 per cent Pb) R* and diluting with a 3.5 per cent *V/V* solution of *cadmium- and lead-free nitric acid R*.

Source: lead hollow-cathode lamp.

Wavelength: 283.3 nm; 217.0 nm may be used depending on the apparatus.

Atomisation device: air-acetylene flame.

Loss on ignition: maximum 1.0 per cent, determined on 1.00 g by ignition to constant mass at 500 ± 50 °C.

ASSAY

Dissolve 0.150 g in 10 ml of *dilute acetic acid R*. Carry out the complexometric titration of zinc (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 8.14 mg of ZnO.

01/2008:0306
corrected 6.0

ZINC STEARATE

Zinci stearas

[557-05-1]

DEFINITION

Zinc stearate [$(C_{17}H_{35}COO)_2Zn$; M_r 632] may contain varying proportions of zinc palmitate [$(C_{15}H_{31}COO)_2Zn$; M_r 576.2] and zinc oleate [$(C_{17}H_{33}COO)_2Zn$; M_r 628].

Content: 10.0 per cent to 12.0 per cent of Zn.

CHARACTERS

Appearance: light, white or almost white, amorphous powder, free from gritty particles.

Solubility: practically insoluble in water and in anhydrous ethanol.

IDENTIFICATION

A. Freezing point (*2.2.18*): minimum 53 °C, determined on the residue obtained in the preparation of solution S (see Tests).

B. Neutralise 5 ml of solution S to *red litmus paper R* with *strong sodium hydroxide solution R*. The solution gives the reaction of zinc (*2.3.1*).

TESTS

Solution S. To 5.0 g add 50 ml of *ether R* and 40 ml of a 7.5 per cent *V/V* solution of *cadmium- and lead-free nitric acid R* in *distilled water R*. Heat under a reflux condenser until dissolution is complete. Allow to cool. In a separating funnel, separate the aqueous layer and shake the ether layer with 2 quantities, each of 4 ml, of *distilled water R*. Combine the aqueous layers, wash with 15 ml of *ether R* and heat on a water-bath until ether is completely eliminated. Allow to cool and dilute to 50.0 ml with *distilled water R* (solution S). Evaporate the ether layer to dryness and dry the residue at 105 °C.

Appearance of solution. Solution S is not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Appearance of solution of fatty acids. Dissolve 0.5 g of the residue obtained in the preparation of solution S in 10 ml of *chloroform R*. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_5 (*2.2.2, Method II*).

Acidity or alkalinity. Shake 1.0 g with 5 ml of *ethanol (96 per cent) R* and add 20 ml of *carbon dioxide-free water R* and 0.1 ml of *phenol red solution R*. Not more than 0.3 ml of *0.1 M hydrochloric acid* or 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Acid value of the fatty acids (*2.5.1*): 195 to 210.

Dissolve 0.20 g of the residue obtained in the preparation of solution S in 25 ml of the prescribed mixture of solvents.

Chlorides (*2.4.4*): maximum 250 ppm.

Dilute 2 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 0.6 per cent.

Dilute 1 ml of solution S to 50 ml with *distilled water R*. Dilute 12.5 ml of this solution to 15 ml with *distilled water R*.

Cadmium: maximum 5.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Dilute 20.0 ml of solution S to 50.0 ml with a 3.5 per cent *V/V* solution of *cadmium- and lead-free nitric acid R*.

Reference solutions. Prepare the reference solutions using *cadmium standard solution (0.1 per cent Cd) R* and diluting with a 3.5 per cent *V/V* solution of *cadmium- and lead-free nitric acid R*.

Source: cadmium hollow-cathode lamp.

Wavelength: 228.8 nm.

Atomisation device: air-acetylene or an air-propane flame.

Lead: maximum 25.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Solution S.

Reference solutions. Prepare the reference solutions using *lead standard solution (0.1 per cent Pb) R* and diluting with a 3.5 per cent *V/V* solution of *cadmium- and lead-free nitric acid R*.

Source: lead hollow-cathode lamp.

Wavelength: 283.3 nm. Depending on the apparatus the line at 217.0 nm may be used.

Atomisation device: air-acetylene flame.

ASSAY

To 1.000 g add 50 ml of *dilute acetic acid R* and boil for at least 10 min or until the layer of fatty acids is clear, adding more *water R* as necessary to maintain the original volume. Cool and filter. Wash the filter and the flask with *water R* until the washings are no longer acid to *blue litmus paper R*. Combine the filtrate and washings. Carry out the complexometric titration of zinc (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 6.54 mg of Zn.

01/2008:0111
corrected 6.0

ZINC SULPHATE HEPTAHYDRATE

Zinci sulfas heptahydricus

$ZnSO_4,7H_2O$ M_r 287.5
[7446-20-0]

DEFINITION

Content: 99.0 per cent to 104.0 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless, transparent crystals, efflorescent.

Solubility: very soluble in water, practically insoluble in alcohol.

IDENTIFICATION

A. Solution S (see Tests) gives the reactions of sulphates (*2.3.1*).

B. Solution S gives the reaction of zinc (*2.3.1*).

C. It complies with the limits of the assay.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 4.4 to 5.6 for solution S.

Chlorides (*2.4.4*): maximum 300 ppm.

3.3 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides.

Iron (*2.4.9*): maximum 100 ppm.

2 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron. Use in this test 0.5 ml of *thioglycollic acid R*.

ASSAY

Dissolve 0.200 g in 5 ml of *dilute acetic acid R*. Carry out the complexometric titration of zinc (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 28.75 mg of $ZnSO_4,7H_2O$.

STORAGE

In a non-metallic, airtight container.

01/2008:1683
corrected 6.0

ZINC SULPHATE HEXAHYDRATE

Zinci sulfas hexahydricus

$ZnSO_4,6H_2O$ M_r 269.5
[13986-24-8]

DEFINITION

Content: 99.0 per cent to 104.0 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless transparent crystals, efflorescent.

Solubility: very soluble in water, practically insoluble in alcohol.

IDENTIFICATION

A. Solution S (see Tests) gives the reactions of sulphates (*2.3.1*).

B. Solution S gives the reaction of zinc (*2.3.1*).

C. It complies with the limits of the assay.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 4.4 to 5.6 for solution S.

Chlorides (*2.4.4*): maximum 300 ppm.

3.3 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides.

Iron (*2.4.9*): maximum 100 ppm.

2 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron. Use in this test 0.5 ml of *thioglycollic acid R*.

ASSAY

Dissolve 0.200 g in 5 ml of *dilute acetic acid R*. Carry out the complexometric titration of zinc (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 26.95 mg of $ZnSO_4,6H_20$.

STORAGE

In a non-metallic, airtight container.

01/2008:2159

ZINC SULPHATE MONOHYDRATE

Zinci sulfas monohydricus

$ZnSO_4,H_2O$ M_r 179.5

DEFINITION

Content: 99.0 per cent to 101.0 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder, or colourless, transparent crystals.

Solubility: very soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Solution S (see Tests) gives the reactions of sulphates (*2.3.1*).

B. Solution S gives the reaction of zinc (*2.3.1*).

C. It complies with the limits of the assay.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 4.4 to 5.6 for solution S.

Chlorides (*2.4.4*): maximum 300 ppm.

Dilute 3.3 ml of solution S to 15 ml with *water R*.

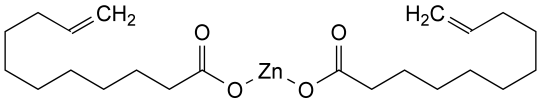
Iron (*2.4.9*): maximum 100 ppm.

Dilute 2 ml of solution S to 10 ml with *water R*. Use 0.5 ml of *thioglycollic acid R* in this test.

ASSAY

Dissolve 0.160 g in 5 ml of *dilute acetic acid R*. Carry out the complexometric titration of zinc (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 17.95 mg of $ZnSO_4,H_2O$.



STORAGE

In a non-metallic container.

corrected 6.0

ZINC UNDECYLENATE

Zinci undecylenas

$C_{22}H_{38}O_4Zn$ M_r 431.9
[557-08-4]

DEFINITION

Zinc di(undec-10-enoate).

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, fine powder.

Solubility: practically insoluble in water and in ethanol (96 per cent).

mp: 116 °C to 121 °C, it may leave a slight solid residue.

IDENTIFICATION

A. To 2.5 g add 10 ml of *water R* and 10 ml of *dilute sulphuric acid R*. Shake with 2 quantities, each of 10 ml, of *ether R*. Reserve the aqueous layer for identification test C. Wash the combined ether layers with *water R* and evaporate to dryness. To the residue add 2 ml of freshly distilled *aniline R* and boil under a reflux condenser for 10 min. Allow to cool and add 30 ml of *ether R*. Shake with 3 quantities, each of 20 ml, of *dilute hydrochloric acid R* and then with 20 ml of *water R*. Evaporate the organic layer to dryness on a water-bath. The residue, after recrystallisation twice from *ethanol (70 per cent V/V) R* and drying *in vacuo* for 3 h, melts (*2.2.14*) at 66 °C to 68 °C.

B. Dissolve 0.1 g in a mixture of 2 ml of *dilute sulphuric acid R* and 5 ml of *glacial acetic acid R*. Add dropwise 0.25 ml of *potassium permanganate solution R*. The colour of the potassium permanganate solution is discharged.

C. A mixture of 1 ml of the aqueous layer obtained in identification test A and 4 ml of *water R* gives the reaction of zinc (*2.3.1*).

TESTS

Alkalinity. Mix 1.0 g with 5 ml of *ethanol (96 per cent) R* and 0.5 ml of *phenol red solution R*. Add 50 ml of *carbon dioxide-free water R* and examine immediately. No reddish colour appears.

Alkali and alkaline-earth metals: maximum 2.0 per cent.

To 1.0 g add 25 ml of *water R* and 5 ml of *hydrochloric acid R* and heat to boiling. Filter whilst hot. Wash the filter and the residue with 25 ml of hot *water R*. Combine the filtrate and washings and add *concentrated ammonia R* until alkaline. Add 7.5 ml of *thioacetamide solution R* and heat on a water-bath for 30 min. Filter and wash the precipitate with 2 quantities, each of 10 ml, of *water R*. Combine the filtrate and washings, evaporate to dryness on a water-bath and ignite. The residue weighs a maximum of 20 mg.

Sulphates (*2.4.13*): maximum 500 ppm.

To 0.1 g add a mixture of 2 ml of *dilute hydrochloric acid R* and 10 ml of *distilled water R* and heat to boiling. Cool, filter and dilute to 15 ml with *distilled water R*. Prepare the standard using 5 ml of *sulphate standard solution (10 ppm SO_4) R* and 10 ml of *distilled water R*.

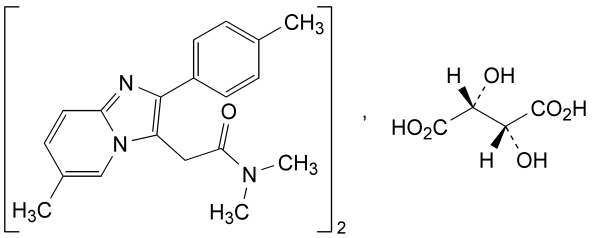
Loss on drying (*2.2.32*): maximum 1.5 per cent, determined on 0.500 g by drying in an oven at 105 °C.

Degree of unsaturation. Dissolve 0.100 g in a mixture of 5 ml of *dilute hydrochloric acid R* and 30 ml of *glacial acetic acid R*. Using 0.05 ml *indigo carmine solution R1*, added towards the end of the titration as indicator. Titrate with *0.0167 M bromide-bromate* until the colour changes from blue to yellow. 9.1 ml to 9.4 ml of *0.0167 M bromide-bromate* is required. Carry out a blank titration.

ASSAY

To 0.350 g add 25 ml of *dilute acetic acid R* and heat to boiling. Carry out the complexometric titration of zinc (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 43.19 mg of $C_{22}H_{38}O_4Zn$.



STORAGE

Protected from light.

01/2008:1280

ZOLPIDEM TARTRATE

Zolpidemi tartras

$C_{42}H_{48}N_6O_8$ M_r 765
[99294-93-6]

DEFINITION

Bis[*N*,*N*-dimethyl-2-[6-methyl-2-(4-methylphenyl)imidazo[1,2-*a*]pyridin-3-yl]acetamide] (2*R*,3*R*)-2,3-dihydroxybutanedioate.

Content: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, hygroscopic, crystalline powder.

Solubility: slightly soluble in water, sparingly soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: dissolve 0.10 g in 10 ml of *0.1 M hydrochloric acid*. Add 10 ml of *water R*. Add dropwise with stirring 1 ml of *dilute ammonia R2*. Filter and collect the resulting precipitate. Wash the precipitate with *water R* and then dry at 100-105 °C for 2 h. Examine the precipitate as a disc.

Comparison: repeat the operations using 0.10 g of *zolpidem tartrate CRS*.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 50 mg of the substance to be examined in 5 ml of *methanol R*, add 0.1 ml of *diethylamine R* and dilute to 10 ml with *methanol R*.

Reference solution (a). Dissolve 50 mg of *zolpidem tartrate CRS* in 5 ml of *methanol R*, add 0.1 ml of *diethylamine R* and dilute to 10 ml with *methanol R*.

Reference solution (b). Dissolve 50 mg of *flunitrazepam CRS* in 5 ml of *methylene chloride R* and dilute to 10 ml with the same solvent. Mix 1 ml of this solution with 1 ml of reference solution (a).

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *diethylamine R, cyclohexane R, ethyl acetate R* (10:45:45 *V/V/V*).

Application: 5 µl.

Development: over a path of 12 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve about 0.1 g in 1 ml of *methanol R* heating gently. 0.1 ml of this solution gives reaction (b) of tartrates (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 or BY_6 (*2.2.2, Method II*). *Prepare the solutions protected from light and carry out the test as rapidly as possible.*

Triturate 0.25 g with 0.125 g of *tartaric acid R*. Dissolve the mixture in 20 ml of *water R* and dilute to 25 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *zolpidem impurity A CRS* in the mobile phase and dilute to 50 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of the substance to be examined in the mobile phase and dilute to 50 ml with the mobile phase. To 10 ml of this solution, add 10 ml of reference solution (a).

Reference solution (c). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 3.9 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (4 µm).

Mobile phase: mix 18 volumes of *acetonitrile R*, 23 volumes of *methanol R* and 59 volumes of a 5.6 g/l solution of *phosphoric acid R* adjusted to pH 5.5 with *triethylamine R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to impurity A and zolpidem.

Limits:

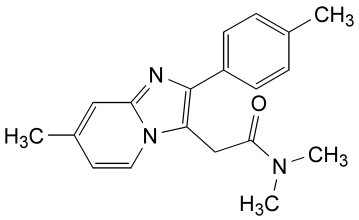
– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.02 per cent); disregard any peak due to tartaric acid (with a relative retention with reference to zolpidem of 0.16).

Water (*2.5.12*): maximum 3.0 per cent, determined on 0.50 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



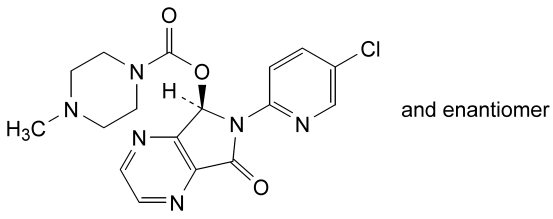
Dissolve 0.300 g in a mixture of 20 ml of *anhydrous acetic acid R* and 20 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 38.24 mg of $C_{42}H_{48}N_6O_8$.

STORAGE

In an airtight container, protected from light.

IMPURITIES



A. *N,N*-dimethyl-2-[7-methyl-2-(4-methylphenyl)imidazo[1,2-*a*]pyridin-3-yl]acetamide.

01/2008:1060

ZOPICLONE

Zopiclonum

and enantiomer

$C_{17}H_{17}ClN_6O_3$ M_r 388.8

[43200-80-2]

DEFINITION

(5*RS*)-6-(5-Chloropyridin-2-yl)-7-oxo-6,7-dihydro-5*H*-pyrrolo[3,4-*b*]pyrazin-5-yl 4-methylpiperazine-1-carboxylate.

Content: 98.5 per cent to 100.5 per cent.

CHARACTERS

Appearance: white or slightly yellowish powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in acetone, practically insoluble in ethanol (96 per cent). It dissolves in dilute mineral acids.

mp: about 177 °C, with decomposition.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50.0 mg in a 3.5 g/l solution of *hydrochloric acid R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with a 3.5 g/l solution of *hydrochloric acid R*.

Spectral range: 220-350 nm.

Absorption maximum: at 303 nm.

Specific absorbance at the absorption maximum: 340 to 380.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *zopiclone CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *zopiclone CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel GF_{254} plate R*.

Mobile phase: *triethylamine R, acetone R, ethyl acetate R* (2:50:50 *V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Solution S. Dissolve 1.0 g in *dimethylformamide R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

Optical rotation (*2.2.7*): −0.05° to + 0.05°.

Dilute 10.0 ml of solution S to 50.0 ml with *dimethylformamide R*.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 40.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 3.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 4.0 mg of *zopiclone oxide CRS* (impurity A) in the mobile phase and dilute to 10.0 ml with the mobile phase. To 10.0 ml of this solution, add 1.0 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 30 °C.

Mobile phase: mix 38 volumes of *acetonitrile R* and 62 volumes of a solution containing 8.1 g/l of *sodium laurilsulfate R* and 1.6 g/l of *sodium dihydrogen phosphate R* adjusted to pH 3.5 with a 10 per cent *V/V* solution of *phosphoric acid R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 303 nm.

Injection: 20 µl.

Run time: 1.5 times the retention time of zopiclone.

Retention time: zopiclone = 27 min to 31 min; if necessary, adjust the concentration of acetonitrile in the mobile phase (increasing the concentration decreases the retention times).

System suitability: reference solution (c):

– *resolution*: minimum 3.0 between the peaks due to impurity A and zopiclone; if necessary, adjust the mobile phase to pH 4.0 with a 10 per cent *V/V* solution of *phosphoric acid R*.

Limits:

– *impurities A, B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent) and not more than 2 such peaks have an area greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

2-Propanol. Gas chromatography (*2.2.28*).

Internal standard solution. Dilute 5 ml of *ethanol R1* to 100 ml with *ethylene chloride R*. Dilute 1 ml of this solution to 10 ml with *ethylene chloride R*.

Test solution. Dissolve 0.25 g of the substance to be examined in *ethylene chloride R*, add 0.5 ml of the internal standard solution and dilute to 5.0 ml with *ethylene chloride R*.

Reference solution. Dilute 4.5 ml of *2-propanol R* to 100.0 ml with *ethylene chloride R*. To 1.0 ml of this solution, add 10.0 ml of the internal standard solution and dilute to 100.0 ml with *ethylene chloride R*.

Column:

– *material*: fused silica;
– *size*: *l* = 10 m, Ø = about 0.53 mm;
– *stationary phase*: *styrene-divinylbenzene copolymer R* (film thickness 20 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 4 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	50
	5 - 10	50 → 70
	10 - 14	70
	14 - 20.5	70 → 200
	20.5 - 27.5	200
Injection port		150
Detector		250

Detection: flame ionisation.

Injection: 1 µl.

Calculate the percentage content *m/m* of 2-propanol taking its density to be 0.785 g/ml at 20 °C.

Limit:

– *2-propanol*: maximum 0.7 per cent *m/m*.

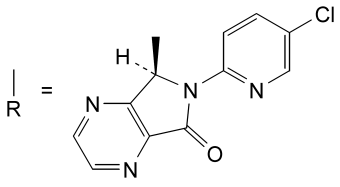
Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

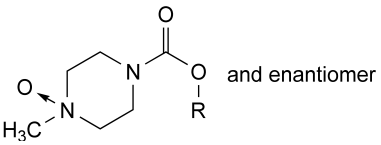
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 10 ml of *anhydrous acetic acid R* and 40 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



1 ml of *0.1 M perchloric acid* is equivalent to 38.88 mg of $C_{17}H_{17}ClN_6O_3$.



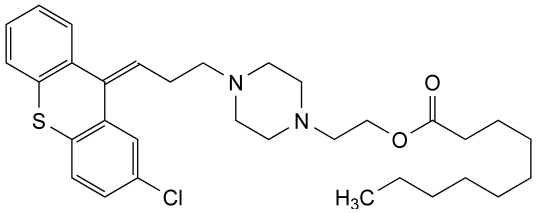
STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C.

A. (5*RS*)-6-(5-chloropyridin-2-yl)-7-oxo-6,7-dihydro-5*H*-pyrrolo[3,4-*b*]pyrazin-5-yl 4-methylpiperazine-1-carboxylate 4-oxide (zopiclone oxide),



B. R-OH and enantiomer: (7*RS*)-6-(5-chloropyridin-2-yl)-7-hydroxy-6,7-dihydro-5*H*-pyrrolo[3,4-*b*]pyrazin-5-one,

C. R-H: 6-(5-chloropyridin-2-yl)-6,7-dihydro-5*H*-pyrrolo[3,4-*b*]pyrazin-5-one.

01/2008:1707

ZUCLOPENTHIXOL DECANOATE

Zuclopenthixoli decanoas

$C_{32}H_{43}ClN_2O_2S$ M_r 555.2

[64053-00-5]

DEFINITION

2-[4-[3-[(9*Z*)-2-Chloro-9*H*-thioxanthen-9-ylidene]propyl]-piperazin-1-yl]ethyl decanoate.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: yellow, viscous, oily liquid.

Solubility: very slightly soluble in water, very soluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of zuclopenthixol decanoate.*

TESTS

Appearance of solution. The solution is clear (*2.2.1*).

Using an ultrasonic bath, dissolve 1.0 g in *ethanol (96 per cent) R* and dilute to 20.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*). *Carry out the test protected from light and prepare the solutions immediately before use.*

Solution A. Dissolve 8.89 g of *docusate sodium R* in *water R*, stirring for about 6-8 h, and dilute to 1000 ml with the same solvent.

Test solution. Dissolve 25.0 mg of the substance to be examined in *acetonitrile R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile R*.

Reference solution (b). Dissolve 5.0 mg of *zuclopenthixol impurity B CRS* in *acetonitrile R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *acetonitrile R*.

Reference solution (c). Dissolve the contents of a vial of *zuclopenthixol for system suitability CRS* (zuclopenthixol decanoate containing impurities A, B and C) in 1 ml of *methanol R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 40 °C.

Mobile phase: mix 25 volumes of solution A and 75 volumes of *anhydrous ethanol R*, then add 0.1 volumes of *phosphoric acid R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 270 nm.

Injection: 20 µl.

Run time: twice the retention time of zuclopenthixol decanoate.

Identification of impurities: use the chromatogram supplied with *zuclopenthixol for system suitability CRS* and the chromatograms obtained with reference solutions (b) and (c) to identify the peaks due to impurities A, B and C.

Relative retention with reference to zuclopenthixol decanoate (retention time = about 12 min): impurity C = about 0.4; impurity B = about 0.5; impurity A = about 1.1.

System suitability: reference solution (c):

– *peak-to-valley ratio*: minimum 2.0, where H_p = height above the baseline of the peak due to impurity C and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity B; and minimum 2.5, where H_p = height above the baseline of the peak due to impurity A and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to zuclopenthixol decanoate.

Limits:

– *impurity A*: not more than 1.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.3 per cent);
– *impurity B*: not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
– *impurity C*: not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
– *unspecified impurities*: for each impurity, not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
– *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent);
– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

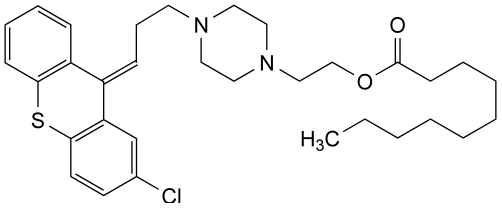
1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

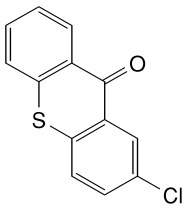
ASSAY

Dissolve 0.250 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



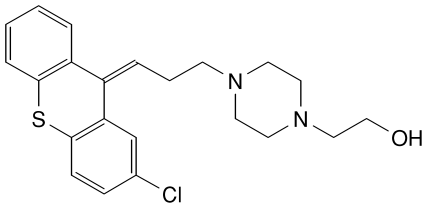
1 ml of *0.1 M perchloric acid* is equivalent to 27.76 mg of $C_{32}H_{43}ClN_2O_2S$.

STORAGE



Under an inert gas in an airtight container, protected from light, at a temperature not exceeding – 20 °C.

IMPURITIES



Specified impurities: A, B, C.

A. 2-[4-[3-[(9*E*)-2-chloro-9*H*-thioxanthen-9-ylidene]propyl]-piperazin-1-yl]ethyl decanoate,

B. 2-chloro-9*H*-thioxanthen-9-one,

C. 2-[4-[3-[(9*Z*)-2-chloro-9*H*-thioxanthen-9-ylidene]propyl]-piperazin-1-yl]ethanol.

INDEX

Monographs deleted from the 5th Edition are not included in the index; a list of deleted texts is found in the Contents of Volume 1, page xxix.

2.5.26. Nitrogen monoxide and nitrogen dioxide in gases ... 146
2.5.27. Oxygen in gases ... 146
2.5.28. Water in gases ... 146
2.5.29. Sulphur dioxide ... 146
2.5.2. Ester value ... 137
2.5.30. Oxidising substances ... 147

2.5.31. Ribose in polysaccharide vaccines ... 147
2.5.32. Water: micro determination ... 147
2.5.33. Total protein ... 148
2.5.34. Acetic acid in synthetic peptides ... 151
2.5.35. Nitrous oxide in gases ... 152
2.5.36. Anisidine value ... 152
2.5.3. Hydroxyl value ... 137
2.5.4. Iodine value ... 137
2.5.5. Peroxide value ... 138
2.5.6. Saponification value ... 139
2.5.7. Unsaponifiable matter ... 139
2.5.8. Determination of primary aromatic amino-nitrogen ... 139
2.5.9. Determination of nitrogen by sulphuric acid digestion ... 139
2.5. Assays ... 137
2.6.10. Histamine ... 165
2.6.11. Depressor substances ... 166
2.6.12. Microbiological examination of non-sterile products: total viable aerobic count ... 166
2.6.13. Microbiological examination of non-sterile products: test for specified micro-organisms ... 173
2.6.14. Bacterial endotoxins ... 182
2.6.15. Prekallikrein activator ... 189
2.6.16. Tests for extraneous agents in viral vaccines for human use ... 190
2.6.17. Test for anticomplementary activity of immunoglobulin ... 191
2.6.18. Test for neurovirulence of live virus vaccines ... 193
2.6.19. Test for neurovirulence of poliomyelitis vaccine (oral) ... 193
2.6.1. Sterility ... 155
2.6.20. Anti-A and anti-B haemagglutinins (indirect method) ... 195
2.6.21. Nucleic acid amplification techniques ... 195
2.6.22. Activated coagulation factors ... 198
2.6.24. Avian viral vaccines: tests for extraneous agents in seed lots ... 198
2.6.25. Avian live virus vaccines: tests for extraneous agents in batches of finished product ... 202
2.6.26. Test for anti-D antibodies in human immunoglobulin for intravenous administration ... 205
2.6.27. Microbiological control of cellular products ... 205
2.6.2. Mycobacteria ... 159
2.6.7. Mycoplasmas ... 159
2.6.8. Pyrogens ... 164
2.6.9. Abnormal toxicity ... 165
2.6. Biological tests ... 155
2.7.10. Assay of human coagulation factor VII ... 228
2.7.11. Assay of human coagulation factor IX ... 229
2.7.12. Assay of heparin in coagulation factors ... 230
2.7.13. Assay of human anti-D immunoglobulin ... 230
2.7.14. Assay of hepatitis A vaccine ... 232
2.7.15. Assay of hepatitis B vaccine (rDNA) ... 233
2.7.16. Assay of pertussis vaccine (acellular) ... 233
2.7.17. Assay of human antithrombin III ... 234
2.7.18. Assay of human coagulation factor II ... 234
2.7.19. Assay of human coagulation factor X ... 235
2.7.19. Assay of human coagulation factor X (2.7.19.) ... 235
2.7.1. Immunochemical methods ... 209
2.7.20. *In vivo* assay of poliomyelitis vaccine (inactivated) ... 235
2.7.21. Assay of human von Willebrand factor ... 237
2.7.22. Assay of human coagulation factor XI ... 238
2.7.23. Numeration of CD34/CD45+ cells in haematopoietic products ... 238
2.7.24. Flow cytometry ... 240
2.7.27. Flocculation value (Lf) of diphtheria and tetanus toxins and toxoids (Ramon assay) ... 241
2.7.28. Colony-forming cell assay for human haematopoietic progenitor cells ... 242
2.7.29. Nucleated cell count and viability ... 243
2.7.2. Microbiological assay of antibiotics ... 210
2.7.4. Assay of human coagulation factor VIII ... 216
2.7.5. Assay of heparin ... 217
2.7.6. Assay of diphtheria vaccine (adsorbed) ... 217
2.7.7. Assay of pertussis vaccine ... 222
2.7.8. Assay of tetanus vaccine (adsorbed) ... 223
2.7.9. Test for Fc function of immunoglobulin ... 227
2.7. Biological assays ... 209
2.8.10. Solubility in alcohol of essential oils ... 250
2.8.11. Assay of 1,8-cineole in essential oils ... 250
2.8.12. Determination of essential oils in herbal drugs ... 251
2.8.13. Pesticide residues ... 252
2.8.14. Determination of tannins in herbal drugs ... 255
2.8.15. Bitterness value ... 255
2.8.16. Dry residue of extracts ... 256
2.8.17. Loss on drying of extracts ... 256
2.8.18. Determination of aflatoxin B_1 in herbal drugs ... 256
2.8.1. Ash insoluble in hydrochloric acid ... 249
2.8.20. Herbal drugs: sampling and sample preparation ... 258
2.8.2. Foreign matter ... 249
2.8.3. Stomata and stomatal index ... 249
2.8.4. Swelling index ... 249
2.8.5. Water in essential oils ... 249
2.8.6. Foreign esters in essential oils ... 250
2.8.7. Fatty oils and resinified essential oils in essential oils ... 250
2.8.8. Odour and taste of essential oils ... 250
2.8.9. Residue on evaporation of essential oils ... 250
2.8. Methods in pharmacognosy ... 249
2.9.10. Ethanol content and alcoholimetric tables ... 281
2.9.11. Test for methanol and 2-propanol ... 282
2.9.12. Sieve test ... 283
2.9.14. Specific surface area by air permeability ... 283
2.9.15. Apparent volume ... 285
2.9.16. Flowability ... 286
2.9.17. Test for extractable volume of parenteral preparations ... 287
2.9.18. Preparations for inhalation: aerodynamic assessment of fine particles ... 287
2.9.19. Particulate contamination: sub-visible particles ... 300
2.9.1. Disintegration of tablets and capsules ... 263
2.9.20. Particulate contamination: visible particles ... 302
2.9.22. Softening time determination of lipophilic suppositories ... 302
2.9.23. Pycnometric density of solids ... 304
2.9.25. Dissolution test for medicated chewing gums ... 304
2.9.26. Specific surface area by gas adsorption ... 306
2.9.27. Uniformity of mass of delivered doses from multidose containers ... 309
2.9.29. Intrinsic dissolution ... 309
2.9.2. Disintegration of suppositories and pessaries ... 265
2.9.31. Particle size analysis by laser light diffraction ... 311
2.9.33. Characterisation of crystalline and partially crystalline solids by X-ray powder diffraction (XRPD) ... 314
2.9.36. Powder flow ... 320
2.9.37. Optical microscopy ... 323
2.9.38. Particle-size distribution estimation by analytical sieving ... 325
2.9.3. Dissolution test for solid dosage forms ... 266
2.9.40. Uniformity of dosage units ... 327
2.9.41. Friability of granules and spheroids ... 330
2.9.42. Dissolution test for lipophilic solid dosage forms ... 332
2.9.43. Apparent dissolution ... 332
2.9.4. Dissolution test for transdermal patches ... 275
2.9.5. Uniformity of mass of single-dose preparations ... 278
2.9.6. Uniformity of content of single-dose preparations ... 278

2.9.7. Friability of uncoated tablets 278
2.9.8. Resistance to crushing of tablets 279
2.9.9. Measurement of consistency by penetrometry 279
2.9. Pharmaceutical technical procedures 263
3.1.10. Materials based on non-plasticised poly(vinyl chloride) for containers for non-injectable, aqueous solutions 360
3.1.11. Materials based on non-plasticised poly(vinyl chloride) for containers for dry dosage forms for oral administration 362
3.1.1.1. Materials based on plasticised poly(vinyl chloride) for containers for human blood and blood components 339
3.1.1.2. Materials based on plasticised poly(vinyl chloride) for tubing used in sets for the transfusion of blood and blood components 342
3.1.13. Plastic additives 364
3.1.14. Materials based on plasticised poly(vinyl chloride) for containers for aqueous solutions for intravenous infusion 366
3.1.15. Polyethylene terephthalate for containers for preparations not for parenteral use 369
3.1.1. Materials for containers for human blood and blood components 339
3.1.3. Polyolefines 344
3.1.4. Polyethylene without additives for containers for parenteral preparations and for ophthalmic preparations 348
3.1.5. Polyethylene with additives for containers for parenteral preparations and for ophthalmic preparations 349
3.1.6. Polypropylene for containers and closures for parenteral preparations and ophthalmic preparations ... 352
3.1.7. Poly(ethylene - vinyl acetate) for containers and tubing for total parenteral nutrition preparations 356
3.1.8. Silicone oil used as a lubricant 358
3.1.9. Silicone elastomer for closures and tubing 358
3.1. Materials used for the manufacture of containers 339
3.2.1. Glass containers for pharmaceutical use 373
3.2.2.1. Plastic containers for aqueous solutions for infusion 379
3.2.2. Plastic containers and closures for pharmaceutical use 378
3.2.3. Sterile plastic containers for human blood and blood components 379
3.2.4. Empty sterile containers of plasticised poly(vinyl chloride) for human blood and blood components 381
3.2.5. Sterile containers of plasticised poly(vinyl chloride) for human blood containing anticoagulant solution 382
3.2.6. Sets for the transfusion of blood and blood components 383
3.2.8. Sterile single-use plastic syringes 384
3.2.9. Rubber closures for containers for aqueous parenteral preparations, for powders and for freeze-dried powders 386
3.2. Containers 373
4.1.1. Reagents 391
4.1.2. Standard solutions for limit tests 504
4.1.3. Buffer solutions 508
4.1. Reagents, standard solutions, buffer solutions 391
4.2.1. Primary standards for volumetric solutions 514
4.2.2. Volumetric solutions 514
4.2. Volumetric analysis 514
4-Aminobenzoic acid 1164

Alfentanil hydrochloride 1128
Alfuzosin hydrochloride 1130
Alginic acid 1131
Alkaline-earth metals and magnesium (2.4.7.) 112
Alkaline impurities in fatty oils (2.4.19.) 117
Allantoin 1131
Allergen products 679
Allopurinol 1132
all-*rac*-α-Tocopherol 3086
all-*rac*-α-Tocopheryl acetate 3089
Almagate 1134
Almond oil, refined 1136
Almond oil, virgin 1136
Aloes, Barbados 1137
Aloes, Cape 1138
Aloes dry extract, standardised 1139
Alphacyclodextrin 1127
Alprazolam 1139
Alprenolol hydrochloride 1141
Alprostadil 1143
Alteplase for injection 1145
Alternative methods for control of microbiological quality (5.1.6.) 532
Alum 1149
Aluminium (2.4.17.) 117
Aluminium chloride hexahydrate 1149
Aluminium hydroxide, hydrated, for adsorption 1150
Aluminium in adsorbed vaccines (2.5.13.) 141
Aluminium magnesium silicate 1151
Aluminium oxide, hydrated 1152
Aluminium phosphate gel 1152
Aluminium phosphate, hydrated 1153
Aluminium sulphate 1154
Alverine citrate 1154
Amantadine hydrochloride 1156
Ambroxol hydrochloride 1156
Amfetamine sulphate 1158
Amidotrizoic acid dihydrate 1158
Amikacin 1159
Amikacin sulphate 1161
Amiloride hydrochloride 1163
Amino acid analysis (2.2.56.) 89
Aminobenzoic acid, 4- 1164
Aminocaproic acid 1166
Aminoglutethimide 1167
Amiodarone hydrochloride 1168
Amisulpride 1170
Amitriptyline hydrochloride 1172
Amlodipine besilate 1173
Ammonia (^{13}N) injection 981
Ammonia solution, concentrated 1175
Ammonio methacrylate copolymer (type A) 1175
Ammonio methacrylate copolymer (type B) 1176
Ammonium (2.4.1.) 111
Ammonium bromide 1177
Ammonium chloride 1178
Ammonium glycyrrhizate 1179
Ammonium hydrogen carbonate 1180
Amobarbital 1180
Amobarbital sodium 1181
Amoxicillin sodium 1182
Amoxicillin trihydrate 1184
Amperometric titration (2.2.19.) 35
Amphotericin B 1187
Ampicillin, anhydrous 1188
Ampicillin sodium 1190
Ampicillin trihydrate 1193
Anaesthetic ether 1834
Analysis, thermal (2.2.34.) 55
Analytical sieving, particle-size distribution estimation by (2.9.38.) 325
Angelica root 1196
Animal anti-T lymphocyte immunoglobulin for human use 1203
Animal immunosera for human use 685
Animal spongiform encephalopathies, products with risk of transmitting agents of 694
Animal spongiform encephalopathy agents, minimising the risk of transmitting via human and veterinary medicinal products (5.2.8.) 558
Aniseed 1199
Anise oil 1197
Anisidine value (2.5.36.) 152
Antazoline hydrochloride 1199
Anthrax spore vaccine (live) for veterinary use 859
Anthrax vaccine for human use (adsorbed, prepared from culture filtrates) 757
Anti-A and anti-B haemagglutinins (indirect method) (2.6.20.) 195
Antibiotics, microbiological assay of (2.7.2.) 210
Antibodies for human use, monoclonal 690
Anticoagulant and preservative solutions for human blood 1200
Anticomplementary activity of immunoglobulin (2.6.17.) 191
Anti-D antibodies in human immunoglobulins for intravenous administration, test for (2.6.26.) 205
Anti-D immunoglobulin for intravenous administration, human 2059
Anti-D immunoglobulin, human 2058
Anti-D immunoglobulin, human, assay of (2.7.13.) 230
Antimicrobial preservation, efficacy of (5.1.3.) 528
Antiserum, European viper venom 970
Antithrombin III concentrate, human 2060
Antithrombin III, human, assay of (2.7.17.) 234
Anti-T lymphocyte immunoglobulin for human use, animal 1203
Apomorphine hydrochloride 1207
Apparatus (2.1.) 15
Apparent dissolution (2.9.43.) 332
Apparent volume (2.9.15.) 285
Application of the F_0 concept to steam sterilisation of aqueous preparations (5.1.5.) 531
Aprotinin 1208
Aprotinin concentrated solution 1209

F_0 concept to steam sterilisation of aqueous preparations, application of (5.1.5.) 531
Factor II, human coagulation, assay of (2.7.18.) 234
Factor IX, human coagulation 2064
Factor IX, human coagulation, assay of (2.7.11.) 229
Factor VII, human coagulation 2061
Factor VII, human coagulation, assay of (2.7.10.) 228
Factor VIII, human coagulation 2062
Factor VIII, human coagulation, assay of (2.7.4.) 216
Factor VIII (rDNA), human coagulation 2063
Factor X, human coagulation, assay of (2.7.19.) 235
Factor XI, human coagulation 2065
Factor XI, human coagulation, assay of (2.7.22.) 238
Falling ball viscometer method (2.2.49.) 84
Famotidine 1865
Fatty acids, composition by gas chromatography (2.4.22.) 118
Fatty oils, alkaline impurities in (2.4.19.) 117
Fatty oils and herbal drugs, heavy metals in (2.4.27.) 128
Fatty oils and resinified essential oils in essential oils (2.8.7.) 250
Fatty oils, foreign oils in, by thin-layer chromatography (2.4.21.) 117
Fatty oils, identification by thin-layer chromatography (2.3.2.) 106
Fatty oils, sterols in (2.4.23.) 120
Fatty oils, vegetable 712
Fc function of immunoglobulin, test for (2.7.9.) 227
Febantel for veterinary use 1870
Felbinac 1866
Feline calicivirosis vaccine (inactivated) 909
Feline calicivirosis vaccine (live) 910
Feline chlamydiosis vaccine (inactivated) 911
Feline infectious enteritis (feline panleucopenia) vaccine (inactivated) 912
Feline infectious enteritis (feline panleucopenia) vaccine (live) 913
Feline leukaemia vaccine (inactivated) 914
Feline panleucopenia vaccine (inactivated) 912
Feline panleucopenia vaccine (live) 913
Feline viral rhinotracheitis vaccine (inactivated) 916
Feline viral rhinotracheitis vaccine (live) 917
Felodipine 1867
Felypressin 1869
Fenbendazole for veterinary use 1871
Fenbufen 1872
Fennel, bitter 1873
Fennel, sweet 1874
Fenofibrate 1875
Fenoterol hydrobromide 1876
Fentanyl 1878
Fentanyl citrate 1879
Fenticonazole nitrate 1880
Fenugreek 1882
Fermentation, products of 693
Ferric chloride hexahydrate 1882
Ferrous fumarate 1883
Ferrous gluconate 1884
Ferrous sulphate, dried 1885
Ferrous sulphate heptahydrate 1886
Feverfew 1887
Fexofenadine hydrochloride 1888
Fibrinogen, human 2066
Fibrin sealant kit 1890
Finasteride 1891
Fish oil, rich in omega-3 acids 1893
Flavoxate hydrochloride 1895
Flecainide acetate 1896
Flocculation value (Lf) of diphtheria and tetanus toxins and toxoids (Ramon assay) (2.7.27.) 241
Flowability (2.9.16.) 286
Flow cytometry (2.7.24.) 240
Flubendazole 1898
Flucloxacillin sodium 1899
Fluconazole 1900
Flucytosine 1902
Fludarabine phosphate 1903
Fludeoxyglucose (^{18}F) injection 986
Fludrocortisone acetate 1906
Flumazenil 1908
Flumazenil (*N*-[^{11}C]methyl) injection 989
Flumequine 1909
Flumetasone pivalate 1910
Flunarizine dihydrochloride 1911
Flunitrazepam 1913
Flunixin meglumine for veterinary use 1914
Fluocinolone acetonide 1915
Fluocortolone pivalate 1916
Fluorescein 1918
Fluorescein sodium 1919
Fluorides (2.4.5.) 112
Fluorimetry (2.2.21.) 36
Fluorodopa (^{18}F) (prepared by electrophilic substitution) injection 990
Fluorouracil 1920
Fluoxetine hydrochloride 1922
Flupentixol dihydrochloride 1924
Fluphenazine decanoate 1926
Fluphenazine dihydrochloride 1928
Fluphenazine enantate 1927
Flurazepam monohydrochloride 1930
Flurbiprofen 1931
Fluspirilene 1932
Flutamide 1933
Fluticasone propionate 1934
Flutrimazole 1936
Foams, cutaneous 728
Foams, intrauterine 726
Foams, medicated 723
Foams, rectal 746
Foams, vaginal 752
Folic acid 1938

Foot-and-mouth disease (ruminants) vaccine (inactivated) 918
Foreign esters in essential oils (2.8.6.) 250
Foreign matter (2.8.2.) 249
Foreign oils in fatty oils by thin-layer chromatography (2.4.21.) 117
Formaldehyde, free (2.4.18.) 117
Formaldehyde solution (35 per cent) 1939
Formoterol fumarate dihydrate 1940
Foscarnet sodium hexahydrate 1942
Fosfomycin calcium 1943
Fosfomycin sodium 1945
Fosfomycin trometamol 1946
Fowl cholera vaccine (inactivated) 920
Fowl-pox vaccine (live) 921
Framycetin sulphate 1947
Frangula bark 1949
Frangula bark dry extract, standardised 1950
Frankincense, Indian 2128
Free formaldehyde (2.4.18.) 117
Freezing point (2.2.18.) 35
Friability of granules and spheroids (2.9.41.) 330
Friability of uncoated tablets (2.9.7.) 278
Fructose 1951
Fucus 2213
Fumitory 1952
Functional groups and ions, identification reactions of (2.3.1.) 103
Furosemide 1953
Furunculosis vaccine (inactivated, oil-adjuvanted, injectable) for salmonids 922
Fusidic acid 1954

Ketorolac trometamol 2220
Ketotifen hydrogen fumarate 2221
Knotgrass 2223
Krypton (^{81m}Kr) inhalation gas 1000

L

Labetalol hydrochloride 2227
Lactic acid 2228
Lactic acid, (*S*)- 2229
Lactitol monohydrate 2229
Lactobionic acid 2231
Lactose, anhydrous 2232
Lactose monohydrate 2233
Lactulose 2234
Lactulose, liquid 2236
Lamivudine 2238
Lansoprazole 2240
Laser light diffraction, particle size analysis by (2.9.31.) 311
Lauroyl macrogolglycerides 2242
Lavender flower 2243
Lavender oil 2244
Lead in sugars (2.4.10.) 115
Leflunomide 2245
Lemon oil 2246

Lemon verbena leaf 2248
Leptospirosis vaccine (inactivated), bovine 876
Leptospirosis vaccine (inactivated), canine 888
Letrozole 2249
Leucine 2250
Leuprorelin 2251
Levamisole for veterinary use 2253
Levamisole hydrochloride 2254
Levocabastine hydrochloride 2255
Levocarnitine 2257
Levodopa 2258
Levodropropizine 2260
Levomenthol 2261
Levomepromazine hydrochloride 2262
Levomepromazine maleate 2263
Levomethadone hydrochloride 2264
Levonorgestrel 2266
Levothyroxine sodium 2267
Lidocaine 2268
Lidocaine hydrochloride 2269
Light liquid paraffin 2612
Light magnesium carbonate 2316
Light magnesium oxide 2321
Lime flower 2270
Limit tests (2.4.) 111
Limit tests, standard solutions for (4.1.2.) 504
Lincomycin hydrochloride 2271
Lindane 2272
Linen thread, sterile, in distributor for veterinary use 1058
Linoleoyl macrogolglycerides 2273
Linseed 2273
Linseed oil, virgin 2274
Liothyronine sodium 2274
Lipophilic solid dosage forms, dissolution test for (2.9.42.) 332
Liquid chromatography (2.2.29.) 46
Liquid extracts 683
Liquid glucose 1982
Liquid glucose, spray-dried 1982
Liquid lactulose 2236
Liquid maltitol 2332
Liquid paraffin 2613
Liquid preparations for cutaneous application 728
Liquid preparations for cutaneous application, veterinary 752
Liquid preparations for inhalation 740
Liquid preparations for oral use 728
Liquids, clarity and degree of opalescence of (2.2.1.) 21
Liquid sorbitol (crystallising) 2942
Liquid sorbitol (non-crystallising) 2943
Liquid sorbitol, partially dehydrated 2944
Liquorice ethanolic liquid extract, standardised 2275
Liquorice root 2276
Lisinopril dihydrate 2277
Lithium carbonate 2279
Lithium citrate 2279
L-Methionine ([^{11}C]methyl) injection 1001
Lobeline hydrochloride 2280
Lomustine 2281
Loosestrife 2283
Loperamide hydrochloride 2283
Loperamide oxide monohydrate 2285
Loratadine 2286
Lorazepam 2288
Loss on drying (2.2.32.) 53
Loss on drying of extracts (2.8.17.) 256
Lovage root 2290
Lovastatin 2291
Low-molecular-mass heparins 2041
Lozenges and pastilles 734
Lozenges, compressed 734
Lubricant, silicone oil (3.1.8.) 358
Lymecycline 2292
Lynestrenol 2294
Lyophilisates, oral 748
Lysine acetate 2295
Lysine hydrochloride 2296

M

Macrogol 15 hydroxystearate 2305
Macrogol 20 glycerol monostearate 2304
Macrogol 40 sorbitol heptaoleate 2310
Macrogol 6 glycerol caprylocaprate 2302
Macrogol cetostearyl ether 2301
Macrogolglycerol cocoates 2302
Macrogolglycerol hydroxystearate 2303
Macrogolglycerol ricinoleate 2304
Macrogol lauryl ether 2306
Macrogol oleate 2307
Macrogol oleyl ether 2308
Macrogols 2308
Macrogol stearate 2311
Macrogol stearyl ether 2312
Magaldrate 2312
Magnesium (2.4.6.) 112
Magnesium acetate tetrahydrate 2313
Magnesium and alkaline-earth metals (2.4.7.) 112
Magnesium aspartate dihydrate 2314
Magnesium carbonate, heavy 2315
Magnesium carbonate, light 2316
Magnesium chloride 4.5-hydrate 2317
Magnesium chloride hexahydrate 2316
Magnesium citrate, anhydrous 2318
Magnesium glycerophosphate 2318
Magnesium hydroxide 2319
Magnesium lactate dihydrate 2320
Magnesium oxide, heavy 2320
Magnesium oxide, light 2321
Magnesium peroxide 2321
Magnesium pidolate 2322
Magnesium stearate 2323
Magnesium sulphate heptahydrate 2325
Magnesium trisilicate 2325
Maize oil, refined 2326
Maize starch 2326
Malathion 2327
Maleic acid 2328
Malic acid 2329
Mallow flower 2330
Maltitol 2330
Maltitol, liquid 2332
Maltodextrin 2333
Mandarin oil 2333
Manganese glycerophosphate, hydrated 2334
Manganese sulphate monohydrate 2335
Mannheimia vaccine (inactivated) for cattle 927
Mannheimia vaccine (inactivated) for sheep 928
Mannitol 2336
Maprotiline hydrochloride 2337
Marek's disease vaccine (live) 930
Marshmallow leaf 2338
Marshmallow root 2339
Mass spectrometry (2.2.43.) 68
Mass spectrometry, inductively coupled plasma- (2.2.58.) 98
Mass uniformity of delivered doses from multidose containers (2.9.27.) 309
Mass uniformity of single-dose preparations (2.9.5.) 278
Mastic 2340

Materials based on non-plasticised poly(vinyl chloride) for containers for dry dosage forms for oral administration (3.1.11.) 362
Materials based on non-plasticised poly(vinyl chloride) for containers for non-injectable, aqueous solutions (3.1.10.) 360
Materials based on plasticised poly(vinyl chloride) for containers for aqueous solutions for intravenous infusion (3.1.14.) 366
Materials based on plasticised poly(vinyl chloride) for containers for human blood and blood components (3.1.1.1.) 339
Materials based on plasticised poly(vinyl chloride) for tubing used in sets for the transfusion of blood and blood components (3.1.1.2.) 342
Materials for containers for human blood and blood components (3.1.1.) 339
Materials used for the manufacture of containers (3.1.) 339
Matricaria flower 2340
Matricaria liquid extract 2341
Matricaria oil 2342
Meadowsweet 2344
Measles immunoglobulin, human 2069
Measles, mumps and rubella vaccine (live) 812
Measles vaccine (live) 813
Measurement of consistency by penetrometry (2.9.9.) 279
Mebendazole 2345
Meclozine hydrochloride 2346
Medicated chewing gum (2.9.25.) 304
Medicated chewing gums 719
Medicated feeding stuffs for veterinary use, premixes for 739
Medicated foams 723
Medicated plasters 747
Medicated tampons 751
Medicated vaginal tampons 752
Medicinal air 1118
Medicinal air, synthetic 1121
Medium-chain triglycerides 3122
Medroxyprogesterone acetate 2347
Mefenamic acid 2349
Mefloquine hydrochloride 2350
Megestrol acetate 2352
Meglumine 2353
Melilot 2354
Melissa leaf 2355
Melting point - capillary method (2.2.14.) 32
Melting point - instantaneous method (2.2.16.) 33
Melting point - open capillary method (2.2.15.) 32
Menadione 2356
Meningococcal group C conjugate vaccine 814
Meningococcal polysaccharide vaccine 816
Menthol, racemic 2356
Mepivacaine hydrochloride 2357
Meprobamate 2359
Mepyramine maleate 2360
Mercaptopurine 2361
Mercuric chloride 2361
Mesalazine 2362
Mesna 2364
Mesterolone 2366
Mestranol 2367
Metacresol 2368
Metamizole sodium 2369
Metformin hydrochloride 2370
Methacrylate copolymer, basic butylated 1254
Methacrylic acid - ethyl acrylate copolymer (1:1) 2371
Methacrylic acid - ethyl acrylate copolymer (1:1) dispersion 30 per cent 2372
Methacrylic acid - methyl methacrylate copolymer (1:1) 2373
Methacrylic acid - methyl methacrylate copolymer (1:2) 2374
Methadone hydrochloride 2374
Methanol 2376
Methanol and 2-propanol, test for (2.9.11.) 282
Methaqualone 2377
Methenamine 2378
Methionine 2379
Methionine ([^{11}C]methyl) injection, L- 1001
Methionine, DL- 2380
Methods in pharmacognosy (2.8.) 249
Methods of preparation of homoeopathic stocks and potentisation 1066
Methods of preparation of sterile products (5.1.1.) 525
Methotrexate 2380
Methylatropine bromide 2383
Methylatropine nitrate 2383
Methylcellulose 2384
Methyldopa 2386
Methylene blue 2402
Methylene chloride 2387
Methylergometrine maleate 2388
Methylhydroxyethylcellulose 2390
Methyl nicotinate 2390
Methyl parahydroxybenzoate 2391
Methylpentoses in polysaccharide vaccines (2.5.21.) 143
Methylphenobarbital 2392
Methylprednisolone 2393
Methylprednisolone acetate 2395
Methylprednisolone hydrogen succinate 2397
Methylpyrrolidone, *N*- 2399
Methylrosanilinium chloride 2400
Methyl salicylate 2401
Methyltestosterone 2402
Methylthioninium chloride 2402
Metixene hydrochloride 2404
Metoclopramide 2405
Metoclopramide hydrochloride 2407
Metolazone 2407
Metoprolol succinate 2409
Metoprolol tartrate 2410
Metrifonate 2412
Metronidazole 2414
Metronidazole benzoate 2415
Mexiletine hydrochloride 2416
Mianserin hydrochloride 2417
Miconazole 2418
Miconazole nitrate 2420
Microbial enumeration tests (microbiological examination of non-sterile products) (2.6.12.) 166
Microbiological assay of antibiotics (2.7.2.) 210
Microbiological control of cellular products (2.6.27.) 205
Microbiological examination of non-sterile products: test for specified micro-organisms (2.6.13.) 173
Microbiological examination of non-sterile products: total viable aerobic count (2.6.12.) 166
Microbiological quality, alternative methods for control of (5.1.6.) 532
Microbiological quality of pharmaceutical preparations (5.1.4.) 529

Plastic additives (3.1.13.) ... 364
Plastic containers and closures for pharmaceutical use (3.2.2.) ... 378
Plastic containers for aqueous solutions for infusion (3.2.2.1.) ... 379
Plastic containers for human blood and blood components, sterile (3.2.3.) ... 379
Plastic syringes, single-use, sterile (3.2.8.) ... 384
Pneumococcal polysaccharide conjugate vaccine (adsorbed) ... 825
Pneumococcal polysaccharide vaccine ... 827

Poliomyelitis (inactivated), diphtheria and tetanus vaccine (adsorbed, reduced antigen(s) content) 770
Poliomyelitis (inactivated), diphtheria, tetanus and pertussis (acellular, component) vaccine (adsorbed) 775
Poliomyelitis (inactivated), diphtheria, tetanus and pertussis (acellular, component) vaccine (adsorbed, reduced antigen(s) content) 778
Poliomyelitis (inactivated), diphtheria, tetanus and pertussis vaccine (adsorbed) 785
Poliomyelitis (inactivated), diphtheria, tetanus, pertussis (acellular, component) and haemophilus type b conjugate vaccine (adsorbed) 783
Poliomyelitis (inactivated), diphtheria, tetanus, pertussis (acellular, component), hepatitis B (rDNA) and haemophilus type b conjugate vaccine (adsorbed) 780
Poliomyelitis (inactivated), diphtheria, tetanus, pertussis and haemophilus type b conjugate vaccine (adsorbed) 787
Poliomyelitis vaccine (inactivated) 829
Poliomyelitis vaccine (inactivated), *in vivo* assay of (2.7.20.) 235
Poliomyelitis vaccine (oral) 832
Poliomyelitis vaccine (oral), test for neurovirulence (2.6.19.) 193
Poloxamers 2705
Polyacrylate dispersion 30 per cent 2706
Polyamide 6/6 suture, sterile, in distributor for veterinary use 1059
Polyamide 6 suture, sterile, in distributor for veterinary use 1058
Polyethyleneglycols 2308
Polyethylene terephthalate for containers for preparations not for parenteral use (3.1.15.) 369
Poly(ethylene terephthalate) suture, sterile, in distributor for veterinary use 1059
Poly(ethylene - vinyl acetate) for containers and tubing for total parenteral nutrition preparations (3.1.7.) 356
Polyethylene with additives for containers for parenteral preparations and for ophthalmic preparations (3.1.5.) ... 349
Polyethylene without additives for containers for parenteral preparations and for ophthalmic preparations (3.1.4.) ... 348
Polymorphism (5.9.) 649
Polymyxin B sulphate 2707
Polyolefines (3.1.3.) 344
Polyoxyl castor oil 2304
Polyoxyl hydrogenated castor oil 2303
Polypropylene for containers and closures for parenteral preparations and ophthalmic preparations (3.1.6.) 352
Polysaccharide vaccines, hexosamines in (2.5.20.) 143
Polysaccharide vaccines, methylpentoses in (2.5.21.) 143
Polysaccharide vaccines, nucleic acids in (2.5.17.) 142
Polysaccharide vaccines, *O*-acetyl in (2.5.19.) 143
Polysaccharide vaccines, phosphorus in (2.5.18.) 142
Polysaccharide vaccines, protein in (2.5.16.) 142
Polysaccharide vaccines, ribose in (2.5.31.) 147
Polysaccharide vaccines, sialic acid in (2.5.23.) 144
Polysaccharide vaccines, uronic acids in (2.5.22.) 144
Polysorbate 20 2709
Polysorbate 40 2710
Polysorbate 60 2710
Polysorbate 80 2711
Poly(vinyl acetate) 2712
Poly(vinyl acetate) dispersion 30 per cent 2713
Poly(vinyl alcohol) 2715
Poly(vinyl chloride), non-plasticised, materials based on for containers for dry dosage forms for oral administration (3.1.11.) 362
Poly(vinyl chloride), non-plasticised, materials based on for containers for non-injectable aqueous solutions (3.1.10.) 360
Poly(vinyl chloride), plasticised, empty sterile containers of for human blood and blood components (3.2.4.) 381
Poly(vinyl chloride), plasticised, materials based on for containers for aqueous solutions for intravenous infusion (3.1.14.) 366
Poly(vinyl chloride), plasticised, materials based on for containers for human blood and blood components (3.1.1.1.) 339
Poly(vinyl chloride), plasticised, materials based on for tubing used in sets for the transfusion of blood and blood components (3.1.1.2.) 342
Poly(vinyl chloride), plasticised, sterile containers of for human blood containing anticoagulant solution (3.2.5.) 382
Poppy petals, red 2811
Porcine actinobacillosis vaccine (inactivated) 943
Porcine influenza vaccine (inactivated) 944
Porcine insulin 2144
Porcine parvovirosis vaccine (inactivated) 946
Porcine progressive atrophic rhinitis vaccine (inactivated) 947
Porosity of sintered-glass filters (2.1.2.) 15

All reference standards required for application of the monographs are available from the EDQM. A catalogue of reference standards is available on request; the catalogue is included in the Pharmeuropa subscription; it can also be consulted on the EDQM website.

EUROPEAN PHARMACOPOEIA 6th EDITION

published 16 July 2007

replaces the 5th Edition on 1 January 2008

Volumes 1 and 2 of this publication 6.0 constitute the 6th Edition of the European Pharmacopoeia. They will be complemented by **non-cumulative supplements** that are to be kept for the duration of the 6th Edition. 2 supplements will be published in 2007 and 3 supplements in each of the years 2008 and 2009. A cumulative list of reagents will be published in supplements 6.4 and 6.7.

If you are using the 6th Edition at any time later than 1 April 2008, make sure that you have all the published supplements and consult the index of the most recent supplement to ensure that you use the latest versions of the monographs and general chapters.

EUROPEAN PHARMACOPOEIA - ELECTRONIC VERSION

The 6th Edition is also available in an electronic format (CD-ROM and online version) containing all of the monographs and general chapters found in the printed version. With the publication of each supplement the electronic version is replaced by a new, fully updated, cumulative version.

In addition to the official English and French online versions, a Spanish online version is also available for the convenience of users.

PHARMEUROPA

Quarterly Forum Publication

Pharmeuropa contains preliminary drafts of all new and revised monographs proposed for inclusion in the European Pharmacopoeia and gives an opportunity for all interested parties to comment on the specifications before they are finalised. Pharmeuropa also contains information on the work programme and on certificates of suitability to monographs of the European Pharmacopoeia issued by the EDQM, and articles of general interest. Pharmeuropa is available on subscription from the EDQM. The subscription also includes Pharmeuropa Bio and Pharmeuropa Scientific Notes (containing scientific articles on pharmacopoeial matters). Pharmeuropa Online is also available as a complementary service for subscribers to the printed version of Pharmeuropa.

INTERNATIONAL HARMONISATION

See the information given in chapter *5.8. Pharmacopoeial Harmonisation*.

HELPDESK

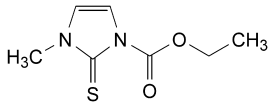
To send a question or to contact the EDQM, use the HELPDESK, accessible through the EDQM website (visit http://www.edqm.eu/site/page_521.php).

KNOWLEDGE

Consult KNOWLEDGE, the new free database at http://www.edqm.eu to obtain information on the work programme of the European Pharmacopoeia, the volume of Pharmeuropa and of the European Pharmacopoeia in which a text has been published, trade names of the reagents (for example, chromatography columns) that were used at the time of the elaboration of the monographs, the history of the revisions of a text since its publication in the 5th Edition, reference chromatograms, the list of reference standards used, and the list of certificates granted.

COMBISTATS

CombiStats is a computer program for the statistical analysis of data from biological assays in agreement with chapter *5.3* of the 6th Edition of the European Pharmacopoeia. For more information, visit the website (http://www.edqm.eu/combistats).



Version date of the text — **01/2008:0884** corrected 6.0

Text reference number

CARBIMAZOLE

Carbimazolum

Modification to be taken into account from the publication date of volume 6.0

CAS number — $C_7H_{10}N_2O_2S$ [22232-54-8] M_r 186.2

DEFINITION

Chemical name in accordance with IUPAC nomenclature rules — Ethyl 3-methyl-2-thioxo-2,3-dihydro-1*H*-imidazole-1-carboxylate.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish-white, crystalline powder.

Solubility: slightly soluble in water, soluble in acetone and in ethanol (96 per cent).

Application of the first and second identification is defined in the General Notices (chapter 1)

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Melting point (*2.2.14*): 122 °C to 125 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Reference standard available from the Secretariat (see www.edqm.eu) — *Comparison*: *carbimazole CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *carbimazole CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel GF$_{254}$ plate R*.

Reagents described in chapter 4 — *Mobile phase*: *acetone R*, *methylene chloride R* (20:80 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air for 30 min.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

Reference to a general chapter — TESTS

Related substances. Liquid chromatography (*2.2.29*).

Line in the margin indicating where part of the text has been modified (technical modification) — *Test solution*. Dissolve 5.0 mg of the substance to be examined in 10.0 ml of a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*. Use this solution within 5 min of preparation.

Reference solution (a). Dissolve 5 mg of *thiamazole R* and 0.10 g of *carbimazole CRS* in a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*.

Reference solution (b). Dissolve 5.0 mg of *thiamazole R* in a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R* and dilute to 10.0 ml with the same mixture of solvents. Dilute 1.0 ml of this solution to 100.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*.

Column:

– *size*: *l* = 0.15 m, Ø = 3.9 mm,

Further information available on www.edqm.eu (KNOWLEDGE) — – *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *acetonitrile R*, *water R* (10:90 *V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 10 µl.

Run time: 1.5 times the retention time of carbimazole.

Retention time: carbimazole = about 6 min.

System suitability: reference solution (a):

– *resolution*: minimum 5.0 between the peaks due to impurity A and carbimazole.

Limits:

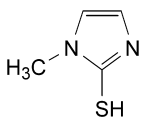
– *impurity A*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

– *unspecified impurities*: for each impurity, not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in a desiccator over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa for 24 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 50.0 mg in *water R* and dilute to 500.0 ml with the same solvent. To 10.0 ml add 10 ml of *dilute hydrochloric acid R* and dilute to 100.0 ml with *water R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 291 nm.

Calculate the content of $C_7H_{10}N_2O_2S$ taking the specific absorbance to be 557.

IMPURITIES

Specified impurities: A.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use): B.*

A. 1-methyl-1*H*-imidazole-2-thiol (thiamazole),

SPECIMEN

IMPORTANT NOTICE

GENERAL MONOGRAPHS

The European Pharmacopoeia contains a number of general monographs covering classes of products. These general monographs give requirements that are applicable to all products in the given class or, in some cases, to any product in the given class for which there is a specific monograph in the Pharmacopoeia (see *1. General Notices*, General monographs). Where no restriction on scope of a general monograph is given in a preamble, it is applicable to all products in the class defined, irrespective of whether there is an individual monograph for the product in the Pharmacopoeia.

Whenever a monograph is used, it is essential to ascertain whether there is a general monograph applicable to the product in question. The general monographs listed below are published in the section General Monographs (unless otherwise stated). This list is updated where necessary and republished in each Supplement.

Allergen products (1063)

Dosage Forms monographs
(published in the Dosage Forms section)

Essential oils (2098)

Extracts (0765)

Herbal drug preparations (1434)

Herbal drugs (1433)

Herbal drugs for homoeopathic preparations (2045)
(published in the Homoeopathic Preparations section)

Herbal teas (1435)

Homoeopathic preparations (1038)
(published in the Homoeopathic Preparations section)

Immunosera for human use, animal (0084)

Immunosera for veterinary use (0030)

Methods of preparation of homoeopathic stocks and potentisation (2371)
(published in the Homoeopathic Preparations section)

Monoclonal antibodies for human use (2031)

Mother tinctures for homoeopathic preparations (2029)
(published in the Homoeopathic Preparations section)

Products of fermentation (1468)

Products with risk of transmitting agents of animal spongiform encephalopathies (1483)

Radiopharmaceutical preparations (0125)

Recombinant DNA technology, products of (0784)

Substances for pharmaceutical use (2034)

Vaccines for human use (0153)

Vaccines for veterinary use (0062)

Vegetable fatty oils (1579)
