
Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *fluphenazine decanoate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *fluphenazine enantate CRS* in reference solution (a) and dilute to 5 ml with the same solution.

Plate: *TLC octadecylsilyl silica gel F_{254} plate R*.

Mobile phase: *concentrated ammonia R1, water R, methanol R* (1:4:95 *V/V/V*).

Application: 2 µl.

Development: over a path of 8 cm.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Related substances. Liquid chromatography (*2.2.29*). *Carry out the test protected from light and prepare the solutions immediately before use.*

Test solution. Dissolve 10.0 mg of the substance to be examined in *acetonitrile R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *fluphenazine octanoate CRS* and 5 mg of *fluphenazine enantate CRS* in *acetonitrile R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with a mixture of 5 volumes of mobile phase A and 95 volumes of mobile phase B. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of 5 volumes of mobile phase A and 95 volumes of mobile phase B.

Reference solution (c). Dissolve 11.7 mg of *fluphenazine dihydrochloride CRS* and 5.0 mg of *fluphenazine sulphoxide CRS* in a mixture of 5 volumes of *water R* and 95 volumes of *acetonitrile R* and dilute to 100.0 ml with the same mixture of solvents. Dilute 1.0 ml to 50.0 ml with a mixture of 5 volumes of *water R* and 95 volumes of *acetonitrile R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: 10 g/l solution of *ammonium carbonate R* adjusted to pH 7.5 with *dilute hydrochloric acid R*,
– *mobile phase B*: mobile phase A, *acetonitrile R*, *methanol R* (7.5:45:45 *V/V/V*),

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 7	20	80
7 - 17	20 → 0	80 → 100
17 - 80	0	100
80 - 81	0 → 20	100 → 80

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 260 nm.

Equilibration: at least 30 min with the mobile phase at the initial composition.

Injection: 10 µl.

Relative retention with reference to fluphenazine decanoate (retention time = about 34 min): impurity A = about 0.13; impurity B = about 0.33; impurity C = about 0.76; impurity D = about 0.82.

System suitability: reference solution (a):

– *resolution*: minimum 6 between the peaks due to impurity C and impurity D.

Limits:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- *total*: not more than 2.0 per cent,
- *disregard limit for any other impurity*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

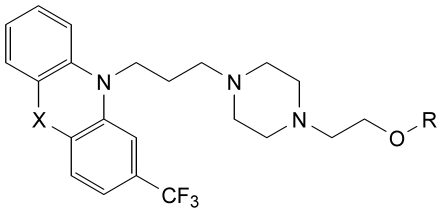
Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY



Dissolve 0.250 g in 30 ml of *glacial acetic acid R*. Using 0.05 ml of *crystal violet solution R* as indicator, titrate with *0.1 M perchloric acid* until the colour changes from violet to green.

1 ml of *0.1 M perchloric acid* is equivalent to 29.59 mg of $C_{32}H_{44}F_3N_3O_2S$.

STORAGE

Protected from light.

IMPURITIES

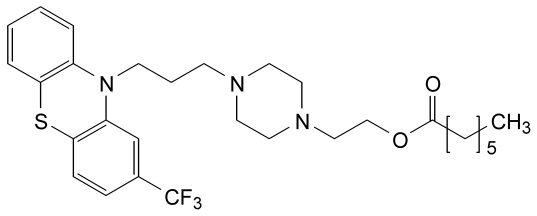
A. X = SO, R = H: fluphenazine *S*-oxide,

B. X = S, R = H: fluphenazine,

C. X = S, R = CO-$[CH_2]_5$-CH_3: fluphenazine enantate,

D. X = S, R = CO-$[CH_2]_6$-CH_3: fluphenazine octanoate,

E. X = S, R = CO-$[CH_2]_7$-CH_3: fluphenazine nonanoate,



F. X = S, R = CO-$[CH_2]_9$-CH_3: fluphenazine undecanoate,

G. X = S, R = CO-$[CH_2]_{10}$-CH_3: fluphenazine dodecanoate.

FLUPHENAZINE ENANTATE

Fluphenazini enantas

$C_{29}H_{38}F_3N_3O_2S$ M_r 549.7
[2746-81-8]

DEFINITION

2-[4-[3-[2-(Trifluoromethyl)-10*H*-phenothiazin-10-yl]propyl]piperazin-1-yl]ethyl heptanoate.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: pale yellow, viscous liquid or yellow solid.

Solubility: practically insoluble in water, very soluble in ethanol and in methylene chloride, freely soluble in methanol.

IDENTIFICATION

First identification: B, C.

Second identification: A, C.

A. Dissolve 50.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml to 50.0 ml with *methanol R*. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 260 nm and a broad absorption maximum at about 310 nm. The specific absorbance at the maximum at 260 nm is 610 to 670.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: apply 50 µl of a 25 g/l solution in *methylene chloride R* to a disc of *potassium bromide R*. Dry the discs at 60 °C for 1 h before use.

Comparison: *fluphenazine enantate CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *fluphenazine enantate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *fluphenazine decanoate CRS* in reference solution (a) and dilute to 5 ml with the same solution.

Plate: *TLC octadecylsilyl silica gel F_{254} plate R*.

Mobile phase: *concentrated ammonia R1, water R, methanol R* (1:4:95 *V/V/V*).

Application: 2 µl.

Development: over a path of 8 cm.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Related substances. Liquid chromatography (*2.2.29*). *Carry out the test protected from light and prepare the solutions immediately before use.*

Test solution. Dissolve 10.0 mg of the substance to be examined in *acetonitrile R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *fluphenazine octanoate CRS* and 5 mg of *fluphenazine enantate CRS* in *acetonitrile R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with a mixture of 5 volumes of mobile phase A and 95 volumes of mobile phase B. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of 5 volumes of mobile phase A and 95 volumes of mobile phase B.

Reference solution (c). Dissolve 5.0 mg of *fluphenazine sulphoxide CRS* in *acetonitrile R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml to 50.0 ml with *acetonitrile R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: 10 g/l solution of *ammonium carbonate R* adjusted to pH 7.5 with *dilute hydrochloric acid R*,

– *mobile phase B*: mobile phase A, *acetonitrile R*, *methanol R* (7.5:45:45 *V/V/V*),

G. X = S, R = CO-$[CH_2]_{10}$-CH_3: fluphenazine dodecanoate.

01/2008:0904

FLUPHENAZINE DIHYDROCHLORIDE

Fluphenazini dihydrochloridum

$C_{22}H_{28}Cl_2F_3N_3OS$ M_r 510.4
[146-56-5]

DEFINITION

2-[4-[3-[2-(Trifluoromethyl)-10*H*-phenothiazin-10-yl]-propyl]piperazin-1-yl]ethanol dihydrochloride.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, slightly soluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *methanol R.*

Spectral range: 230-350 nm.

Absorption maxima: at 260 nm and at about 310 nm (broad band).

Specific absorbance at the absorption maximum at 260 nm: 630 to 700.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *fluphenazine dihydrochloride CRS.*

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *fluphenazine dihydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *perphenazine CRS* in reference solution (a) and dilute to 5 ml with reference solution (a).

Plate: *TLC octadecylsilyl silica gel F_{254} plate R.*

Mobile phase: *concentrated ammonia R1, water R, methanol R* (1:4:95 *V/V/V*).

Application: 2 µl.

Development: over 2/3 of the plate.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

pH (*2.2.3*): 1.9 to 2.4.

Dissolve 0.5 g in 10 ml of *water R.*

Related substances. Liquid chromatography (*2.2.29*). *Carry out the test protected from light and prepare the solutions immediately before use.*

Test solution. Dissolve 25.0 mg of the substance to be examined in mobile phase B and dilute to 50.0 ml with mobile phase B.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase B.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with mobile phase B.

Reference solution (c). Dissolve the contents of a vial of *fluphenazine impurity mixture CRS* (containing impurities A, B, C and D) in 1 ml of the test solution.

Reference solution (d). Dissolve 5.0 mg of *fluphenazine sulphoxide CRS* (impurity A) in mobile phase B and dilute to 50.0 ml with mobile phase B. Dilute 1.0 ml of this solution to 100.0 ml with mobile phase B.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: 10 g/l solution of *ammonium carbonate R* adjusted to pH 7.5 with *dilute hydrochloric acid R*;

– *mobile phase B*: mobile phase A, *acetonitrile R, methanol R* (7.5:45:45 *V/V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 7	25	75
7 - 17	25 → 0	75 → 100
17 - 50	0	100
50 - 51	0→ 25	100 → 75

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 260 nm and at 274 nm.

Injection: 10 µl of the test solution and reference solutions (b), (c) and (d).

Identification of impurities: use the chromatogram supplied with *fluphenazine impurity mixture CRS* and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A, B, C and D.

Relative retention with reference to fluphenazine (retention time = about 14.5 min): impurity A = about 0.3; impurity B = about 0.4; impurity C = about 1.8; impurity D = about 2.2.

System suitability: reference solution (c):

– *resolution*: minimum 2.5 between the peaks due to impurities A and B.

Limits:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.3; impurity C = 0.6;

– *impurity A at 274 nm*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.2 per cent);

– *impurity B at 274 nm*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *impurities C, D at 260 nm*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *unspecified impurities at 260 nm*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *sum of the impurities at 260 nm and impurities A and B at 274 nm*: maximum 1.0 per cent;

– *disregard limit at 260 nm*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R.*

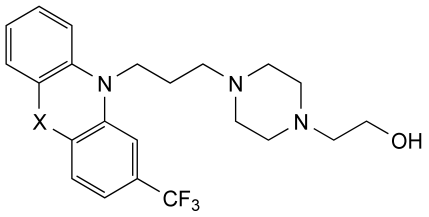
Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 0.500 g by drying in an oven at 65 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

In order to avoid overheating during the titration, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

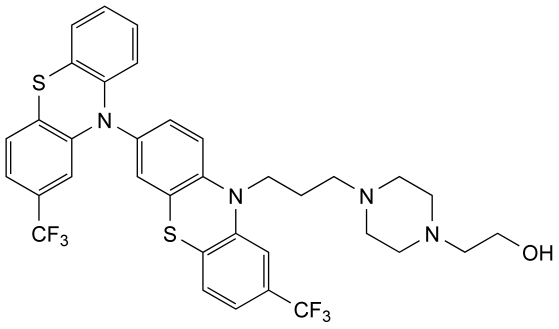
Dissolve 0.220 g in a mixture of 10 ml of *anhydrous formic acid R* and 40 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



1 ml of *0.1 M perchloric acid* is equivalent to 25.52 mg of $C_{22}H_{28}Cl_2F_3N_3OS$.

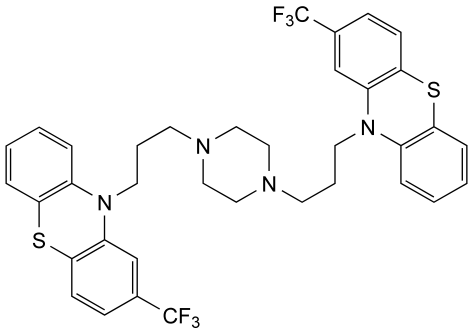
STORAGE

Protected from light.



IMPURITIES

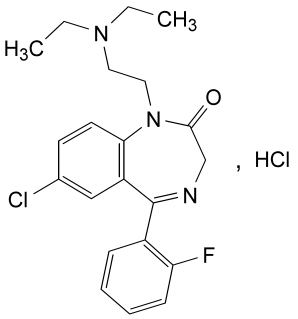
Specified impurities: A, B, C, D.



A. X = SO: 2-[4-[3-[5-oxo-2-(trifluoromethyl)-10*H*-5^4-phenothiazin-10-yl]propyl]piperazin-1-yl]ethanol (fluphenazine *S*-oxide),

B. X = SO_2: 2-[4-[3-[5,5-dioxo-2-(trifluoromethyl)-10*H*-5^6-phenothiazin-10-yl]propyl]piperazin-1-yl]ethanol (fluphenazine *S,S*-dioxide),

C. 2-[4-[3-[2′,8-bis(trifluoromethyl)-10*H*-3,10′-biphenothiazin-10-yl]propyl]piperazin-1-yl]ethanol,



D. 10,10′-[piperazine-1,4-diylbis(propane-3,1-diyl)]bis[2-(trifluoromethyl)-10*H*-phenothiazine].

FLURAZEPAM MONOHYDROCHLORIDE

Flurazepami monohydrochloridum

$C_{21}H_{24}Cl_2FN_3O$ M_r 424.3
[36105-20-1]

DEFINITION

7-Chloro-1-[2-(diethylamino)ethyl]-5-(2-fluorophenyl)-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one monohydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very soluble in water, freely soluble in alcohol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of flurazepam monohydrochloride*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

pH (*2.2.3*): 5.0 to 6.0.

Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of the substance to be examined and 5 mg of *oxazepam R* in 10 ml of *acetonitrile R* and dilute to 50.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: *base-deactivated octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 350 volumes of *acetonitrile R* and 650 volumes of a 10.5 g/l solution of *potassium dihydrogen phosphate R* and ajust to pH 6.1 with a 40 g/l solution of *sodium hydroxide R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 239 nm.

Injection: 20 µl.

Run time: 6 times the retention time of flurazepam.

Relative retention with reference to flurazepam (retention time = about 7 min): impurity C = about 1.5; impurity B = about 1.9; impurity A = about 2.4.

System suitability: reference solution (b):

– *resolution*: minimum of 4.5 between the peaks due to flurazepam and to oxazepam.

Limits:

– *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.61; impurity C = 0.65,

– *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

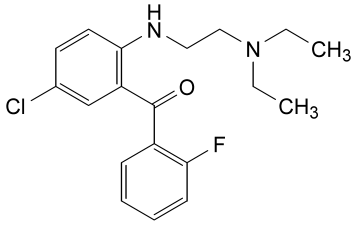
Fluorides (*2.4.5*): maximum 500 ppm.

0.10 g complies with the limit test for fluorides.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

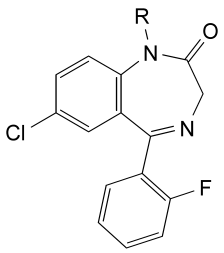
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.350 g in a mixture of 1.0 ml of *0.1 M hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 42.43 mg of $C_{21}H_{24}Cl_2FN_3O$.

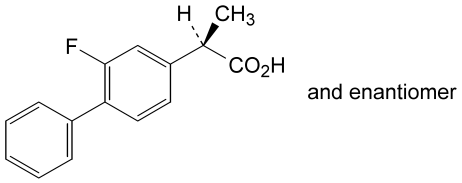


STORAGE

Protected from light.

IMPURITIES

A. [5-chloro-2-[[2-(diethylamino)ethyl]amino]phenyl](2-fluorophenyl)methanone,



B. R = H: 7-chloro-5-(2-fluorophenyl)-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one,

C. R = CHOH-CH_3: 7-chloro-5-(2-fluorophenyl)-1-[(1*RS*)-1-hydroxyethyl]-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one.

01/2008:1519

FLURBIPROFEN

Flurbiprofenum

$C_{15}H_{13}FO_2$ M_r 244.3

[5104-49-4]

DEFINITION

(2*RS*)-2-(2-Fluorobiphenyl-4-yl)propanoic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in ethanol (96 per cent) and in methylene chloride. It dissolves in aqueous solutions of alkali hydroxides and carbonates.

IDENTIFICATION

First identification: C, D.

Second identification: A, B, D.

A. Melting point (*2.2.14*): 114 °C to 117 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 0.10 g in *0.1 M sodium hydroxide* and dilute to 100.0 ml with the same alkaline solution. Dilute 1.0 ml of this solution to 100.0 ml with *0.1 M sodium hydroxide*.

Spectral range: 230-350 nm.

Absorption maximum: at 247 nm.

Specific absorbance at the absorption maximum: 780 to 820.

C. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *flurbiprofen CRS*.

D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R* add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method I*).

Dissolve 1.0 g in *methanol R* and dilute to 10 ml with the same solvent.

Optical rotation (*2.2.7*): – 0.1° to + 0.1°.

Dissolve 0.50 g in *methanol R* and dilute to 20.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Solvent mixture: *acetonitrile R, water R* (45:55 *V/V*).

Test solution. Dissolve 0.20 g of the substance to be examined in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dissolve 10.0 mg of *flurbiprofen impurity A CRS* in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 10.0 ml of this solution to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with reference solution (b).

Column:

– *size*: *l* = 0.15 m, Ø = 3.9 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *glacial acetic acid R, acetonitrile R, water R* (5:35:60 *V/V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 10 µl.

Run time: twice the retention time of flurbiprofen.

System suitability: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to impurity A and flurbiprofen.

Limits:

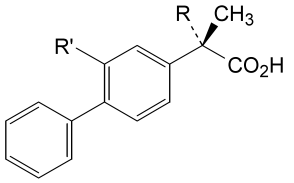
– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *impurities B, C, D, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *sum of impurities other than A*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in a mixture of 10 volumes of *water R* and 90 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with test B. Prepare the reference solution using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 10 volumes of *water R* and 90 volumes of *methanol R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.



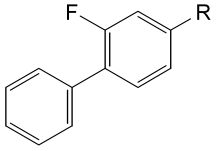
ASSAY

Dissolve 0.200 g in 50 ml of *ethanol (96 per cent) R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M sodium hydroxide* is equivalent to 24.43 mg of $C_{15}H_{13}FO_2$.

IMPURITIES

Specified impurities: *A, B, C, D, E.*

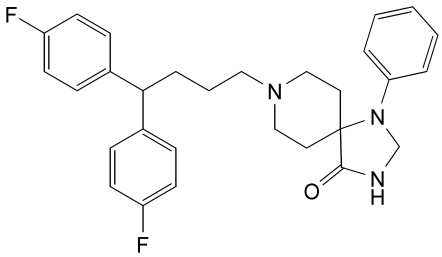


and enantiomer

A. R = R′ = H: (2*RS*)-2-(biphenyl-4-yl)propanoic acid,

B. R = $CH(CH_3)$-CO_2H: 2-(2-fluorobiphenyl-4-yl)-2,3-dimethylbutanedioic acid,

C. C. R = OH, R′ = F: (2*RS*)-2-(2-fluorobiphenyl-4-yl)-2-hydroxypropanoic acid,



D. R = CO-CH_3: 1-(2-fluorobiphenyl-4-yl)ethanone,

E. R = CO_2H: 2-fluorobiphenyl-4-carboxylic acid.

corrected 6.0

FLUSPIRILENE

Fluspirilenum

$C_{29}H_{31}F_2N_3O$ M_r 475.6
[1841-19-6]

DEFINITION

8-[4,4-bis(4-Fluorophenyl)butyl]-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, soluble in methylene chloride, slightly soluble in alcohol.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *fluspirilene CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *methylene chloride R*, gently evaporate to dryness and record new spectra using the residues.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 0.25 g in 25 ml of *methylene chloride R*.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in *dimethylformamide R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *fluspirilene impurity C CRS* in *dimethylformamide R*, add 0.5 ml of the test solution and dilute to 100.0 ml with *dimethylformamide R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with *dimethylformamide R*. Dilute 1.0 ml of this solution to 25.0 ml with *dimethylformamide R*.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:

– *mobile phase A*: 13.6 g/l solution of *tetrabutylammonium hydrogen sulphate R*,

– *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	75 → 70	25 → 30
15 - 20	70	30
20 - 22	70 → 0	30 → 100
22 - 30	0	100
30 - 31	0 → 75	100 → 25
31 - 40	75	25

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 250 nm.

Injection: 10 µl.

Relative retention with reference to fluspirilene (retention time = about 15 min): impurity A = about 0.8; impurity B = about 0.93; impurity C = 0.97.

System suitability: reference solution (a):

– *resolution*: minimum 2.2 between the peaks due to impurity C and fluspirilene.

Limits:

– *impurities A, B, C*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),

– *any other impurity*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent),

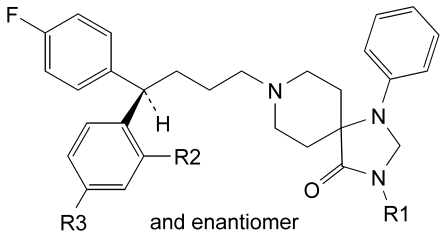
– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.350 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.



1 ml of *0.1 M perchloric acid* is equivalent to 47.56 mg of $C_{29}H_{31}F_2N_3O$.

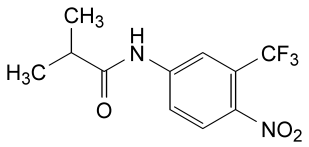
STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C.

A. R1 = R2 = R3 = H: 8-[(4*RS*)-4-(4-fluorophenyl)-4-phenylbutyl]-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one,



B. R1 = R3 = H, R2 = F: 8-[(4*RS*)-4-(2-fluorophenyl)-4-(4-fluorophenyl)butyl]-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one,

C. R1 = CH_2OH, R2 = H, R3 = F: 8-[4,4-bis(4-fluorophenyl)butyl]-3-(hydroxymethyl)-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one.

01/2008:1423

FLUTAMIDE

Flutamidum

$C_{11}H_{11}F_3N_2O_3$ M_r 276.2

[13311-84-7]

DEFINITION

2-Methyl-*N*-[4-nitro-3-(trifluoromethyl)phenyl]propanamide.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: pale yellow, crystalline powder.

Solubility: practically insoluble in water, freely soluble in acetone and in ethanol (96 per cent).

mp: about 112 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *flutamide CRS*.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *flutamide CRS* and 2 mg of *flutamide impurity C CRS* in the mobile phase, then dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 20.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *acetonitrile R, water R* (50:50 *V/V*).

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 20 µl.

Run time: 1.5 times the retention time of flutamide.

Retention time: impurity C = about 14 min; flutamide = about 19 min.

Relative retention with reference to flutamide: impurity C = about 0.72.

System suitability: reference solution (a):

– *resolution*: minimum 10.5 between the peaks due to impurity C and flutamide.

Limits:

– *impurity C*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);

– *impurities A, B, D, E, F*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

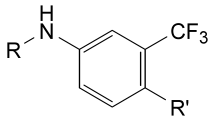
1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 25.0 mg in *methanol R* and dilute to 25.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *methanol R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 295 nm.



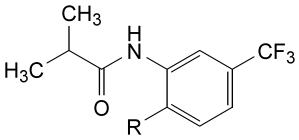
Calculate the content of $C_{11}H_{11}F_3N_2O_3$ taking the specific absorbance to be 295.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F.

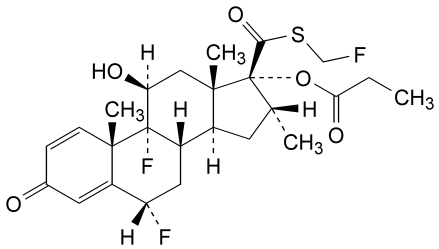


A. R = H, R′ = NO_2: 4-nitro-3-(trifluoromethyl)aniline,

B. R = CO-CH_3, R′ = NO_2: *N*-[4-nitro-3-(trifluoromethyl)-phenyl]acetamide,

C. R = CO-CH_2-CH_3, R′ = NO_2: *N*-[4-nitro-3-(trifluoromethyl)phenyl]propanamide,

D. R = R′ = H: 3-(trifluoromethyl)aniline,



E. R = H: 2-methyl-*N*-[3-(trifluoromethyl)phenyl]propanamide,

F. R = NO_2: 2-methyl-*N*-[2-nitro-5-(trifluoromethyl)-phenyl]propanamide.

01/2008:1750

FLUTICASONE PROPIONATE

Fluticasoni propionas

$C_{25}H_{31}F_3O_5S$ M_r 500.6

[80474-14-2]

DEFINITION

6α,9-Difluoro-17-[[(fluoromethyl)sulphanyl]carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl propanoate.

Content: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, sparingly soluble in methylene chloride, slightly soluble in alcohol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *fluticasone propionate CRS*.

B. Examine the chromatograms obtained in the assay.
Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (b).

TESTS

Specific optical rotation (*2.2.7*): + 32 to + 36 (anhydrous substance).

Dissolve 0.25 g in *methylene chloride R* and dilute to 50.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*): use the normalisation procedure.

Test solution. Dissolve 20 mg of the substance to be examined in a mixture of equal volumes of mobile phase A and mobile phase B and dilute to 100.0 ml with the same mixture of mobile phases.

Reference solution (a). Dissolve 4 mg of *fluticasone impurity D CRS* in a mixture of equal volumes of mobile phase A and mobile phase B and dilute to 100.0 ml with the same mixture of mobile phases.

Reference solution (b). Dissolve 20 mg of *fluticasone propionate CRS* in a mixture of equal volumes of mobile phase A and mobile phase B, add 1.0 ml of reference solution (a) and dilute to 100.0 ml with a mixture of equal volumes of mobile phase A and mobile phase B.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
– *temperature*: 40 °C.

Mobile phase:

– *mobile phase A*: a solution containing 0.05 per cent *V/V* of *phosphoric acid R* and 3.0 per cent *V/V* of *methanol R* in *acetonitrile R*,
– *mobile phase B*: a solution containing 0.05 per cent *V/V* of *phosphoric acid R* and 3.0 per cent *V/V* of *methanol R* in *water R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 40	43 → 55	57 → 45
40 - 60	55 → 90	45 → 10
60 - 70	90	10
70 - 75	90 → 43	10 → 57

Flow rate: 1 ml/min.

Detection: spectrophotometer at 239 nm.

Injection: 50 µl; inject the test solution and reference solution (b).

Relative retention with reference to fluticasone propionate (retention time = about 30 min): impurity A = about 0.38; impurity B = about 0.46; impurity C = about 0.76; impurity D = about 0.95; impurity E = about 1.12; impurity F = about 1.18; impurity G = about 1.33; impurity H = about 1.93; impurity I = about 2.01.

System suitability: reference solution (b):

– *resolution*: minimum 1.5 between the peaks due to impurity D and to fluticasone propionate.

Limits:

– *impurities D, G*: for each impurity, maximum 0.3 per cent,
– *impurities A, B, C, E, F, H, I*: for each impurity, maximum 0.2 per cent,
– *impurity with relative retention at about 1.23*: maximum 0.2 per cent,
– *any other impurity*: maximum 0.1 per cent,
– *total*: maximum 1.2 per cent,
– *disregard limit*: 0.05 per cent.

Acetone. Gas chromatography (*2.2.28*).

Internal standard solution. Dilute 0.5 ml of *tetrahydrofuran R* to 1000 ml with *dimethylformamide R*.

Test solution. Dissolve 0.50 g of the substance to be examined in the internal standard solution and dilute to 10.0 ml with the same solution.

Reference solution. Dilute 0.40 g of *acetone R* to 100.0 ml with the internal standard solution. Dilute 1.0 ml to 10.0 ml with the internal standard solution.

Column:

– *material*: fused silica,
– *size*: *l* = 25 m, Ø = 0.53 mm,
– *stationary phase*: cross-linked *macrogol 20 000 R* (film thickness 2 µm).

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 5.5 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 3.5	60
	3.5 - 7.5	60 → 180
	7.5 - 10.5	180
Injection port		150
Detector		250

Detection: flame ionisation.

Injection: 0.1 µl.

Limit:

– *acetone*: maximum 1.0 per cent *m/m*.

Water (*2.5.12*): maximum 0.5 per cent determined on 0.250 g.

Use as solvent a mixture of equal volumes of *chloroform R* and *methanol R*.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 20.0 mg of *fluticasone propionate CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 4.0 mg of *fluticasone impurity D CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. To 1.0 ml of this solution, add 1.0 ml of reference solution (a) and dilute to 10.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
– *temperature*: 40 °C.

Mobile phase: mix 15 volumes of *acetonitrile R*, 35 volumes of a 1.15 g/l solution of *ammonium dihydrogen phosphate R* adjusted to pH 3.5 and 50 volumes of *methanol R*.

Flow rate: 1.5 ml/min.

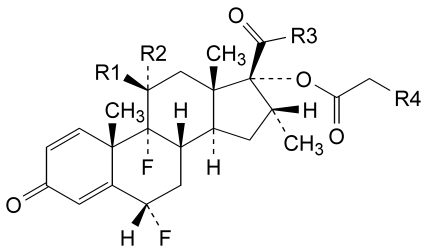
Detection: spectrophotometer at 239 nm.

Injection: 20 µl; inject the test solution and reference solutions (b) and (c).

System suitability: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to impurity D and to fluticasone propionate.

If necessary, adjust the ratio of acetonitrile to methanol in the mobile phase.



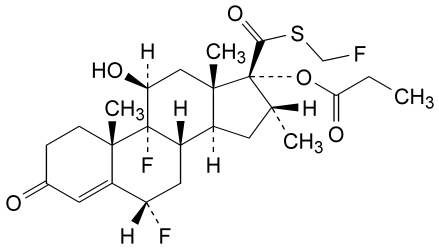
Calculate the percentage content of $C_{25}H_{31}F_3O_5S$ using the chromatograms obtained with the test solution and reference solution (b), and the declared content of *fluticasone propionate CRS*.

STORAGE

Protected from light.

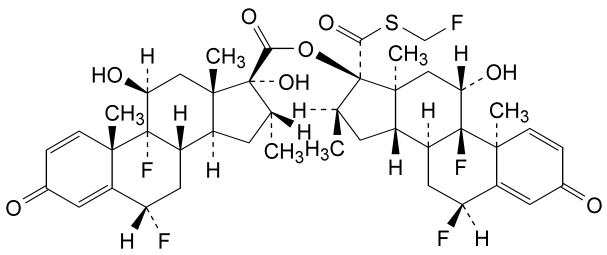
IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I.



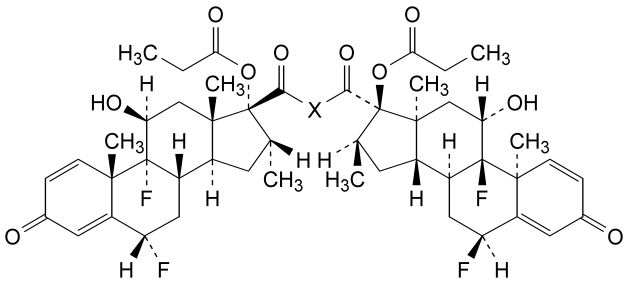
A. R1 = R3 = OH, R2 = H, R4 = CH_3: 6α,9-difluoro-11β-hydroxy-16α-methyl-3-oxo-17-(propanoyloxy)androsta-1,4-diene-17β-carboxylic acid,

B. R1 = OH, R2 = H, R3 = S-OH, R4 = CH_3: [[6α,9-difluoro-11β-hydroxy-16α-methyl-3-oxo-17-(propanoyloxy)androsta-1,4-dien-17β-yl]carbonyl]sulphenic acid,



C. R1 = OH, R2 = R4 = H, R3 = S-CH_2-F: 6α,9-difluoro-17-[[(fluoromethyl)sulphanyl]carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl acetate,

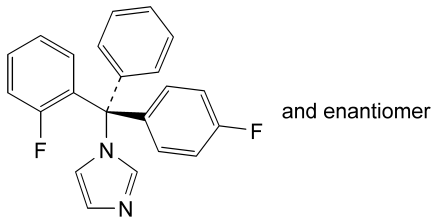
D. R1 = OH, R2 = H, R3 = S-CH_3, R4 = CH_3: 6α,9-difluoro-17-[(methylsulphanyl)carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl propanoate,



F. R1 + R2 = O, R3 = S-CH_2-F, R4 = CH_3: 6α,9-difluoro-17-[[(fluoromethyl)sulphanyl]carbonyl]-16α-methyl-3,11-dioxoandrosta-1,4-dien-17α-yl propanoate,

E. 6α,9-difluoro-17-[[(fluoromethyl)sulphanyl]carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrost-4-en-17α-yl propanoate,

G. 6α,9-difluoro-17-[[(fluoromethyl)sulphanyl]carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl 6α,9-difluoro-11β,17-dihydroxy-16α-methyl-3-oxoandrosta-1,4-diene-17β-carboxylate,



H. X = S-S: 17,17′-(disulphanediyldicarbonyl)bis(6α,9-difluoro-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl) dipropanoate,

I. X = S-S-S: 17,17′-(trisulphanediyldicarbonyl)bis(6α,9-difluoro-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl) dipropanoate.

corrected 6.0

FLUTRIMAZOLE

Flutrimazolum

$C_{22}H_{16}F_2N_2$ M_r 346.4
[119006-77-8]

DEFINITION

(*RS*)-1-[(2-Fluorophenyl)(4-fluorophenyl)phenylmethyl]-1*H*-imidazole.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in tetrahydrofuran, soluble in methanol.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 161 °C to 166 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *flutrimazole CRS.*

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 20 mg of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *flutrimazole CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *flutrimazole CRS* and 10 mg of *metronidazole benzoate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel F_{254} plate R.*

Pretreatment: heat the plate at 110 °C for 1 h.

Mobile phase: *2-propanol R, ethyl acetate R* (10:90 *V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. Add 1.0 ml of the filtrate to a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Solution S. Dissolve 1.00 g in *methanol R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Optical rotation (*2.2.7*): – 0.05° to + 0.05°, determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 40.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *imidazole CRS* (impurity A) in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 30.0 mg of *flutrimazole impurity B CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Mix 2.0 ml of reference solution (a) and 2.0 ml of reference solution (b) and dilute to 50.0 ml with the mobile phase.

Reference solution (d). Dilute 10.0 ml of reference solution (c) to 50.0 ml with the mobile phase.

Reference solution (e). Mix 2.0 ml of the test solution and 10.0 ml of reference solution (c) and dilute to 50.0 ml with the mobile phase.

Reference solution (f). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.2 m, Ø = 4.6 mm;

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *0.03 M phosphate buffer solution pH 7.0 R, acetonitrile R* (40:60 *V/V*).

Flow rate: 1.3 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl.

Run time: 2.5 times the retention time of flutrimazole.

System suitability: reference solution (e):

– *resolution*: minimum 2.0 between the peaks due to impurity A (1st peak) and impurity B (2nd peak); minimum 1.5 between the peaks due to impurity B and flutrimazole (3rd peak);

– *symmetry factors*: maximum 2.0 for the peaks due to impurities A and B.

Limits:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.1 per cent);

– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.3 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (f) (0.10 per cent);

– *sum of impurities other than B*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (f) (0.3 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (f) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test F. Use a platinum crucible. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

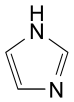
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

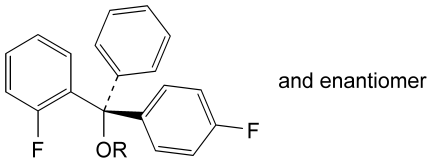
Dissolve 0.300 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 34.64 mg of $C_{22}H_{16}F_2N_2$.



STORAGE

Protected from light.

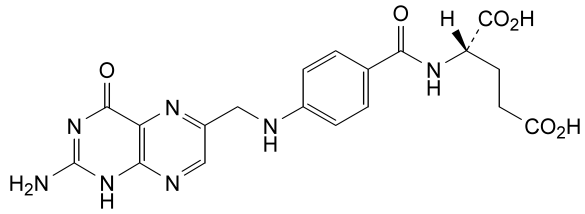


IMPURITIES

Specified impurities: *A, B.*

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C.*

A. imidazole,



B. R = H: (*RS*)-(2-fluorophenyl)(4-fluorophenyl)phenylmethanol,

C. R = CH_3: (*RS*)-(2-fluorophenyl)(4-fluorophenyl)methoxyphenylmethane.

01/2008:0067

FOLIC ACID

Acidum folicum

$C_{19}H_{19}N_7O_6$ M_r 441.4
[59-30-3]

DEFINITION

(2*S*)-2-[[4-[[(2-Amino-4-oxo-1,4-dihydropteridin-6-yl)methyl]amino]benzoyl]amino]pentanedioic acid.

Content: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: yellowish or orange, crystalline powder.

Solubility: practically insoluble in water and in most organic solvents. It dissolves in dilute acids and in alkaline solutions.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. Specific optical rotation (*2.2.7*): + 18 to + 22 (anhydrous substance).

Dissolve 0.25 g in *0.1 M sodium hydroxide* and dilute to 25.0 ml with the same solvent.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 50 mg of the substance to be examined in a mixture of 2 volumes of *concentrated ammonia R* and 9 volumes of *methanol R* and dilute to 100 ml with the same mixture of solvents.

Reference solution. Dissolve 50 mg of *folic acid CRS* in a mixture of 2 volumes of *concentrated ammonia R* and 9 volumes of *methanol R* and dilute to 100 ml with the same mixture of solvents.

Plate: *TLC silica gel G plate R.*

Mobile phase: *concentrated ammonia R, propanol R, ethanol (96 per cent) R* (20:20:60 *V/V/V*).

Application: 2 µl.

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 365 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, fluorescence and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in 5 ml of a 28.6 g/l solution of *sodium carbonate R* and dilute to 100.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 0.100 g of *folic acid CRS* in 5 ml of a 28.6 g/l solution of *sodium carbonate R* and dilute to 100.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). To 20 mg of *pteroic acid R*, add 5 ml of a 28.6 g/l solution of *sodium carbonate R*, dilute to 100.0 ml with the mobile phase and mix until completely dissolved. Mix 1.0 ml of this solution with 1.0 ml of reference solution (a) and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 2.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (d). Dissolve 10.0 mg of *N-(4-aminobenzoyl)-L-glutamic acid R* in 1 ml of a 28.6 g/l solution of *sodium carbonate R* and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (e). To 12.0 mg of *pteroic acid R*, add 1 ml of a 28.6 g/l solution of *sodium carbonate R*, dilute to 100.0 ml with the mobile phase and mix until completely dissolved. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;
– *stationary phase*: spherical *octylsilyl silica gel for chromatography R* (5 µm) with a carbon loading of 12.5 per cent, a specific surface of 350 m^2/g and a pore size of 10 nm.

Mobile phase: mix 12 volumes of *methanol R* and 88 volumes of a solution containing 11.16 g/l of *potassium dihydrogen phosphate R* and 5.50 g/l of *dipotassium hydrogen phosphate R*.

Flow rate: 0.6 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 5 µl of the test solution and reference solutions (b), (c) (d) and (e).

Run time: 3 times the retention time of folic acid.

Relative retention with reference to folic acid (retention time = about 8.5 min): impurity A = about 0.5; impurity B = about 0.6; impurity C = about 0.9; impurity E = about 1.27; impurity D = about 1.33; impurity F = about 2.2.

System suitability: reference solution (b):

– *resolution*: minimum 4.0 between the peaks due to folic acid and impurity D.

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent);

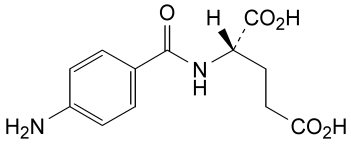
– *impurity D*: not more than the area of the principal peak in the chromatogram obtained with reference solution (e) (0.6 per cent);
– *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent);
– *total of other impurities*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent);
– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Water (*2.5.12*): 5.0 per cent to 8.5 per cent, determined on 0.150 g.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

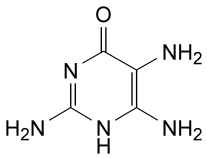
ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.



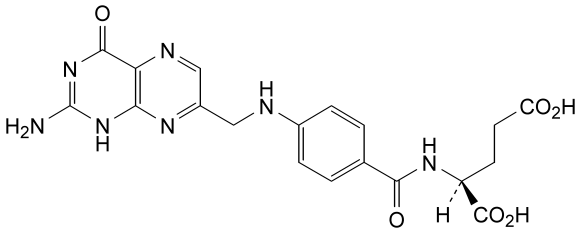
Injection: test solution and reference solution (a).

STORAGE

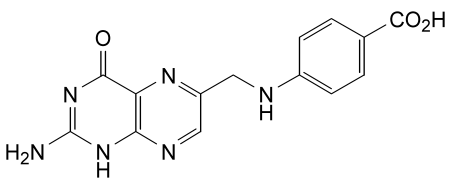


Protected from light.

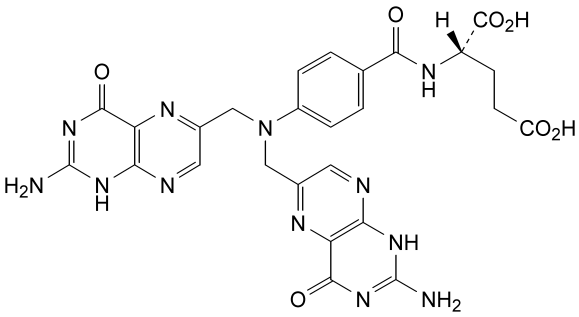
IMPURITIES



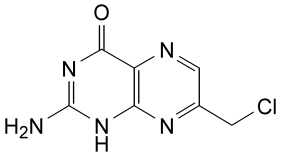
Specified impurities: A, B, C, D, E, F.



A. (2*S*)-2-[(4-aminobenzoyl)amino]pentanedioic acid (*N*-(4-aminobenzoyl)-L-glutamic acid),



B. 2,5,6-triaminopyrimidin-4(1*H*)-one,



C. (2*S*)-2-[[4-[[(2-amino-4-oxo-1,4-dihydropteridin-7-yl)methyl]amino]benzoyl]amino]pentanedioic acid (isofolic acid),

D. 4-[[(2-amino-4-oxo-1,4-dihydropteridin-6-yl)methyl]amino]benzoic acid (pteroic acid),

E. (2*S*)-2-[[4-[bis[(2-amino-4-oxo-1,4-dihydropteridin-6-yl)methyl]amino]benzoyl]amino]pentanedioic acid (6-pterinylfolic acid),

F. 2-amino-7-(chloromethyl)pteridin-4(1*H*)-one.

01/2008:0826

FORMALDEHYDE SOLUTION (35 PER CENT)

Formaldehydi solutio (35 per centum)

[50-00-0]

DEFINITION

Content: 34.5 per cent *m/m* to 38.0 per cent *m/m* of formaldehyde (CH_2O; M_r 30.03).

It contains methanol as stabiliser.

CHARACTERS

Appearance: clear, colourless liquid.

Solubility: miscible with water and with ethanol (96 per cent).

It may be cloudy after storage.

IDENTIFICATION

A. Dilute 1 ml of solution S (see Tests) to 10 ml with *water R*. To 0.05 ml of the solution add 1 ml of a 15 g/l solution of *chromotropic acid sodium salt R*, 2 ml of *water R* and 8 ml of *sulphuric acid R*. A violet-blue or violet-red colour develops within 5 min.
B. To 0.1 ml of solution S add 10 ml of *water R*. Add 2 ml of a 10 g/l solution of *phenylhydrazine hydrochloride R*, prepared immediately before use, 1 ml of *potassium ferricyanide solution R* and 5 ml of *hydrochloric acid R*. An intense red colour is formed.
C. Mix 0.5 ml with 2 ml of *water R* and 2 ml of *silver nitrate solution R2* in a test-tube. Add *dilute ammonia R2* until slightly alkaline. Heat on a water-bath. A grey precipitate or a silver mirror is formed.
D. It complies with the limits of the assay.

TESTS

Solution S. Dilute 10 ml, filtered if necessary, to 50 ml with *carbon dioxide-free water R*.

Appearance of solution. Solution S is colourless (*2.2.2, Method II*).

Acidity. To 10 ml of solution S add 1 ml of *phenolphthalein solution R*. Not more than 0.4 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to red.

Methanol. Gas chromatography (*2.2.28*).

Internal standard solution. Dilute 10 ml of *ethanol R1* to 100 ml with *water R*.

Test solution. To 10.0 ml of the solution to be examined add 10.0 ml of the internal standard solution and dilute to 100.0 ml with *water R*.

Reference solution. To 1.0 ml of *methanol R* add 10.0 ml of the internal standard solution and dilute to 100.0 ml with *water R*.

Column:

– *material*: glass,
– *size*: *l* = 1.5-2.0 m, Ø = 2-4 mm,
– *stationary phase*: *ethylvinylbenzene-divinylbenzene copolymer R* (150-180 µm).

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 30-40 ml/min.

Temperature:

– *column*: 120 °C,
– *injection port and detector*: 150 °C.

Detection: flame ionisation.

Injection: 1 µl of the test solution and the reference solution.

System suitability: reference solution:

– *resolution*: minimum 2.0 between the peaks due to methanol and ethanol.

Limit:

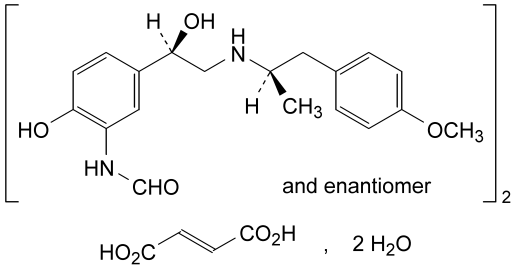
– *methanol*: 9.0 per cent *V/V* to 15.0 per cent *V/V*.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Into a 100 ml volumetric flask containing 2.5 ml of *water R* and 1 ml of *dilute sodium hydroxide solution R*, introduce 1.000 g of the solution to be examined, shake and dilute to 100.0 ml with *water R*. To 10.0 ml of the solution add 30.0 ml of *0.05 M iodine*. Mix and add 10 ml of *dilute sodium hydroxide solution R*. After 15 min, add 25 ml of *dilute sulphuric acid R* and 2 ml of *starch solution R*. Titrate with *0.1 M sodium thiosulphate*.

1 ml of *0.05 M iodine* is equivalent to 1.501 mg of CH_2O.



STORAGE

Protected from light, at a temperature of 15 °C to 25 °C.

01/2008:1724

FORMOTEROL FUMARATE DIHYDRATE

Formoteroli fumaras dihydricus

$C_{42}H_{52}N_4O_{12},2H_2O$ M_r 841

DEFINITION

N-[2-Hydroxy-5-[(1*RS*)-1-hydroxy-2-[[(1*RS*)-2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide (*E*)-butenedioate dihydrate.

Content: 98.5 per cent to 101.5 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white or slightly yellow powder.

Solubility: slightly soluble in water, soluble in methanol, slightly soluble in 2-propanol, practically insoluble in acetonitrile.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *formoterol fumarate dihydrate CRS*.

TESTS

pH (*2.2.3*): 5.5 to 6.5.

Dissolve 20 mg in *carbon dioxide-free water R* while heating to about 40 °C, allow to cool and dilute to 20 ml with the same solvent.

Optical rotation (*2.2.7*): – 0.10° to + 0.10°.

Dissolve 0.25 g in *methanol R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Solution A. Dissolve 6.10 g of *sodium dihydrogen phosphate monohydrate R* and 1.03 g of *disodium hydrogen phosphate dihydrate R* in *water R* and dilute to 1000 ml with the same solvent. The pH is 6.0 ± 0.1.

Solvent mixture: *acetonitrile R*, solution A (16:84 *V/V*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 ml with the solvent mixture. *Inject within 4 h of preparation, or within 24 h if stored protected from light at 4 °C.*

Reference solution (a). Dissolve 5 mg of *formoterol fumarate for system suitability CRS* (containing impurities A, B, C, D, E, F and G) in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 25.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 20.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: spherical *octylsilyl silica gel for chromatography R3* (5 µm) with a pore size of 8 nm.

Mobile phase:

– *mobile phase A*: *acetonitrile R1*;
– *mobile phase B*: dissolve 3.73 g of *sodium dihydrogen phosphate monohydrate R* and 0.35 g of *phosphoric acid R* in *water R* and dilute to 1000 ml with the same solvent; the pH is 3.1 ± 0.1;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 10	16	84
10 - 37	16 → 70	84 → 30
37 - 40	70 → 16	30 → 84
40 - 55	16	84

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 20 µl; inject the solvent mixture until a repeatable profile is obtained.

Identification of impurities: use the chromatogram obtained with reference solution (a) and the chromatogram supplied with *formoterol for system suitability CRS* to identify the peaks.

Relative retention with reference to formoterol (retention time = about 12 min): impurity G = about 0.4; impurity A = about 0.5; impurity B = about 0.7; impurity C = about 1.2; impurity D = about 1.3; impurity E = about 1.8; impurity F = about 2.0; impurity H = about 2.2.

System suitability: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to impurity G and impurity A.

– *peak-to-valley ratio*: minimum 2.5, where H_p = height above the baseline of the peak due to impurity C and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to formoterol.

Limits:

– *correction factor*: for the calculation of content, multiply the peak area of impurity A by 1.75;

– *impurity A*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);

– *impurities B, C, D, F*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *impurity E*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Impurity I. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 5.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent. Sonicate if necessary.

Reference solution (a). Dissolve 5.0 mg of *formoterol for impurity I identification CRS* in *water R* and dilute to 50.0 ml with the same solvent. Sonicate if necessary.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with *water R*. Dilute 1.0 ml of this solution to 25.0 ml with *water R*.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: *octadecyl vinyl polymer for chromatography R*.

Mobile phase: mix 12 volumes of *acetonitrile R1* with 88 volumes of a 5.3 g/l solution of *tripotassium phosphate trihydrate R* previously adjusted to pH 12.0 ± 0.1 with a 280 g/l solution of *potassium hydroxide R* or *phosphoric acid R*.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 225 nm.

Injection: 20 µl.

Elution order: formoterol, impurity I.

System suitability: reference solution (a):

– *peak-to-valley ratio*: minimum 2.5, where H_p = height above the baseline of the peak due to impurity I and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to formoterol.

Limit:

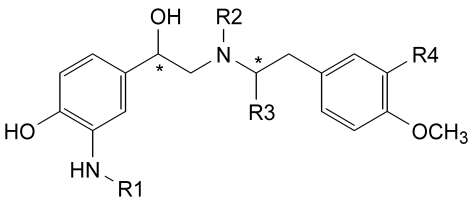
– *impurity I*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent).

Water (*2.5.12*): 4.0 per cent to 5.0 per cent, determined on 0.100 g.

ASSAY

Dissolve 0.350 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 40.24 mg of $C_{42}H_{52}N_4O_{12}$.



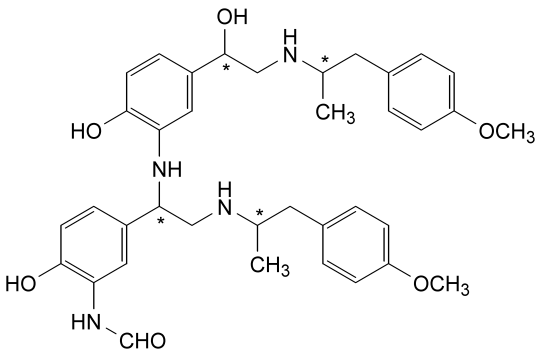
STORAGE

Protected from light.

IMPURITIES

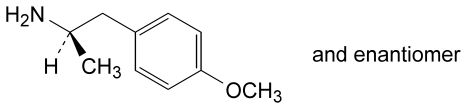
Specified impurities: A, B, C, D, E, F, I.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *G, H.*



A. R1 = R2 = R4 = H, R3 = CH_3: 1-(3-amino-4-hydroxyphenyl)-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethanol,

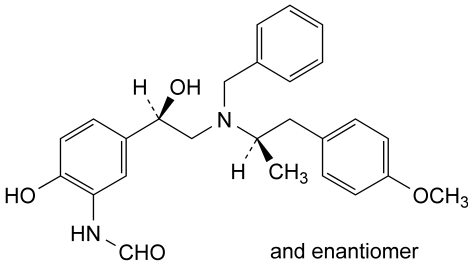
B. R1 = CHO, R2 = R3 = R4 = H: *N*-[2-hydroxy-5-[(1*RS*)-1-hydroxy-2-[[2-(4-methoxyphenyl)ethyl]amino]ethyl]phenyl]formamide,



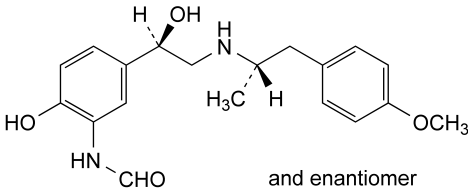
C. R1 = CO-CH_3, R2 = R4 = H, R3 = CH_3: *N*-[2-hydroxy-5-[1-hydroxy-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]acetamide,

D. R1 = CHO, R2 = R3 = CH_3, R4 = H: *N*-[2-hydroxy-5-[1-hydroxy-2-[methyl[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide,

E. R1 = CHO, R2 = H, R3 = R4 = CH_3: *N*-[2-hydroxy-5-[1-hydroxy-2-[[2-(4-methoxy-3-methylphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide,



F. *N*-[2-hydroxy-5-[1-[[2-hydroxy-5-[1-hydroxy-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]amino]-2-[[2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide,

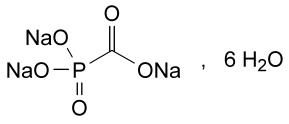


and enantiomer

G. (2*RS*)-1-(4-methoxyphenyl)propan-2-amine,

and enantiomer

H. *N*-[5-[(1*RS*)-2-[benzyl[(1*RS*)-2-(4-methoxyphenyl)-1-methylethyl]amino]-1-hydroxyethyl]-2-hydroxyphenyl]formamide (monobenzyl analogue),



and enantiomer

I. *N*-[2-hydroxy-5-[(1*RS*)-1-hydroxy-2-[[(1*SR*)-2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide (diastereoisomer).

01/2008:1520

FOSCARNET SODIUM HEXAHYDRATE

Foscarnetum natricum hexahydricum

$CNa_3O_5P,6H_2O$ M_r 300.0
[63585-09-1]

DEFINITION

Trisodium phosphonatoformate hexahydrate.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *foscarnet sodium hexahydrate CRS*.

B. It gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension I (*2.2.1*) and is colourless (*2.2.2, Method II*).

pH (*2.2.3*): 9.0 to 11.0 for solution S.

Impurity D. Gas chromatography (*2.2.28*).

Test solution. Dissolve 0.25 g of the substance to be examined in 9.0 ml of *0.1 M acetic acid* using a magnetic stirrer. Add 1.0 ml of *anhydrous ethanol R* and mix.

Reference solution. Dissolve 25 mg of *triethyl phosphonoformate R* in *anhydrous ethanol R* and dilute to 100 ml with the same solvent. Dilute 1 ml of this solution to 10 ml with *anhydrous ethanol R*.

Column:
- *material*: fused silica;
- *size*: *l* = 25 m, Ø = 0.31 mm;
- *stationary phase*: *poly(dimethyl)(diphenyl)(divinyl)-siloxane R* (film thickness 0.5 µm).

Carrier gas: *helium for chromatography R*.

Split ratio: 1:20.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 8	100 → 180
Injection port		200
Detector		250

Detection: flame ionisation.

Injection: 3 µl

Limit:
- *impurity D*: not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.1 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *foscarnet impurity B CRS* in the mobile phase, add 2.0 ml of the test solution and dilute to 50.0 ml with the mobile phase.

Column:
- *size*: *l* = 0.10 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase: dissolve 3.22 g of *sodium sulphate decahydrate R* in *water R*, add 3 ml of *glacial acetic acid R*, 6 ml of a 44.61 g/l solution of *sodium pyrophosphate R* and dilute to 1000 ml with *water R* (solution A); dissolve 3.22 g of *sodium sulphate decahydrate R* in *water R*, add 6.8 g of *sodium acetate R* and 6 ml of a 44.61 g/l solution

of *sodium pyrophosphate R* and dilute to 1000 ml with *water R* (solution B). Mix about 700 ml of solution A and about 300 ml of solution B to obtain a solution of pH 4.4. To 1000 ml of this solution, add 0.25 g of *tetrahexylammonium hydrogen sulphate R* and 100 ml of *methanol R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl.

Run time: 2.5 times the retention time of foscarnet.

System suitability: reference solution (b):

– *resolution*: minimum 7 between the peaks due to foscarnet and impurity B.

Limits:

– *impurities A, B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent);
– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.04 per cent); disregard any peak with a relative retention time less than 0.6.

Phosphate and phosphite. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 60.0 mg of the substance to be examined in *water R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 28 mg of *sodium dihydrogen phosphate monohydrate R* in *water R* and dilute to 100 ml with the same solvent.

Reference solution (b). Dissolve 43 mg of *sodium phosphite pentahydrate R* in *water R* and dilute to 100 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of reference solution (a) and 1.0 ml of reference solution (b) to 25 ml with *water R*.

Reference solution (d). Dilute 3 ml of reference solution (a) and 3 ml of reference solution (b) to 25 ml with *water R*.

Column:

– *size*: *l* = 0.05 m, Ø = 4.6 mm;
– *stationary phase*: *anion exchange resin R*.

Mobile phase: dissolve 0.102 g of *potassium hydrogen phthalate R* in *water R*, add 2.5 ml of *1 M nitric acid* and dilute to 1000 ml with *water R*.

Flow rate: 1.4 ml/min.

Detection: spectrophotometer at 290 nm (indirect detection).

Injection: 20 µl of the test solution and reference solutions (c) and (d).

System suitability: reference solution (d):

– *resolution*: minimum 2.0 between the peaks due to phosphate (1st peak) and phosphite;
– *signal-to-noise ratio*: minimum 10 for the principal peak.

Limits:

– *phosphate*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.3 per cent);
– *phosphite*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.3 per cent).

Heavy metals: maximum 10 ppm.

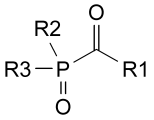
Dissolve 1.25 g in 12.5 ml of *1 M hydrochloric acid*. Warm on a water-bath for 3 min and cool to room temperature. Transfer to a beaker and adjust the pH to about 3.5 with *dilute ammonia R1* and dilute to 25 ml with *water R* (solution A). To 12 ml of solution A, add 2.0 ml of *buffer solution pH 3.5 R*. Rapidly pour the mixture into a test tube containing 1 drop of *sodium sulphide solution R*. The solution is not more intensely coloured than a reference solution prepared simultaneously and in the same manner pouring a mixture of 5.0 ml of *lead standard solution (1 ppm Pb) R*, 5.0 ml of *water R*, 2.0 ml of solution A and 2.0 ml of *buffer solution pH 3.5 R* into a test tube containing 1 drop of *sodium sulphide solution R*.

Loss on drying (*2.2.32*): 35.0 per cent to 37.0 per cent, determined on 1.000 g by drying in an oven at 150 °C.

Bacterial endotoxins (*2.6.14*): less than 83.3 IU/g, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.200 g in 50 ml of *water R*. Titrate with *0.05 M sulphuric acid*, determining the end-point potentiometrically (*2.2.20*) at the 1st inflexion point.



1 ml of *0.05 M sulphuric acid* is equivalent to 19.20 mg of CNa_3O_5P.

STORAGE

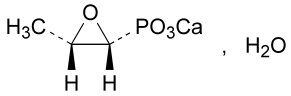
Protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

A. R1 = OC_2H_5, R2 = R3 = ONa: disodium (ethoxycarbonyl)phosphonate,

B. R1 = R2 = ONa, R3 = OC_2H_5: disodium (ethoxyoxydophosphanyl)formate,



C. R1 = R2 = OC_2H_5, R3 = ONa: ethyl sodium (ethoxycarbonyl)phosphonate,

D. R1 = R2 = R3 = OC_2H_5: methyl (diethoxyphosphoryl)-formate.

FOSFOMYCIN CALCIUM

Fosfomycinum calcicum

$C_3H_5CaO_4P,H_2O$ M_r 194.1

DEFINITION

Calcium (2*R*,3*S*)-(3-methyloxiran-2-yl)phosphonate monohydrate.

Substance produced by certain strains of *Streptomyces fradiae* or obtained by any other means.

Content: 95.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: slightly soluble in water, practically insoluble in acetone, in methanol and in methylene chloride.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs of *potassium bromide R*.

Comparison: *Ph. Eur. reference spectrum of fosfomycin calcium*.

B. Dissolve about 0.1 g in 3 ml of a 25 per cent *V/V* solution of *perchloric acid R*. Add 1 ml of *0.1 M sodium periodate* and heat on a water-bath for 30 min. Allow to cool and add 50 ml of *water R*. Neutralise with a saturated solution of *sodium hydrogen carbonate R* and add 1 ml of a freshly prepared 400 g/l solution of *potassium iodide R*. Prepare a blank at the same time and in the same manner. The test solution remains colourless and the blank is orange.

C. To about 8 mg add 2 ml of *water R*, 1 ml of *perchloric acid R* and 2 ml of *0.1 M sodium periodate*. Heat on a water-bath for 10 min and add, without cooling, 1 ml of *ammonium molybdate solution R5* and 1 ml of *aminohydroxynaphthalenesulphonic acid solution R*. Allow to stand for 30 min. A blue colour develops.

D. It gives reaction (a) of calcium (*2.3.1*).

TESTS

pH (*2.2.3*): 8.1 to 9.6.

Dissolve 20 mg in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent.

Specific optical rotation (*2.2.7*): – 11.0 to – 13.0 (anhydrous substance).

Dissolve 2.5 g in a 125 g/l solution of *sodium edetate R* previously adjusted to pH 8.5 with *strong sodium hydroxide solution R*, and dilute to 50.0 ml with the same solution. Measure at 405 nm using a mercury lamp.

Impurity A: maximum 1.5 per cent.

In a glass-stoppered flask, dissolve 0.200 g in 100.0 ml of *water R*. Add 50 ml of *0.5 M phthalate buffer solution pH 6.4 R* and 5.0 ml of *0.005 M sodium periodate*, close and shake. Allow to stand protected from light for 90 min. Add 10 ml of a freshly prepared 400 g/l solution of *potassium iodide R*, close and shake for 2 min. Titrate with *0.0025 M sodium arsenite* until the yellow colour almost disappears. Add 2 ml of *starch solution R* and slowly continue the titration until the colour is completely discharged. Carry out a blank test under the same conditions. Calculate the percentage content of $C_3H_7CaO_5P$ using the following expression:

$$\frac{(n_1 - n_2) \times c \times 97}{m\,(100 - H)} \times 100$$

m = mass of the substance to be examined, in milligrams;

n_1 = volume of *0.0025 M sodium arsenite* used in the blank titration;

n_2 = volume of *0.0025 M sodium arsenite* used in the titration of the test solution;

c = molarity of the sodium arsenite solution;

H = percentage content of water.

Chlorides (*2.4.4*): maximum 0.2 per cent.

Dissolve 0.500 g in *water R*, add 2 ml of *nitric acid R* and dilute to 50 ml with the same acid. To 2.5 ml of this solution add 12.5 ml of *water R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

Dissolve 2.5 g in 6 ml of *glacial acetic acid R* and dilute to 25.0 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Water (*2.5.12*): 8.5 per cent to 11.5 per cent, determined on 0.250 g. Use as the solvent a mixture of 1 volume of *pyridine R* and 3 volumes of *ethylene glycol R*.

ASSAY

In a glass-stoppered flask, dissolve 0.120 g in 20.0 ml of *0.1 M sodium periodate*. Add 5 ml of a 50 per cent *V/V* solution of *perchloric acid R* and shake. Heat in a water-bath at 37 °C for 105 min. Add 50 ml of *water R* and immediately adjust to pH 6.4 with a saturated solution of *sodium hydrogen carbonate R*. Add 10 ml of a freshly prepared 400 g/l solution of *potassium iodide R*, close and allow to stand for 2 min. Titrate with *0.1 M sodium arsenite* until the yellow colour almost disappears. Add 2 ml of *starch solution R* and slowly continue the titration until the colour is completely discharged. Carry out a blank test under the same conditions.

Calculate the percentage content of $C_3H_5CaO_4P$ using the following expression:

$$\frac{(n_1 - n_2) \times c \times 88 \times 100}{m\,(100 - H)} \times 100 - G$$

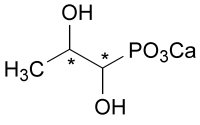
m = mass of the substance to be examined, in milligrams;

n_1 = volume of *0.1 M sodium arsenite* used in the blank titration;

n_2 = volume of *0.1 M sodium arsenite* used in the titration of the test solution;

c = molarity of the sodium arsenite solution;

G = percentage content of impurity A;



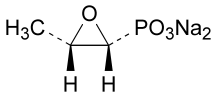
H = percentage content of water.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: *A*.



A. calcium (1,2-dihydroxypropyl)phosphonate.

corrected 6.0

FOSFOMYCIN SODIUM

Fosfomycinum natricum

$C_3H_5Na_2O_4P$ M_r 182.0
[26016-99-9]

DEFINITION

Disodium (2*R*,3*S*)-(3-methyloxiran-2-yl)phosphonate.

Substance produced by certain strains of *Streptomyces fradiae* or obtained by any other means.

Content: 95.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, very hygroscopic powder.

Solubility: very soluble in water, sparingly soluble in methanol, practically insoluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).
Preparation: discs of *potassium bromide R*.
Comparison: *Ph. Eur. reference spectrum of fosfomycin sodium*.

B. Dissolve about 0.1 g in 3 ml of a 25 per cent *V/V* solution of *perchloric acid R*. Add 1 ml of *0.1 M sodium periodate* and heat on a water-bath for 30 min. Allow to cool and add 50 ml of *water R*. Neutralise with a saturated solution of *sodium hydrogen carbonate R* and add 1 ml of a freshly prepared 400 g/l solution of *potassium iodide R*. Prepare a blank at the same time and in the same manner. The test solution remains colourless and the blank is orange.

C. To about 8 mg add 2 ml of *water R*, 1 ml of *perchloric acid R* and 2 ml of *0.1 M sodium periodate*. Heat on a water-bath for 10 min and add, without cooling, 1 ml of *ammonium molybdate solution R5* and 1 ml of *aminohydroxynaphthalenesulphonic acid solution R*. Allow to stand for 30 min. A blue colour develops.

D. It gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution B_9 (*2.2.2, Method II*).

pH (*2.2.3*): 9.0 to 10.5.

Dilute 10 ml of solution S to 20 ml with *carbon dioxide-free water R*.

Specific optical rotation (*2.2.7*): – 13.0 to – 15.0 (anhydrous substance).

Dissolve 2.5 g in *water R* and dilute to 50.0 ml with the same solvent. Measure at 405 nm using a mercury lamp.

Impurity A: maximum 1.0 per cent.

In a glass-stoppered flask, dissolve 0.200 g in 100.0 ml of *water R*. Add 50 ml of *0.5 M phthalate buffer solution pH 6.4 R* and 5.0 ml of *0.005 M sodium periodate*, close and shake. Allow to stand protected from light for 90 min. Add 10 ml of a freshly prepared 400 g/l solution of *potassium iodide R*, close and shake for 2 min. Titrate with *0.0025 M sodium arsenite* until the yellow colour almost disappears. Add 2 ml of *starch solution R* and slowly continue the titration until the colour is completely discharged. Carry out a blank test under the same conditions.

Calculate the percentage content of $C_3H_7Na_2O_5P$ using the following expression:

$$\frac{(n_1 - n_2) \times c \times 100}{m\,(100 - H)} \times 100$$

m = mass of the substance to be examined, in milligrams;
n_1 = volume of *0.0025 M sodium arsenite* used in the blank titration;
n_2 = volume of *0.0025 M sodium arsenite* used in the titration of the test solution;
c = molarity of the sodium arsenite solution;
H = percentage content of water.

Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Water (*2.5.12*): maximum 1.0 per cent, determined on 0.50 g. Use as the solvent a mixture of 1 volume of *pyridine R* and 3 volumes of *ethylene glycol R*.

Bacterial endotoxins (*2.6.14*): less than 0.083 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

In a glass-stoppered flask, dissolve 0.120 g in 20.0 ml of *0.1 M sodium periodate*. Add 5 ml of a 50 per cent *V/V* solution of *perchloric acid R* and shake. Heat on a water-bath at 37 °C for 105 min. Add 50 ml of *water R* and immediately adjust to pH 6.4 with a saturated solution of *sodium hydrogen carbonate R*. Add 10 ml of a freshly prepared 400 g/l solution of *potassium iodide R*, close and allow to stand for 2 min. Titrate with *0.1 M sodium arsenite* until the yellow colour almost disappears. Add 2 ml of *starch solution R* and slowly continue the titration until the colour is completely discharged. Carry out a blank test under the same conditions.

Calculate the percentage content of $C_3H_5Na_2O_4P$ using the following expression:

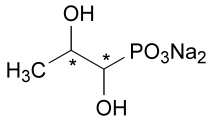
$$\frac{(n_1 - n_2) \times c \times 91 \times 100}{m\,(100 - H)} \times 100 - G$$

m = mass of the substance to be examined, in milligrams;
n_1 = volume of *0.1 M sodium arsenite* used in the blank titration;
n_2 = volume of *0.1 M sodium arsenite* used in the titration of the test solution;

Monographs F-H

c = molarity of the sodium arsenite solution;

G = percentage content of impurity A;



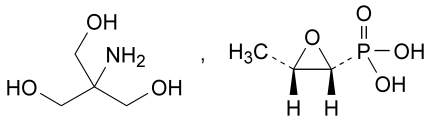
H = percentage content of water.

STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

IMPURITIES

Specified impurities: *A*.



A. disodium (1,2-dihydroxypropyl)phosphonate.

01/2008:1425

FOSFOMYCIN TROMETAMOL

Fosfomycinum trometamolum

$C_7H_{18}NO_7P$ M_r 259.2

[78964-85-9]

DEFINITION

2-Amino-2-(hydroxymethyl)propane-1,3-diol hydrogen (2*R*,3*S*)-(3-methyloxiran-2-yl)phosphonate.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, hygroscopic powder.

Solubility: very soluble in water, slightly soluble in ethanol (96 per cent) and in methanol, practically insoluble in acetone.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *fosfomycin trometamol CRS*.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 50 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 mg of *fosfomycin trometamol CRS* in *water R* and dilute to 10 ml with the same solvent.

Plate: *cellulose for chromatography R* as the coating substance.

Mobile phase: *concentrated ammonia R, water R, 2-propanol R* (10:20:70 *V/V/V*).

Application: 10 µl.

Development: over 3/4 of the plate.

Drying: in a current of warm air.

Detection: expose to iodine vapour until the spots appear.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. To about 15 mg add 2 ml of *water R*, 1 ml of *perchloric acid R* and 2 ml of *0.1 M sodium periodate*. Heat on a water-bath for 10 min and add, without cooling, 1 ml of *ammonium molybdate solution R5* and 1 ml of *aminohydroxynaphthalenesulphonic acid solution R*. Allow to stand for 30 min. A blue colour develops.

TESTS

Solution S. Dissolve 1.00 g in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent.

pH (*2.2.3*): 3.5 to 5.5 for solution S.

Specific optical rotation (*2.2.7*): – 13.5 to – 12.5 (anhydrous substance), determined on solution S at 365 nm using a mercury lamp.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 0.600 g of the substance to be examined in the mobile phase and dilute to 5.0 ml with the mobile phase.

Reference solution (a). Dissolve 0.600 g of *fosfomycin trometamol CRS* in the mobile phase and dilute to 5.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 3.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (c). Wet 0.3 g of the substance to be examined with 60 µl of *water R* and heat in an oven at 60 °C for 24 h. Dissolve the residue in the mobile phase and dilute to 20.0 ml with the mobile phase (solution A). Dissolve 0.6 g of the substance to be examined in solution A and dilute to 5.0 ml with the same solution (*in situ* degradation to obtain impurities A, B, C and D).

Blank solution. The mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *aminopropylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: 10.89 g/l solution of *potassium dihydrogen phosphate R* in *water for chromatography R*.

Flow rate: 1.0 ml/min.

Detection: differential refractometer at 35 °C.

Injection: 10 µl of the blank solution, the test solution and reference solutions (b) and (c).

Run time: twice the retention time of fosfomycin.

Relative retention with reference to fosfomycin (retention time = about 9 min): trometamol (2 peaks) = about 0.3; impurity B = about 0.48; impurity C = about 0.54; impurity A = about 0.88; impurity D = about 1.27.

System suitability: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to impurity A and fosfomycin,

– *peak-to-valley ratio*: minimum 1.5, where H_p = height above the baseline of the peak due to impurity C and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity B.

Limits:

– *impurities A, B*: for each impurity, not more than the area of the peak due to fosfomycin in the chromatogram obtained with reference solution (b) (0.3 per cent),

– *impurities C, D*: for each impurity, not more than 0.33 times the area of the peak due to fosfomycin in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *unspecified impurities*: for each impurity, not more than 0.33 times the area of the peak due to fosfomycin in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *total*: not more than 1.67 times the area of the peak due to fosfomycin in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *disregard limit*: 0.17 times the area of the peak due to fosfomycin in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard the 2 peaks due to trometamol and any peak due to the blank.

Phosphates: maximum 500 ppm.

Dissolve 0.1 g in 3 ml of *dilute nitric acid R* and dilute to 10 ml with *water R*. To 5 ml of this solution add 5 ml of *water R* and 5 ml of *molybdovanadic reagent R*. Shake vigorously. After 5 min, any colour in the test solution is not more intense than that in a standard prepared at the same time in the same manner, using 5 ml of *phosphate standard solution (5 ppm PO_4) R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

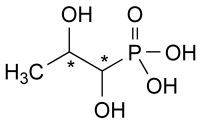
Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): maximum 0.5 per cent, determined on 0.500 g.

ASSAY

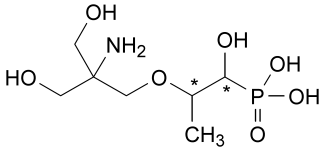
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: 5 µl of the test solution and reference solution (a).



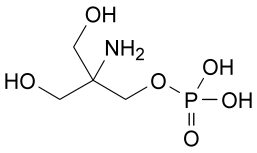
Calculate the percentage content of $C_7H_{18}NO_7P$ from the areas of the peaks due to fosfomycin and the declared content of *fosfomycin trometamol CRS*.

STORAGE

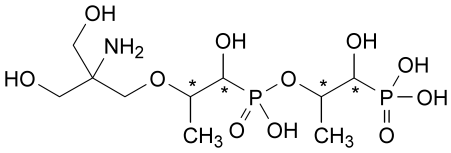


In an airtight container.

IMPURITIES



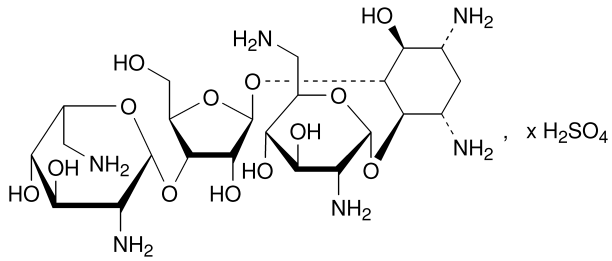
Specified impurities: A, B, C, D.



A. (1,2-dihydroxypropyl)phosphonic acid,

B. [2-[2-amino-3-hydroxy-2-(hydroxymethyl)propoxy]-1-hydroxypropyl]phosphonic acid,

C. 2-amino-3-hydroxy-2-(hydroxymethyl)propyl dihydrogen phosphate (trometamol phosphoric acid monoester),



D. [2-[[[2-[2-amino-3-hydroxy-2-(hydroxymethyl)propoxy]-1-hydroxypropyl]hydroxyphosphoryl]oxy]-1-hydroxypropyl]phosphonic acid (trometamoyloxy fosfomycin dimer).

01/2008:0180

FRAMYCETIN SULPHATE

Framycetini sulfas

$C_{23}H_{46}N_6O_{13},xH_2SO_4$ M_r 615 (base)
[4146-30-9]

DEFINITION

Sulphate of 2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-β-L-idopyranosyl)-β-D-ribofuranosyl]-D-streptamine (neomycin B).

Substance produced by the growth of selected strains of *Streptomyces fradiae* or *Streptomyces decaris* or obtained by any other means.

Content: minimum of 630 IU/mg (dried substance).

CHARACTERS

Appearance: white or yellowish-white powder, hygroscopic.

Solubility: freely soluble in water, very slightly soluble in alcohol, practically insoluble in acetone.

IDENTIFICATION

A. Examine the chromatograms obtained in the test for related substances.

Results:

– the retention time of the principal peak in the chromatogram obtained with the test solution is approximately the same as that of the principal peak in the chromatogram obtained with reference solution (a),

– it complies with the limit given for impurity C.

B. It gives reaction (a) of sulphates (*2.3.1*).

TESTS

pH (*2.2.3*): 6.0 to 7.0.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Specific optical rotation (*2.2.7*): + 52.5 to + 55.5 (dried substance).

Dissolve 1.00 g in *water R* and dilute to 10.0 ml with the same solvent

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve the contents of a vial of *framycetin sulphate CRS* in the mobile phase and dilute with the mobile phase to obtain a solution containing 0.5 mg/ml.

Reference solution (b). Dilute 3.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (d). Dissolve the contents of a vial of *neamine CRS* (corresponding to 0.5 mg) in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (e). Dissolve 10 mg of *neomycin sulphate CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: 25 °C.

Mobile phase: mix 20.0 ml of *trifluoroacetic acid R*, 6.0 ml of *carbonate-free sodium hydroxide solution R* and 500 ml of *water R*, allow to equilibrate, dilute to 1000 ml with *water R* and degas.

Flow rate: 0.7 ml/min.

Post-column solution: *carbonate-free sodium hydroxide solution R* diluted 1 in 25 previously degassed, which is added pulse-less to the column effluent using a 375 µl polymeric mixing coil.

Flow rate: 0.5 ml/min.

Detection: pulsed amperometric detector with a gold working electrode, a silver-silver chloride reference electrode and a stainless steel auxiliary electrode which is the cell body, held at respectively 0.00 V detection, + 0.80 V oxidation and – 0.60 V reduction potentials, with pulse durations according to the instrument used.

Injection: 10 µl.

Run time: 1.5 times the retention time of neomycin B.

Relative retention with reference to neomycin B (retention time = about 10 min): impurity A = about 0.65; impurity C = about 0.9; impurity G = about 1.1.

System suitability:

- *resolution*: minimum 2.0 between the peaks due to impurity C and to neomycin B in the chromatogram obtained with reference solution (e); if necessary, adjust the volume of the carbonate-free sodium hydroxide solution in the mobile phase,
- *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (c).

Limits:

- *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (d) and taking into account the declared content of *neamine CRS* (1.0 per cent),
- *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),
- *total of other impurities*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),
- *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

Sulphate: 27.0 per cent to 31.0 per cent (dried substance).

Dissolve 0.250 g in 100 ml of *water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 ml of *0.1 M barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with *0.1 M sodium edetate* adding 50 ml of *alcohol R* when the colour of the solution begins to change and continuing the titration until the violet-blue colour disappears.

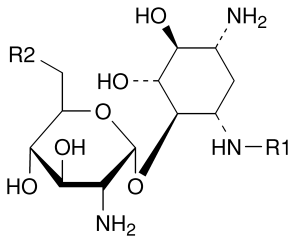
1 ml of *0.1 M barium chloride* is equivalent to 9.606 mg of SO_4.

Loss on drying (*2.2.32*): maximum 8.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (*2.4.14*): maximum 1.0 per cent, determined on 1.0 g.

Sterility (*2.6.1*). If intended for introduction into body cavities without a further appropriate sterilisation procedure, it complies with the test for sterility.

Bacterial endotoxins (*2.6.14, Method D*): less than 1.3 IU/mg if intended for introduction into body cavities without a further appropriate procedure for the removal of bacterial endotoxins.

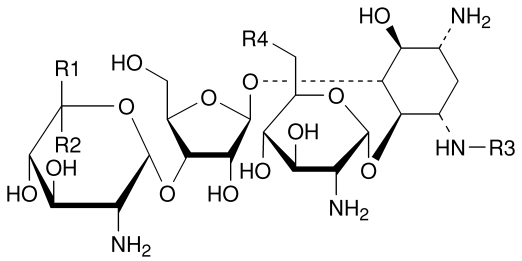


ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*). Use *framycetin sulphate CRS* as the reference substance.

STORAGE

In an airtight container, protected from light. If the substance is intended for introduction into body cavities, store in a sterile, tamper-proof container.



IMPURITIES

A. R1 = H, R2 = NH_2: 2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-D-streptamine (neamine or neomycin A-LP),

B. R1 = $CO\text{-}CH_3$, R2 = NH_2: 3-*N*-acetyl-2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-D-streptamine (3-acetylneamine),

D. R1 = H, R2 = OH: 4-*O*-(2-amino-2-deoxy-α-D-glucopyranosyl)-2-deoxy-D-streptamine (paromamine or neomycin D),

C. R1 = $CH_2\text{-}NH_2$, R2 = R3 = H, R4 = NH_2: 2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-β-D-ribofuranosyl]-D-streptamine (neomycin C),

E. R1 = R3 = H, R2 = $CH_2\text{-}NH_2$, R4 = OH: 4-*O*-(2-amino-2-deoxy-α-D-glucopyranosyl)-2-deoxy-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-β-L-idopyranosyl)-β-D-ribofuranosyl]-D-streptamine (paromomycin I or neomycin E),

F. R1 = $CH_2\text{-}NH_2$, R2 = R3 = H, R4 = OH: 4-*O*-(2-amino-2-deoxy-α-D-glucopyranosyl)-2-deoxy-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-β-D-ribofuranosyl]-D-streptamine (paromomycin II or neomycin F),

G. R1 = H, R2 = $CH_2\text{-}NH_2$, R3 = $CO\text{-}CH_3$, R4 = NH_2: 3-*N*-acetyl-2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-β-L-idopyranosyl)-β-D-ribofuranosyl]-D-streptamine (neomycin B-LP).

01/2008:0025
corrected 6.0

FRANGULA BARK

Frangulae cortex

DEFINITION

Dried, whole or fragmented bark of the stems and branches of *Rhamnus frangula* L. (*Frangula alnus* Miller).

Content: minimum 7.0 per cent of glucofrangulins, expressed as glucofrangulin A ($C_{27}H_{30}O_{14}$; M_r 578.5) (dried drug).

IDENTIFICATION

A. The bark occurs in curved, almost flat or rolled fragments or in single or double quilled pieces usually 0.5-2 mm thick and variable in length and width. The greyish-brown or dark brown outer surface is wrinkled longitudinally and covered with numerous greyish, transversely elongated lenticels; when the outer layers are removed, a dark red layer is exposed. The orange-brown or reddish-brown inner surface is smooth and bears fine longitudinal striations; it becomes red when treated with alkali. The fracture is short, fibrous in the inner part.

B. Reduce to a powder (355) (*2.9.12*). The powder is yellowish or reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous phloem fibres, partially lignified, in groups with crystal sheaths containing calcium oxalate prisms; reddish-brown fragments of cork; fragments of parenchyma containing calcium oxalate cluster crystals. Sclereids are absent.

C. Examine the chromatogram obtained in test B for "Other species of *Rhamnus*; anthrones" in daylight.

Results: the chromatogram obtained with the test solution shows 2 orange-brown zones (glucofrangulins) in the lower third and 2-4 red zones (frangulins, not always clearly separated, and above them frangula-emodin) in the upper third.

D. To about 50 mg of the powdered drug (180) (*2.9.12*) add 25 ml of *dilute hydrochloric acid R* and heat the mixture on a water-bath for 15 min. Allow to cool, shake with 20 ml of *ether R* and discard the aqueous layer. Shake the ether layer with 10 ml of *dilute ammonia R1*. The aqueous layer becomes reddish-violet.

TESTS

Other species of *Rhamnus*; anthrones. Thin-layer chromatography (*2.2.27*).

Test solution. To 0.5 g of the powdered drug (180) (*2.9.12*) add 5 ml of *ethanol (70 per cent V/V) R* and heat to boiling. Cool and centrifuge. Decant the supernatant solution immediately and use within 30 min.

Reference solution. Dissolve 20 mg of *barbaloin R* in *ethanol (70 per cent V/V) R* and dilute to 10 ml with the same solvent.

Plates: *TLC silica gel plate R* (2 plates).

Mobile phase: *water R, methanol R, ethyl acetate R* (13:17:100 *V/V/V*).

A. *Application*: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air for 5 min.

Detection: spray with a 50 g/l solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R*, and heat at 100-105 °C for 15 min. Examine in ultraviolet light at 365 nm.

Results: the chromatogram obtained with the reference solution shows a brownish-yellow zone due to barbaloin in the central part. The chromatogram obtained with the test solution shows no zones of intense yellow fluorescence and no zone of orange or reddish fluorescence similar in position to the zone due to barbaloin in the chromatogram obtained with the reference solution.

B. *Application*: 10 µl of the test solution, as a band.

Development: over a path of 10 cm.

Drying: in air for maximum 5 min.

Detection: spray immediately with a 5 g/l solution of *nitrotetrazolium blue R* in *methanol R*. Examine immediately.

Results: no violet or greyish-blue zones appear.

Foreign matter (*2.8.2*): maximum 1 per cent.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 6.0 per cent.

ASSAY

Carry out the assay protected from bright light.

In a tared, round-bottomed flask with a ground-glass neck, weigh 0.250 g of powdered drug (180) (*2.9.12*). Add 25.0 ml of a 70 per cent *V/V* solution of *methanol R*; mix and weigh. Heat in a water-bath under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with a 70 per cent *V/V* solution of *methanol R*. Filter and transfer 5.0 ml of the filtrate to a separating funnel. Add 50 ml of *water R* and 0.1 ml of *hydrochloric acid R*. Shake with 5 quantities, each of 20 ml, of *light petroleum R*. Allow the layers to separate and transfer the aqueous layer to a 100 ml volumetric flask. Combine the light petroleum layers and wash with 2 quantities, each of 15 ml, of *water R*. Use this water for washing the separating funnel and add it to the aqueous solution in the volumetric flask. Add 5 ml of a 50 g/l solution of *sodium carbonate R* and dilute to 100.0 ml with *water R*. Discard the light petroleum layer. Transfer 40.0 ml of the aqueous solution to a 200 ml round-bottomed flask with a ground-glass neck. Add 20 ml of a 200 g/l solution of *ferric chloride R* and heat under a reflux condenser for 20 min in a water-bath with the water level above that of the liquid in the flask. Add 2 ml of *hydrochloric acid R* and continue heating for 20 min, shaking frequently, until the precipitate is dissolved. Allow to cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 ml, of *ether R*, previously used to rinse the flask. Combine the ether extracts and wash with 2 quantities, each of 15 ml, of *water R*. Transfer the ether layer to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 20.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (*2.2.25*) at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of glucofrangulins, expressed as glucofrangulin A, using the following expression:

$$\frac{A \times 3.06}{m}$$

i.e. taking the specific absorbance of glucofrangulin A to be 204.

A = absorbance at 515 nm,

m = mass of the substance to be examined, in grams.

01/2008:1214

FRANGULA BARK DRY EXTRACT, STANDARDISED

Frangulae corticis extractum siccum normatum

DEFINITION

Standardised frangula bark dry extract is produced from *Frangula bark (0025)*. It contains not less than 15.0 per cent and not more than 30.0 per cent of glucofrangulins, expressed as glucofrangulin A ($C_{27}H_{30}O_{14}$; M_r 578.5) and calculated with reference to the dried extract. The measured content does not deviate from that stated on the label by more than ± 10 per cent.

PRODUCTION

The extract is produced from the drug and ethanol (50 to 80 per cent *V/V*) by an appropriate procedure.

CHARACTERS

A yellowish-brown, fine powder.

IDENTIFICATION

A. Examine by thin-layer chromatography (*2.2.27*), using a suitable silica gel as the coating substance.

Test solution. To 0.05 g add 5 ml of *alcohol (70 per cent V/V) R* and heat to boiling. Cool and centrifuge. Decant the supernatant solution immediately and use within 30 min.

Reference solution. Dissolve 20 mg of *barbaloin R* in *alcohol (70 per cent V/V) R* and dilute to 10 ml with the same solvent.

Apply separately to the plate, as bands, 10 µl of each solution. Develop over a path of 10 cm using a mixture of 13 volumes of *water R*, 17 volumes of *methanol R* and 100 volumes of *ethyl acetate R*. Allow the plate to dry for 5 min, then spray with a 50 g/l solution of *potassium hydroxide R* in *alcohol (50 per cent V/V) R* and heat at 100-105 °C for 15 min. Examine immediately after heating. The chromatogram obtained with the reference solution shows a reddish-brown zone in the median third corresponding to barbaloin. The chromatogram obtained with the test solution shows two orange-brown zones (glucofrangulins) in the lower third and two to four red zones (frangulins, not always clearly separated, and above them frangula-emodin) in the upper third.

B. To about 25 mg add 25 ml of *dilute hydrochloric acid R* and heat the mixture on a water-bath for 15 min. Allow to cool, shake with 20 ml of *ether R* and discard the aqueous layer. Shake the ether layer with 10 ml of *dilute ammonia R1*. The aqueous layer becomes reddish-violet.

TESTS

Loss on drying (*2.8.17*): maximum 5.0 per cent.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^4 per gram of which not more than 10^2 fungi per gram, determined by plate count. It complies with the test for *Escherichia coli* and *Salmonella* (*2.6.13*).

ASSAY

Carry out the assay protected from bright light.

In a tared round-bottomed flask with a ground-glass neck, weigh 0.100 g of the preparation to be examined. Add 25.0 ml of a 70 per cent *V/V* solution of *methanol R*, mix and weigh again. Heat the flask in a water-bath under a reflux condenser at 70 °C for 15 min. Allow to cool, weigh and adjust to the original mass with a 70 per cent *V/V* solution of *methanol R*. Filter and transfer 5.0 ml of the filtrate to a separating funnel. Add 50 ml of *water R* and 0.1 ml of *hydrochloric acid R*. Shake with five quantities, each of 20 ml, of *light petroleum R1*. Allow the layers to separate and transfer the aqueous layer to a 100 ml volumetric flask. Combine the light petroleum layers and wash with two quantities, each of 15 ml, of *water R*. Use this water for washing the separating funnel and add it to the aqueous solution in the volumetric flask. Add 5 ml of a 50 g/l solution of *sodium carbonate R* and dilute to 100.0 ml with *water R*. Discard the light petroleum layer. Transfer 40.0 ml of the aqueous solution to a 200 ml round-bottomed flask with a

ground-glass neck. Add 20 ml of a 200 g/l solution of *ferric chloride R* and heat under a reflux condenser for 20 min in a water-bath with the water level above that of the liquid in the flask. Add 2 ml of *hydrochloric acid R* and continue heating for 20 min, shaking frequently, until the precipitate is dissolved. Allow to cool, transfer the mixture to a separating funnel and shake with three quantities, each of 25 ml, of *ether R*, previously used to rinse the flask. Combine the ether extracts and wash with two quantities, each of 15 ml, of *water R*. Transfer the ether layer to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 20.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (*2.2.25*) at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage of glucofrangulins, expressed as glucofrangulin A from the expression:

$$\frac{A \times 3.06}{m}$$

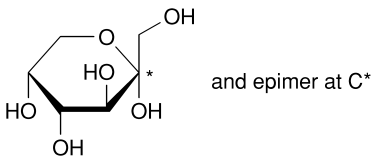
i.e. taking the specific absorbance of glucofrangulin A to be 204, calculated on the basis of the specific absorbance of barbaloin,

A = absorbance at 515 nm,

m = mass of the preparation to be examined, in grams.

STORAGE

Store in an airtight container.



LABELLING

The label states the content of glucofrangulins.

corrected 6.0

FRUCTOSE

Fructosum

$C_6H_{12}O_6$ M_r 180.2
[57-48-7]

DEFINITION

(−)-D-Arabino-hex-2-ulopyranose.

The substance described in this monograph is not necessarily suitable for parenteral use.

CHARACTERS

Appearance: white or almost white, crystalline powder.

It has a very sweet taste.

Solubility: very soluble in water, soluble in ethanol (96 per cent).

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Solvent mixture: *water R, methanol R* (2:3 *V/V*).

Test solution. Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (a). Dissolve 10 mg of *fructose CRS* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (b). Dissolve 10 mg each of *fructose CRS, glucose CRS, lactose CRS* and *sucrose CRS* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Plate: *TLC silica gel G plate R*.

Mobile phase: *water R, methanol R, anhydrous acetic acid R, ethylene chloride R* (10:15:25:50 *V/V/V/V*). Measure the volumes accurately since a slight excess of water produces cloudiness.

Application: 2 µl; thoroughly dry the starting points.

Development A: over a path of 15 cm.

Drying A: in a current of warm air.

Development B: immediately, over a path of 15 cm, after renewing the mobile phase.

Drying B: in a current of warm air.

Detection: spray with a solution of 0.5 g of *thymol R* in a mixture of 5 ml of *sulphuric acid R* and 95 ml of *ethanol (96 per cent) R*. Heat at 130 °C for 10 min.

System suitability: reference solution (b):

– the chromatogram shows 4 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

B. Dissolve 0.1 g in 10 ml of *water R*. Add 3 ml of *cupri-tartaric solution R* and heat. A red precipitate is formed.

C. To 1 ml of solution S (see Tests) add 9 ml of *water R*. To 1 ml of the solution add 5 ml of *hydrochloric acid R* and heat to 70 °C. A brown colour develops.

D. Dissolve 5 g in *water R* and dilute to 10 ml with the same solvent. To 0.5 ml of the solution add 0.2 g of *resorcinol R* and 9 ml of *dilute hydrochloric acid R* and heat on a water-bath for 2 min. A red colour develops.

TESTS

Solution S. Dissolve 10.0 g in *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Dissolve 5.0 g in *water R* and dilute to 10 ml with the same solvent. The solution is clear (*2.2.1*). Add 10 ml of *water R*. The solution is colourless (*2.2.2, Method II*).

Acidity or alkalinity. Dissolve 6.0 g in 25 ml of *carbon dioxide-free water R* and add 0.3 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.15 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to pink.

Specific optical rotation (*2.2.7*): – 91.0 to – 93.5 (anhydrous substance).

Dissolve 10.0 g in 80 ml of *water R*, add 0.2 ml of *dilute ammonia R1*, allow to stand for 30 min and dilute to 100.0 ml with *water R*.

Foreign sugars. Dissolve 5.0 g in *water R* and dilute to 10 ml with the same solvent. To 1 ml of the solution add 9 ml of *ethanol (96 per cent) R*. Any opalescence in the solution is not more intense than that in a mixture of 1 ml of the initial solution and 9 ml of *water R*.

5-Hydroxymethylfurfural and related compounds. To 5 ml of solution S add 5 ml of *water R*. The absorbance (*2.2.25*) measured at 284 nm is not greater than 0.32.

Barium. To 10 ml of solution S add 1 ml of *dilute sulphuric acid R*. When examined immediately and after 1 h, any opalescence in the solution is not more intense than that in a mixture of 1 ml of *distilled water R* and 10 ml of solution S.

Lead (*2.4.10*): maximum 0.5 ppm.

Water (*2.5.12*): maximum 0.5 per cent, determined on 1.00 g.

Sulphated ash : maximum 0.1 per cent.

Dissolve 5.0 g in 10 ml of *water R*, add 2 ml of *sulphuric acid R*, evaporate to dryness on a water-bath and ignite to constant mass.

01/2008:1869
corrected 6.0

FUMITORY

Fumariae herba

DEFINITION

Whole or fragmented, dried aerial parts of *Fumaria officinalis* L. harvested in full bloom.

Content: minimum 0.40 per cent of total alkaloids, expressed as protopine ($C_{20}H_{19}NO_5$; M_r 353.4) (dried drug).

IDENTIFICATION

A. The hollow, angular stem is light green or greenish-brown. The leaves are alternate, bipinnatisect with 2 or 3 leaf segments, the ultimate lobes lanceolate to obovate; they are greenish-blue and glabrous on both surfaces. The flowers are small and occur in loose racemes; each has a short pedicel and is subtended by a leafy bract; they are pink to purplish-red, dark purple to brown at the apex; the calyx is short, composed of 2 petalloid sepals and the corolla is tubular with 4 petals, the upper petal slightly spurred; there are 6 stamens united by their filaments into 2 groups of 3. The greenish-brown, indehiscent fruits are globular or keel-shaped, truncated or slightly emarginate at the apex, and each contains a small brown seed.

B. Reduce to a powder (355) (*2.9.12*). The powder is green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the leaf lamina in surface view with the upper epidermis composed of irregularly polygonal cells, some of which contain masses of very small sandy crystals; the cells of the lower epidermis having more wavy walls; anomocytic stomata (*2.8.3*) on both surfaces; marginal cells at the apex of the lamina elongated to form blunt papillae; groups of lignified fibres and reticulate and bordered-pitted vessels from the stem; fragments of the epidermis of the petals composed of polygonal cells with sinuous to wavy anticlinical walls and no papillae; pollen grains spherical, about 30 µm in diameter, with a pitted exine and 6 large pores; polygonal cells of the epicarp with a thick, warty cuticle.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 2 g of the powdered drug (355) (*2.9.12*) add 15 ml of *0.05 M sulphuric acid* and stir for 15 min. Filter. Dilute the filtrate to 20 ml with *0.05 M sulphuric acid*. Add 1 ml of *concentrated ammonia R* and 10 ml of *ethyl acetate R*. Stir and centrifuge. Collect the upper organic layer. Repeat the extraction in the same manner. Collect the organic layers and dry over *anhydrous sodium sulphate R*. Evaporate to dryness under reduced pressure. Take up the residue with 0.5 ml of *methanol R*.

Reference solution. Dissolve 5 mg of *protopine hydrochloride R* and 5 mg of *quinine R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *concentrated ammonia R, ethanol (96 per cent) R, acetone R, toluene R* (2:6:40:52 *V/V/V/V*).

Application: 30 µl as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 365 nm.

Results A: see below the sequence of zones present in the chromatogram obtained with the reference solution and the test solution. Furthermore, other blue fluorescent zones are present in the chromatogram obtained with the test solution.

Top of the plate	
	4 blue fluorescent zones
Quinine: a blue fluorescent zone	A greenish-blue fluorescent zone
Reference solution	**Test solution**

Detection B: spray with a mixture of *potassium iodobismuthate solution R2, acetic acid R* and *water R* (1:2:10 *V/V/V*) until orange zones appear against a yellow background.

Results B: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other less intense orange zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Protopine: an orange zone	An orange zone (protopine)
	2 orange zones
Quinine: an orange zone	A faint orange zone
Reference solution	**Test solution**

TESTS

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C.

Total ash (*2.4.16*): maximum 15.0 per cent.

ASSAY

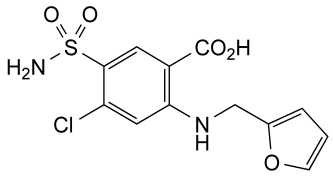
To 5.000 g of the powdered drug (355) (*2.9.12*) add 5 ml of *dilute ammonia R1* and 50 ml of *ethyl acetate R*. Shake for 15 min. Filter. Repeat the procedure in the same manner and combine the filtrates. Evaporate the filtrates to dryness under reduced pressure. Dissolve the residue by sonication for 10 min in 50 ml of *0.05 M sulphuric acid*. Filter. Dilute the filtrate to 100 ml with *0.05 M sulphuric acid*. Adjust to pH 9-10 with *concentrated ammonia R* and then add 50 ml of *ethyl acetate R*. Shake gently. Collect the upper organic layer, after centrifugation if necessary. Repeat the procedure in the same manner. Combine the organic layers and dry over *anhydrous sodium sulphate R*. Evaporate to dryness

under reduced pressure. Take up the residue with 100 ml of *anhydrous acetic acid R*. Titrate with *0.02 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.02 M perchloric acid* is equivalent to 7.068 mg of protopine.

Calculate the percentage content of total alkaloids expressed as protopine from the following expression:

$$\frac{n \times 706.8}{m}$$



n = volume of *0.02 M perchloric acid* used, in millilitres;

m = mass of the drug to be examined, in milligrams.

corrected 6.0

FUROSEMIDE

Furosemidum

$C_{12}H_{11}ClN_2O_5S$ M_r 330.7
[54-31-9]

DEFINITION

4-Chloro-2-[(furan-2-ylmethyl)amino]-5-sulphamoylbenzoic acid.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, soluble in acetone, sparingly soluble in ethanol (96 per cent), practically insoluble in methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

mp: about 210 °C, with decomposition.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50 mg in a 4 g/l solution of *sodium hydroxide R* and dilute to 100 ml with the same solution. Dilute 1 ml of this solution to 100 ml with a 4 g/l solution of *sodium hydroxide R*.

Spectral range: 220-350 nm.

Absorption maxima: at 228 nm, 270 nm and 333 nm.

Absorbance ratio: A_{270} / A_{228} = 0.52 to 0.57.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *furosemide CRS*.

C. Dissolve about 25 mg in 10 ml of *ethanol (96 per cent) R*. To 5 ml of this solution add 10 ml of *water R*. To 0.2 ml of the solution add 10 ml of *dilute hydrochloric acid R* and heat under a reflux condenser for 15 min. Allow to cool and add 18 ml of *1 M sodium hydroxide* and 1 ml of a 5 g/l solution of *sodium nitrite R*. Allow to stand for 3 min, add 2 ml of a 25 g/l solution of *sulphamic acid R* and mix. Add 1 ml of a 5 g/l solution of *naphthylethylenediamine dihydrochloride R*. A violet-red colour develops.

TESTS

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use and protect from light.*

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 2.0 mg of *furosemide impurity A CRS* in the mobile phase and dilute to 2.0 ml with the mobile phase.

Reference solution (b). Dilute a mixture of 1.0 ml of the test solution and 1.0 ml of reference solution (a) to 20.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dissolve 0.2 g of *potassium dihydrogen phosphate R* and 0.25 g of *cetrimide R* in 70 ml of *water R*; adjust to pH 7.0 with *ammonia R* and add 30 ml of *propanol R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 238 nm.

Injection: 20 µl of the test solution and reference solution (b).

Run time: 3 times the retention time of furosemide.

System suitability: reference solution (b):

– *resolution*: minimum 4 between the peaks due to impurity A (1st peak) and furosemide (2nd peak).

Limits:

– *impurities A, B, C, D, E*: for each impurity, not more than the area of the peak due to impurity A in the chromatogram obtained with reference solution (b) (0.25 per cent);
– *total*: not more than twice the area of the peak due to impurity A in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *disregard limit*: 0.1 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (b) (0.025 per cent).

Chlorides (*2.4.4*): maximum 200 ppm.

To 0.5 g add a mixture of 0.2 ml of *nitric acid R* and 30 ml of *water R* and shake for 5 min. Allow to stand for 15 min and filter.

Sulphates (*2.4.13*): maximum 300 ppm.

To 1.0 g add a mixture of 0.2 ml of *acetic acid R* and 30 ml of *distilled water R* and shake for 5 min. Allow to stand for 15 min and filter.

Heavy metals (*2.4.8*): maximum 20 ppm.

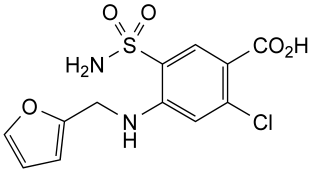
1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

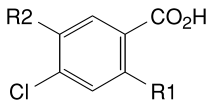
ASSAY

Dissolve 0.250 g in 20 ml of *dimethylformamide R*. Titrate with *0.1 M sodium hydroxide* using 0.2 ml of *bromothymol blue solution R2*. Carry out a blank titration.



1 ml of *0.1 M sodium hydroxide* is equivalent to 33.07 mg of $C_{12}H_{11}ClN_2O_5S$.

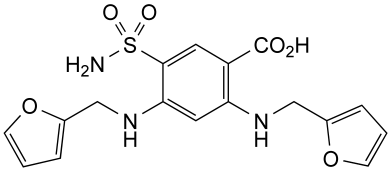
STORAGE



Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.

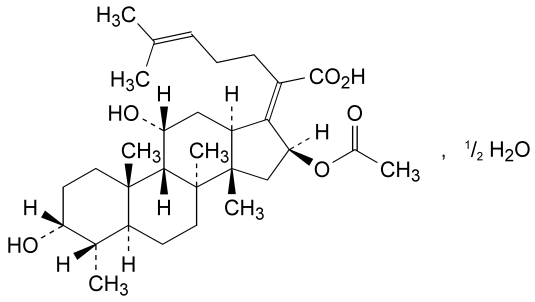


A. 2-chloro-4-[(furan-2-ylmethyl)amino]-5-sulphamoylbenzoic acid,

B. R1 = Cl, R2 = SO_2-NH_2: 2,4-dichloro-5-sulphamoylbenzoic acid,

C. R1 = NH_2, R2 = SO_2-NH_2: 2-amino-4-chloro-5-sulphamoylbenzoic acid,

E. R1 = Cl, R2 = H: 2,4-dichlorobenzoic acid,



D. 2,4-bis[(furan-2-ylmethyl)amino]-5-sulphamoylbenzoic acid.

01/2008:0798

FUSIDIC ACID

Acidum fusidicum

$C_{31}H_{48}O_6, {}^1/_2H_2O$ M_r 525.7

DEFINITION

ent-(17*Z*)-16α-(Acetyloxy)-3β,11β-dihydroxy-4β,8,14-trimethyl-18-nor-5β,10α-cholesta-17(20),24-dien-21-oic acid hemihydrate.

Antimicrobial substance produced by the growth of certain strains of *Fusidium coccineum* or by any other means.

Content: 97.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in ethanol (96 per cent).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of fusidic acid*.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 24 mg of *diethanolamine fusidate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *methanol R, cyclohexane R, glacial acetic acid R, chloroform R* (2.5:10:10:80 *V/V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in a current of warm air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *3-ketofusidic acid CRS* in 5 ml of the mobile phase. To 1.0 ml of this solution add 0.20 ml of the test solution and dilute to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 20 µl of the test solution to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.125-0.15 m, Ø = 4-5 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *methanol R*, 10 g/l solution of *phosphoric acid R, water R, acetonitrile R* (10:20:20:50 *V/V/V/V*).

Flow rate: 2 ml/min.

Detection: spectrophotometer at 235 nm.

Injection: 20 µl.

Run time: 3.5 times the retention time of fusidic acid.

System suitability:

– *resolution*: minimum 2.5 between the peaks due to 3-ketofusidic acid and fusidic acid in the chromatogram obtained with reference solution (a);
– *signal-to-noise ratio*: minimum 3 for the principal peak in the chromatogram obtained with reference solution (b).

Limits:

– *total*: not more than twice the area of the peak due to fusidic acid in the chromatogram obtained with reference solution (a) (2.0 per cent);
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Water (*2.5.12*): 1.4 per cent to 2.0 per cent, determined on 0.50 g.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.500 g in 10 ml of *ethanol (96 per cent) R*. Add 0.5 ml of *phenolphthalein solution R*. Titrate with *0.1 M sodium hydroxide* until a pink colour is obtained.

1 ml of *0.1 M sodium hydroxide* is equivalent to 51.67 mg of $C_{31}H_{48}O_6$.

STORAGE

Protected from light, at a temperature of 2 °C to 8 °C.

GALACTOSE

Galactosum

$C_6H_{12}O_6$ M_r 180.2
[59-23-4]

DEFINITION

D-Galactopyranose.

CHARACTERS

Appearance: white or almost white, crystalline or finely granulated powder.

Solubility: freely soluble or soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *galactose CRS*.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *galactose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *galactose CRS*, 10 mg of *glucose CRS* and 10 mg of *lactose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Plate: suitable silica gel as the coating substance.

Mobile phase: *water R, propanol R* (15:85 *V/V*).

Application: 2 µl; thoroughly dry the starting points.

Development: in an unsaturated tank over a path of 15 cm.

Drying: in a current of warm air.

Detection: spray with a solution of 0.5 g of *thymol R* in a mixture of 5 ml of *sulphuric acid R* and 95 ml of *ethanol (96 per cent) R*. Heat in an oven at 130 °C for 10 min.

System suitability: reference solution (b):

– the chromatogram shows 3 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in 10 ml of *water R*. Add 3 ml of *cupri-tartaric solution R* and heat. An orange or red precipitate is formed.

TESTS

Solution S. Dissolve, with heating in a water-bath at 50 °C, 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution B_8 (*2.2.2, Method II*).

Acidity or alkalinity. To 30 ml of solution S add 0.3 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 1.5 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink.

Specific optical rotation (*2.2.7*): + 78.0 to + 81.5 (anhydrous substance).

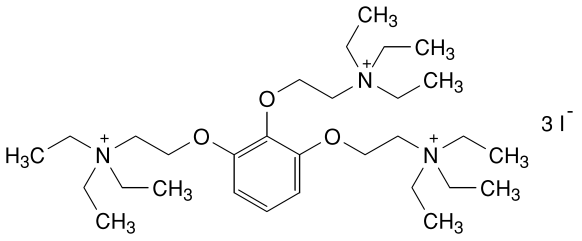
Dissolve 10.00 g in 80 ml of *water R* and add 0.2 ml of *dilute ammonia R1*. Allow to stand for 30 min and dilute to 100.0 ml with *water R*.

Barium. Dilute 5 ml of solution S to 10 ml with *distilled water R*. Add 1 ml of *dilute sulphuric acid R*. When examined immediately and after 1 h, any opalescence in the solution is not more intense than that in a mixture of 5 ml of solution S and 6 ml of *distilled water R*.

Lead (*2.4.10*): maximum 0.5 ppm.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g.

Sulphated ash: maximum 0.1 per cent.



To 5 ml of solution S add 2 ml of *sulphuric acid R*, evaporate to dryness on a water-bath and ignite to constant mass. The residue weighs a maximum of 1 mg.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^2 micro-organisms per gram.

corrected 6.0

GALLAMINE TRIETHIODIDE

Gallamini triethiodidum

$C_{30}H_{60}I_3N_3O_3$ M_r 892
[65-29-2]

DEFINITION

2,2′,2″-[Benzene-1,2,3-triyltris(oxy)]tris(*N,N,N*-triethylethanaminium) triiodide.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: very soluble in water, slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50 mg in *0.01 M hydrochloric acid* and dilute to 50.0 ml with the same acid. Dilute 1.0 ml of this solution to 100.0 ml with *0.01 M hydrochloric acid*.

Spectral range: 220-350 nm.

Absorption maximum: at 225 nm.

Specific absorbance at the absorption maximum: 500 to 550.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *gallamine triethiodide CRS*.

C. To 5 ml of solution S (see Tests) add 1 ml of *potassium tetraiodomercurate solution R*. A yellow precipitate is formed.

D. Dilute 0.5 ml of solution S to 2 ml with *water R*. Add 0.2 ml of *dilute nitric acid R*. The solution gives reaction (a) of iodides (*2.3.1*).

TESTS

Solution S. Dissolve 0.6 g in *water R* and dilute to 30 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and immediately after preparation is not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Acidity or alkalinity. To 50 ml of *water R* add 0.2 ml of *methyl red solution R*. Add either *0.01 M sulphuric acid* or *0.02 M sodium hydroxide* until an orange-yellow colour is obtained. Add 1.0 g of the substance to be examined and dissolve by shaking. Not more than 0.2 ml of *0.01 M sulphuric acid* or *0.02 M sodium hydroxide* is required to restore the orange-yellow colour.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 30.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dissolve 14 g of *sodium perchlorate R* in 850 ml of *phosphate buffer pH 3.0 R* and add 150 ml of *methanol R2*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 20 µl.

Run time: 1.5 times the retention time of triethylgallamine as perchlorate.

Relative retention with reference to triethylgallamine as perchlorate (retention time = about 40 min): impurity A = about 0.45; impurity B = about 0.50; impurity C = about 0.65; impurity D = about 0.75; impurity E = about 0.85; impurity F = about 0.90.

Limits:

– *impurities A, B, C, D, E, F*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with the reference solution (1 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (2 per cent);

– *disregard limit*: disregard the peak due to iodide with a retention time of zero.

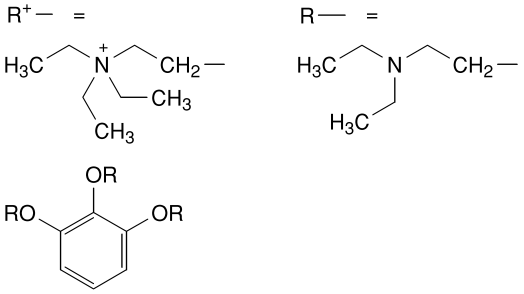
Loss on drying (*2.2.32*): maximum 1.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

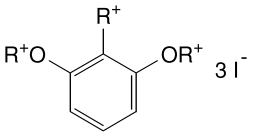
In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.270 g in a mixture of 5.0 ml of *anhydrous formic acid R* and 50.0 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



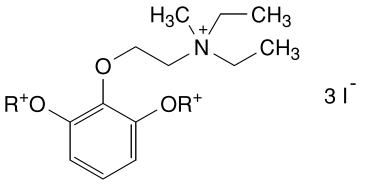
1 ml of *0.1 M perchloric acid* is equivalent to 29.72 mg of $C_{30}H_{60}I_3N_3O_3$.

STORAGE

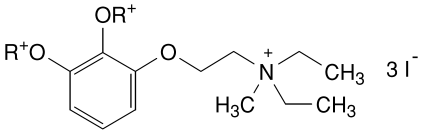


In an airtight container, protected from light.

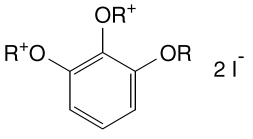
IMPURITIES



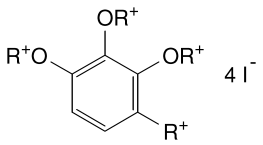
Specified impurities: A, B, C, D, E, F.



A. 2,2′,2″-[benzene-1,2,3-triyltris(oxy)]tris(*N,N*-diethylethanamine),



B. 2,2′-[2-[2-(triethylammonio)ethyl]-1,3-phenylene-bis(oxy)]bis(*N,N,N*-triethylethanaminium) triiodide,



C. 2,2′-[2-[2-(diethylmethylammonio)ethoxy]-1,3-phenylenebis(oxy)]bis(*N,N,N*-triethylethanaminium) triiodide,

D. 2,2′-[3-[2-(diethylmethylammonio)ethoxy]-1,2-phenylenebis(oxy)]bis(*N,N,N*-triethylethanaminium) triiodide,

E. 2,2′-[3-[2-(diethylamino)ethoxy]-1,2-phenylene-bis(oxy)]bis(*N,N,N*-triethylethanaminium) diiodide,

F. 2,2′,2″-[4-[2-(triethylammonio)ethyl]benzene-1,2,3triyltris(oxy)]tris(*N,N,N*-triethylethanaminium) tetraiodide.

corrected 6.0

GARLIC POWDER

Allii sativi bulbi pulvis

DEFINITION

Bulbs of *Allium sativum* L., cut, freeze-dried or dried at a temperature not exceeding 65 °C and powdered.

Content: minimum 0.45 per cent of allicin ($C_6H_{10}OS_2$; M_r 162.3) (dried drug).

CHARACTERS

Appearance: light yellowish powder.

IDENTIFICATION

A. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous fragments of parenchyma and groups of spiral or annular vessels accompanied by thin-walled parenchyma.

B. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of garlic powder add 5.0 ml of *methanol R*, shake for 60 s and filter.

Reference solution. Dissolve 5 mg of *alanine R* in 10 ml of *water R* and dilute to 20 ml with *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *glacial acetic acid R, propanol R, water R, anhydrous ethanol R* (20:20:20:40 *V/V/V/V*).

Application: 20 µl of the test solution and 10 µl of the reference solution, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with a 2 g/l solution of *ninhydrin R* in a mixture of 5 volumes of *glacial acetic acid R* and 95 volumes of *butanol R* and heat at 105-110 °C for 5-10 min; examine in daylight.

Results: the chromatogram obtained with the reference solution shows a violet zone (alanine) in its central third. The chromatogram obtained with the test solution shows a violet or brownish-red zone similar in position to that in the chromatogram obtained with the reference solution and corresponding to alliin; above and below this zone are other, generally fainter, violet zones.

TESTS

Starch. Examine the powdered drug under a microscope using *water R*. Add *iodine solution R1*. No blue colour develops.

Loss on drying (*2.2.32*): maximum 7.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 105 °C.

Total ash (*2.4.16*): maximum 5.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*). *Carry out the assay as quickly as possible.*

Internal standard solution. Dissolve 20.0 mg of *butyl parahydroxybenzoate CRS* in 100.0 ml of a mixture of equal volumes of *methanol R* and *water R*.

Test solution. To 0.800 g of garlic powder add 20.0 ml of *water R* and homogenise the mixture in an ultrasonic bath at 4 °C for 5 min. Allow to stand at room temperature for 30 min. Then centrifuge for 30 min. Dilute 10.0 ml of the supernatant to 25.0 ml with a mixture of 40 volumes of a 1 per cent *V/V* solution of *anhydrous formic acid R* and 60 volumes of *methanol R* (stock solution). Shake and centrifuge for 5 min. Place 0.50 ml of the internal standard solution in a volumetric flask and dilute to 10.0 ml with the stock solution.

Precolumn:

– *size*: *l* = 20 mm, Ø = 4 mm,
– *stationary phase*: silanised *octadecylsilyl silica gel for chromatography R* (5 µm).

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm,
– *stationary phase*: silanised *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 40 volumes of a 1 per cent *V/V* solution of *anhydrous formic acid R* and 60 volumes of *methanol R*.

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: loop injector, 1 µl of the internal standard solution and 10 µl of the test solution.

Calculate the percentage of allicin using the following expression:

$$\frac{S_1 \times m_2 \times 22.75}{S_2 \times m_1}$$

S_1 = area of the peak due to allicin (principal peak) in the chromatogram obtained with the test solution,

S_2 = area of the peak due to butyl parahydroxybenzoate in the chromatogram obtained with the test solution,

m_1 = mass of the drug to be examined, in grams,

m_2 = mass of butyl parahydroxybenzoate in 100.0 ml of the internal standard solution, in grams. 1 mg of butylparahydroxybenzoate corresponds to 8.65 mg of allicin.

01/2008:0330
corrected 6.0

GELATIN

Gelatina

DEFINITION

Purified protein obtained either by partial acid hydrolysis (type A), partial alkaline hydrolysis (type B) or enzymatic hydrolysis of collagen from animals (including fish and poultry); it may also be a mixture of different types.

The hydrolysis leads to gelling or non-gelling product grades. Both product grades are covered by this monograph.

Gelatin described in this monograph is not suitable for parenteral use or for other special purposes.

CHARACTERS

Appearance: faintly yellow or light yellowish-brown, solid, usually occurring as translucent sheets, shreds, granules or powder.

Solubility: practically insoluble in common organic solvents; gelling grades swell in cold water and give on heating a colloidal solution which on cooling forms a more or less firm gel.

The isoelectric point is a relevant quality parameter for use of gelatin in different applications: for type A gelatin it is typically between pH 6.0 and pH 9.5 and for type B gelatin is typically between pH 4.7 and pH 5.6. These ranges cover a variety of different gelatins and for specific applications a narrower tolerance is usually applied.

Different gelatins form aqueous solutions that vary in clarity and colour. For a particular application, a suitable specification for clarity and colour is usually applied.

IDENTIFICATION

A. To 2 ml of solution S (see Tests) add 0.05 ml of *copper sulphate solution R*. Mix and add 0.5 ml of *dilute sodium hydroxide solution R*. A violet colour is produced.

B. To 0.5 g in a test-tube add 10 ml of *water R*. Allow to stand for 10 min, heat at 60 °C for 15 min and keep the tube upright at 0 °C for 6 h. Invert the tube; the contents immediately flow out for non-gelling grades and do not flow out immediately for gelling grades.

TESTS

Solution S. Dissolve 1.00 g in *carbon dioxide-free water R* at about 55 °C, dilute to 100 ml with the same solvent and keep the solution at this temperature to carry out the tests.

pH (*2.2.3*): 3.8 to 7.6 for solution S.

Conductivity (*2.2.38*): maximum 1 $mS \cdot cm^{-1}$, determined on a 1.0 per cent solution at 30 ± 1.0 °C.

Sulphur dioxide (*2.5.29*): maximum 50 ppm.

Peroxides: maximum 10 ppm, determined using *peroxide test strips R*.

Peroxidase transfers oxygen from peroxides to an organic redox indicator which is converted to a blue oxidation product. The intensity of the colour obtained is proportional to the quantity of peroxide and can be compared with a colour scale provided with the test strips, to determine the peroxide concentration.

Suitability test. Dip a test strip for 1 s into *hydrogen peroxide standard solution (10 ppm H_2O_2) R*, such that the reaction zone is properly wetted. Remove the test strip, shake off excess liquid and compare the reaction zone after 15 s with the colour scale provided with the test strips used. The colour must match that of the 10 ppm concentration, otherwise the test is invalid.

Test. Weigh 20.0 ± 0.1 g of the substance to be tested in a beaker and add 80.0 ± 0.2 ml of *water R*. Stir to moisten all gelatin and allow the sample to stand at room temperature for 1-3 h. Cover the beaker with a watch-glass. Place the beaker for 20 ± 5 min in a water bath at 65 ± 2 °C to dissolve the sample. Stir the contents of the beaker with a glass rod to achieve a homogeneous solution. Dip a test strip for 1 s into the test solution, such that the reaction zone is properly wetted. Remove the test strip, shake off excess liquid and compare the reaction zone after 15 s with the colour scale provided with the test strips used. Multiply the concentration read from the colour scale by a factor of 5 to calculate the concentration in parts per million of peroxide in the test substance.

Gel strength (Bloom value): 80 to 120 per cent of the labelled nominal value.

The gel strength is expressed as the mass in grams necessary to produce the force which, applied to a plunger 12.7 mm in diameter, makes a depression 4 mm deep in a gel having a concentration of 6.67 per cent *m/m* and matured at 10 °C.

Apparatus. Texture analyser or gelometer with:

– a cylindrical piston 12.7 ± 0.1 mm in diameter with a plane pressure surface with a sharp bottom edge,

– a bottle 59 ± 1 mm in internal diameter and 85 mm high.

Adjust the apparatus according to the manufacturer's manual. Settings are: distance 4 mm, test speed 0.5 mm/s.

Method. Perform the test in duplicate. Place 7.5 g of the substance to be tested in each bottle. Add 105 ml of *water R*, place a watch-glass over each bottle and allow to stand for 1-4 h. Heat in a water-bath at 65 ± 2 °C for 15 min. While heating, gently stir with a glass rod. Ensure that the solution is uniform and that any condensed water on the inner walls of the bottle is incorporated. Allow to cool at room temperature for 15 min and transfer the bottles to a thermostatically controlled bath at 10.0 ± 0.1 °C, and fitted with a device to ensure that the platform on which the bottles stand is perfectly horizontal. Close the bottles with a rubber stopper and allow to stand for 17 ± 1 h. Remove the sample bottles from the bath and quickly wipe the water from the exterior of the bottle. Centre consecutively the 2 bottles on the platform of the apparatus so that the plunger contacts the sample as nearly at its midpoint as possible and start the measurement. Report the result as the average of the 2 measurements.

Iron: maximum 30.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. To 5.00 g of the substance to be examined, in a conical flask, add 10 ml of *hydrochloric acid R*. Close the flask and place in a water-bath at 75-80 °C for 2 h. Allow to cool and adjust the content of the flask to 100.0 g with *water R*.

Reference solutions. Prepare the reference solutions using *iron standard solution (8 ppm Fe) R*, diluted as necessary with *water R*.

Wavelength: 248.3 nm.

Chromium: maximum 10.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Test solution described in the test for iron.

Reference solutions. Prepare the reference solutions using *chromium standard solution (100 ppm Cr) R*, diluted if necessary with *water R*.

Wavelength: 357.9 nm.

Zinc: maximum 30.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Test solution described in the test for iron.

Reference solutions. Prepare the reference solutions using *zinc standard solution (10 ppm Zn) R*, diluted if necessary with *water R*.

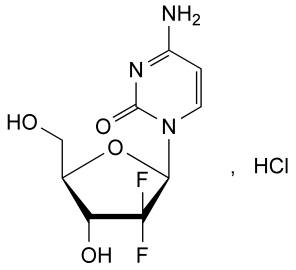
Wavelength: 213.9 nm.

Loss on drying (*2.2.32*): maximum 15.0 per cent, determined on 1.000 g, by drying in an oven at 105 °C.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 micro-organisms per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (*2.6.13*).

STORAGE

Protect from heat and moisture.



LABELLING

The label states the gel strength (Bloom value) or that it is a non-gelling grade.

01/2008:2306

GEMCITABINE HYDROCHLORIDE

Gemcitabini hydrochloridum

$C_9H_{12}ClF_2N_3O_4$ M_r 299.7

[122111-03-9]

DEFINITION

4-Amino-1-(2-deoxy-2,2-difluoro-β-D-*erythro*-pentofuranosyl)pyrimidin-2(1*H*)-one hydrochloride.

Content: 98.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: white or almost white powder.

Solubility: soluble in water, slightly soluble in methanol, practically insoluble in acetone.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *gemcitabine hydrochloride CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 1.00 g in *carbon dioxide-free water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

pH (*2.2.3*): 2.0 to 3.0 for solution S.

Specific optical rotation (*2.2.7*): + 43.0 to + 50.0, determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 25.0 ml with the same solvent.

Test solution (b). Dissolve 20.0 mg of the substance to be examined in *water R* and dilute to 200.0 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of the substance to be examined and 10.0 mg of *gemcitabine impurity A CRS* in *water R* and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml of this solution to 200.0 ml with *water R*.

Reference solution (b). Dissolve 20.0 mg of *gemcitabine hydrochloride CRS* in *water R* and dilute to 200.0 ml with the same solvent.

Reference solution (c). Place 10 mg of the substance to be examined in a small vial. Add 4 ml of a 168 g/l solution of *potassium hydroxide R* in *methanol R*, sonicate for 5 min then seal with a cap. The mixture may be cloudy. Heat at 55 °C for a minimum of 6 h to produce impurity B. Allow to cool, then transfer the entire contents of the vial to a 100 ml volumetric flask by successively washing with a 1 per cent *V/V* solution of *phosphoric acid R*. Dilute to 100 ml with a 1 per cent *V/V* solution of *phosphoric acid R* and mix.

Column:
- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:
- *mobile phase A*: 13.8 g/l solution of *sodium dihydrogen phosphate monohydrate R* adjusted to pH 2.5 ± 0.1 with *phosphoric acid R*;
- *mobile phase B*: *methanol R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 8	97	3
8 - 13	97 → 50	3 → 50
13 - 20	50	50

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 275 nm.

Injection: 20 µl of test solution (a) and reference solutions (a) and (c).

Relative retention with reference to gemcitabine (retention time = about 8 min): impurity A = about 0.4; impurity B = about 0.7.

System suitability: reference solution (c):
- *resolution*: minimum 8.0 between the peaks due to impurity B and gemcitabine.

Limits:
- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the peak due to gemcitabine in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than twice the area of the peak due to gemcitabine in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *disregard limit*: 0.5 times the area of the peak due to gemcitabine in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 1.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with test A. Prepare the reference solution using 5 ml of *lead standard solution (1 ppm Pb) R*, 5 ml of *water R* and 2 ml of the aqueous solution to be examined. If necessary, filter the solutions and compare the spots on the membrane filter.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

Bacterial endotoxins (*2.6.14*): less than 0.05 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Mobile phase: mobile phase A.

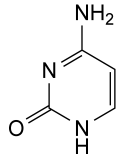
Injection: test solution (b) and reference solutions (b) and (c).

Relative retention with reference to gemcitabine (retention time = about 10 min): impurity B = about 0.5.

System suitability: reference solution (c):

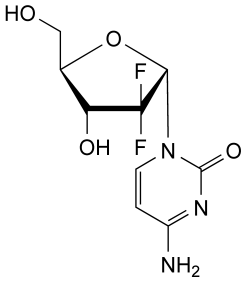
– *resolution*: minimum 8.0 between the peaks due to impurity B and gemcitabine.

Calculate the percentage content of $C_9H_{12}ClF_2N_3O_4$ from the declared content of *gemcitabine hydrochloride CRS*.



STORAGE

If the substance is sterile, store in a sterile, airtight, tamper-proof container.

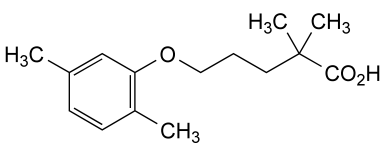


IMPURITIES

Specified impurities: A.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B.*

A. 4-aminopyrimidin-2(1*H*)-one (cytosine),



B. 4-amino-1-(2-deoxy-2,2-difluoro-α-D-*erythro*-pentofuranosyl)pyrimidin-2(1*H*)-one (gemcitabine α-anomer).

01/2008:1694

GEMFIBROZIL

Gemfibrozilum

$C_{15}H_{22}O_3$ M_r 250.3

[25812-30-0]

DEFINITION

5-(2,5-Dimethylphenoxy)-2,2-dimethylpentanoic acid.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, waxy, crystalline powder.

Solubility: practically insoluble in water, very soluble in methylene chloride, freely soluble in anhydrous ethanol and in methanol.

IDENTIFICATION

A. Melting point (*2.2.14*): 58 °C to 61 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *gemfibrozil CRS*.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 40 mg of the substance to be examined in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (a). Dissolve the contents of a vial of *gemfibrozil for system suitability CRS* (containing impurities C, D and E) in 2 ml of *acetonitrile R*.

Reference solution (b). Dilute 1.0 ml of test solution to 100.0 ml with mobile phase A. Dilute 1.0 ml of this solution to 10.0 ml with mobile phase A.

Reference solution (c). Dissolve 5 mg of *2,5-dimethylphenol R* (impurity A) in mobile phase A and dilute to 10 ml with mobile phase A.

Column:

– *size*: *l* = 0.250 m, Ø = 4.0 mm,

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 μm).

Mobile phase:

– *mobile phase A*: dissolve 0.27 g of *potassium dihydrogen phosphate R* in 400 ml of *water R*, adjust to pH 4.0 with *phosphoric acid R* and add 600 ml of *acetonitrile R*;

– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	100	0
5 - 20	100 → 0	0 → 100
20 - 25	0	100
25 - 30	0 → 100	100 → 0
30 - 35	100	0

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 276 nm.

Injection: 20 μl.

Identification of impurities: use the chromatogram supplied with *gemfibrozil for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities C, D and E. Use the chromatogram obtained with reference solution (c) to identify the peak due to impurity A.

Relative retention with reference to gemfibrozil (retention time = about 7 min): impurity A = about 0.4; impurity C = about 1.3; impurity D = about 1.5; impurity E = about 1.7; impurity I = about 2.0; impurity H = about 2.9.

System suitability: reference solution (a):

– *resolution*: minimum 6.0 between the peaks due to gemfibrozil and impurity C, and minimum 2.0 between the peaks due to impurity D and impurity E.

Limits:

- *correction factors*: for the calculations of content multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.5; impurity D = 3.3; impurity E = 0.2; impurity I = 2;
- *impurities E, I*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *impurities A, D, H*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test F. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

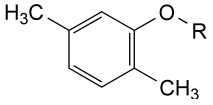
Water (*2.5.12*): maximum 0.25 per cent, determined on 2.000 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 2.0 g. Allow to stand for 1 h after the first moistening before heating.

ASSAY

Dissolve 0.200 g in 25 ml of *methanol R*. Add 25 ml of *water R* and 1 ml of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*) using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 25.03 mg of $C_{15}H_{22}O_3$.



STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, D, E, H, I.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, F, G.*

GENTAMICIN SULPHATE

Gentamicini sulfas

Gentamicin	Mol. Formula	R1	R2	R3
C1	$C_{21}H_{43}N_5O_7$	CH_3	CH_3	H
C1a	$C_{19}H_{39}N_5O_7$	H	H	H
C2	$C_{20}H_{41}N_5O_7$	H	CH_3	H
C2a	$C_{20}H_{41}N_5O_7$	H	H	CH_3
C2b	$C_{20}H_{41}N_5O_7$	CH_3	H	H

DEFINITION

Mixture of the sulphates of antimicrobial substances produced by *Micromonospora purpurea*, the main components being gentamicins C1, C1a, C2, C2a and C2b.

Content: minimum 590 IU/mg (anhydrous substance).

CHARACTERS

Appearance: white or almost white, hygroscopic powder.

Solubility: freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

First identification: C, D.

Second identification: A, B, D.

A. Dissolve about 10 mg in 1 ml of *water R* and add 5 ml of a 400 g/l solution of *sulphuric acid R*. Heat on a water-bath for 100 min, cool and dilute to 25 ml with *water R*. Examined between 240 nm and 330 nm (*2.2.25*), the solution shows no absorption maximum.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve the contents of a vial of *gentamicin sulphate CRS* in *water R* and dilute to 5 ml with the same solvent.

Plate: *TLC silica gel plate R.*

Mobile phase: the lower layer of a mixture of equal volumes of *concentrated ammonia R, methanol R* and *methylene chloride R.*

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with *ninhydrin solution R1* and heat at 110 °C for 5 min.

Results: the 3 principal spots in the chromatogram obtained with the test solution are similar in position, colour and size to the 3 principal spots in the chromatogram obtained with the reference solution.

C. Examine the chromatograms obtained in the test for composition.

Results: the chromatogram obtained with the test solution shows 5 principal peaks having the same retention times as the 5 principal peaks in the chromatogram obtained with reference solution (a).

D. It gives reaction (a) of sulphates (*2.3.1*).

TESTS

Solution S. Dissolve 0.8 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

pH (*2.2.3*): 3.5 to 5.5 for solution S.

Specific optical rotation (*2.2.7*): + 107 to + 121 (anhydrous substance).

Dissolve 2.5 g in *water R* and dilute to 25.0 ml with the same solvent.

Composition. Liquid chromatography (*2.2.29*): use the normalisation procedure taking into account only the peaks due to gentamicins C1, C1a, C2, C2a and C2b; use the chromatogram supplied with *gentamicin sulphate CRS* to identify the corresponding peaks.

Test solution. Dissolve 50 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve the content of a vial of *gentamicin sulphate CRS* in the mobile phase and dilute with the mobile phase to obtain a solution containing 0.5 mg/ml.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *styrene-divinylbenzene copolymer R* (8 µm) with a pore size of 100 nm,
- *temperature*: 55 °C.

Mobile phase: a mixture prepared with *carbon dioxide-free water R* containing 60 g/l of *anhydrous sodium sulphate R*, 1.75 g/l of *sodium octanesulphonate R*, 8 ml/l of *tetrahydrofuran R*, 50 ml/l of *0.2 M potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *dilute phosphoric acid R* and degassed.

Flow rate: 1.0 ml/min.

Post-column solution: a *carbonate-free sodium hydroxide solution R* diluted 1 to 25, previously degassed, which is added pulse-less to the column effluent using a 375 µl polymeric mixing coil.

Flow rate: 0.3 ml/min.

Detection: pulsed amperometric detector or equivalent with a gold indicator electrode, a silver-silver chloride reference electrode, and a stainless steel auxiliary electrode which is the cell body, held at respectively + 0.05 V detection, + 0.75 V oxidation and – 0.15 V reduction potentials, with pulse durations according to the instrument used.

Injection: 20 µl.

Run time: 1.2 times the retention time of gentamicin C1.

System suitability: reference solution (a):

- *peak-to-valley ratio*: minimum 2.0 where H_p = height above the baseline of the peak due to gentamicin C2a, and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to gentamicin C2.

Limits:

- *gentamicin C1*: 20.0 per cent to 40.0 per cent,
- *gentamicin C1a*: 10.0 per cent to 30.0 per cent,
- *sum of gentamicins C2, C2a, and C2b*: 40.0 per cent to 60.0 per cent,
- *disregard limit*: the area of the peak due to gentamicin C1a in the chromatogram obtained with reference solution (b).

Related substances. Liquid chromatography (*2.2.29*) as described in the test for composition.

Limits (for related substances eluting before gentamicin C1a):

- *any impurity*: maximum 3.0 per cent,
- *total*: maximum 10.0 per cent.

Methanol (*2.4.24, System B*): maximum 1.0 per cent.

Sulphate: 32.0 per cent to 35.0 per cent (anhydrous substance).

Dissolve 0.250 g in 100 ml of *distilled water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 ml of *0.1 M barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with *0.1 M sodium edetate*, adding 50 ml of *alcohol R* when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears.

1 ml of *0.1 M barium chloride* is equivalent to 9.606 mg of SO_4.

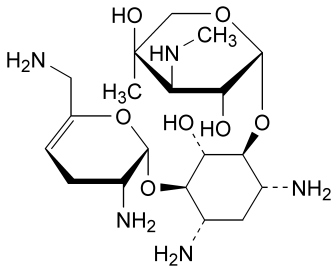
Water (*2.5.12*): maximum 15.0 per cent, determined on 0.300 g.

Sulphated ash (*2.4.14*): maximum 1.0 per cent, determined on 0.50 g.

Bacterial endotoxins (*2.6.14*): less than 0.71 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

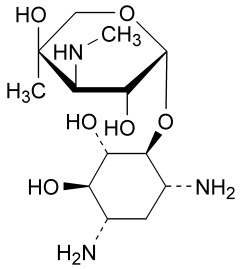
ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*).



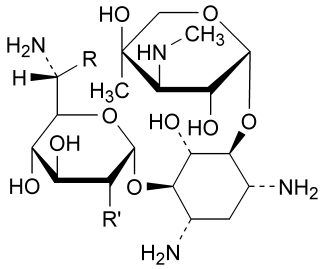
STORAGE

In an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.



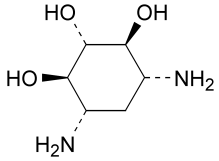
IMPURITIES

Specified impurities: *A, B, C.*



Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *D, E.*

A. 2-deoxy-4-*O*-[3-deoxy-4-*C*-methyl-3-(methylamino)-β-L-arabinopyranosyl]-6-*O*-(2,6-diamino-2,3,4,6-tetradeoxy-α-D-*glycero*-hex-4-enopyranosyl)-L-streptamine (sisomicin),



B. 2-deoxy-4-*O*-[3-deoxy-4-*C*-methyl-3-(methylamino)-β-L-arabinopyranosyl]-L-streptamine (garamine),

C. R = CH_3, R′ = OH: 4-*O*-(6-amino-6,7-dideoxy-D-*glycero*-α-D-*gluco*-heptopyranosyl)-2-deoxy-6-*O*-[3-deoxy-4-*C*-methyl-3-(methylamino)-β-L-arabinopyranosyl]-D-streptamine (gentamicin B_1),

D. R = H, R′ = NH_2: 2-deoxy-4-*O*-[3-deoxy-4-*C*-methyl-3-(methylamino)-β-L-arabinopyranosyl]-6-*O*-(2,6-diamino-2,6-dideoxy-α-D-*gluco*-hexopyranosyl)-L-streptamine,

E. 2-deoxystreptamine.

01/2008:0392

GENTIAN ROOT

Gentianae radix

DEFINITION

Dried, fragmented underground organs of *Gentiana lutea* L.

CHARACTERS

Characteristic odour.

Strong and persistent bitter taste.

Gentian root occurs as single or branched subcylindrical pieces of various lengths and usually 10-40 mm thick but occasionally up to 80 mm thick at the crown.

IDENTIFICATION

A. The surface is brownish-grey, and the colour of a transverse section is yellowish or reddish-yellow, but not reddish-brown. The root is longitudinally wrinkled and bears occasional rootlet scars. The branches of the rhizome frequently bear a terminal bud and are always encircled by closely arranged leaf scars. The rhizome and root are brittle when dry and break with a short fracture but they absorb moisture readily to become flexible. The smoothed, transversely cut surface shows a bark, occupying about one-third of the radius, separated by the well-marked cambium from an indistinctly radiate and mainly parenchymatous xylem.

B. Reduce to a powder (355) (*2.9.12*). The powder is light brown or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the subero-phellodermic layer, consisting of thin-walled yellowish-brown cork cells and thick-walled collenchyma (phello-derm); fragments of cortical and ligneous parenchymatous cells with moderately thickened walls containing droplets of oil and small prisms and minute needles of calcium oxalate; fragments of lignified vessels with spiral or reticulate thickening.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 25 ml of *methanol R*, shake for 15 min and filter. Evaporate the filtrate to dryness under reduced pressure, at a temperature not exceeding 50 °C. Take up the residue with small quantities of *methanol R* so as to obtain 5 ml of a solution, which may contain a sediment.

Reference solution. Dissolve 5 mg of *phenazone R* and 5 mg of *hyperoside R* in 10 ml of *methanol R*.

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *water R, anhydrous formic acid R, ethyl formate R* (4:8:88 *V/V/V*).

Application: 20 µl, as bands.

Development: in an unsaturated tank, over a path of 8 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A prominent quenching zone
Phenazone: a quenching zone	
	A weak quenching zone (amarogentin)
———	———
———	———
Hyperoside: a quenching zone	A prominent quenching zone (gentiopicroside)
Reference solution	**Test solution**

Detection B: spray with a 100 g/l solution of *potassium hydroxide R* in *methanol R* and then with a freshly prepared 2 g/l solution of *fast blue B salt R* in a mixture of 50 volumes of *anhydrous ethanol R* and 50 volumes of *water R*. Examine in daylight.

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A prominent dark violet zone
	A violet-red zone (amarogentin)
———	———
———	———
Hyperoside: a brownish-red zone	A weak light brown zone (gentiopicroside)
Reference solution	**Test solution**

TESTS

Other species of *Gentiana*. Examine the chromatograms obtained in identification test C, detection B.

Results: the chromatogram obtained with the test solution does not show violet zones immediately above the zone due to amarogentine.

Total ash (*2.4.16*): maximum 6.0 per cent.

Bitterness value (*2.8.15*): minimum 10 000.

Water-soluble extractive: minimum 33 per cent.

To 5.0 g of powdered drug (710) (*2.9.12*) add 200 ml of boiling *water R*. Allow to stand for 10 min, shaking occasionally. Allow to cool, dilute to 200.0 ml with *water R* and filter. Evaporate 20.0 ml of the filtrate to dryness on a water-bath. Dry the residue in an oven at 100-105 °C. The residue weighs a minimum of 0.165 g.

01/2008:1870

GENTIAN TINCTURE

Gentianae tinctura

DEFINITION

Tincture produced from *Gentian root (0392)*.

PRODUCTION

The tincture is produced from 1 part of the comminuted drug and 5 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

Appearance: yellowish-brown or reddish-brown liquid.

It has a strong bitter taste.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. The tincture to be examined.

Reference solution. Dissolve 5 mg of *phenazone R* and 5 mg of *hyperoside R* in 10 ml of *methanol R*.

Plate: *TLC silica gel F_{254} plate R* .

Mobile phase: *water R, anhydrous formic acid R, ethyl formate R* (4:8:88 *V/V/V*).

Application: 20 µl, as bands.

Development: over a path of 8 cm, in an unsaturated tank.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A prominent quenching zone
Phenazone: a quenching zone	
	A weak quenching zone (amarogentin)
———	———
———	———
Hyperoside: a quenching zone	A prominent quenching zone (gentiopicroside)
Reference solution	**Test solution**

Detection B: spray with a 10 per cent *V/V* solution of *potassium hydroxide R* in *methanol R* and then with a freshly prepared 2 g/l solution of *fast blue B salt R* in a mixture of *ethanol R* and *water R* (50:50 *V/V*). Examine in daylight.

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A prominent dark violet zone
	A violet-red zone (amarogentin)
———	———
———	———
Hyperoside: a brownish-red zone	A weak light brown zone (gentiopicroside)
Reference solution	**Test solution**

TESTS

Ethanol content (*2.9.10*): 62 per cent *V/V* to 67 per cent *V/V*.

Bitterness value (*2.8.15*): minimum 1000.

Dry residue (*2.8.16*): minimum 5.0 per cent *m/m*, determined on 3.00 g.

01/2008:1522

GINGER

Zingiberis rhizoma

DEFINITION

Dried, whole or cut rhizome of *Zingiber officinale* Roscoe, with the cork removed, either completely or from the wide flat surfaces only.

Content: minimum 15 ml/kg of essential oil (anhydrous drug).

CHARACTERS

Characteristic aromatic odour.

Spicy and burning taste.

IDENTIFICATION

A. The rhizome is laterally compressed, bearing short, flattened, obovate oblique branches on the upper side, each sometimes having a depressed scar at the apex; the whole rhizomes are about 5-10 cm long, 1.5-3 cm or 4 cm wide and 1-1.5 cm thick, sometimes split longitudinally. The scraped rhizome with a light-brown external surface shows longitudinal striations and occasional loose fibres; the outer surface of the unscraped rhizome varies from pale to dark brown and is more or less covered with cork which shows conspicuous, narrow, longitudinal and transverse ridges; the cork readily exfoliates from the lateral surfaces but persists between the branches. The fracture is short and starchy with projecting fibres. The smoothed transversely cut surface exhibits a narrow cortex separated by an endodermis from a much wider stele; it shows numerous, scattered, fibrovascular bundles and abundant scattered oleoresin cells with yellow contents. The unscraped rhizome shows, in addition, an outer layer of dark brown cork.

B. Reduce to a powder (355) (*2.9.12*). The powder is pale yellow or brownish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: groups of large, thin-walled, septate fibres, with one wall frequently dentate; fairly large vessels with reticulate thickening and often accompanied by narrow, thin-walled cells containing brown pigment; abundant thin-walled parenchyma of the ground tissue, some cells containing brown oleoresin; fragments of brown cork, usually seen in surface view. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows abundant starch granules, simple, flattened, oblong or oval or irregular, up to about 50 µm long and 25 µm wide, with a small point hilum situated at the narrower end; occasional granules show faint, transverse striations.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (710) (*2.9.12*) add 5 ml of *methanol R*. Shake for 15 min and filter.

Reference solution. Dissolve 10 µl of *citral R* and 10 mg of *resorcinol R* in 10 ml of *methanol R*. Prepare the solution immediately before use.

Plate: *TLC silica gel plate R*.

Mobile phase: *hexane R, ether R* (40:60 *V/V*).

Application: 20 µl, as bands.

Development: in an unsaturated tank, over a path of 15 cm.

Drying: in air.

Detection: spray with a 10 g/l solution of *vanillin R* in *sulphuric acid R* and examine in daylight while heating at 100-105 °C for 10 min.

Results: the chromatogram obtained with the reference solution shows in the lower half an intense red zone (resorcinol) and in the upper half 2 violet zones (citral). The chromatogram obtained with the test solution shows below the zone due to resorcinol in the chromatogram obtained with the reference solution 2 intense violet zones (gingerols) and in the middle, between the zones due to resorcinol and citral in the chromatogram obtained with the reference solution, 2 other less intense violet zones (shogaols). Other zones may be present.

TESTS

Water (*2.2.13*): maximum 100 ml/kg, determined by distillation on 20.0 g of the powdered drug (710) (*2.9.12*).

Total ash (*2.4.16*): maximum 6.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs (*2.8.12*). Use 20.0 g of the freshly, coarsely powdered drug, a 1000 ml round-bottomed flask, 10 drops of *liquid paraffin R* or other antifoam, 500 ml of *water R* as distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 4 h.

GINKGO LEAF

Ginkgonis folium

DEFINITION

Whole or fragmented, dried leaf of *Ginkgo biloba* L.

Content: not less than 0.5 per cent of flavonoids, calculated as flavone glycosides (M_r 757) (dried drug).

CHARACTERS

Greyish or yellowish-green or yellowish-brown.

IDENTIFICATION

A. The upper surface of ginkgo leaf is slightly darker than the lower surface. The petioles of the leaf are about 4 cm to 9 cm long. The lamina is about 4 cm to 10 cm wide, fan-shaped, usually bilobate or sometimes undivided. Both surfaces are smooth, and the venation dichotomous, the veins appearing to radiate from the base; they are equally prominent on both surfaces. The distal margin is incised, irregularly and to different degrees, and irregularly lobate or emarginate. The lateral margins are entire and taper towards the base.

B. Reduce to a powder (355) (*2.9.12*). The powder is greyish or yellowish-green or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows irregularly-shaped fragments of the lamina in surface view, the upper epidermis consisting of elongated cells with irregularly sinuous walls, the lower epidermal cells smaller, with a finely striated cuticle and each cell shortly papillose; stomata about 60 µm, large, deeply sunken with 6 to 8 subsidiary cells, are more numerous in the lower epidermis; abundant large cluster crystals of calcium oxalate of various sizes in the mesophyll; fragments of fibro-vascular tissue from the petiole and veins.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 2.0 g of the powdered drug (710) (*2.9.12*) add 10 ml of *methanol R*. Heat in a water-bath at 65 °C for 10 min. Shake frequently. Allow to cool to room temperature and filter.

Reference solution. Dissolve 1.0 mg of *chlorogenic acid R* and 3.0 mg of *rutin R* in 20 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R* (7.5:7.5:17.5:67.5 *V/V/V/V*).

Application: 20 µl, as bands.

Development: over a path of 17 cm.

Drying: at 100-105 °C.

Detection: spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray with the same volume of a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for about 30 min. Examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other weaker fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A yellowish-brown fluorescent zone
	A green fluorescent zone
	2 yellowish-brown fluorescent zones
	An intense light blue fluorescent zone sometimes overlapped by a greenish-brown fluorescent zone
Chlorogenic acid: a light blue fluorescent zone	
	A green fluorescent zone
Rutin: a yellowish-brown fluorescent zone	2 yellowish-brown fluorescent zones
	A green fluorescent zone
	A yellowish-brown fluorescent zone
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 5 per cent of stems and 2 per cent of other foreign matter.

Loss on drying (*2.2.32*): maximum 11.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 11.0 per cent.

ASSAY

Flavonoids. Liquid chromatography (*2.2.29*).

Test solution. Heat 2.500 g of the powdered drug (710) (*2.9.12*) in 50 ml of a 60 per cent *V/V* solution of *acetone R* under a reflux condenser for 30 min. Filter and collect the filtrate. Extract the drug residue a second time in the same manner, using 40 ml of a 60 per cent *V/V* solution of *acetone R* and filter. Collect the filtrates and dilute to 100.0 ml with a 60 per cent *V/V* solution of *acetone R*. Evaporate 50.0 ml of the solution to eliminate the acetone and transfer to a 50.0 ml vial, rinsing with 30 ml of *methanol R*. Add 4.4 ml of *hydrochloric acid R1*, dilute to 50.0 ml with *water R* and centrifuge. Place 10 ml of the supernatant liquid in a 10 ml brown-glass vial. Close with a rubber seal and an aluminium cap and heat on a water-bath for 25 min. Allow to cool to room temperature.

Reference solution. Dissolve 10.0 mg of *quercetin dihydrate R* in 20 ml of *methanol R*. Add 15.0 ml of *dilute hydrochloric acid R* and 5 ml of *water R* and dilute to 50.0 ml with *methanol R*.

Column:

- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
- *size*: l = 0.125 m, Ø = 4 mm,
- *temperature*: 25 °C.

Mobile phase:

- *mobile phase A*: 0.3 g/l solution of *phosphoric acid R* adjusted to pH 2.0,
- *mobile phase B*: *methanol R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 1	60	40
1 - 20	60 → 45	40 → 55
20 - 21	45 → 0	55 → 100
21 - 25	0	100

Flow rate: 1.0 ml/min.

Detector: spectrophotometer at 370 nm.

Injection: 10 µl.

Relative retention with reference to quercetin (retention time = about 12.5 min): kaempferol = about 1.4; isorhamnetin= about 1.5.

System suitability:

- *resolution*: minimum 1.5 between the peaks due to kaempferol and to isorhamnetin.

Do not take into account peaks eluting before the quercetin peak or after the isorhamnetin peak in the chromatogram obtained with the test solution.

Calculate the percentage content of flavonoids, expressed as flavone glycosides, from the expression:

$$2 \times \frac{F_1 \times m_1 \times 2.514 \times p}{F_2 \times m_2}$$

F_1 = sum of the areas of all the considered peaks in the chromatogram obtained with the test solution,

F_2 = area of the peak corresponding to quercetin in the chromatogram obtained with the reference solution,

m_1 = mass of quercetin used to prepare the reference solution, in grams,

m_2 = mass of the drug to be examined used to prepare the test solution, in grams,

p = percentage content of anhydrous quercetin in *quercetin dihydrate R*.

corrected 6.0

GINSENG

Ginseng radix

DEFINITION

Whole or cut dried root, designated white ginseng; treated with steam and then dried, designated red ginseng, of *Panax ginseng* C. A. Meyer.

Content: minimum 0.40 per cent for the sum of ginsenosides Rg1 ($C_{42}H_{72}O_{14}$,$2H_2O$; M_r 837) and Rb1 ($C_{54}H_{92}O_{23}$,$3H_2O$; M_r 1163) (dried drug).

IDENTIFICATION

A. The principal root is fusiform or cylindrical, sometimes branched, up to about 20 cm long and 2.5 cm in diameter, and may be curved or markedly re-curved. The surface is pale yellow to cream in white ginseng, brownish-red in red ginseng and shows longitudinal ridges. Stem scars may be seen at the crown. The fracture is short. The transversely-cut surface shows a wide outer zone with scattered orange-red resin canals and a finely radiate inner region. The rootlets, numerous in the lower part of white ginseng, are normally absent in red ginseng.

B. Reduce to a powder (355) (*2.9.12*). The powder is light yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following characters: abundant fragments of thin-walled parenchymatous cells and fragments of large secretory canals containing yellowish-brown resin, non-lignified tracheids and partially-lignified vessels with spiral or reticulate thickening, isolated or in groups; scattered cluster crystals of calcium oxalate. Examine under a microscope using a mixture of equal volumes of *glycerol R* and *water R*. The starch granules are very abundant, simple or 2 or 3 compound, and range from 1 µm to 10 µm in diameter. In red ginseng the starch granules are often deformed and destroyed by treating with steam, or may be absent.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Boil 1.0 g of the powdered drug (355) (*2.9.12*) under a reflux condenser with 10 ml of a 70 per cent *V/V* solution of *methanol R* for 15 min. Filter after cooling and dilute to 10.0 ml with *methanol R*.

Reference solution. Dissolve 5.0 mg of *aescin R* and 5.0 mg of *arbutin R* in 1 ml of *methanol R*.

Plate: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

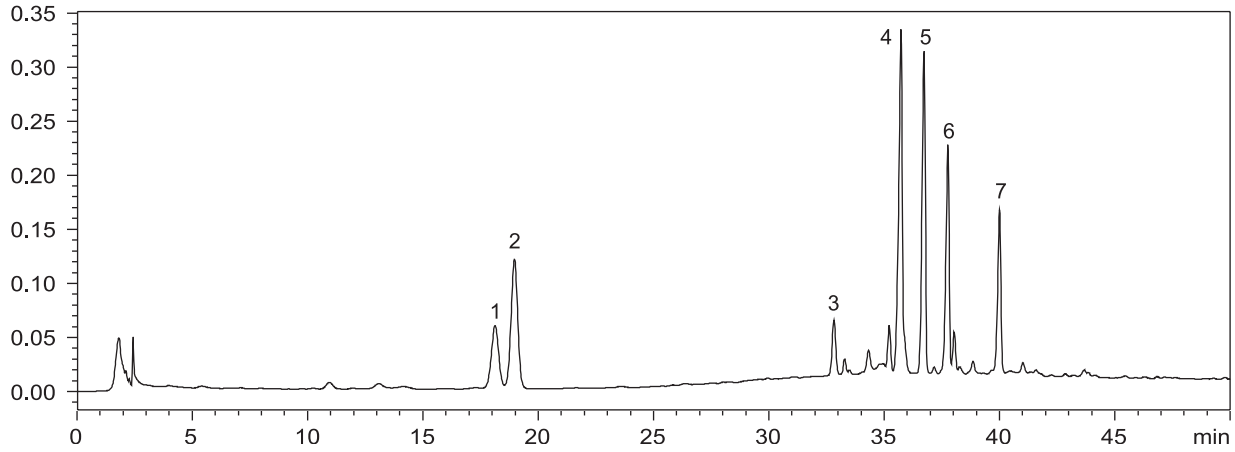
Mobile phase: *ethyl acetate R, water R, butanol R* (25:50:100 *V/V/V*), allow the mixture to separate for 10 min. Use the upper layer.

Application: 20 µl [or 4 µl] as bands.

Development: over 10 cm [or 5 cm] in an unsaturated tank.

Drying: in air.

Detection: spray with *anisaldehyde solution R* and heat at 105-110 °C for 5-10 min. Examine in daylight.



Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Arbutin: a brown zone	
———	———
	A violet zone (ginsenoside Rg1 + Rg2)
	A faint violet zone (ginsenoside Rf)
	A violet zone (ginsenoside Re)
	A violet zone (ginsenoside Rd)
	A faint violet zone
———	———
	A violet zone (ginsenoside Rc)
Aescin: a grey zone	A violet zone (ginsenoside Rb1 + Rb2)
Reference solution	**Test solution**

TESTS

Panax quinquefolium. Examine the chromatograms obtained in the assay. The chromatogram obtained with the test solution shows a peak due to ginsenoside Rf (see Figure 1523.-1). In the case of a substitution by *Panax quinquefolium* no peak due to ginsenoside Rf is present.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C.

1. ginsenoside Rg1
2. ginsenoside Re
3. ginsenoside Rf
4. ginsenoside Rb1
5. ginsenoside Rc
6. ginsenoside Rb2
7. ginsenoside Rd

Figure 1523.-1. – *Chromatogram for the assay of ginseng: test solution*

Total ash (*2.4.16*): maximum 7.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 1.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Reduce about 50 g to a powder (355) (*2.9.12*). Place 1.00 g of the powdered drug and 70 ml of a 50 per cent *V/V* solution of *methanol R* in a 250 ml round-bottomed flask. After adding a few grains of pumice, boil on a water-bath under a reflux condenser for 1 h. After cooling, centrifuge and collect the supernatant liquid. Treat the residue as described above. Mix the collected liquids and evaporate to dryness under reduced pressure at a temperature not exceeding 60 °C. Take up the residue with 20.0 ml of a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*. Dilute 2.0 ml of the solution to 10.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*. Filter through a suitable membrane filter (0.45 µm) before injection.

Reference solution. Dissolve 3.0 mg of *ginsenoside Rg1 R*, 3.0 mg of *ginsenoside Re R*, 3.0 mg of *ginsenoside Rf R* and 3.0 mg of *ginsenoside Rb1 R* in *methanol R* and dilute to 10.0 ml with the same solvent.

Column:

– *size*: *l* = 0.125 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
– *temperature*: 35 °C.

Mobile phase:

– *mobile phase A*: *water R* adjusted to pH 2 with *phosphoric acid R*,
– *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 8	80	20
8 - 40	80 → 60	20 → 40
40 - 45	60 → 40	40 → 60
45 - 47	40 → 0	60 → 100
47 - 52	0	100
52 - 55	0 → 80	100 → 20

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 203 nm.

Equilibration time: 20 min.

Injection: 20 µl.

Elution order: order indicated in the composition of the reference solution; record the retention times of these substances.

System suitability: reference solution:

– *resolution*: minimum 1.0 between the peaks due to ginsenoside Rg1 and ginsenoside Re.

Locate the peaks due to ginsenoside Rb1 and ginsenoside Rg1 in the chromatogram obtained with the test solution.

Calculate the percentage content of ginsenosides Rb1 and Rg1 from the expression:

$$\frac{A_1 \times m_2 \times p_1}{A_3 \times m_1 \times 100} + \frac{A_2 \times m_3 \times p_2}{A_4 \times m_1 \times 100}$$

A_1 = area of the peak due to ginsenoside Rb1 in the chromatogram obtained with the test solution,

A_2 = area of the peak due to ginsenoside Rg1 in the chromatogram obtained with the test solution,

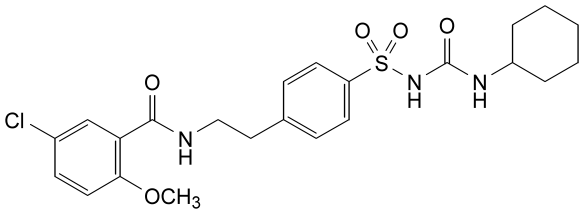
A_3 = area of the peak due to ginsenoside Rb1 in the chromatogram obtained with the reference solution,

A_4 = area of the peak due to ginsenoside Rg1 in the chromatogram obtained with the reference solution,

m_1 = mass of the drug to be examined, in grams,

m_2 = mass of ginsenoside Rb1 in the reference solution, in milligrams,

m_3 = mass of ginsenoside Rg1 in the reference solution, in milligrams,



p_1 = percentage content of ginsenoside Rb1 in the reagent,

p_2 = percentage content of ginsenoside Rg1 in the reagent.

GLIBENCLAMIDE

Glibenclamidum

$C_{23}H_{28}ClN_3O_5S$ M_r 494.0
[10238-21-8]

DEFINITION

1-[[4-[2-[(5-Chloro-2-methoxybenzoyl)amino]ethyl]phenyl]sulphonyl]-3-cyclohexylurea.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, sparingly soluble in methylene chloride, slightly soluble in alcohol and in methanol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

A. Melting point (*2.2.14*): 169 °C to 174 °C.

B. Dissolve 50.0 mg in *methanol R*, with the aid of ultrasound if necessary, and dilute to 50.0 ml with the same solvent. To 10.0 ml of the solution add 1.0 ml of a 103 g/l solution of *hydrochloric acid R* and dilute to 100.0 ml with *methanol R*. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 300 nm and a less intense maximum at 275 nm. The specific absorbances at the maxima are 61 to 65 and 27 to 32, respectively.

C. Infrared absorption spectrophotometry (*2.2.24*).
Preparation: discs of *potassium bromide R*.

Comparison: *glibenclamide CRS*.

If the spectra obtained show differences, moisten separately the substance to be examined and the reference substance with *methanol R*, triturate, dry at 100-105 °C and record the spectra again.

D. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 10 mg of *glibenclamide CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Plate: *TLC silica gel GF_{254} plate R*.

Mobile phase: *alcohol R, glacial acetic acid R, cyclohexane R, methylene chloride R* (5:5:45:45 *V/V/V/V*).

Application: 10 µl.

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

E. Dissolve 20 mg in 2 ml of *sulphuric acid R*. The solution is colourless and shows blue fluorescence in ultraviolet light at 365 nm. Dissolve 0.1 g of *chloral hydrate R* in the solution. Within about 5 min, the colour changes to deep yellow and, after about 20 min, develops a brownish tinge.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent. Prepare immediately before use.

Reference solution (a). Dissolve 5.0 mg of *glibenclamide impurity A CRS* and 5.0 mg of *glibenclamide impurity B CRS* in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 20.0 ml with *methanol R*.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 50.0 ml with *methanol R*.

Reference solution (c). Dissolve 5 mg of *gliclazide CRS* in *methanol R*, add 2 ml of the test solution and dilute to 100 ml with *methanol R*. Dilute 1 ml of this solution to 10 ml with *methanol R*.

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm,
– *stationary phase*: spherical *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (3 µm),
– *temperature*: 35 °C.

Mobile phase:

– *mobile phase A*: mix 20 ml of a 101.8 g/l solution of freshly distilled *triethylamine R* adjusted to pH 3.0 using *phosphoric acid R*, and 50 ml of *acetonitrile R*; dilute to 1000 ml with *water R*,
– *mobile phase B*: mobile phase A, *water R*, *acetonitrile R* (20:65:915 *V/V/V*),

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	45	55
15 - 30	45 → 5	55 → 95
30 - 40	5	95
40 - 41	5 → 45	95 → 55
41 - 55	45	55

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 10 µl.

Relative retention with reference to glibenclamide (retention time = about 5 min): impurity A = about 0.5; impurity B = about 0.6.

System suitability: reference solution (c):

– *resolution*: minimum 5.0 between the peaks due to glibenclamide and gliclazide.

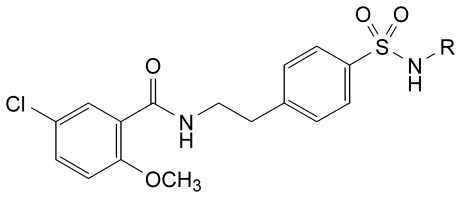
Limits:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
– *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), and not more than 2 such peaks have an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
– *total of other impurities*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.



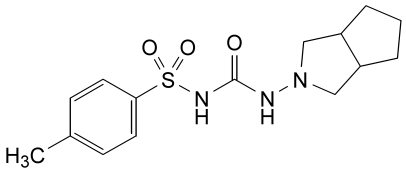
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g with heating in 100 ml of *alcohol R*. Titrate with *0.1 M sodium hydroxide*, using 1.0 ml of *phenolphthalein solution R* as indicator, until a pink colour is obtained.

1 ml of *0.1 M sodium hydroxide* is equivalent to 49.40 mg of $C_{23}H_{28}ClN_3O_5S$.

IMPURITIES



A. R = H: 5-chloro-2-methoxy-*N*-[2-(4-sulphamoylphenyl)ethyl]benzamide,

B. R = CO-OCH_3: methyl [[4-[2-[(5-chloro-2-methoxybenzoyl)amino]ethyl]phenyl]sulphonyl]carbamate.

corrected 6.0

GLICLAZIDE

Gliclazidum

$C_{15}H_{21}N_3O_3S$ M_r 323.4
[21187-98-4]

DEFINITION

1-(Hexahydrocyclopenta[*c*]pyrrol-2(1*H*)-yl)-3-[(4-methylphenyl)sulphonyl]urea.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in acetone, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *gliclazide CRS*.

TESTS

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Solvent mixture: *acetonitrile R, water R* (45:55 *V/V*).

Test solution. Dissolve 50.0 mg of the substance to be examined in 23 ml of *acetonitrile R* and dilute to 50.0 ml with *water R*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 10.0 ml of this solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dissolve 5 mg of the substance to be examined and 15 mg of *gliclazide impurity F CRS* in 23 ml of *acetonitrile R* and dilute to 50 ml with *water R*. Dilute 1 ml of this solution to 20 ml with the solvent mixture.

Reference solution (c). Dissolve 10.0 mg of *gliclazide impurity F CRS* in 45 ml of *acetonitrile R* and dilute to 100.0 ml with *water R*. Dilute 1.0 ml of this solution to 100.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm;

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *triethylamine R, trifluoroacetic acid R, acetonitrile R, water R* (0.1:0.1:45:55 *V/V/V/V*).

Flow rate: 0.9 ml/min.

Detection: spectrophotometer at 235 nm.

Injection: 20 µl.

Run time: twice the retention time of gliclazide.

Relative retention with reference to gliclazide (retention time = about 16 min): impurity F = about 0.9.

System suitability: reference solution (b):

– *resolution*: minimum 1.8 between the peaks due to impurity F and gliclazide.

Limits:

– *impurity F*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.1 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *sum of impurities other than F*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Impurity B. Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Test solution. Dissolve 0.400 g of the substance to be examined in 2.5 ml of *dimethyl sulphoxide R* and dilute to 10.0 ml with *water R*. Stir for 10 min, store at 4 °C for 30 min and filter.

Reference solution. Dissolve 20.0 mg of *gliclazide impurity B CRS* in *dimethyl sulphoxide R* and dilute to 100.0 ml with the same solvent. To 1.0 ml of the solution, add 12 ml of *dimethyl sulphoxide R* and dilute to 50.0 ml with *water R*. To 1.0 ml of this solution, add 12 ml of *dimethyl sulphoxide R* and dilute to 50.0 ml with *water R*.

Injection: 50 µl.

Retention time: impurity B = about 8 min.

Limit:

– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (2 ppm).

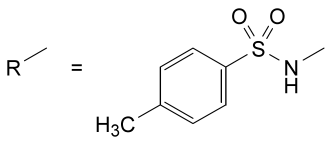
Heavy metals (*2.4.8*): maximum 10 ppm.

1.5 g complies with test F. Prepare the reference solution using 1.5 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.25 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

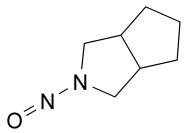
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.250 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

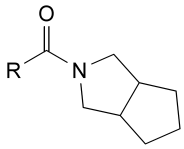
1 ml of *0.1 M perchloric acid* is equivalent to 32.34 mg of $C_{15}H_{21}N_3O_3S$.



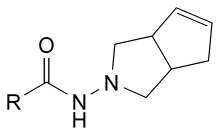
IMPURITIES

Specified impurities: B, F.

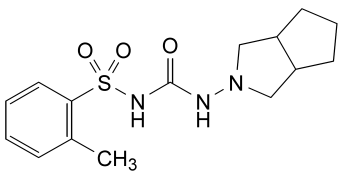
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, C, D, E, G.*



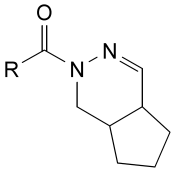
A. R-H: 4-methylbenzenesulphonamide,



B. 2-nitroso-octahydrocyclopenta[*c*]pyrrole,



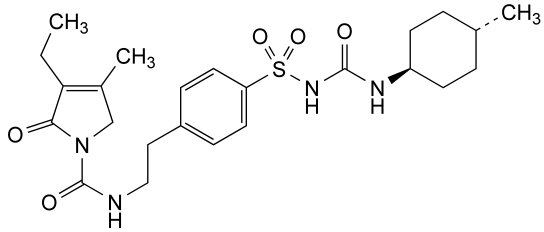
C. R-CO-O-C_2H_5: ethyl [(4-methylphenyl)sulphonyl]-carbamate,



D. *N*-[(4-methylphenyl)sulphonyl]hexahydrocyclopenta[*c*]pyrrol-2(1*H*)-carboxamide,

E. 1-[(4-methylphenyl)sulphonyl]-3-(3,3a,4,6a-tetrahydrocyclopenta[*c*]pyrrol-2(1*H*)-yl)urea,

F. 1-(hexahydrocyclopenta[*c*]pyrrol-2(1*H*)-yl)-3-[(2-methylphenyl)sulphonyl]urea,



G. *N*-[(4-methylphenyl)sulphonyl]-1,4a,5,6,7,7a-hexahydro-2*H*-cyclopenta[*d*]pyridazine-2-carboxamide.

GLIMEPIRIDE

Glimepiridum

$C_{24}H_{34}N_4O_5S$ M_r 490.6
[93479-97-1]

DEFINITION

1-[[4-[2-(3-Ethyl-4-methyl-2-oxo-3-pyrroline-1-carboxamido)-ethyl]phenyl]sulphonyl]-3-*trans*-(4-methylcyclohexyl)urea.

Content: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, soluble in dimethylformamide, slightly soluble in methylene chloride, very slightly soluble in methanol.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *glimepiride CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *dimethylformamide R*, evaporate to dryness and record new spectra using the residues.

TESTS

Related substances. Liquid chromatography (*2.2.29*). *Store the solutions at a temperature not exceeding 12 °C and for not more than 15 h.*

Solvent mixture: *water for chromatography R, acetonitrile for chromatography R* (1:4 *V/V*).

Test solution. Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). Dissolve the contents of a vial of *glimepiride for system suitability CRS* (containing impurities B, C and D) in 2.0 ml of the test solution.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Reference solution (c). Dissolve 20.0 mg of *glimepiride CRS* in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm,

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (4 µm).

Mobile phase: dissolve 0.5 g of *sodium dihydrogen phosphate R* in 500 ml of *water for chromatography R* and adjust to pH 2.5 with *phosphoric acid R*. Add 500 ml of *acetonitrile for chromatography R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 228 nm.

Injection: 20 µl of the test solution and reference solutions (a) and (b).

Run time: 2.5 times the retention time of glimepiride.

Relative retention with reference to glimepiride (retention time = about 17 min): impurity B = about 0.2; impurity C = about 0.3; impurity D = about 1.1.

System suitability: reference solution (a):

– *resolution*: minimum 4.0 between the peaks due to impurity B and impurity C.

Limits:

– *impurity B*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent),

– *impurity D*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *sum of impurities other than B*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Impurity A. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 10.0 mg of the substance to be examined in 5 ml of *methylene chloride R* and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dilute 0.8 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 2.0 mg of *glimepiride CRS* (containing impurity A) in 1 ml of *methylene chloride R* and dilute to 4.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 4 mm,

– *stationary phase*: *diol silica gel for chromatography R* (5 µm).

Mobile phase: *anhydrous acetic acid R, 2-propanol R, heptane R* (1:100:899 *V/V/V*).

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 228 nm.

Injection: 10 µl.

Run time: 1.5 times the retention time of glimepiride.

Identification of impurities: use the chromatogram supplied with *glimepiride CRS* and the chromatogram obtained with reference solution (b) to identify the peak due to impurity A.

Relative retention with reference to glimepiride (retention time = about 14 min): impurity A = about 0.9.

System suitability: reference solution (b):

– *peak-to-valley ratio*: minimum 2.0, where H_p = height above the baseline of the peak due to impurity A and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to glimepiride.

Limit:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent).

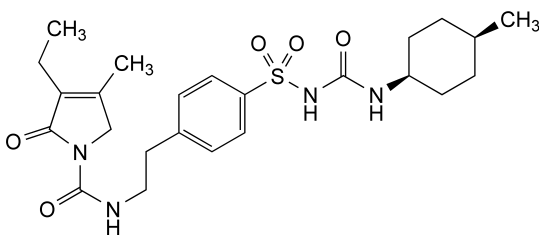
Water (*2.5.32*): maximum 0.5 per cent.

Dissolve 0.250 g in *dimethylformamide R* and dilute to 5.0 ml with the same solvent. Carry out the test on 1.0 ml of solution. Carry out a blank test.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

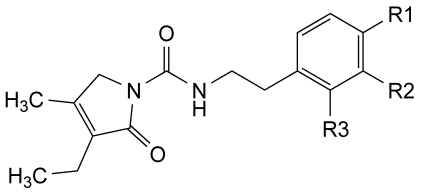
ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.



Injection: test solution and reference solution (c).

Calculate the percentage content of $C_{24}H_{34}N_4O_5S$ from the areas of the peaks and the declared content of *glimepiride CRS*.



IMPURITIES

Specified impurities: A, B, D.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, E, F, G, H, I, J.*

GLIPIZIDE

Glipizidum

$C_{21}H_{27}N_5O_4S$ M_r 445.5
[29094-61-9]

DEFINITION

1-Cyclohexyl-3-[[4-[2-[[(5-methylpyrazin-2-yl)carbonyl]-amino]ethyl]phenyl]sulphonyl]urea.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, very slightly soluble in methylene chloride and in acetone, practically insoluble in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve about 2 mg in *methanol R* and dilute to 100 ml with the same solvent.

Spectral range: 220-350 nm.

Absorption maxima: at 226 nm and 274 nm.

Absorbance ratio: A_{226}/A_{274} = 2.0 to 2.4.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *glipizide CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 10 mg of *glipizide CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Plate: *TLC silica gel GF_{254} plate R*.

Mobile phase: *anhydrous formic acid R, ethyl acetate R, methylene chloride R* (25:25:50 *V/V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Place 25 mg of the substance to be examined into a volumetric flask and add 75 ml of the mobile phase. Dissolve using sonication. Dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *glipizide impurity A CRS* and 5 mg of *glipizide impurity D CRS* in the mobile phase and dilute to 100 ml with the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 17 volumes of *acetonitrile R* and 83 volumes of a 3.5 g/l solution of *dipotassium hydrogen phosphate R* previously adjusted to pH 8.0 with *phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 274 nm.

Injection: 50 µl.

Run time: 1.5 times the retention time of glipizide.

Relative retention with reference to glipizide (retention time = about 24 min): impurity A = about 0.3; impurity D = about 0.4; impurity E = about 1.1.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to impurities A and D.

Limits:

– *impurity A*: not more 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
– *impurities D, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Impurity B. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 25 mg of *decane R* in *methylene chloride R* and dilute to 100 ml with the same solvent. Dilute 5 ml of this solution to 100 ml with *methylene chloride R*.

Test solution (a). Dissolve 1.0 g of the substance to be examined in 50 ml of a 12 g/l solution of *sodium hydroxide R* and shake with 2 quantities, each of 5.0 ml of *methylene chloride R*. Use the combined lower layers.

Test solution (b). Dissolve 1.0 g of the substance to be examined in 50 ml of a 12 g/l solution of *sodium hydroxide R* and shake with 2 quantities, each of 5.0 ml of the internal standard solution. Use the combined lower layers.

Reference solution. Dissolve 10.0 mg of *cyclohexylamine R* (impurity B) in a 17.5 g/l solution of *hydrochloric acid R* and dilute to 100.0 ml with the same acid. To 1.0 ml of this solution add 50 ml of a 12 g/l solution of *sodium hydroxide R* and shake with 2 quantities, each of 5.0 ml of the internal standard solution. Use the combined lower layers.

Column:

– *material*: fused silica,
– *size*: *l* = 25 m, Ø = 0.32 mm,
– *stationary phase*: *poly(dimethyl)(diphenyl)siloxane R* (film thickness 0.5 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.8 ml/min.

Split ratio: 1:11.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 4	40
	4 - 20	40 → 200
	20 - 25	200
Injection port		250
Detector		270

Detection: flame ionisation.

Injection: 1 µl.

Elution order: impurity B, decane.

System suitability:

– *resolution*: minimum 7 between the peaks due to impurity B and the internal standard in the chromatogram obtained with the reference solution,
– there is no peak with the same retention time as that of the internal standard in the chromatogram obtained with test solution (a).

Limit:

– *impurity B*: calculate the ratio (*R*) of the area of the peak due to impurity B to the area of the peak due to the internal standard from the chromatogram obtained with the reference solution; from the chromatogram obtained with test solution (b), calculate the ratio of the area of any peak due to impurity B to the area of the peak due to the internal standard: this ratio is not greater than *R* (100 ppm).

Impurity C. Liquid chromatography (*2.2.29*).

Solvent mixture. Mixture of equal volumes of *acetonitrile R* and *water R* previously adjusted to pH 3.5 with *acetic acid R*.

Test solution. Dissolve 10.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution. Dissolve 5.0 mg of *glipizide impurity C CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture. To 5.0 ml of the solution add 1.0 ml of the test solution and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: spherical *base-deactivated end-capped octadecylsilyl silica gel for chromatography R1* (3 µm).

Mobile phase: mix 35 volumes of *acetonitrile R1* and 65 volumes of *water R* previously adjusted to pH 3.5 with *acetic acid R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 225 nm.

Injection: 50 µl.

Run time: twice the retention time of glipizide.

Relative retention with reference to glipizide (retention time = about 6 min): impurity C = about 1.4.

System suitability: reference solution:

– *resolution*: minimum 4.0 between the peaks due to glipizide and impurity C,

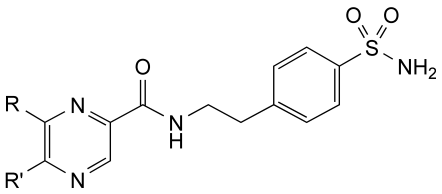
– *symmetry factor*: maximum 1.2 for the peak due to glipizide.

Limit:

– *impurity C*: not more than 0.4 times the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

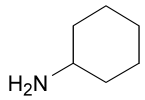
Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.



ASSAY

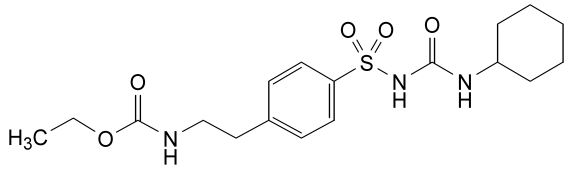
Dissolve 0.400 g in 50 ml of *dimethylformamide R*. Add 0.2 ml of *quinaldine red solution R*. Titrate with *0.1 M lithium methoxide* until the colour changes from red to colourless.

1 ml of *0.1 M lithium methoxide* is equivalent to 44.55 mg of $C_{21}H_{27}N_5O_4S$.

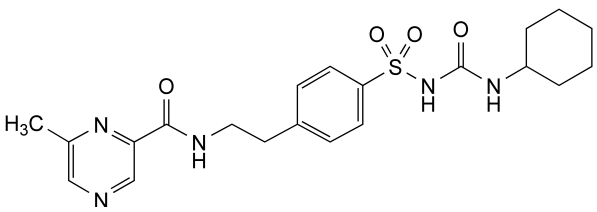


IMPURITIES

Specified impurities: A, B, C, D, E.



A. R = H, R′ = CH_3: 5-methyl-*N*-[2-(4-sulphamoylphenyl)ethyl]pyrazine-2-carboxamide,



D. R = CH_3, R′ = H: 6-methyl-*N*-[2-(4-sulphamoylphenyl)ethyl]pyrazine-2-carboxamide,

B. cyclohexanamine,

C. ethyl [2-[4-[(cyclohexylcarbamoyl)sulphamoyl]phenyl]ethyl]carbamate,

E. 1-cyclohexyl-3-[[4-[2-[[(6-methylpyrazin-2-yl)carbonyl]amino]ethyl]phenyl]sulphonyl]urea.

01/2008:1635

GLUCAGON, HUMAN

Glucagonum humanum

H-His–Ser–Gln–Gly–Thr–Phe–Thr–Ser–Asp–Tyr–
Ser–Lys–Tyr–Leu–Asp–Ser–Arg–Arg–Ala–Gln–
Asp–Phe–Val–Gln–Trp–Leu–Met–Asn–Thr-OH

$C_{153}H_{225}N_{43}O_{49}S$ M_r 3483

DEFINITION

Polypeptide having the same structure (29 amino acids) as the hormone produced by the α-cells of the human pancreas, which increases the blood-glucose concentration by promoting rapid breakdown of liver glycogen.

Content: 92.5 per cent to 105.0 per cent (anhydrous substance).

PRODUCTION

Human glucagon is produced by a method based on recombinant DNA (rDNA) technology. During the course of product development it must be demonstrated that the manufacturing process produces a product having a biological activity of not less than 1 IU/mg using a suitable validated bioassay.

Host-cell-derived proteins. The limit is approved by the competent authority.

Host-cell- and vector-derived DNA. The limit is approved by the competent authority.

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water and in most organic solvents. It is soluble in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

A. Peptide mapping. Liquid chromatography (*2.2.29*).

Test solution. Prepare a 5 mg/ml solution of the substance to be examined in *0.01 M hydrochloric acid*. Mix 200 µl of this solution with 800 µl of *0.1 M ammonium carbonate buffer solution pH 10.3 R* (diluted stock solution). Prepare a 2 mg/ml solution of *α-chymotrypsin for peptide mapping R* in *0.1 M ammonium carbonate buffer solution pH 10.3 R* and add 25 µl of this solution to the diluted stock solution. Place the solution in a closed vial at 37 °C for 2 h. Remove the vial and stop the reaction immediately by adding 120 µl of *glacial acetic acid R*.

Reference solution. Prepare a 1 mg/ml solution of *human glucagon CRS* in *0.1 M ammonium carbonate buffer solution pH 10.3 R* (diluted stock solution) and continue as described for the test solution.

Column:

– *size*: *l* = 0.05 m, Ø = 4 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: mix 500 µl of *trifluoroacetic acid R* and 1000 ml of *water R*;

– *mobile phase B*: mix 500 µl of *trifluoroacetic acid R* with 600 ml of *anhydrous ethanol R* and add 400 ml of *water R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 35	100 → 53	0 → 47
35 - 45	53 → 0	47 → 100
45 - 46	0 → 100	100 → 0
46 - 75	100	0

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 215 nm.

Equilibration: with mobile phase A for at least 15 min.

Injection: 20 µl.

Results: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

TESTS

Deamidated glucagon. Liquid chromatography (*2.2.29*): use the normalisation procedure.

Test solution. Dissolve the substance to be examined in *0.01 M hydrochloric acid* to obtain a concentration of 1.0 mg/ml.

Resolution solution. Dissolve the substance to be examined in *0.1 M hydrochloric acid* to obtain a concentration of 1.0 mg/ml. Incubate in an oven at 60 °C for 2 h. Immediately after degradation, adjust to pH 2.5 with *1 M sodium hydroxide*.

Column:

– *material*: glass;

– *size*: *l* = 0.05 m, Ø = 5 mm;

– *stationary phase*: *anion exchange resin R2*.

Mobile phase:

– *mobile phase A*: mix 1000 ml of *tris-hydrochloride buffer solution pH 8.3 R* and 1000 ml of *anhydrous ethanol R*;

– *mobile phase B*: dissolve 29.2 g of *sodium chloride R* in 1000 ml of *tris-hydrochloride buffer solution pH 8.3 R*; add 1000 ml of *anhydrous ethanol R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 4	100	0
4 - 30	100 → 78	0 → 22
30 - 34	78 → 45	22 → 55
34 - 38	45 → 20	55 → 80
38 - 40	20 → 100	80 → 0
40 - 60	100	0

Flow rate: 0.6 ml/min.

Detection: spectrophotometer at 230 nm.

Equilibration: with mobile phase A for at least 15 min.

Injection: 60 µl.

System suitability: resolution solution:

– *retention time*: glucagon = about 10 min; 4 deamidated forms: between 15 min and 40 min;

– *resolution*: baseline separation of the 4 deamidated forms and glucagon.

Limit:

– *sum of the 4 deamidated forms*: maximum 0.5 per cent, calculated from the peaks eluting between 15 min and 40 min.

Related proteins. Liquid chromatography (*2.2.29*): use the normalisation procedure.

2.8 M urea solution. Dissolve 16.8 g of *urea R* in 100 ml of *water R*.

Test solution. Dissolve the substance to be examined in *0.01 M hydrochloric acid* to obtain a concentration of 0.5 mg/ml. *Maintain the solution at 2-8 °C.*

Reference solution. Dissolve the contents of a vial of *human glucagon CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 0.5 mg/ml. *Maintain the solution at 2-8 °C.*

Resolution solution. Dissolve 10 mg of the substance to be examined in 20 ml of the 2.8 M urea solution. Heat at 50 °C for 2 h. Cool and adjust to pH 2.2 with *1 M hydrochloric acid. Maintain the solution at 2-8 °C and use within 2 h, or maintain the solution below – 15 °C and then thaw and filter through a 0.22 µm filter before use.*

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm;

– *temperature*: 45 °C.

Mobile phase:

– *mobile phase A*: dissolve 13.6 g of *potassium dihydrogen phosphate R* in 400 ml of *water R*, adjust to pH 2.5 (*2.2.3*) with *phosphoric acid R*, and add 100 ml of *acetonitrile for chromatography R*;

– *mobile phase B*: *acetonitrile for chromatography R*, *water R* (40:60 *V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 23	57	43
23 - 29	57 → 10	43 → 90
29 - 30	10	90
30 - 31	10 → 57	90 → 43
31 - 75	57	43

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 50 µl of the test solution and the resolution solution.

Relative retention with reference to glucagon (retention time = about 20 min): carbamoylglucagon = about 1.1.

System suitability: resolution solution:

– *resolution*: minimum 2.0 between the peaks due to glucagon and carbamoylglucagon.

Limit:

– *total*: maximum 2.5 per cent.

Water (*2.5.12*): maximum 10 per cent, determined on 50 mg.

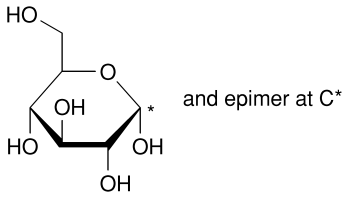
Bacterial endotoxins (*2.6.14*): less than 10 IU/mg.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related proteins with the following modification.

Injection: test solution and reference solution.

Calculate the content of human glucagon ($C_{153}H_{225}N_{43}O_{49}S$) from the declared content of $C_{153}H_{225}N_{43}O_{49}S$ in *human glucagon CRS*.



STORAGE

In an airtight container, protected from light, at a temperature lower than – 15 °C.

01/2008:0177
corrected 6.0

GLUCOSE, ANHYDROUS

Glucosum anhydricum

$C_6H_{12}O_6$ M_r 180.2
[50-99-7]

DEFINITION

(+)-D-Glucopyranose.

CHARACTERS

Appearance: white or almost white, crystalline powder.

It has a sweet taste.

Solubility: freely soluble in water, sparingly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Thin-layer chromatography (*2.2.27*).

Solvent mixture: *water R, methanol R* (2:3 *V/V*).

Test solution. Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (a). Dissolve 10 mg of *glucose CRS* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (b). Dissolve 10 mg each of *fructose CRS, glucose CRS, lactose CRS* and *sucrose CRS* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Plate: *TLC silica gel G plate R*.

Mobile phase: *water R, methanol R, anhydrous acetic acid R, ethylene chloride R* (10:15:25:50 *V/V/V/V*); measure the volumes accurately since a slight excess of water produces cloudiness.

Application: 2 µl; thoroughly dry the starting points.

Development A: over a path of 15 cm.

Drying A: in a current of warm air.

Development B: immediately, over a path of 15 cm, after renewing the mobile phase.

Drying B: in a current of warm air.

Detection: spray with a solution of 0.5 g of *thymol R* in a mixture of 5 ml of *sulphuric acid R* and 95 ml of *ethanol (96 per cent) R*. Heat at 130 °C for 10 min.

System suitability: test solution (b):

– the chromatogram shows 4 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in 10 ml of *water R*. Add 3 ml of *cupri-tartaric solution R* and heat. A red precipitate is formed.

TESTS

Solution S. Dissolve 10.0 g in *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

Dissolve 10.0 g in 15 ml of *water R*.

Acidity or alkalinity. Dissolve 6.0 g in 25 ml of *carbon dioxide-free water R* and add 0.3 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.15 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to pink.

Specific optical rotation (*2.2.7*): + 52.5 to + 53.3 (anhydrous substance).

Dissolve 10.0 g in 80 ml of *water R*, add 0.2 ml of *dilute ammonia R1*, allow to stand for 30 min and dilute to 100.0 ml with *water R*.

Foreign sugars, soluble starch, dextrins. Dissolve 1.0 g by boiling in 30 ml of *ethanol (90 per cent V/V) R*. Cool; the appearance of the solution shows no change.

Sulphites: maximum 15 ppm, expressed as SO_2.

Test solution. Dissolve 5.0 g in 40 ml of *water R*, add 2.0 ml of *0.1 M sodium hydroxide* and dilute to 50.0 ml with *water R*. To 10.0 ml of the solution, add 1 ml of a 310 g/l solution of *hydrochloric acid R*, 2.0 ml of *decolorised fuchsin solution R1* and 2.0 ml of a 0.5 per cent *V/V* solution of *formaldehyde R*. Allow to stand for 30 min.

Reference solution. Dissolve 76 mg of *sodium metabisulphite R* in *water R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *water R*. To 3.0 ml of this solution add 4.0 ml of *0.1 M sodium hydroxide* and dilute to 100.0 ml with *water R*. Immediately add to 10.0 ml of this solution 1 ml of a 310 g/l solution of *hydrochloric acid R*, 2.0 ml of *decolorised fuchsin solution R1* and 2.0 ml of a 0.5 per cent *V/V* solution of *formaldehyde R*. Allow to stand for 30 min.

Measure the absorbance (*2.2.25*) of the 2 solutions at the absorption maximum at 583 nm using for both measurements a solution prepared in the same manner using 10.0 ml of *water R* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution.

Chlorides (*2.4.4*): maximum 125 ppm.

Dilute 4 ml of solution S with 15 ml of *water R*.

Sulphates (*2.4.13*): maximum 200 ppm.

Dilute 7.5 ml of solution S with 15 ml of *distilled water R*.

Arsenic (*2.4.2, Method A*): maximum 1 ppm, determined on 1.0 g.

Barium. To 10 ml of solution S add 1 ml of *dilute sulphuric acid R*. When examined immediately and after 1 h, any opalescence in the solution is not more intense than that in a mixture of 1 ml of *distilled water R* and 10 ml of solution S.

Calcium (*2.4.3*): maximum 200 ppm.

Dilute 5 ml of solution S with 15 ml of *distilled water R*.

Lead (*2.4.10*): maximum 0,5 ppm.

Water (*2.5.12*): maximum 1.0 per cent, determined on 0.50 g.

Sulphated ash: maximum 0.1 per cent.

Dissolve 5.0 g in 5 ml of *water R*, add 2 ml of *sulphuric acid R*, evaporate to dryness on a water-bath and ignite to constant mass. If necessary, repeat the heating with *sulphuric acid R*.

Pyrogens (*2.6.8*). If intended for use in the manufacture of large-volume parental dosage forms without a further appropriate procedure for the removal of pyrogens, the competent authority may require that it comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 ml of a solution in *water for injections R* containing 50 mg of the substance to be examined per millilitre.

01/2008:1330

GLUCOSE, LIQUID

Glucosum liquidum

DEFINITION

Aqueous solution containing a mixture of glucose, oligosaccharides and polysaccharides obtained by hydrolysis of starch.

It contains a minimum of 70.0 per cent dry matter.

The degree of hydrolysis, expressed as dextrose equivalent (DE), is not less than 20 (nominal value).

CHARACTERS

Appearance: clear, colourless or brown, viscous liquid.

Solubility: miscible with water.

It may partly or totally solidify at room temperature and liquefies again when heated to 50 °C.

IDENTIFICATION

A. Dissolve 0.1 g in 2.5 ml of *water R* and heat with 2.5 ml of *cupri-tartaric solution R*. A red precipitate is formed.

B. Dip, for 1 s, a suitable stick with a reactive pad containing glucose-oxidase, peroxidase and a hydrogen-donating substance, such as tetramethylbenzidine, in a 5 g/l solution of the substance to be examined. Observe the colour of the reactive pad; within 60 s the colour changes from yellow to green or blue.

C. It is a clear, colourless or brown, viscous liquid, miscible with water. The substance may partly or totally solidify at room temperature and liquefies again when heated to 50 °C.

D. Dextrose equivalent (see Tests).

TESTS

Solution S. Dissolve 25.0 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

pH (*2.2.3*): 4.0 to 6.0.

Mix 1 ml of a 223.6 g/l solution of *potassium chloride R* and 30 ml of solution S.

Sulphur dioxide (*2.5.29*): maximum 20 ppm; maximum 400 ppm if intended for the production of lozenges or pastilles obtained by high boiling techniques, provided that the final product contains maximum 50 ppm of sulphur dioxide.

Heavy metals (*2.4.8*): maximum 10 ppm.

Dilute 2 ml of solution S to 30 ml with *water R*. The solution complies with test E. Prepare the reference solution using 10 ml of *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 30.0 per cent, determined on 1.000 g. Triturate the sample with 3.000 g of *kieselguhr G R*, previously dried at 80 °C under reduced pressure for 2 h, and dry at 80 °C under reduced pressure for 2 h.

Sulphated ash (*2.4.14*): maximum 0.5 per cent, determined on 1.0 g.

Dextrose equivalent (DE): within 10 per cent of the nominal value.

Weigh an amount of the substance to be examined equivalent to 2.85-3.15 g of reducing carbohydrates, calculated as dextrose equivalent, into a 500 ml volumetric flask. Dissolve in *water R* and dilute to 500.0 ml with the same solvent. Transfer the solution to a 50 ml burette.

Pipette 25.0 ml of *cupri-tartaric solution R* into a 250 ml flask and add 18.5 ml of the test solution from the burette, mix and add a few glass beads. Place the flask on a hot plate, previously adjusted so that the solution begins to boil after 2 min ± 15 s. Allow to boil for exactly 120 s, add 1 ml of a 1 g/l solution of *methylene blue R* and titrate with the test solution (V_1) until the blue colour disappears. Maintain the solution at boiling throughout the titration.

Standardise the cupri-tartaric solution using a 6.00 g/l solution of *glucose R* (V_0).

Calculate the dextrose equivalent using the following expression:

$$\frac{300 \times V_0 \times 100}{V_1 \times M \times D}$$

V_0 = total volume of glucose standard solution, in millilitres,

V_1 = total volume of test solution, in millilitres,

M = mass of the sample, in grams,

D = percentage content of dry matter in the substance.

LABELLING

The label states the dextrose equivalent (DE) (= nominal value).

01/2008:1525
corrected 6.0

GLUCOSE, LIQUID, SPRAY-DRIED

Glucosum liquidum dispersione desiccatum

DEFINITION

Mixture of glucose, oligosaccharides and polysaccharides, obtained by the partial hydrolysis of starch.

The degree of hydrolysis, expressed as dextrose equivalent (DE), is not less than 20 (nominal value).

CHARACTERS

Appearance: white or almost white, slightly hygroscopic powder or granules.

Solubility: freely soluble in water.

IDENTIFICATION

A. Dissolve 0.1 g in 2.5 ml of *water R* and heat with 2.5 ml of *cupri-tartaric solution R*. A red precipitate is formed.

B. Dip, for 1 s, a suitable stick with a reactive pad containing glucose-oxidase, peroxidase and a hydrogen-donating substance, such as tetramethylbenzidine, in a 5 g/l solution of the substance to be examined. Observe the colour of the reactive pad; within 60 s the colour changes from yellow to green or blue.

C. It is a powder or granules.

D. Dextrose equivalent (see Tests).

TESTS

Solution S. Dissolve 12.5 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

pH (*2.2.3*): 4.0 to 7.0.

Mix 1 ml of a 223.6 g/l solution of *potassium chloride R* and 30 ml of solution S.

Sulphur dioxide (*2.5.29*): maximum 20 ppm.

Heavy metals (*2.4.8*): maximum 10 ppm.

Dilute 4 ml of solution S to 30 ml with *water R*. The solution complies with test E. Prepare the reference solution using 10 ml of *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 6.0 per cent, determined on 10.00 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.5 per cent, determined on 1.0 g.

Dextrose equivalent (DE): within 10 per cent of the nominal value.

Weigh an amount of the substance to be examined equivalent to 2.85-3.15 g of reducing carbohydrates, calculated as dextrose equivalent, into a 500 ml volumetric flask. Dissolve in *water R* and dilute to 500.0 ml with the same solvent. Transfer the solution to a 50 ml burette.

Pipette 25.0 ml of *cupri-tartaric solution R* into a 250 ml flask and add 18.5 ml of the test solution from the burette, mix and add a few glass beads. Place the flask on a hot plate, previously adjusted so that the solution begins to boil after 2 min ± 15 s. Allow to boil for exactly 120 s, add 1 ml of a 1 g/l solution of *methylene blue R* and titrate with the test solution (V_1) until the blue colour disappears. Maintain the solution at boiling throughout the titration.

Standardise the cupri-tartaric solution using a 6.00 g/l solution of *glucose R* (V_0).

Calculate the dextrose equivalent using the following expression:

$$\frac{300 \times V_0 \times 100}{V_1 \times M \times D}$$

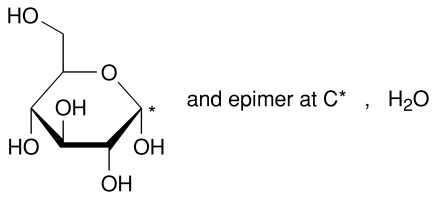
V_0 = total volume of glucose standard solution, in millilitres,

V_1 = total volume of test solution, in millilitres,

M = mass of the sample, in grams,

D = percentage content of dry matter in the substance.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 bacteria and not more than 10^2 fungi per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (*2.6.13*).



LABELLING

The label states the dextrose equivalent (DE) (= nominal value).

corrected 6.0

GLUCOSE MONOHYDRATE

Glucosum monohydricum

$C_6H_{12}O_6,H_2O$ M_r 198.2
[5996-10-1]

DEFINITION

(+)-D-Glucopyranose monohydrate.

CHARACTERS

Appearance: white or almost white, crystalline powder.

It has a sweet taste.

Solubility: freely soluble in water, sparingly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Thin-layer chromatography (*2.2.27*).

Solvent mixture: *water R, methanol R* (2:3 *V/V*).

Test solution. Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (a). Dissolve 10 mg of *glucose CRS* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (b). Dissolve 10 mg each of *fructose CRS, glucose CRS, lactose CRS* and *sucrose CRS* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Plate: *TLC silica gel G plate R*.

Mobile phase: *water R, methanol R, anhydrous acetic acid R, ethylene chloride R* (10:15:25:50 *V/V/V/V*); measure the volumes accurately since a slight excess of water produces cloudiness.

Application: 2 µl; thoroughly dry the starting points.

Development A: over a path of 15 cm.

Drying A: in a current of warm air.

Development B: immediately, over a path of 15 cm, after renewing the mobile phase.

Drying B: in a current of warm air.

Detection: spray with a solution of 0.5 g of *thymol R* in a mixture of 5 ml of *sulphuric acid R* and 95 ml of *ethanol (96 per cent) R*; heat at 130 °C for 10 min.

System suitability: test solution (b):

– the chromatogram shows 4 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in 10 ml of *water R*. Add 3 ml of *cupri-tartaric solution R* and heat. A red precipitate is formed.

TESTS

Solution S. Dissolve 10.0 g in *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

Dissolve 10.0 g in 15 ml of *water R*.

Acidity or alkalinity. Dissolve 6.0 g in 25 ml of *carbon dioxide-free water R* and add 0.3 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.15 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to pink.

Specific optical rotation (*2.2.7*): + 52.5 to + 53.3 (anhydrous substance).

Dissolve 10.0 g in 80 ml of *water R*, add 0.2 ml of *dilute ammonia R1*, allow to stand for 30 min and dilute to 100.0 ml with *water R*.

Foreign sugars, soluble starch, dextrins. Dissolve 1.0 g by boiling in 30 ml of *ethanol (90 per cent V/V) R*. Cool; the appearance of the solution shows no change.

Sulphites: maximum 15 ppm, expressed as SO_2.

Test solution. Dissolve 5.0 g in 40 ml of *water R*, add 2.0 ml of *0.1 M sodium hydroxide* and dilute to 50.0 ml with *water R*. To 10.0 ml of the solution, add 1 ml of a 310 g/l solution of *hydrochloric acid R*, 2.0 ml of *decolorised fuchsin solution R1* and 2.0 ml of a 0.5 per cent *V/V* solution of *formaldehyde R*. Allow to stand for 30 min.

Reference solution. Dissolve 76 mg of *sodium metabisulphite R* in *water R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *water R*. To 3.0 ml of this solution add 4.0 ml of *0.1 M sodium hydroxide* and dilute to 100.0 ml with *water R*. Immediately add to 10.0 ml of this solution 1 ml of a 310 g/l solution of *hydrochloric acid R*, 2.0 ml of *decolorised fuchsin solution R1* and 2.0 ml of a 0.5 per cent *V/V* solution of *formaldehyde R*. Allow to stand for 30 min.

Measure the absorbance (*2.2.25*) of the 2 solutions at the absorption maximum at 583 nm using for both measurements a solution prepared in the same manner using 10.0 ml of *water R* as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution.

Chlorides (*2.4.4*): maximum 125 ppm.

Dilute 4 ml of solution S with 15 ml of *water R*.

Sulphates (*2.4.13*): maximum 200 ppm.

Dilute 7.5 ml of solution S with 15 ml of *distilled water R*.

Arsenic (*2.4.2, Method A*): maximum 1 ppm, determined on 1.0 g.

Barium. To 10 ml of solution S add 1 ml of *dilute sulphuric acid R*. When examined immediately and after 1 h, any opalescence in the solution is not more intense than that in a mixture of 1 ml of *distilled water R* and 10 ml of solution S.

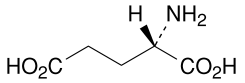
Calcium (*2.4.3*): maximum 200 ppm.

Dilute 5 ml of solution S with 15 ml of *distilled water R*.

Lead (*2.4.10*): maximum 0.5 ppm.

Water (*2.5.12*): 7.0 per cent to 9.5 per cent, determined on 0.50 g.

Sulphated ash: maximum 0.1 per cent.



Dissolve 5.0 g in 5 ml of *water R*, add 2 ml of *sulphuric acid R*, evaporate to dryness on a water-bath and ignite to constant mass. If necessary, repeat the heating with *sulphuric acid R*.

Pyrogens (*2.6.8*). If intended for use in the manufacture of large-volume parenteral dosage forms without a further appropriate procedure for the removal of pyrogens, the competent authority may require that it comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 ml of a solution in *water for injections R* containing 55 mg of the substance to be examined per millilitre.

corrected 6.0

GLUTAMIC ACID

Acidum glutamicum

$C_5H_9NO_4$ M_r 147.1
[56-86-0]

DEFINITION

Glutamic acid contains not less than 98.5 per cent and not more than the equivalent of 100.5 per cent of (2*S*)-2-aminopentanedioic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, freely soluble in boiling water, slightly soluble in cold water, practically insoluble in acetic acid, in acetone and in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *glutamic acid CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum quantity of *water R*, evaporate to dryness at 60 °C and record new spectra using the residues.

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To 2.0 ml of solution S (see Tests) add 0.1 ml of *phenolphthalein solution R* and 3.0 ml to 3.5 ml of *1 M sodium hydroxide* to change the colour of the indicator to red. Add a mixture of 3 ml of *formaldehyde solution R*, 3 ml of *carbon dioxide-free water R* and 0.1 ml of *phenolphthalein solution R*, to which sufficient *1 M sodium hydroxide* has been added to produce a pink colour. The solution is decolourised. Add *1 M sodium hydroxide* until a red colour is produced. The total volume of *1 M sodium hydroxide* used is 4.0 ml to 4.7 ml.

TESTS

Solution S. Dissolve 5.00 g in *1 M hydrochloric acid* with gentle heating, and dilute to 50.0 ml with the same acid.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*Method II, 2.2.2*).

Specific optical rotation (*2.2.7*): + 30.5 to + 32.5, determined on solution S and calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 5 ml of *dilute ammonia R2* and dilute to 10 ml with *water R*.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *glutamic acid CRS* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *glutamic acid CRS* and 10 mg of *aspartic acid CRS* in *water R* and dilute to 25 ml with the same solvent.

Apply to the plate 5 µl of each solution. Dry the plate in a current of air for 15 min. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at 100-105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows 2 clearly separated spots.

Chlorides (*2.4.4*). Dissolve 0.25 g in 3 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution, to which 1 ml of *water R* is added instead of *dilute nitric acid R*, complies with the limit test for chlorides (200 ppm).

Sulphates (*2.4.13*). Dilute 5 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (*2.4.1*). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (*2.4.9*). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (*2.4.8*). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

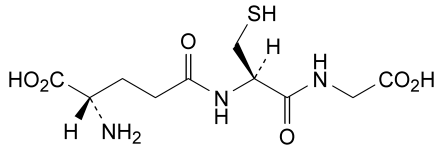
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.130 g in 50 ml of *carbon dioxide-free water R* with gentle heating. Cool. Using 0.1 ml of *bromothymol blue solution R1* as indicator, titrate with *0.1 M sodium hydroxide* until the colour changes from yellow to blue.

1 ml of *0.1 M sodium hydroxide* is equivalent to 14.71 mg of $C_5H_9NO_4$.



STORAGE

Protected from light.

corrected 6.0

GLUTATHIONE

Glutathionum

$C_{10}H_{17}N_3O_6S$ M_r 307.3
[70-18-8]

DEFINITION

L-γ-Glutamyl-L-cysteinylglycine.

Fermentation product.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: freely soluble in water, very slightly soluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *glutathione CRS*.

TESTS

Solution S. Dissolve 5.0 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*): – 15.5 to – 17.5 (dried substance).

Dissolve 1.0 g in *water R* and dilute to 25.0 ml with the same solvent.

Related substances. Capillary electrophoresis (*2.2.47*).
Prepare the solutions immediately before use.

Internal standard solution (a). Dissolve 0.100 g of *phenylalanine R* in the electrolyte solution and dilute to 50.0 ml with the same solution.

Internal standard solution (b). Dilute 10.0 ml of internal standard solution (a) to 100.0 ml with the electrolyte solution.

Test solution (a). Dissolve 0.200 g of the substance to be examined in the electrolyte solution and dilute to 10.0 ml with the same solution.

Test solution (b). Dissolve 0.200 g of the substance to be examined in internal standard solution (b) and dilute to 10.0 ml with the same solution.

Reference solution (a). Dissolve 20 mg of the substance to be examined in internal standard solution (a) and dilute to 10.0 ml with the same solution.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the electrolyte solution.

Reference solution (c). Dissolve 0.200 g of the substance to be examined in 5 ml of the electrolyte solution. Add 1.0 ml of internal standard solution (a), 0.5 ml of a 2 mg/ml solution of *L-cysteine R* (impurity B) in the electrolyte solution, 0.5 ml of a 2 mg/ml solution of *oxidised L-glutathione R* (impurity C)

in the electrolyte solution and 0.5 ml of a 2 mg/ml solution of *L-γ-glutamyl-L-cysteine R* (impurity D) in the electrolyte solution. Dilute to 10.0 ml with the electrolyte solution.

Capillary:

– *material*: uncoated fused silica;

– *size*: length to the detector cell = 0.5 m; total length = 0.6 m; Ø = 75 µm.

Temperature: 25 °C.

Electrolyte solution. Dissolve 1.50 g of *anhydrous sodium dihydrogen phosphate R* in 230.0 ml of *water R* and adjust to pH 1.80 with *phosphoric acid R*. Dilute to 250.0 ml with *water R*. Check the pH and, if necessary, adjust with *phosphoric acid R* or *dilute sodium hydroxide solution R*.

Detection: spectrophotometer at 200 nm.

Preconditioning of a new capillary: rinse the new capillary before the first injection with *0.1 M hydrochloric acid* at 138 kPa for 20 min and with *water R* at 138 kPa for 10 min; for complete equilibration, condition the capillary with the electrolyte solution at 350 kPa for 40 min, and subsequently at a voltage of 20 kV for 60 min.

Preconditioning of the capillary: rinse the capillary with the electrolyte solution at 138 kPa for 40 min.

Between-run rinsing: rinse the capillary with *water R* at 138 kPa for 1 min, with *0.1 M sodium hydroxide* at 138 kPa for 2 min, with *water R* at 138 kPa for 1 min, with *0.1 M hydrochloric acid* at 138 kPa for 3 min and with the electrolyte solution at 138 kPa for 10 min.

Injection: test solutions (a) and (b), reference solutions (b) and (c) and the electrolyte solution (blank): under pressure (3.45 kPa) for 5 s.

Migration: apply a voltage of 20 kV.

Run time: 45 min.

Relative migration with reference to the internal standard (about 14 min): impurity A = about 0.77; impurity B = about 1.04; impurity E = about 1.2; impurity C = about 1.26; impurity D = about 1.3.

System suitability:

– *resolution*: minimum 1.5 between the peaks due to the internal standard and impurity B in the chromatogram obtained with reference solution (c); if necessary, increase the pH with *dilute sodium hydroxide solution R*;

– *peak-to-valley ratio*: minimum 2.5, where H_p = height above the baseline of the peak due to impurity D and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to glutathione in the chromatogram obtained with reference solution (c); if necessary, lower the pH with *phosphoric acid R*;

– check that in the electropherogram obtained with test solution (a) there is no peak with the same migration time as the internal standard (in such case correct the area of the phenylalanine peak).

Limits: test solution (b):

– *corrected areas*: divide all the peak areas by the corresponding migration times;

– *correction factors*: for the calculation of content, multiply the ratio of time-corrected peak areas of impurity and the internal standard by the corresponding correction factor: impurity B = 3.0; impurity D = 1.4;

– *impurities A, B, E*: for each impurity, not more than 0.5 times the ratio of the area of the peak due to glutathione to the area of the peak due to the internal standard in the electropherogram obtained with reference solution (b) (0.5 per cent);

– *impurities C, D*: for each impurity, not more than the ratio of the area of the peak due to glutathione to the area of the peak due to the internal standard in the electropherogram obtained with reference solution (b) (1.0 per cent);

– *any other impurity*: for each impurity, not more than 0.2 times the ratio of the area of the peak due to glutathione to the area of the peak due to the internal standard in the electropherogram obtained with reference solution (b) (0.2 per cent);

– *total*: not more than 2.5 times the ratio of the area of the peak due to glutathione to the area of the peak due to the internal standard in the electropherogram obtained with reference solution (b) (2.5 per cent);

– *disregard limit*: 0.05 times the ratio of the area of the peak due to glutathione to the area of the peak due to the internal standard in the electropherogram obtained with reference solution (b) (0.05 per cent).

Chlorides (*2.4.4*): maximum 200 ppm.

Dilute 2.5 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 300 ppm.

Dilute 5 ml of solution S to 15 ml with *distilled water R*.

Ammonium (*2.4.1, Method B*): maximum 200 ppm, determined on 50 mg.

Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (*2.4.9*): maximum 10 ppm.

In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers, add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the test.

Heavy metals (*2.4.8*): maximum 10 ppm.

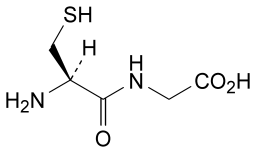
12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

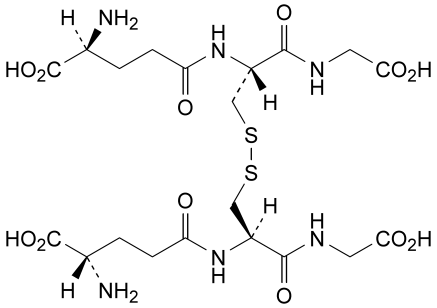
In a ground-glass-stoppered flask, dissolve 0.500 g of the substance to be examined and 2 g of *potassium iodide R* in 50 ml of *water R*. Cool the solution in iced water and add 10 ml of *hydrochloric acid R1* and 20.0 ml of *0.05 M iodine*. Stopper the flask and allow to stand in the dark for 15 min. Titrate with *0.1 M sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration.



1 ml of *0.05 M iodine* is equivalent to 30.73 mg of $C_{10}H_{17}N_3O_6S$.

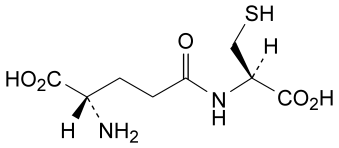
STORAGE

Protected from light.



IMPURITIES

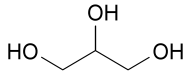
Specified impurities: A, B, C, D, E.



A. L-cysteinylglycine,

B. cysteine,

C. bis(L-γ-glutamyl-L-cysteinylglycine) disulfide (L-glutathione oxidised),



D. L-γ-glutamyl-L-cysteine,

E. unknown structure (product of degradation).

01/2008:0496

GLYCEROL

Glycerolum

$C_3H_8O_3$ M_r 92.1
[56-81-5]

DEFINITION

Propane-1,2,3-triol.

Content: 98.0 per cent *m/m* to 101.0 per cent *m/m* (anhydrous substance).

CHARACTERS

Aspect: syrupy liquid, unctuous to the touch, colourless or almost colourless, clear, very hygroscopic.

Solubility: miscible with water and with alcohol, slightly soluble in acetone, practically insoluble in fatty oils and in essential oils.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. It complies with the test for refractive index (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
Preparation: to 5 ml add 1 ml of *water R* and mix carefully.
Comparison: *Ph. Eur. reference spectrum of glycerol (85 per cent).*

C. Mix 1 ml with 0.5 ml of *nitric acid R*. Superimpose 0.5 ml of *potassium dichromate solution R*. A blue ring develops at the interface of the liquids. Within 10 min, the blue colour does not diffuse into the lower layer.

D. Heat 1 ml with 2 g of *potassium hydrogen sulphate R* in an evaporating dish. Vapours (acrolein) are evolved which blacken filter paper impregnated with *alkaline potassium tetraiodomercurate solution R*.

TESTS

Solution S. Dilute 100.0 g to 200.0 ml with *carbon dioxide-free water R*.

Appearance of solution. Solution S is clear (*2.2.1*). Dilute 10 ml of solution S to 25 ml with *water R*. The solution is colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 50 ml of solution S add 0.5 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to pink.

Refractive index (*2.2.6*): 1.470 to 1.475.

Aldehydes: maximum 10 ppm.

Place 7.5 ml of solution S in a ground-glass-stoppered flask and add 7.5 ml of *water R* and 1.0 ml of *decolorised pararosaniline solution R*. Close the flask and allow to stand for 1 h at a temperature of 25 ± 1 °C. The absorbance (*2.2.25*) of the solution measured at 552 nm is not greater than that of a standard prepared at the same time and in the same manner using 7.5 ml of *formaldehyde standard solution (5 ppm CH_2O) R* and 7.5 ml of *water R*. The test is not valid unless the standard is pink.

Esters. Add 10.0 ml of *0.1 M sodium hydroxide* to the final solution obtained in the test for acidity or alkalinity. Boil under a reflux condenser for 5 min. Cool. Add 0.5 ml of *phenolphthalein solution R* and titrate with *0.1 M hydrochloric acid*. Not less than 8.0 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator.

Impurity A and related substances. Gas chromatography (*2.2.28*).

Test solution. Dilute 10.0 ml of solution S to 100.0 ml with *water R*.

Reference solution (a). Dilute 10.0 g of *glycerol R1* to 20.0 ml with *water R*. Dilute 10.0 ml of the solution to 100.0 ml with *water R*.

Reference solution (b). Dissolve 1.000 g of *diethylene glycol R* in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with reference solution (a). Dilute 1.0 ml of this solution to 20.0 ml with reference solution (a).

Reference solution (d). Mix 1.0 ml of the test solution and 5.0 ml of reference solution (b) and dilute to 100.0 ml with *water R*. Dilute 1.0 ml of this solution to 10.0 ml with *water R*.

Reference solution (e). Dilute 5.0 ml of reference solution (b) to 100.0 ml with *water R*.

Column:

– *size*: *l* = 30 m, Ø = 0.53 mm,

– *stationary phase*: 6 per cent polycyanopropylphenyl siloxane and 94 per cent of polydimethylsiloxane.

Carrier gas: *helium for chromatography R.*

Split ratio: 1:10.

Linear velocity: 38 cm/s.

Temperature:

	Time (min)	Temperature (°C)
Column	0	100
	0 - 16	100 → 220
	16 - 20	220
Injection port		220
Detector		250

Detection: flame ionisation.

Injection: 0.5 µl.

Elution order: impurity A, glycerol.

System suitability: reference solution (d):

– *resolution*: minimum 7.0 between the peaks due to impurity A and glycerol.

Limits:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.1 per cent),

– *any other impurity with a retention time less than the retention time of glycerol*: not more than the area of the peak due to impurity A in the chromatogram obtained with reference solution (c) (0.1 per cent),

– *total of all impurities with retention times greater than the retention time of glycerol*: not more than 5 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (c) (0.5 per cent),

– *disregard limit*: 0.05 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (e) (0.05 per cent).

Halogenated compounds: maximum 35 ppm.

To 10 ml of solution S add 1 ml of *dilute sodium hydroxide solution R*, 5 ml of *water R* and 50 mg of *halogen-free nickel-aluminium alloy R*. Heat on a water-bath for 10 min, allow to cool and filter. Rinse the flask and the filter with *water R* until 25 ml of filtrate is obtained. To 5 ml of the filtrate add 4 ml of *alcohol R*, 2.5 ml of *water R*, 0.5 ml of *nitric acid R* and 0.05 ml of *silver nitrate solution R2* and mix. Allow to stand for 2 min. Any opalescence in the solution is not more intense than that in a standard prepared at the same time by mixing 7.0 ml of *chloride standard solution (5 ppm Cl) R*, 4 ml of *alcohol R*, 0.5 ml of *water R*, 0.5 ml of *nitric acid R* and 0.05 ml of *silver nitrate solution R2*.

Sugars. To 10 ml of solution S add 1 ml of *dilute sulphuric acid R* and heat on a water-bath for 5 min. Add 3 ml of carbonate-free *dilute sodium hydroxide solution R* (prepared by the method described for carbonate-free *1 M sodium hydroxide* (*4.2.2*)), mix and add dropwise 1 ml of freshly prepared *copper sulphate solution R*. The solution is clear and blue. Continue heating on the water-bath for 5 min. The solution remains blue and no precipitate is formed.

Chlorides (*2.4.4*): maximum 10 ppm.

1 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides. Prepare the standard using 1 ml of *chloride standard solution (5 ppm Cl) R* diluted to 15 ml with *water R*.

Heavy metals (*2.4.8*): maximum 5 ppm.

Dilute 8 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): maximum 2.0 per cent, determined on 1.000 g.

Sulphated ash (*2.4.14*): maximum 0.01 per cent, determined on 5.0 g after heating to boiling and ignition.

ASSAY

Thoroughly mix 0.075 g with 45 ml of *water R*. Add 25.0 ml of a mixture of 1 volume of *0.1 M sulphuric acid* and 20 volumes of *0.1 M sodium periodate*. Allow to stand protected from light for 15 min. Add 5.0 ml of a 500 g/l solution of *ethylene glycol R* and allow to stand protected from light for 20 min. Using 0.5 ml of *phenolphthalein solution R* as indicator, titrate with *0.1 M sodium hydroxide*. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 9.21 mg of $C_3H_8O_3$.

STORAGE

In an airtight container.

IMPURITIES

A. 2,2'-oxydiethanol (diethylene glycol),

B. ethane-1,2-diol (ethylene glycol),

C. propylene glycol.

01/2008:0497

GLYCEROL (85 PER CENT)

Glycerolum (85 per centum)

DEFINITION

Aqueous solution of propane-1,2,3-triol.

Content: 83.5 per cent *m/m* to 88.5 per cent *m/m* of propane-1,2,3-triol ($C_3H_8O_3$; M_r 92.1).

CHARACTERS

Aspect: syrupy liquid, unctuous to the touch, colourless or almost colourless, clear, very hygroscopic.

Solubility: miscible with water and with alcohol, slightly soluble in acetone, practically insoluble in fatty oils and in essential oils.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. It complies with the test for refractive index (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *Ph. Eur. reference spectrum of glycerol (85 per cent).*

C. Mix 1 ml with 0.5 ml of *nitric acid R*. Superimpose 0.5 ml of *potassium dichromate solution R*. A blue ring develops at the interface of the liquids. Within 10 min, the blue colour does not diffuse into the lower layer.

D. Heat 1 ml with 2 g of *potassium hydrogen sulphate R* in an evaporating dish. Vapours (acrolein) are evolved which blacken filter paper impregnated with *alkaline potassium tetraiodomercurate solution R*.

TESTS

Solution S. Dilute 117.6 g to 200.0 ml with *carbon dioxide-free water R*.

Appearance of solution. Solution S is clear (*2.2.1*). Dilute 10 ml of solution S to 25 ml with *water R*. The solution is colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 50 ml of solution S add 0.5 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to pink.

Refractive index (*2.2.6*): 1.449 to 1.455.

Aldehydes: maximum 10 ppm.

Place 7.5 ml of solution S in a ground-glass-stoppered flask and add 7.5 ml of *water R* and 1.0 ml of *decolorised pararosaniline solution R*. Close the flask and allow to stand for 1 h at a temperature of 25 ± 1 °C. The absorbance (*2.2.25*) of the solution measured at 552 nm is not greater than that of a standard prepared at the same time and in the same manner using 7.5 ml of *formaldehyde standard solution (5 ppm CH_2O) R* and 7.5 ml of *water R*. The test is not valid unless the standard is pink.

Esters. Add 10.0 ml of *0.1 M sodium hydroxide* to the final solution obtained in the test for acidity or alkalinity. Boil under a reflux condenser for 5 min. Cool. Add 0.5 ml of *phenolphthalein solution R* and titrate with *0.1 M hydrochloric acid*. Not less than 8.0 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator.

Impurity A and related substances. Gas chromatography (*2.2.28*).

Test solution. Dilute 10.0 ml of solution S to 100.0 ml with *water R*.

Reference solution (a). Dilute 11.8 g of *glycerol (85 per cent) R1* to 20.0 ml with *water R*. Dilute 10.0 ml of the solution to 100.0 ml with *water R*.

Reference solution (b). Dissolve 1.000 g of *diethylene glycol R* in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with reference solution (a). Dilute 1.0 ml of this solution to 20.0 ml with reference solution (a).

Reference solution (d). Mix 1.0 ml of the test solution and 5.0 ml of reference solution (b) and dilute to 100.0 ml with *water R*. Dilute 1.0 ml of this solution to 10.0 ml with *water R*.

Reference solution (e). Dilute 5.0 ml of reference solution (b) to 100.0 ml with *water R*.

Column:

– *size*: *l* = 30 m, Ø = 0.53 mm,

– *stationary phase*: 6 per cent polycyanolpropylphenyl siloxane and 94 per cent of polydimethylsiloxane.

Carrier gas: *helium for chromatography R*.

Split ratio: 1:10.

Linear velocity: 38 cm/s.

Temperature:

	Time (min)	Temperature (°C)
Column	0	100
	0 - 16	100 → 220
	16 - 20	220
Injection port		220
Detector		250

Detection: flame ionisation.

Injection: 0.5 µl.

Elution order: impurity A, glycerol.

System suitability: reference solution (d):

– *resolution*: minimum 7.0 between the peaks due to impurity A and glycerol.

Limits:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.1 per cent),

– *any other impurity with a retention time less than the retention time of glycerol*: not more than the area of the peak due to impurity A in the chromatogram obtained with reference solution (c) (0.1 per cent),

– *total of all impurities with retention times greater than the retention time of glycerol*: not more than 5 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (c) (0.5 per cent),

– *disregard limit*: 0.05 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (e) (0.05 per cent).

Halogenated compounds: maximum 30 ppm.

To 10 ml of solution S add 1 ml of *dilute sodium hydroxide solution R*, 5 ml of *water R* and 50 mg of *halogen-free nickel-aluminium alloy R*. Heat on a water-bath for 10 min, allow to cool and filter. Rinse the flask and the filter with *water R* until 25 ml of filtrate is obtained. To 5 ml of the filtrate add 4 ml of *alcohol R*, 2.5 ml of *water R*, 0.5 ml of *nitric acid R* and 0.05 ml of *silver nitrate solution R2* and mix. Allow to stand for 2 min. Any opalescence in the solution is not more intense than that in a standard prepared at the same time by mixing 7.0 ml of *chloride standard solution (5 ppm Cl) R*, 4 ml of *alcohol R*, 0.5 ml of *water R*, 0.5 ml of *nitric acid R* and 0.05 ml of *silver nitrate solution R2*.

Sugars. To 10 ml of solution S add 1 ml of *dilute sulphuric acid R* and heat on a water-bath for 5 min. Add 3 ml of carbonate-free *dilute sodium hydroxide solution R* (prepared by the method described for carbonate-free *1 M sodium hydroxide* (*4.2.2*)), mix and add dropwise 1 ml of freshly prepared *copper sulphate solution R*. The solution is clear and blue. Continue heating on the water-bath for 5 min. The solution remains blue and no precipitate is formed.

Chlorides (*2.4.4*): maximum 10 ppm.

1 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides. Prepare the standard using 1 ml of *chloride standard solution (5 ppm Cl) R* diluted to 15 ml with *water R*.

Heavy metals (*2.4.8*): maximum 5 ppm.

Dilute 8 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): 12.0 per cent to 16.0 per cent, determined on 0.200 g.

Sulphated ash (*2.4.14*): maximum 0.01 per cent, determined on 5.0 g after heating to boiling and ignition.

ASSAY

Thoroughly mix 0.075 g with 45 ml of *water R*. Add 25.0 ml of a mixture of 1 volume of *0.1 M sulphuric acid* and 20 volumes of *0.1 M sodium periodate*. Allow to stand protected from light for 15 min. Add 5.0 ml of a 500 g/l solution of *ethylene glycol R* and allow to stand protected from light for 20 min. Using 0.5 ml of *phenolphthalein solution R* as indicator, titrate with *0.1 M sodium hydroxide*. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 9.21 mg of $C_3H_8O_3$.

STORAGE

In an airtight container.

IMPURITIES

A. 2,2′-oxydiethanol (diethylene glycol),

B. ethane-1,2-diol (ethylene glycol),

C. propylene glycol.

01/2008:1427

GLYCEROL DIBEHENATE

Glyceroli dibehenas

DEFINITION

Mixture of diacylglycerols, mainly dibehenylglycerol, together with variable quantities of mono- and triacylglycerols, obtained by esterification of *glycerol (0496)* with behenic (docosanoic) acid.

Content:

– *monoacylglycerols*: 15.0 per cent to 23.0 per cent,
– *diacylglycerols*: 40.0 per cent to 60.0 per cent,
– *triacylglycerols*: 21.0 per cent to 35.0 per cent.

CHARACTERS

Appearance: hard, waxy mass or powder or white or almost white, unctuous flakes.

Solubility: practically insoluble in water, soluble in methylene chloride, partly soluble in hot ethanol (96 per cent).

IDENTIFICATION

A. Melting point (*2.2.14*): 65 °C to 77 °C.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 1.0 g of the substance to be examined in *toluene R* with gentle heating and dilute to 20 ml with the same solvent.

Reference solution. Dissolve 1.0 g of *glycerol dibehenate CRS* in *toluene R* with gentle heating and dilute to 20 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *hexane R, ether R* (30:70 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 0.1 g/l solution of *rhodamine B R* in *ethanol (96 per cent) R*; examine in ultraviolet light at 365 nm.

Results: the spots in the chromatogram obtained with the test solution are similar in position to the spots in the chromatogram obtained with the reference solution.

C. Composition of fatty acids (see Tests).

TESTS

Acid value (*2.5.1*): maximum 4.0, determined on 1.0 g, using a mixture of equal volumes of *ethanol (96 per cent) R* and *toluene R* as solvent and with gentle heating.

Iodine value (*2.5.4, Method A*): maximum 3.0.

Saponification value (*2.5.6*): 145 to 165.

Carry out the titration with heating.

Free glycerol: maximum 1.0 per cent, determined as described under Assay.

Composition of fatty acids (*2.4.22, Method C*). Raise the temperature of the column to 240 °C and use the mixture of calibrating substances in Table 2.4.22.-3.

Composition of the fatty acid fraction of the substance:

– *palmitic acid*: maximum 3.0 per cent;
– *stearic acid*: maximum 5.0 per cent;
– *arachidic acid*: maximum 10.0 per cent;
– *behenic acid*: minimum 83.0 per cent;
– *erucic acid*: maximum 3.0 per cent;
– *lignoceric acid*: maximum 3.0 per cent.

Nickel (*2.4.31*): maximum 1 ppm.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g. Use *pyridine R* as the solvent.

Total ash (*2.4.16*): maximum 0.1 per cent, determined on 1.00 g.

ASSAY

Size-exclusion chromatography (*2.2.30*).

Stock solution. Place 0.100 g of *glycerol R* in a flask and dilute to 25.0 ml with *tetrahydrofuran R*.

Test solution. In a 15 ml flask, weigh 0.2 g (*m*) of the substance to be examined. Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Heat gently, at about 35 °C. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

Reference solutions. Into four 15 ml flasks, introduce respectively 0.25 ml, 0.5 ml, 1.0 ml and 2.5 ml of the stock solution and add 5.0 ml of *tetrahydrofuran R*. Weigh each flask and calculate the concentration of glycerol in milligrams per gram of each reference solution.

Column:

– *size*: *l* = 0.6 m, Ø = 7 mm;
– *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm) with a pore size of 10 nm.

Mobile phase: *tetrahydrofuran R*.

Flow rate: 1 ml/min.

Detection: differential refractive index.

Injection: 40 µl; when injecting the test solution, maintain the flask at about 35 °C to avoid precipitation.

Relative retention with reference to glycerol (retention time = about 15 min): triacylglycerols = about 0.73; diacylglycerols = about 0.76; monoacylglycerols = about 0.82.

Calculations:

– *free glycerol*: from the calibration curve obtained with the reference solutions, determine the concentration (*C*) in milligrams per gram in the test solution and calculate the percentage content in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

– *monoacylglycerols*: calculate the percentage content of monoacylglycerols using the following expression:

$$A - D$$

A = percentage content of monoacylglycerols determined by the normalisation procedure,

D = percentage content of free fatty acids.

Calculate the percentage content of free fatty acids using the following expression:

$$\frac{I_A \times 340}{561.1}$$

I_A = acid value.

– *diacylglycerols, triacylglycerols*: determine the percentage content of each by the normalisation procedure.

01/2008:1428

GLYCEROL DISTEARATE

Glyceroli distearas

DEFINITION

Mixture of diacylglycerols, mainly distearoylglycerol, together with variable quantities of mono- and triacylglycerols. It is obtained by partial glycerolysis of vegetable oils containing triacylglycerols of palmitic (hexadecanoic) or stearic (octadecanoic) acid or by esterification of glycerol with stearic acid. The fatty acids may be of vegetable or animal origin.

Content:

– *monoacylglycerols*: 8.0 per cent to 22.0 per cent;

– *diacylglycerols*: 40.0 per cent to 60.0 per cent;

– *triacylglycerols*: 25.0 per cent to 35.0 per cent.

CHARACTERS

Appearance: hard, waxy mass or powder, or white or almost white, unctuous flakes.

Solubility: practically insoluble in water, soluble in methylene chloride, partly soluble in hot ethanol (96 per cent).

IDENTIFICATION

First identification: C, D.

Second identification: A, B.

A. Melting point (*2.2.14*): 50 °C to 60 °C (types I and II), 50 °C to 70 °C (type III).

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.5 g of the substance to be examined in *methylene chloride R*, with gentle heating, and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.5 g of *glycerol distearate CRS* in *methylene chloride R*, with gentle heating, and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R.*

Mobile phase: *hexane R, ether R* (30:70 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Detection: spray with a 0.1 g/l solution of *rhodamine B R* in *ethanol (96 per cent) R* and examine in ultraviolet light at 365 nm.

System suitability: reference solution:

– the chromatogram shows 4 clearly separated spots.

Results: the spots in the chromatogram obtained with the test solution are similar in position to those in the chromatogram obtained with the reference solution.

C. Composition of fatty acids (see Tests) according to the type stated on the label.

D. It complies with the limits of the assay (diacylglycerol content).

TESTS

Acid value (*2.5.1*): maximum 6.0, determined on 1.0 g.

Use a mixture of equal volumes of *ethanol (96 per cent) R* and *toluene R* as solvent and heat gently.

Iodine value (*2.5.4, Method A*): maximum 3.0.

Saponification value (*2.5.6*): 165 to 195, determined on 2.0 g. Carry out the titration with heating.

Free glycerol: maximum 1.0 per cent, determined as described under Assay.

Composition of fatty acids (*2.4.22, Method C*). Use the mixture of calibrating substances in Table 2.4.22.-1.

Composition of the fatty-acid fraction of the substance:

Glycerol distearate	Composition of fatty acids
Type I	*Stearic acid*: 40.0 per cent to 60.0 per cent
	Sum of the contents of palmitic and stearic acids: minimum 90.0 per cent
Type II	*Stearic acid*: 60.0 per cent to 80.0 per cent
	Sum of the contents of palmitic and stearic acids: minimum 90.0 per cent
Type III	*Stearic acid*: 80.0 per cent to 99.0 per cent
	Sum of the contents of palmitic and stearic acids: minimum 96.0 per cent

Nickel (*2.4.31*): maximum 1 ppm.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g. Use *pyridine R* as the solvent.

Total ash (*2.4.16*): maximum 0.1 per cent.

ASSAY

Size-exclusion chromatography (*2.2.30*).

Test solution. Into a 15 ml flask, weigh 0.200 g (*m*). Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

Reference solutions. Into three 15 ml flasks, respectively weigh 2.0 mg, 5.0 mg and 10.0 mg of *glycerol R* and add 5.0 ml of *tetrahydrofuran R* to each flask. Into a 4th flask, weigh about 2.0 mg of *glycerol R* and add 10.0 ml of *tetrahydrofuran R*. Weigh the flasks again and calculate the concentration of glycerol in milligrams per gram for each reference solution.

Column:

– *size*: *l* = 0.6 m, Ø = 7 mm;

– *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm) with a pore size of 10 nm.

Mobile phase: *tetrahydrofuran R*.

Flow rate: 1 ml/min.

Detection: differential refractometer.

Injection: 40 µl.

Relative retention with reference to glycerol (retention time = about 15 min): triacylglycerols = about 0.75; diacylglycerols = about 0.80; monoacylglycerols = about 0.85.

Calculations:

– *free glycerol*: from the calibration curve obtained with the reference solutions, determine the concentration (*C*) in milligrams per gram in the test solution and calculate the percentage content in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

– *mono-, di- and triacylglycerols*: calculate the percentage contents by the normalisation procedure.

LABELLING

The label states the type of glycerol distearate.

01/2008:2213

GLYCEROL MONOCAPRYLATE

Glyceroli monocaprylas

DEFINITION

Mixture of monoacylglycerols, mainly mono-*O*-octanoylglycerol, containing variable quantities of di- and triacylglycerols, obtained by direct esterification of glycerol with caprylic (octanoic) acid, followed by a distillation step in the case of glycerol monocaprylate (type II).

Content:

– *glycerol monocaprylate (type I)*:
  – *monoacylglycerols*: 45.0 per cent to 75.0 per cent;
  – *diacylglycerols*: 20.0 per cent to 50.0 per cent;
  – *triacylglycerols*: maximum 10.0 per cent;
– *glycerol monocaprylate (type II)*:
  – *monoacylglycerols*: minimum 80.0 per cent;
  – *diacylglycerols*: maximum 20.0 per cent;
  – *triacylglycerols*: maximum 5.0 per cent.

CHARACTERS

Appearance: colourless or slightly yellow, oily liquid or soft mass.

Solubility: practically insoluble in water, very soluble in ethanol (96 per cent) and freely soluble in methylene chloride.

IDENTIFICATION

A. Composition of fatty acids (see Tests).

B. It complies with the limits of the assay (monoacylglycerols).

TESTS

Acid value (*2.5.1*): maximum 3.0.

Composition of fatty acids (*2.4.22, Method C*). Use the mixture of calibrating substances in Table 2.4.22.-2.

Composition of the fatty acid fraction of the substance:

– *caproic acid*: maximum 1.0 per cent;
– *caprylic acid*: minimum 90.0 per cent;
– *capric acid*: maximum 10.0 per cent;
– *lauric acid*: maximum 1.0 per cent;
– *myristic acid*: maximum 0.5 per cent.

Free glycerol: maximum 3.0 per cent.

Dissolve 1.20 g in 25.0 ml of *methylene chloride R*. Heat to about 50 °C then allow to cool. Add 100 ml of *water R*. Shake and add 25.0 ml of *periodic acetic acid solution R*. Shake again and allow to stand for 30 min. Add 40 ml of a 75 g/l solution of *potassium iodide R* and allow to stand for 1 min. Add 1 ml of *starch solution R*. Titrate with *0.1 M sodium thiosulfate* until the aqueous phase becomes colourless. Carry out a blank titration.

1 ml of *0.1 M sodium thiosulfate* is equivalent to 2.3 mg of glycerol.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g.

Total ash (*2.4.16*): maximum 0.5 per cent.

ASSAY

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. To 0.25 g of the substance to be examined, add 5.0 ml of *tetrahydrofuran R* and shake to dissolve.

Reference solution (a). To 0.25 g of *glycerol monocaprylate CRS*, add 5.0 ml of *tetrahydrofuran R* and shake to dissolve.

Reference solution (b). To 50 mg of *glycerol 1-octanoate R* and 50 mg of *glycerol 1-decanoate R*, add 2.5 ml of *tetrahydrofuran R* and shake to dissolve.

Column:

– *size*: *l* = 10 m, Ø = 0.32 mm;
– *stationary phase*: *poly(dimethyl)(diphenyl)siloxane R* (film thickness 0.1 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 2.3 ml/min.

Split ratio: 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 3	60
	3 - 38	60 → 340
	38 - 50	340
Injection port		350
Detector		370

Detection: flame ionisation.

Injection: 1 µl.

Identification of peaks: use the chromatogram supplied with *glycerol monocaprylate CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to mono-, di- and triacylglycerols.

System suitability: reference solution (b):

– *resolution*: minimum 5 between the peaks due to glycerol 1-octanoate and glycerol 1-decanoate.

For the calculation of the contents of mono-, di- and triacylglycerols, disregard the peaks with a retention time less than that of the monoacylglycerols, which are due to impurities of the solvent and to the free fatty acids.

Calculate the percentage content of free fatty acids (*C*) using the following expression:

$$\frac{I_A \times 144}{561.1}$$

I_A = acid value of glycerol monocaprylate.

Calculate the content of mono-, di- and triacylglycerols using the following equations:

$$\text{Monoacylglycerols content} = \frac{X \times (100 - A - B - C)}{100}$$

$$\text{Diacylglycerols content} = \frac{Y \times (100 - A - B - C)}{100}$$

$$\text{Triacylglycerols content} = \frac{Z \times (100 - A - B - C)}{100}$$

A = percentage content of free glycerol (see Tests);

B = percentage content of water;

X = monoacylglycerols content obtained by normalisation;

Y = diacylglycerols content obtained by normalisation;

Z = triacylglycerols content obtained by normalisation.

LABELLING

The label states the type of glycerol monocaprylate (type I or II).

01/2008:2392

GLYCEROL MONOCAPRYLOCAPRATE

Glyceroli monocaprylocapras

DEFINITION

Mixture of monoacylglycerols, mainly mono-*O*-octanoylglycerol and mono-*O*-decanoylglycerol, containing variable quantities of di- and triacylglycerols, obtained by direct esterification of glycerol with caprylic (octanoic) and capric (decanoic) acids, followed by a distillation step in the case of glycerol monocaprylocaprate (type II).

Content:

- *glycerol monocaprylocaprate (type I)*:
  - *monoacylglycerols*: 45.0 per cent to 75.0 per cent;
  - *diacylglycerols*: 20.0 per cent to 50.0 per cent;
  - *triacylglycerols*: maximum 10.0 per cent;
- *glycerol monocaprylocaprate (type II)*:
  - *monoacylglycerols*: minimum 80.0 per cent;
  - *diacylglycerols*: maximum 20.0 per cent;
  - *triacylglycerols*: maximum 5.0 per cent.

CHARACTERS

Appearance: colourless or slightly yellow, oily liquid or soft mass.

Solubility: practically insoluble in water, very soluble in ethanol (96 per cent) and freely soluble in methylene chloride.

IDENTIFICATION

A. Composition of fatty acids (see Tests).

B. It complies with the limits of the assay (monoacylglycerols).

TESTS

Acid value (*2.5.1*): maximum 3.0.

Composition of fatty acids (*2.4.22, Method C*). Use the mixture of calibrating substances in Table 2.4.22.-2.

Composition of the fatty acid fraction of the substance:

- *caproic acid*: maximum 3.0 per cent;
- *caprylic acid*: 50.0 per cent to 90.0 per cent;
- *capric acid*: 10.0 per cent to 50.0 per cent;
- *lauric acid*: maximum 3.0 per cent;
- *myristic acid*: maximum 1.0 per cent.

Free glycerol : maximum 3.0 per cent.

Dissolve 1.20 g in 25.0 ml of *methylene chloride R*. Heat to about 50 °C and allow to cool. Add 100 ml of *water R*, shake and add 25.0 ml of *periodic acetic acid solution R*. Shake again and allow to stand for 30 min. Add 40 ml of a 75 g/l solution of *potassium iodide R* and allow to stand for 1 min. Add 1 ml of *starch solution R*. Titrate with *0.1 M sodium thiosulphate* until the aqueous phase becomes colourless. Carry out a blank titration.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 2.3 mg of glycerol.

Water (*2.5.12*): maximum 0.5 per cent, determined on 1.00 g.

Total ash (*2.4.16*): maximum 0.5 per cent.

ASSAY

Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. To 0.25 g of the substance to be examined, add 5.0 ml of *tetrahydrofuran R* and shake to dissolve.

Reference solution (a). To 0.25 g of *glycerol monocaprylocaprate CRS*, add 5.0 ml of *tetrahydrofuran R* and shake to dissolve.

Reference solution (b). To 50 mg of *glycerol 1-octanoate R* and 50 mg of *glycerol 1-decanoate R*, add 2.5 ml of *tetrahydrofuran R* and shake to dissolve.

Column:

- *size*: *l* = 10 m, Ø = 0.32 mm;
- *stationary phase*: *poly(dimethyl)(diphenyl)siloxane R* (film thickness 0.1 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 2.3 ml/min.

Split ratio: 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 3	60
	3 - 38	60 → 340
	38 - 50	340
Injection port		350
Detector		370

Detection: flame ionisation.

Injection: 1 µl.

Identification of peaks: use the chromatogram supplied with *glycerol monocaprylocaprate CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to mono-, di- and triacylglycerols.

System suitability: reference solution (b):

– *resolution*: minimum 5 between the peaks due to glycerol 1-octanoate and glycerol 1-decanoate.

For the calculation of the contents of mono-, di- and triacylglycerols, disregard the peaks with a retention time less than that of the monoacylglycerols, which are due to the impurities of the solvent and to the free fatty acids.

Calculate the percentage content of free fatty acids *(C)* using the following equations:

$$\frac{I_A \times 144}{561.1}$$

I_A = acid value of the glycerol monocaprylocaprate.

Calculate the content of mono-, di- and triacylglycerols using the following equations:

$$\text{Monoacylglycerols content} = \frac{X \times (100 - A - B - C)}{100}$$

$$\text{Diacylglycerols content} = \frac{Y \times (100 - A - B - C)}{100}$$

$$\text{Triacylglycerols content} = \frac{Z \times (100 - A - B - C)}{100}$$

A = percentage content of free glycerol (see Tests);

B = percentage content of water;

X = monoacylglycerols content obtained by normalisation;

Y = diacylglycerols content obtained by normalisation;

Z = triacylglycerols content obtained by normalisation.

LABELLING

The labelling states the type of glycerol monocaprylocaprate (type I or II).

corrected 6.0

GLYCEROL MONOLINOLEATE

Glyceroli monolinoleas

DEFINITION

Mixture of monoacylglycerols, mainly mono-oleoyl- and monolinoleoylglycerol, together with variable quantities of di- and triacylglycerols, obtained by partial glycerolysis of vegetable oils mainly containing triacylglycerols of linoleic (*cis,cis*-9,12-octadecadienoic) acid. A suitable antioxidant may be added.

Content:

– *monoacylglycerols*: 32.0 per cent to 52.0 per cent;

– *diacylglycerols*: 40.0 per cent to 55.0 per cent;

– *triacylglycerols*: 5.0 per cent to 20.0 per cent.

CHARACTERS

Appearance: amber, oily liquid which may be partially solidified at room temperature.

Solubility: practically insoluble in water, freely soluble in methylene chloride.

IDENTIFICATION

A. Iodine value (see Tests).

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 20 ml with the same solvent.

Reference solution. Dissolve 1.0 g of *glycerol monolinoleate CRS* in *methylene chloride R* and dilute to 20 ml with the same solvent.

Plate: *TLC silica gel plate R.*

Mobile phase: *hexane R, ether R* (30:70 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 0.1 g/l solution of *rhodamine B R* in *ethanol (96 per cent) R* and examine in ultraviolet light at 365 nm.

Results: the spots in the chromatogram obtained with the test solution are similar in position to those in the chromatogram obtained with the reference solution.

C. Composition of fatty acids (see Tests).

TESTS

Acid value (*2.5.1*): maximum 6.0, determined on 1.0 g.

Iodine value (*2.5.4, Method A*): 100 to 140.

Peroxide value (*2.5.5, Method A*): maximum 12.0, determined on 2.0 g.

Saponification value (*2.5.6*): 160 to 180, determined on 2.0 g.

Free glycerol: maximum 6.0 per cent, determined as described in the assay.

Composition of fatty acids (*2.4.22, Method C*).

Composition of the fatty acid fraction of the substance:

– *palmitic acid*: 4.0 per cent to 20.0 per cent;

– *stearic acid*: maximum 6.0 per cent;

– *oleic acid*: 10.0 per cent to 35.0 per cent;

– *linoleic acid*: minimum 50.0 per cent;

– *linolenic acid*: maximum 2.0 per cent;

– *arachidic acid*: maximum 1.0 per cent;

– *eicosenoic acid*: maximum 1.0 per cent.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g. Use as the solvent a mixture of equal volumes of *anhydrous methanol R* and *methylene chloride R*.

Total ash (*2.4.16*): maximum 0.1 per cent.

ASSAY

Size-exclusion chromatography (*2.2.30*).

Test solution. Into a 15 ml flask, weigh about 0.2 g (*m*), to the nearest 0.1 mg. Add 5 ml of *tetrahydrofuran R* and shake to dissolve. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

Reference solutions. Into four 15 ml flasks, respectively weigh, to the nearest 0.1 mg, about 2.5 mg, 5 mg, 10 mg and 20 mg of *glycerol R*. Add 5 ml of *tetrahydrofuran R* and

shake until well mixed. Weigh the flasks again and calculate the concentration of glycerol in milligrams per gram for each reference solution.

Column:

– *size*: *l* = 0.6 m, Ø = 7 mm,
– *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm) with a pore size of 10 nm.

Mobile phase: *tetrahydrofuran R*.

Flow rate: 1 ml/min.

Detection: differential refractometer.

Injection: 40 µl.

Relative retention with reference to glycerol (retention time = about 15.6 min): triacylglycerols = about 0.76; diacylglycerols = about 0.80; monoacylglycerols = about 0.86.

Calculations:

– *free glycerol*: from the calibration curve obtained with the reference solutions, determine the concentration (*C*) of glycerol in milligrams per gram in the test solution and calculate the percentage content of free glycerol in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

– *mono-, di- and triacylglycerols*: calculate the percentage content of mono-, di- and triacylglycerols using the normalisation procedure.

STORAGE

In an airtight container, protected from light.

01/2008:1430
corrected 6.0

GLYCEROL MONO-OLEATE

Glyceroli mono-oleas

DEFINITION

Mixture of monoacylglycerols, mainly mono-oleoylglycerol, together with variable quantities of di- and triacylglycerols. It is defined by the nominal content of monoacylglycerols and obtained by partial glycerolysis of vegetable oils mainly containing triacylglycerols of oleic (*cis*-9-octadecenoic) acid or by esterification of glycerol by oleic acid, this fatty acid being of vegetable or animal origin. A suitable antioxidant may be added.

Content:

	Nominal content of acylglycerol (per cent)		
	40	**60**	**90**
Monoacylglycerols	32.0 - 52.0	55.0 - 65.0	90.0 - 101.0
Diacylglycerols	30.0 - 50.0	15.0 - 35.0	< 10.0
Triacylglycerols	5.0 - 20.0	2.0 - 10.0	< 2.0

CHARACTERS

Appearance: amber, oily liquid which may be partially solidified at room temperature.

Solubility: practically insoluble in water, freely soluble in methylene chloride.

IDENTIFICATION

A. Iodine value (see Tests).

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 20 ml with the same solvent.

Reference solution. Dissolve 1.0 g of *glycerol mono-oleate CRS* in *methylene chloride R* and dilute to 20 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *hexane R, ether R* (30:70 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 0.1 g/l solution of *rhodamine B R* in *ethanol (96 per cent) R* and examine in ultraviolet light at 365 nm.

Results: the spots in the chromatogram obtained with the test solution are similar in position to those in the chromatogram obtained with the reference solution.

C. It complies with the limits of the assay (monoacylglycerol content).

TESTS

Acid value (*2.5.1*): maximum 6.0, determined on 1.0 g.

Iodine value (*2.5.4, Method A*): 65.0 to 95.0.

Peroxide value (*2.5.5, Method A*): maximum 12.0, determined on 2.0 g.

Saponification value (*2.5.6*): 150 to 170, determined on 2.0 g.

Free glycerol: maximum 6.0 per cent, determined as described in the assay.

Composition of fatty acids (*2.4.22, Method C*).

Composition of the fatty acid fraction of the substance:

– *palmitic acid*: maximum 12.0 per cent,
– *stearic acid*: maximum 6.0 per cent,
– *oleic acid*: minimum 60.0 per cent,
– *linoleic acid*: maximum 35.0 per cent,
– *linolenic acid*: maximum 2.0 per cent,
– *arachidic acid*: maximum 2.0 per cent,
– *eicosenoic acid*: maximum 2.0 per cent.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g. Use as the solvent a mixture of equal volumes of *anhydrous methanol R* and *methylene chloride R*.

Total ash (*2.4.16*): maximum 0.1 per cent.

ASSAY

Size-exclusion chromatography (*2.2.30*).

Test solution. Into a 15 ml flask, weigh about 0.2 g (*m*), to the nearest 0.1 mg. Add 5 ml of *tetrahydrofuran R* and shake to dissolve. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

Reference solutions. Into four 15 ml flasks, respectively weigh, to the nearest 0.1 mg, about 2.5 mg, 5 mg, 10 mg and 20 mg of *glycerol R*. Add 5 ml of *tetrahydrofuran R* and shake until well mixed. Weigh the flasks again and calculate the concentration of glycerol in milligrams per gram for each reference solution.

Column:

– *size*: *l* = 0.6 m, Ø = 7 mm,
– *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm) with a pore size of 10 nm.

Mobile phase: *tetrahydrofuran R*.

Flow rate: 1 ml/min.

Detection: differential refractometer.

Injection: 40 µl.

Relative retention with reference to glycerol (retention time = about 15.6 min): triacylglycerols = about 0.76; diacylglycerols = about 0.79; monoacylglycerols = about 0.85.

Calculations:

– *free glycerol*: from the calibration curve obtained with the reference solutions determine the concentration (*C*) of glycerol in milligrams per gram in the test solution and calculate the percentage content of free glycerol in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

– *mono-, di- and triacylglycerols*: calculate the percentage content of mono-, di- and triacylglycerols using the normalisation procedure.

STORAGE

In an airtight container, protected from light.

LABELLING

The label states the nominal content of monoacylglycerol.

01/2008:0495

GLYCEROL MONOSTEARATE 40-55

Glyceroli monostearas 40-55

DEFINITION

Mixture of monoacylglycerols, mainly monostearoylglycerol, together with variable quantities of di- and triacylglycerols. It is obtained by partial glycerolysis of vegetable oils mainly containing triacylglycerols of palmitic (hexadecanoic) or stearic (octadecanoic) acid or by esterification of glycerol with stearic acid. The fatty acids may be of vegetable or animal origin.

Content:

– *monoacylglycerols*: 40.0 per cent to 55.0 per cent;
– *diacylglycerols*: 30.0 per cent to 45.0 per cent;
– *triacylglycerols*: 5.0 per cent to 15.0 per cent.

CHARACTERS

Appearance: hard, waxy mass or unctuous powder or flakes, white or almost white.

Solubility: practically insoluble in water, soluble in ethanol (96 per cent) at 60 °C.

IDENTIFICATION

First identification: C, D.

Second identification: A, B.

A. Melting point (*2.2.15*): 54 °C to 66 °C.

Introduce the melted substance into the capillary tubes and allow to stand for 24 h in a well-closed container.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.5 g of the substance to be examined in *methylene chloride R*, with gentle heating, and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.5 g of *glycerol monostearate 40-55 CRS* in *methylene chloride R*, with gentle heating, and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R.*

Mobile phase: *hexane R, ether R* (30:70 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Detection: spray with a 0.1 g/l solution of *rhodamine B R* in *ethanol (96 per cent) R* and examine in ultraviolet light at 365 nm.

Suitability system: reference solution:

– the chromatogram shows 4 clearly separated spots.

Results: the spots in the chromatogram obtained with the test solution are similar in position to those in the chromatogram obtained with the reference solution.

C. Composition of fatty acids (see Tests) according to the type stated on the label.

D. It complies with the limits of the assay (monoacylglycerol content).

TESTS

Acid value (*2.5.1*): maximum 3.0, determined on 1.0 g.

Use a mixture of equal volumes of *ethanol (96 per cent) R* and *toluene R* as solvent and heat gently.

Iodine value (*2.5.4, Method A*): maximum 3.0.

Saponification value (*2.5.6*): 158 to 177, determined on 2.0 g. Carry out the titration with heating.

Free glycerol: maximum 6.0 per cent, determined as described under Assay.

Composition of fatty acids (*2.4.22, Method C*). Use the mixture of calibrating substances in Table 2.4.22.-1.

Composition of the fatty-acid fraction of the substance:

Glycerol monostearate 40-55	Composition of fatty acids
Type I	*Stearic acid*: 40.0 per cent to 60.0 per cent
	Sum of the contents of palmitic and stearic acids: minimum 90.0 per cent
Type II	*Stearic acid*: 60.0 per cent to 80.0 per cent
	Sum of the contents of palmitic and stearic acids: minimum 90.0 per cent
Type III	*Stearic acid*: 80.0 per cent to 99.0 per cent
	Sum of the contents of palmitic and stearic acids: minimum 96.0 per cent

Nickel (*2.4.31*): maximum 1 ppm.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g. Use *pyridine R* as the solvent and heat gently.

Total ash (*2.4.16*): maximum 0.1 per cent.

ASSAY

Size-exclusion chromatography (*2.2.30*).

Test solution. Into a 15 ml flask, weigh 0.200 g (*m*). Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

Reference solutions. Into four 15 ml flasks, respectively weigh 2.5 mg, 5.0 mg, 10.0 mg and 20.0 mg of *glycerol R*, and add 5.0 ml of *tetrahydrofuran R* to each flask. Weigh the flasks again and calculate the concentration of glycerol in milligrams per gram for each reference solution.

Column:

– *size*: *l* = 0.6 m, Ø = 7 mm;
– *stationary phase*: *styrene-divinylbenzene copolymer R* (5 µm) with a pore size of 10 nm.

Mobile phase: *tetrahydrofuran R.*

Flow rate: 1 ml/min.

Detection: differential refractometer.

Injection: 40 µl.

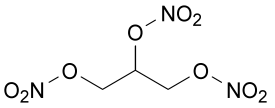
Relative retention with reference to glycerol (retention time = about 15 min): triacylglycerols = about 0.75; diacylglycerols = about 0.80; monoacylglycerols = about 0.85.

Calculations:

– *free glycerol*: from the calibration curve obtained with the reference solutions, determine the concentration (*C*) in milligrams per gram in the test solution and calculate the percentage content in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

– *mono-, di- and triacylglycerols*: calculate the percentage contents by the normalisation procedure.



LABELLING

The label states the type of glycerol monostearate 40-55.

01/2008:1331

GLYCERYL TRINITRATE SOLUTION

Glyceroli trinitratis solutio

$C_3H_5N_3O_9$ M_r 227.1

DEFINITION

Ethanolic solution of glyceryl trinitrate.

Content: 1 per cent *m/m* to 10 per cent *m/m* of propane-1,2,3-triyl trinitrate and 96.5 per cent to 102.5 per cent of the declared content of glyceryl trinitrate stated on the label.

CHARACTERS

Appearance: clear, colourless or slightly yellow solution.

Solubility: miscible with acetone and with ethanol.

Solubility of pure glyceryl trinitrate: practically insoluble in water, freely soluble in ethanol, miscible with acetone.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

Upon diluting glyceryl trinitrate solution, care must be taken to always use anhydrous ethanol, otherwise droplets of pure glyceryl trinitrate may precipitate from the solution.

After examination, the residues and the solutions obtained in both the identification and the test sections must be heated on a water-bath for 5 min with dilute sodium hydroxide solution R.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: place 50 µl of a solution diluted, if necessary, with *ethanol R*, to contain 10 g/l of glyceryl trinitrate, on a disc of *potassium bromide R* and evaporate the solvent *in vacuo*.

Comparison: *Ph. Eur. reference spectrum of glyceryl trinitrate.*

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dilute a quantity of the substance to be examined corresponding to 50 mg of glyceryl trinitrate to 100 ml with *acetone R*.

Reference solution. Dilute 0.05 ml of *glyceryl trinitrate solution CRS* to 1 ml with *acetone R*.

Plate: *TLC silica gel G plate R.*

Mobile phase: *ethyl acetate R, toluene R* (20:80 *V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with freshly prepared *potassium iodide and starch solution R*. Expose the plate to ultraviolet light at 254 nm for 15 min. Examine in daylight.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. It complies with the limits of the assay.

TESTS

Upon diluting glyceryl trinitrate solution, care must be taken always to use anhydrous ethanol, otherwise droplets of pure glyceryl trinitrate may precipitate from the solution.

After examination, the residues and the solutions obtained in both the identification and the test sections must be heated on a water-bath for 5 min with dilute sodium hydroxide solution R.

Appearance of solution. If necessary dilute the solution to be examined to a concentration of 10 g/l with *ethanol R*. The solution is not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Inorganic nitrates. Thin-layer chromatography (*2.2.27*).

Test solution. If necessary dilute the solution to be examined to a concentration of 10 g/l with *ethanol R*.

Reference solution. Dissolve 5 mg of *potassium nitrate R* in 1 ml of *water R* and dilute to 100 ml with *alcohol R*.

Plate: *TLC silica gel plate R.*

Mobile phase: *glacial acetic acid R, acetone R, toluene R* (15:30:60 *V/V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in a current of air until the acetic acid is completely removed.

Detection: spray intensively with freshly prepared *potassium iodide and starch solution R*. Expose the plate to ultraviolet light at 254 nm for 15 min. Examine in daylight.

Limit:

– *nitrate ion*: any spot corresponding to the nitrate ion in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent of the content of glyceryl trinitrate calculated as potassium nitrate).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve a quantity of the substance to be examined corresponding to 2 mg of glyceryl trinitrate in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dissolve 0.10 g of *glyceryl trinitrate solution CRS* and a quantity of *diluted pentaerythrityl tetranitrate CRS* equivalent to 1.0 mg of pentaerythrityl tetranitrate in the mobile phase and dilute to 100.0 ml with the mobile phase. Sonicate and filter if necessary.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *acetonitrile R, water R* (50:50 *V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Run time: 3 times the retention time of the principal peak.

System suitability: reference solution (a):

– *resolution*: minimum 2.0 between the peaks due to glyceryl trinitrate and to pentaerythrityl tetranitrate.

Limits:

– *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent, calculated as glyceryl trinitrate),

– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent, calculated as glyceryl trinitrate),

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

ASSAY

Test solution. Prepare a solution containing 1.0 mg of glyceryl trinitrate in 250.0 ml of *methanol R*.

Reference solution. Dissolve 70.0 mg of *sodium nitrite R* in *methanol R* and dilute to 250.0 ml with the same solvent. Dilute 5.0 ml of the solution to 500.0 ml with *methanol R*.

Into three 50 ml volumetric flasks introduce 10.0 ml of the test solution, 10.0 ml of the reference solution and 10 ml of *methanol R* as a blank. To each flask add 5 ml of *dilute sodium hydroxide solution R*, close the flask, mix and allow to stand at room temperature for 30 min. Add 10 ml of *sulphanilic acid solution R* and 10 ml of *dilute hydrochloric acid R* and mix. After exactly 4 min, add 10 ml of *naphthylethylenediamine dihydrochloride solution R*, dilute to volume with *water R* and mix. After 10 min read the absorbance (*2.2.25*) of the test solution and the reference solution at 540 nm using the blank solution as the compensation liquid.

Calculate the amount of glyceryl trinitrate in milligrams in the test solution from the following expression:

$$\frac{A_T \times m_S \times C}{A_R \times m_T \times 60.8 \times 100}$$

A_T = absorption of the test solution,

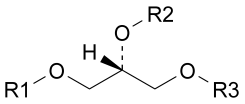
m_T = mass of the substance to be examined, in milligrams,

C = percentage content of sodium nitrite used as reference,

A_R = absorption of the reference solution,

m_S = mass of sodium nitrite, in milligrams.

STORAGE



Store diluted solutions (10 g/l) protected from light, at a temperature of 2 °C to 15 °C. Store more concentrated solutions protected from light, at a temperature of 15 °C to 20 °C.

LABELLING

The label states the declared content of glyceryl trinitrate.

IMPURITIES

A. inorganic nitrates,

and enantiomer

B. R1 = NO_2, R2 = R3 = H: (2*RS*)-2,3-dihydroxypropyl nitrate,

C. R1 = R3 = H, R2 = NO_2: 2-hydroxy-1-(hydroxymethyl)ethyl nitrate,

D. R1 = R2 = NO_2, R3 = H: (2*RS*)-3-hydroxypropane-1,2-diyl dinitrate,

E. R1 = R3 = NO_2, R2 = H: 2-hydroxypropane-1,3-diyl dinitrate.

01/2008:0614
corrected 6.0

GLYCINE

Glycinum

$C_2H_5NO_2$ M_r 75.1
[56-40-6]

DEFINITION

2-Aminoacetic acid.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, very slightly soluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *glycine CRS.*

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *ethanol (60 per cent V/V) R*, evaporate to dryness and record the spectra again.

B. Examine the chromatograms obtained in the test for ninhydrin-positive substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 50 mg in 5 ml of *water R*, add 1 ml of *strong sodium hypochlorite solution R* and boil for 2 min. Add 1 ml of *hydrochloric acid R* and boil for 4-5 min. Add 2 ml of *hydrochloric acid R* and 1 ml of a 20 g/l solution of *resorcinol R*, boil for 1 min and cool. Add 10 ml of *water R* and mix. To 5 ml of the solution add 6 ml of *dilute sodium hydroxide solution R*. The solution is violet with greenish-yellow fluorescence. After a few minutes, the colour becomes orange and then yellow and an intense fluorescence remains.

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

pH (*2.2.3*): 5.9 to 6.4.

Dilute 10 ml of solution S to 20 ml with *carbon dioxide-free water R*.

Ninhydrin-positive substances. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 0.10 g of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *glycine CRS* in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 200 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *glycine CRS* and 10 mg of *alanine CRS* in *water R* and dilute to 25 ml with the same solvent.

Plate: *cellulose for chromatography R* as the coating substance.

Mobile phase: *glacial acetic acid R, water R, butanol R* (20:20:60 *V/V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: at 80 °C for 30 min.

Detection: spray with *ninhydrin solution R* and dry at 100-105 °C for 15 min.

System suitability: the chromatogram obtained with reference solution (c) shows 2 clearly separated spots.

Limits: in the chromatogram obtained with test solution (a):

– *any impurity*: any spots, apart from the principal spot, are not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Chlorides (*2.4.4*): maximum 75 ppm.

Dissolve 0.67 g in *water R* and dilute to 15 ml with the same solvent.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 70.0 mg in 3 ml of *anhydrous formic acid R* and add 30 ml of *anhydrous acetic acid R*. Immediately after dissolution, titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 7.51 mg of $C_2H_5NO_2$.

corrected 6.0

GOLDENROD

Solidaginis herba

DEFINITION

Whole or cut, dried, flowering aerial parts of *Solidago gigantea* Ait or *Solidago canadensis* L., their varieties or hybrids and/or mixtures of these.

Content: minimum 2.5 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

A. The stems are greenish-yellow or greenish-brown, partly tinted reddish, roundish, more or less conspicuously grooved, glabrous and smooth in the lower part, slightly or densely pubescent in the upper part. They are solid with a whitish pith.

The leaves are green, sessile, lanceolate, with a serrate margin, 8-12 cm long and about 1-3 cm wide, the upper surface is green and more or less glabrous, the lower surface is greyish-green and pubescent, especially on the veins. The inflorescence consists of a number of unilateral, curved racemes which together form a pyramidal panicle at the end of the stems.

Each capitulum has an involucre composed of linear-lanceolate, imbricated yellowish-green bracts, surrounding a single row of yellow ligulate florets about the same length as the involucre; yellow, radially arranged tubular florets, as long as, or longer, than the ligulate florets; a brownish inferior ovary surmounted by a white pappus of silky hairs.

B. Reduce to a powder (355) (*2.9.12*). The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows pappus bristles and their fragments, consisting of multiseriate trichomes composed of elongated cells with the tips free from the surface and forming pointed projections over the entire length; fragments of the leaf mesophyll with vascular bundles accompanied by secretory cells; fragments of the leaf epidermis with sinuous to wavy-walled cells and stomata of the anomocytic type (*2.8.3*); uniseriate covering trichomes with up to 5 or 6 cells, some whip-like with a thicker-walled terminal cell; fragments of the style with long, slender papillae; fragments of the stem with reticulate and spiral vessels; pollen grains, with 3 germinal pores and a spiny exine; numerous whisk-shaped hairs, a few isolated twin-hairs from the ovary, absence of multicellular trichomes with a terminal cell bent at a right angle.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 0.75 g of the powdered drug (355) (*2.9.12*) add 5 ml of *methanol R* and boil in a water-bath under a reflux condenser for 10 min. Cool and filter.

Reference solution. Dissolve 1.0 mg of *chlorogenic acid R*, 2.5 mg of *quercitrin R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (6:6:18:30 *V/V/V/V*).

Application: 20 µl of the test solution and 10 µl of the reference solution as bands.

Development: over a path of 10 cm.

Drying: at 100-105 °C.

Detection: spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow to stand for 30 min. Examine in ultraviolet light at 365 nm.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A bluish-green fluorescent zone
Quercitrin: a yellowish-brown fluorescent zone	A faint to intense yellowish-brown fluorescent zone (quercitrin)
	A more or less intense yellowish brown zone
Chlorogenic acid: a light blue fluorescent zone	A light blue zone and/or a yellow fluorescent zone (chlorogenic acid)
Rutin: an orange fluorescent zone	A faint to intense yellowish-brown fluorescent zone (rutin)
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 5 per cent of brownish parts and maximum 2 per cent of other foreign matter.

Loss on drying (*2.2.32*): maximum 10 per cent, determined on 0.500 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 7.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 1.0 per cent.

ASSAY

Stock solution. In a 100 ml round-bottomed flask, introduce 0.200 g of the powdered drug (250) (*2.9.12*), add 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a small plug of absorbent cotton into a 100 ml flask. Add the absorbent cotton to the residue in the round-bottomed flask, extract with 2 quantities, each of 20 ml of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool. Filter the combined acetone extracts through a filter paper into a volumetric flask. Rinse the flask and the filter paper and dilute to 100.0 ml with *acetone R*. Introduce 20.0 ml of the solution into a separating funnel, add 20 ml of *water R* and shake the mixture with 1 quantity of 15 ml and then 3 quantities, each of 10 ml, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash twice with 50 ml of *water R* and filter the extracts over 10 g of *anhydrous sodium sulphate R* into a volumetric flask. Dilute to 50.0 ml with *ethyl acetate R*, rinsing the separating funnel and the sodium sulphate.

Test solution. To 10.0 ml of the stock solution add 1.0 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Compensation solution. Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance of the test solution (*2.2.25*) at 425 nm after 30 min by comparison with the compensation solution.

Calculate the percentage content of flavonoids, expressed as hyperoside, from the expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the value of the specific absorbance of hyperoside to be 500.

A = absorbance measured at 425 nm,

m = mass of the drug to be examined, in grams.

01/2008:1893
corrected 6.0

GOLDENROD, EUROPEAN

Solidaginis virgaureae herba

DEFINITION

Whole or cut, dried, flowering aerial parts of *Solidago virgaurea* L.

Content: minimum 0.5 per cent and maximum 1.5 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

A. The stem is cylindrical, striated, the lower part often reddish-violet, sometimes entirely glabrous or pubescent with short, bent, apically directed hairs. The basal leaves are obovate to oblanceolate, with a serrate margin, and taper at the base into a long, winged petiole; the cauline leaves are alternate, smaller than the basal leaves and more elliptical in outline, with an entire or slightly toothed margin; they are sessile or with only a short petiole. Both surfaces of the leaves are glabrous or only slightly pubescent with a prominent reticulate venation on the lower surface. The capitula form a tightly packed panicle. At the base of the pedicels there are 2, small, linear bracts with scarious margins. The involucre consists of 2-4 rows of loosely-arranged, imbricate bracts, each bract greenish-yellow with a smooth and shiny inner surface, the outer surface hairy or glabrous, with a scarious margin. Each capitulum contains from 6-12 widely separated female ray florets, about twice as long as the bracts, and about 10-30 hermaphrodite, tubular florets. All florets are yellow. The brown, inferior ovary tapers towards the base and has a ribbed surface, covered with scattered hairs; it is surmounted by a whitish pappus composed of smooth or rough, bristly hairs.

B. Reduce to a powder (355) (*2.9.12*). The powder is light green. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of the leaf in surface view, those of the upper epidermis composed of polygonal cells with straight, beaded walls and distinct

cuticular striations, those of the lower epidermis more sinuous with fewer striations and numerous anomocytic stomata (*2.8.3*); occasional leaf fragments showing cells containing small, isolated cluster crystals of calcium oxalate; uniseriate, conical covering trichomes from the leaves and the bracts with up to about 10 cells, some of the shorter trichomes showing a terminal cell extended and pennant-like; occasional glandular trichomes with a 1 or 2 celled stalk and a unicellular, elongated head; rare paired, covering trichomes from the ovary with a distinctly pitted central wall and a bifid apex; abundant pappus hairs and their fragments, multiseriate with the marginal cells overlapping outwards; groups of fibres and vascular tissue from the stems; fragments of the epidermis of the petals with striated cuticle and occasional long, biseriate glandular trichomes; pollen grains spherical, with 3 pores and a spiny exine.

C. Thin-layer chromatography (*2.2.27*) as described in the test for *Solidago gigantea* and *Solidago canadensis*.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate

TESTS

Foreign matter (*2.8.2*): maximum 5 per cent of brown coloured matter and maximum 5 per cent of other foreign matter.

Solidago gigantea* and *Solidago canadensis. Thin-layer chromatography (*2.2.27*).

Test solution. To 0.75 g of the powdered drug (355) (*2.9.12*) add 5 ml of *methanol R* and heat on a water-bath under a reflux condenser for 10 min. Cool and filter.

Reference solution. Dissolve 1.0 mg of *chlorogenic acid R*, 2.5 mg of *quercitrin R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (6:6:18:30 *V/V/V/V*).

Application: 20 µl as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray the plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Examine in ultraviolet light at 365 nm after 30 min.

Results: the chromatogram obtained with the test solution shows no strong orange fluorescent zone similar in position to the zone of quercitrin in the chromatogram obtained with the reference solution.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 8.0 per cent.

ASSAY

Stock solution. In a 100 ml round-bottomed flask, place 0.200 g of the powdered drug (355) (*2.9.12*), add 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1*. Boil the mixture in a water-bath under a reflux condenser for 30 min. Filter the liquid through a small plug of absorbent cotton into a 100 ml flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 ml, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool. Filter the combined acetone extracts through filter paper, dilute to 100.0 ml with *acetone R*, rinsing the volumetric flask and the filter paper with acetone. Introduce 20.0 ml of the solution into a suitable separating funnel, add 20 ml of *water R* and shake the mixture with 1 quantity of 15 ml and then with 3 quantities, each of 10 ml, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash twice with 50 ml of *water R* and filter the extracts over 10 g of *anhydrous sodium sulphate R* into a volumetric flask. Dilute to 50.0 ml with *ethyl acetate R*, rinsing the separating funnel and the sodium sulphate.

Test solution. To 10.0 ml of the stock solution add 1.0 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Compensation liquid. Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

After 30 min, measure the absorbance (*2.2.25*) of the test solution at 425 nm by comparison with the compensation liquid.

Calculate the percentage content of flavonoids, expressed as hyperoside, from the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

A = measured absorbance at 425 nm,

m = mass of the drug to be examined, in grams.

01/2008:1831
corrected 6.0

GOLDENSEAL RHIZOME

Hydrastis rhizoma

DEFINITION

Whole or cut, dried rhizome and root of *Hydrastis canadensis* L.

Content:

– hydrastine ($C_{21}H_{21}NO_6$; M_r 383.4): minimum 2.5 per cent (dried drug),

– berberine ($C_{20}H_{19}NO_5$; M_r 353.4): minimum 3.0 per cent (dried drug).

IDENTIFICATION

A. The rhizome is tortuous and knotty, about 5 cm long and 5 mm to 10 mm thick. The surface is yellowish to brownish-grey and irregularly wrinkled, and bears the

remains of numerous slender, wiry roots; stem bases and scale leaves occur on the upper surface. The fracture is short and resinous. The transversely-cut surface is yellowish-brown and shows a fairly wide bark, a ring of from about 12 to 20 widely separated xylem bundles and a large, central pith.

B. Reduce to a powder (180) (*2.9.12*). The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: abundant thin-walled parenchyma; occasional fragments of yellowish-brown cork from the rhizome and roots; groups of small vessels with conspicuous perforations in the oblique end walls and with simple or bordered, slit-shaped pits; infrequent groups of thin-walled, pitted fibres, usually found associated with the vessels; numerous ovoid or spherical, orange-brown granular masses. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows abundant starch granules, mostly simple but sometimes compound with up to 4 components; the granules are small, spherical to ovoid, up to about 10 µm in diameter, occasionally with a small, rounded or slit-shaped hilum.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Sonicate for 10 min 250 mg of powdered drug (180) (*2.9.12*) in 4 ml of a mixture of 20 ml of *water R* and 80 ml of *methanol R* and filter. Wash the residue twice with 2 ml of *methanol R*. Combine the solutions and dilute to 20 ml with *methanol R*.

Reference solution. Dissolve 5 mg of *hydrastine hydrochloride R* and 5 mg of *berberine chloride R* in 20 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, water R, ethyl acetate R* (10:10:80 *V/V/V*).

Application: 20 µl as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
———	———

	A bright light blue fluorescent zone (hydrastinine)
	A deep blue fluorescent zone
Reference solution	**Test solution**

TESTS

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (180) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 8.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 4.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. To 1.000 g of the powdered drug (355) (*2.9.12*) in a 100 ml round-bottomed flask, add 50 ml of a 10 ml/l solution of *concentrated ammonia R* in *alcohol R* and boil the mixture under a reflux condenser for 30 min. Allow to cool to room temperature and filter the liquid through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and repeat the extraction with a further 2 quantities, each of 30 ml of a 10 ml/l solution of *concentrated ammonia R* in *alcohol R*, each time boiling under a reflux condenser for 10 min and filtering through a plug of absorbent cotton in the same flask as previously. Filter the combined filtrates through a filter-paper into a 250 ml round-bottomed flask, and rinse flask and filter with 20 ml of a 10 ml/l solution of *concentrated ammonia R* in *alcohol R*. Evaporate the filtrate to dryness *in vacuo* in a water-bath at 55 °C. Dissolve the residue in 50.0 ml of the mobile phase. Dilute 10.0 ml of this solution to 250.0 ml with the mobile phase.

Reference solution. Dissolve 10 mg of *hydrastine hydrochloride R* and 10 mg of *berberine chloride R* in *methanol R* and dilute to 100.0 ml with the same solvent.

Column:

- *size*: *l* = 0.125 m, Ø = 4 mm,
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dissolve 9.93 g of *potassium dihydrogen phosphate R* in 730 ml of *water R*, add 270 ml of *acetonitrile R* and mix.

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 235 nm.

Injection: 10 µl.

System suitability: reference solution:

- *elution order*: when the chromatograms are recorded in the prescribed conditions, the components elute in the order indicated in the composition of the reference solution; record the retention times of these substances;
- *resolution*: minimum 1.5 between the peaks due to hydrastine and berberine.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution.

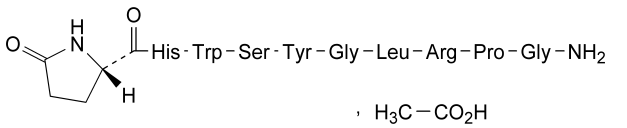
Calculate the percentage content of each alkaloid (hydrastine and berberine) from the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1} \times 12.5$$

A_1 = area of the peak due to hydrastine or berberine in the chromatogram obtained with the test solution,

A_2 = area of the peak due to hydrastine or berberine in the chromatogram obtained with the reference solution,

m_1 = mass of the drug to be examined, in grams,



m_2 = mass of hydrastine hydrochloride or berberine chloride in the reference solution, in grams,

p = percentage content of hydrastine in *hydrastine hydrochloride R* or berberine in *berberine chloride R*.

01/2008:0827

GONADORELIN ACETATE

Gonadorelini acetas

$C_{57}H_{79}N_{17}O_{15}$ M_r 1242
[33515-09-2]

DEFINITION

Gonadorelin acetate is the acetate form of a hypothalamic peptide that stimulates the release of follicle-stimulating hormone and luteinising hormone from the pituitary gland. It contains not less than 95.0 per cent and not more than the equivalent of 102.0 per cent of the peptide $C_{55}H_{75}N_{17}O_{13}$, calculated with reference to the anhydrous, acetic acid-free substance. It is obtained by chemical synthesis.

CHARACTERS

A white or slightly yellowish powder, soluble in water and in a 1 per cent *V/V* solution of glacial acetic acid, sparingly soluble in methanol.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay. The retention time and size of the principal peak in the chromatogram obtained with the test solution are approximately the same as those of the principal peak in the chromatogram obtained with reference solution (a).

B. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel G plate R*.

Use the test solution and reference solution (a) prepared under Assay.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 6 volumes of *glacial acetic acid R*, 14 volumes of *water R*, 45 volumes of *methanol R* and 60 volumes of *methylene chloride R*. Allow the plate to dry in air for 5 min. At the bottom of a chromatography tank, place an evaporating dish containing a mixture of 10 ml of a 50 g/l solution of *potassium permanganate R* and 3 ml of *hydrochloric acid R*, close the tank and allow to stand. Place the dried plate in the tank and close the tank. Leave the plate in contact with the chlorine vapour for 2 min. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed and an area of coating below the points of application no longer gives a blue colour with 0.05 ml of *potassium iodide and starch solution R*. Spray with *potassium iodide and starch solution R*. The principal spot in the chromatogram obtained with the test solution corresponds in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. A 10 g/l solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_5 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*). Dissolve 10.0 mg in 1.0 ml of a 1 per cent *V/V* solution of *glacial acetic acid R*. The specific optical rotation is – 54 to – 66, calculated on the basis of the peptide content as determined in the assay.

Absorbance (*2.2.25*). Dissolve 10.0 mg in *water R* and dilute to 100.0 ml with the same solvent. The absorbance, determined at the maximum at 278 nm, corrected to a 10 mg/100 ml solution on the basis of the peptide content determined in the assay, is 0.55 to 0.61.

Amino acids. Examine by means of an amino-acid analyser. Standardise the apparatus with a mixture containing equimolar amounts of ammonia, glycine and the L-form of the following amino acids:

lysine	threonine	alanine	leucine
histidine	serine	valine	tyrosine
arginine	glutamic acid	methionine	phenylalanine
aspartic acid	proline	isoleucine	

together with half the equimolar amount of L-cystine. For the validation of the method, an appropriate internal standard, such as *DL-norleucine R*, is used.

Test solution. Place 1.0 mg of the substance to be examined in a rigorously cleaned hard-glass tube 100 mm long and 6 mm in internal diameter. Add a suitable amount of a 50 per cent *V/V* solution of *hydrochloric acid R*. Immerse the tube in a freezing mixture at – 5 °C, reduce the pressure to below 133 Pa and seal. Heat at 110 °C to 115 °C for 16 h. Cool, open the tube, transfer the contents to a 10 ml flask with the aid of five quantities, each of 0.2 ml, of *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure. Take up the residue in *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure; repeat these operations once. Take up the residue in a buffer solution suitable for the amino-acid analyser used and dilute to a suitable volume with the same buffer solution. Apply a suitable volume to the amino-acid analyser.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids, taking one-eighth of the sum of the number of moles of histidine, glutamic acid, leucine, proline, glycine, tyrosine and arginine as equal to one. The values fall within the following limits: serine 0.7 to 1.05; glutamic acid 0.95 to 1.05; proline 0.95 to 1.05; glycine 1.9 to 2.1; leucine 0.9 to 1.1; tyrosine 0.7 to 1.05; histidine 0.95 to 1.05 and arginine 0.95 to 1.05. Lysine and isoleucine are absent; not more than traces of other amino acids are present, with the exception of tryptophan.

Related substances. Examine by liquid chromatography (*2.2.29*) as described under Assay.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of the test solution. Continue the chromatography for twice the retention time of gonadorelin. In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent); the sum of the areas of the peaks, apart from the principal peak, is not greater than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (5 per cent). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Acetic acid (*2.5.34*): 4.0 per cent to 7.5 per cent.

Test solution. Dissolve 10.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and

95 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of solvents.

Water (*2.5.12*). Not more than 7.0 per cent, determined on 0.200 g by the semi-micro determination of water.

Bacterial endotoxins (*2.6.14*): less than 70 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (*2.2.29*).

Test solution. Dissolve 5.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve the contents of a vial of *gonadorelin CRS* in *water R* to obtain a concentration of 0.5 mg/ml.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *water R*.

Reference solution (c). Dissolve 2.5 mg of the substance to be examined in 1 ml of *0.1 M hydrochloric acid* and heat in a water-bath at 65 °C for 4 h. Add 1 ml of *0.1 M sodium hydroxide* and dilute to 5.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.12 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 13 volumes of *acetonitrile R* and 87 volumes of a 1.18 per cent *V/V* solution of *phosphoric acid R* (adjusted to pH 2.3 with *triethylamine R*),
- as detector a spectrophotometer set at 215 nm.

Inject 20 µl of reference solution (c). The test is not valid unless the resolution between the first and second peaks is at least 2.0.

Inject 20 µl of the test solution and 20 µl of reference solution (a).

Calculate the content of gonadorelin ($C_{55}H_{75}N_{17}O_{13}$) from the peak areas in the chromatograms obtained with the test solution and reference solution (a) and the declared content of $C_{55}H_{75}N_{17}O_{13}$ in *gonadorelin CRS*.

STORAGE

Store in an airtight container, protected from light at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states the mass of peptide in the container.

01/2008:0498

GONADOTROPHIN, CHORIONIC

Gonadotropinum chorionicum

DEFINITION

Chorionic gonadotrophin is a dry preparation of placental glycoproteins which have luteinising activity. The potency is not less than 2500 IU/mg.

PRODUCTION

Chorionic gonadotrophin is extracted from the urine of pregnant women using a suitable fractionation procedure. It is either dried under reduced pressure or freeze-dried.

CHARACTERS

Appearance: white to yellowish-white, amorphous powder.

Solubility: soluble in water.

IDENTIFICATION

When administered to immature rats as prescribed in the assay, it causes an increase in the mass of the seminal vesicles and of the prostate gland.

TESTS

Water (*2.5.32*): maximum 5.0 per cent.

Bacterial endotoxins (*2.6.14*): less than 0.02 IU per IU of chorionic gonadotrophin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

The potency of chorionic gonadotrophin is estimated by comparing under given conditions its effect of increasing the mass of the seminal vesicles (or the prostate gland) of immature rats with the same effect of the International Standard of chorionic gonadotrophin or of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard, which consists of a mixture of a freeze-dried extract of chorionic gonadotrophin from the urine of pregnant women with lactose. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Use immature male rats of the same strain, 19 to 28 days old, differing in age by not more than 3 days and having body masses such that the difference between the heaviest and the lightest rat is not more than 10 g. Assign the rats at random to 6 equal groups of at least 5 animals. If sets of 6 litter mates are available, assign one litter mate from each set to each group and mark according to litter.

Choose 3 doses of the reference preparation and 3 doses of the preparation to be examined such that the smallest dose is sufficient to produce a positive response in some of the rats and the largest dose does not produce a maximal response in all the rats. Use doses in geometric progression and as an initial approximation total doses of 4 IU, 8 IU and 16 IU may be tried although the dose will depend on the sensitivity of the animals used, which may vary widely.

Dissolve separately the total quantities of the preparation to be examined and of the reference preparation corresponding to the daily doses to be used in sufficient *phosphate-albumin buffered saline pH 7.2 R* such that the daily dose is administered in a volume of about 0.5 ml. Add a suitable antimicrobial preservative such as 4 g/l of phenol or 0.02 g/l of thiomersal. Store the solutions at 5 ± 3 °C.

Inject subcutaneously into each rat the daily dose allocated to its group, on 4 consecutive days at the same time each day. On the fifth day, about 24 h after the last injection, euthanise the rats and remove the seminal vesicles. Remove any extraneous fluid and tissue and weigh the vesicles immediately. Calculate the results by the usual statistical methods, using the mass of the vesicles as the response. (The precision of the assay may be improved by a suitable correction of the organ mass with reference to the body mass of the animal from which it was taken; an analysis of covariance may be used).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

In an airtight, tamper-proof container, protected from light at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

– the number of International Units per container,
– the potency in International Units per milligram.

01/2008:0719

GONADOTROPHIN, EQUINE SERUM, FOR VETERINARY USE

Gonadotropinum sericum equinum ad usum veterinarium

DEFINITION

Equine serum gonadotrophin for veterinary use is a dry preparation of a glycoprotein fraction obtained from the serum or plasma of pregnant mares. It has follicle-stimulating and luteinising activities. The potency is not less than 1000 IU of gonadotrophin activity per milligram, calculated with reference to the anhydrous substance.

PRODUCTION

Equine serum gonadotrophin may be prepared by precipitation with alcohol (70 per cent *V/V*) and further purification by a suitable form of chromatography. It is prepared in conditions designed to minimise microbial contamination.

CHARACTERS

Appearance: white or pale grey, amorphous powder.

Solubility: soluble in water.

IDENTIFICATION

When administered as prescribed in the assay it causes an increase in the mass of the ovaries of immature female rats.

TESTS

Water (*2.5.12*): maximum 10.0 per cent, determined on 80 mg.

Bacterial endotoxins (*2.6.14, method C*): less than 0.035 IU per IU of equine serum gonadotrophin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

The potency of equine serum gonadotrophin is estimated by comparing under given conditions its effect of increasing the mass of the ovaries of immature female rats with the same effect of the International Standard of equine serum gonadotrophin or of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard, which consists of a mixture of a freeze-dried extract of equine serum gonadotrophin from the serum of pregnant mares with lactose. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Use immature female rats of the same strain, 21 to 28 days old, differing in age by not more than 3 days and having masses such that the difference between the heaviest and the lightest rat is not more than 10 g. Assign the rats at random to 6 equal groups of not fewer than 5 animals. If sets of 6 litter mates are available, assign one litter mate from each set to each group and mark according to litter.

Choose 3 doses of the reference preparation and 3 doses of the preparation to be examined such that the smallest dose is sufficient to produce a positive response in some of the rats and the largest dose does not produce a maximal response in all the rats. Use doses in geometric progression: as an initial approximation total doses of 8 IU, 12 IU and 18 IU may be tried, although the dose will depend on the sensitivity of the animals used and may vary widely.

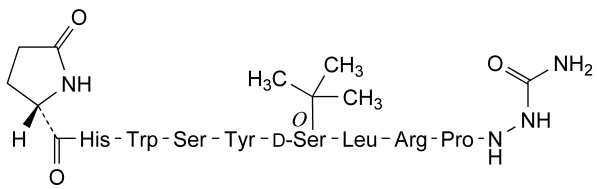
Dissolve separately the total quantities of the preparation to be examined and of the reference preparation corresponding to the doses to be used in sufficient of a sterile 9 g/l solution of *sodium chloride R* containing 1 mg/ml of *bovine albumin R* such that each single dose is administered in a volume of about 0.2 ml. Store the solutions at 5 ± 3 °C.

Inject subcutaneously into each rat the dose allocated to its group. Repeat the injections 18 h, 21 h, 24 h, 42 h and 48 h after the first injection. Not less than 40 h and not more than 72 h after the last injection, euthanise the rats and remove the ovaries. Remove any extraneous fluid and tissue and weigh the 2 ovaries immediately. Calculate the results by the usual statistical methods, using the combined mass of the 2 ovaries of each animal as the response.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

In an airtight container, protected from light, at a temperature not exceeding 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.



LABELLING

The label states the potency in International Units per milligram.

01/2008:1636

GOSERELIN

Goserelinum

$C_{59}H_{84}N_{18}O_{14}$ M_r 1269

[65807-02-5]

DEFINITION

1-Carbamoyl-2-[5-oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-*O*-(1,1-dimethylethyl)-D-seryl-L-leucyl-L-arginyl-L-prolyl]diazane.

Synthetic nonapeptide analogue of the hypothalamic decapeptide, gonadorelin. It is obtained by chemical synthesis and is available as an acetate.

Content: 94.5 per cent to 103.0 per cent of the peptide $C_{59}H_{84}N_{18}O_{14}$ (anhydrous and acetic-acid free substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: soluble in water, freely soluble in glacial acetic acid. It dissolves in dilute solutions of mineral acids and alkali hydroxides.

IDENTIFICATION

A. Nuclear magnetic resonance spectrometry (*2.2.33*).

Preparation: 40 mg/ml solution of the substance to be examined in *deuterium oxide R* adjusted to pH 4.0 with *deuterated acetic acid R*.

Results: the ^{13}C, proton decoupled NMR spectrum obtained is qualitatively similar to the *Ph. Eur. reference spectrum of goserelin*.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

C. Amino acid analysis (*2.2.56*). For protein hydrolysis use Method 1 and for analysis use Method 1.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids taking one sixth of the sum of the number of moles of glutamic acid, histidine, tyrosine, leucine, arginine, proline as equal to 1. The values fall within the following limits: glutamic acid, histidine, tyrosine, leucine, arginine and proline 0.9 to 1.1; serine 1.6 to 2.2. Not more than traces of other amino acids are present, with the exception of tryptophan.

TESTS

Specific optical rotation (*2.2.7*): – 52 to – 56 (anhydrous and acetic-acid free substance).

Dissolve the substance to be examined in *water R* to obtain a concentration of 2 mg/ml.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve the substance to be examined in *water R* to obtain a concentration of 1.0 mg/ml.

Reference solution (a). Dissolve the contents of a vial of *goserelin CRS* in *water R* to obtain a concentration of 1.0 mg/ml.

Reference solution (b). Dilute 1.0 ml of the test solution to 100 ml with *water R*.

Reference solution (c). Dilute 1.0 ml of the test solution to 10.0 ml with *water R*.

Resolution solution (a). Dissolve the contents of a vial of *4-D-Ser-goserelin CRS* in *water R* to obtain a concentration of 0.1 mg/ml. Mix equal volumes of this solution and of reference solution (c).

Resolution solution (b). Dissolve the contents of a vial of *goserelin validation mixture CRS* with 1.0 ml of *water R*.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl amorphous organosilica polymer R* (3.5 µm) with a pore size of 12.5 nm,
– *temperature*: 50-55 °C.

Mobile phase: *trifluoroacetic acid R, acetonitrile for chromatography R, water R* (0.5:200:800 *V/V/V*).

Flow rate: 0.7-1.2 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 10 µl of the test solution, reference solution (b) and the resolution solutions.

Run time: 90 min.

Relative retention with reference to goserelin: impurity A = about 0.67; impurity C = about 0.78; impurity B = about 0.79; impurity D = about 0.85; impurity E = about 0.89; impurity F = about 0.92; impurity G = about 0.94; impurity H = about 0.98; impurity I = about 1.43; impurity J = about 1.53; impurity K = about 1.67; impurity L = about 1.77.

System suitability:

– *retention time*: goserelin = 40 min to 50 min in the chromatogram obtained with resolution solution (b); adjust the flow rate of the mobile phase if necessary; if adjusting the flow rate does not result in a correct retention time of the principal peak, change the composition of acetonitrile in the mobile phase to obtain the requested retention time for goserelin;
– *resolution*: minimum 7.0 between the peaks due to impurity A and goserelin in the chromatogram obtained with resolution solution (a);
– *symmetry factor*: 0.8 to 2.5 for the peaks due to impurity A and goserelin in the chromatogram obtained with resolution solution (a);
– the chromatogram obtained with resolution solution (b) is similar to the chromatogram supplied with *goserelin validation mixture CRS*. 2 peaks eluting prior to the principal peak and corresponding to impurity E and impurity G, are clearly visible. 3 peaks eluting after the principal peak are clearly visible.

Limits:

– *impurity E*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
– *any other impurity*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
– *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent),
– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Acetic acid (*2.5.34*): 4.5 per cent to 15.0 per cent.

Test solution. Dissolve 10.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of mobile phases.

Water (*2.5.32*): maximum 10.0 per cent.

Bacterial endotoxins (*2.6.14*): less than 16 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

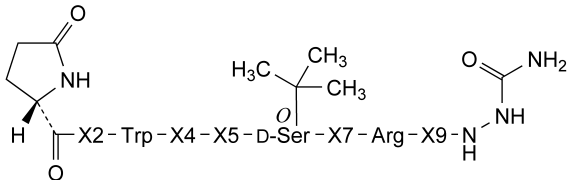
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Injection: test solution and reference solution (a).

Run time: 60 min.

Calculate the content of goserelin ($C_{59}H_{84}N_{18}O_{14}$) using the chromatograms obtained with the test solution and reference solution (a) and the declared content of $C_{59}H_{84}N_{18}O_{14}$ in *goserelin CRS*.

STORAGE



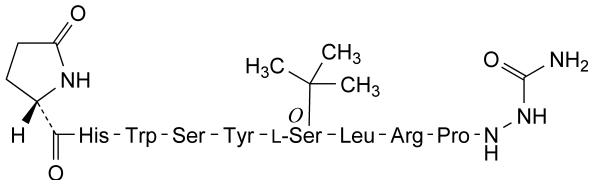
In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

LABELLING

The label states the mass of peptide in the container.

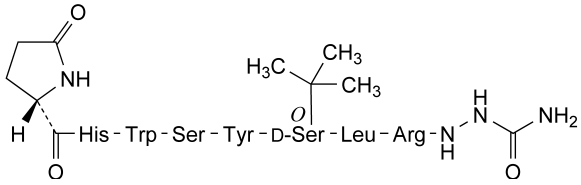
IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J, K, L.



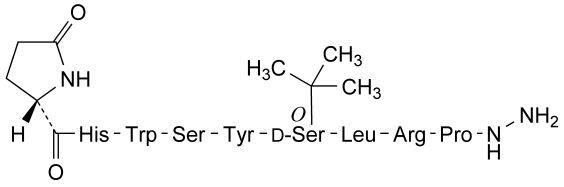
A. X2 = L-His, X4 = D-Ser, X5 = L-Tyr, X7 = L-Leu, X9 = L-Pro: [4-D-serine]goserelin,

C. X2 = L-His, X4 = L-Ser, X5 = L-Tyr, X7 = L-Leu, X9 = D-Pro: [9-D-proline]goserelin,

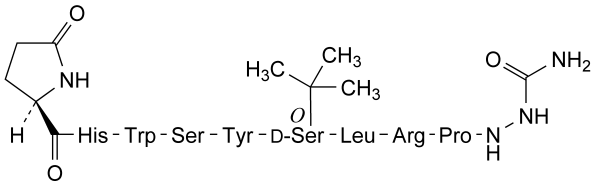


F. X2 = L-His, X4 = L-Ser, X5 = D-Tyr, X7 = L-Leu, X9 = L-Pro: [5-D-tyrosine]goserelin,

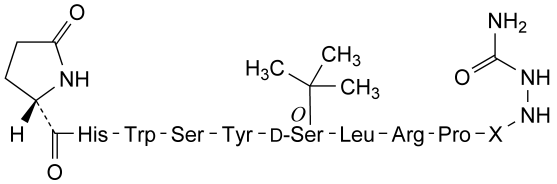
G. X2 = D-His, X4 = L-Ser, X5 = L-Tyr, X7 = L-Leu, X9 = L-Pro: [2-D-histidine]goserelin,



L. X2 = L-His, X4 = L-Ser, X5 = L-Tyr, X7 = D-Leu, X9 = L-Pro: [7-D-leucine]goserelin,

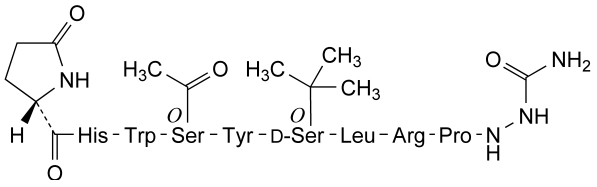


B. [6-[*O*-(1,1-dimethylethyl)-L-serine]]goserelin,



D. 1-carbamoylyl-2-[5-oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-*O*-(1,1-dimethylethyl)-D-seryl-L-leucyl-L-arginyl]diazane,

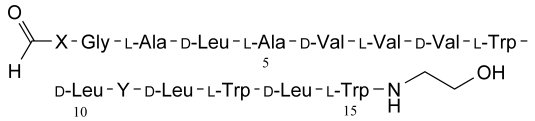
E. 5-oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-*O*-(1,1-dimethylethyl)-D-seryl-L-leucyl-L-arginyl-L-prolinohydrazide,



H. [1-(5-oxo-D-proline)]goserelin,

I. X = Pro-Pro: endo-8a,8b-di-L-proline-goserelin,

J. X = Pro: endo-8a-L-proline-goserelin,



K. O^4-acetylgoserelin.

01/2008:0907

GRAMICIDIN

Gramicidinum

Gramicidin	X	Y	Mol. formula	M_r
A1	L-Val	L-Trp	$C_{99}H_{140}N_{20}O_{17}$	1882
A2	L-Ile	L-Trp	$C_{100}H_{142}N_{20}O_{17}$	1896
B1	L-Val	L-Phe	$C_{97}H_{139}N_{19}O_{17}$	1843
C1	L-Val	L-Tyr	$C_{97}H_{139}N_{19}O_{18}$	1859
C2	L-Ile	L-Tyr	$C_{98}H_{141}N_{19}O_{18}$	1873

DEFINITION

Gramicidin consists of a family of antimicrobial linear polypeptides, usually obtained by extraction from tyrothricin, the complex isolated from the fermentation broth of *Brevibacillus brevis* Dubos. The main component is gramicidin A1, together with gramicidins A2, B1, C1 and C2 in particular.

Content: minimum 900 IU/mg (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder, slightly hygroscopic.

Solubility: practically insoluble in water, soluble in methanol, sparingly soluble in alcohol.

mp: about 230 °C.

IDENTIFICATION

First identification: A, C.

Second identification: A, B.

A. Dissolve 0.100 g in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *alcohol R*. Examined between 240 nm and 320 nm (*2.2.25*), the solution shows 2 absorption maxima, at 282 nm and 290 nm, a shoulder at about 275 nm and an absorption minimum at 247 nm. The specific absorbance at the maximum at 282 nm is 105 to 125.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 5 mg of the substance to be examined in 6.0 ml of *alcohol R*.

Reference solution (a). Dissolve 5 mg of *gramicidin CRS* in 6.0 ml of *alcohol R*.

Reference solution (b). Dissolve 5 mg of *tyrothricin CRS* in 6.0 ml of *alcohol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *methanol R, butanol R, water R, glacial acetic acid R, butyl acetate R* (3:9:15:24:49 *V/V/V/V/V*).

Application: 1 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: dip the plate into *dimethylaminobenzaldehyde solution R2*. Heat at 90 °C until the spots appear.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots or 2 clearly separated groups of spots.

Results: the principal spot or group of principal spots in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot or group of principal spots in the chromatogram obtained with reference solution (a) and to the spot or group of spots with the highest R_F value in the chromatogram obtained with reference solution (b).

C. Examine the chromatograms obtained in the test for composition.

Results: the 3 principal peaks in the chromatogram obtained with the test solution are similar in retention time to the 3 principal peaks in the chromatogram obtained with reference solution (a).

TESTS

Composition. Liquid chromatography (*2.2.29*): use the normalisation procedure.

Test solution. Dissolve 25 mg of the substance to be examined in 10 ml of *methanol R* and dilute to 25 ml with the mobile phase.

Reference solution (a). Dissolve 25 mg of *gramicidin CRS* in 10 ml of *methanol R* and dilute to 25 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: 50 °C.

Mobile phase: *water R, methanol R* (29:71 *V/V*).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 282 nm.

Injection: 20 µl.

Run time: 2.5 times the retention time of gramicidin A1.

Relative retention with reference to gramicidin A1 (retention time = about 22 min): gramicidin C1 = about 0.7; gramicidin C2 = about 0.8; gramicidin A2 = about 1.2; gramicidin B1 = about 1.9.

System suitability: reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to gramicidin A1 and gramicidin A2,
- the chromatogram obtained is concordant with the chromatogram supplied with *gramicidin CRS*.

Composition:

- *sum of the contents of gramicidins A1, A2, B1, C1 and C2*: minimum 95.0 per cent,
- *ratio of the content of gramicidin A1 to the sum of the contents of gramicidins A1, A2, B1, C1 and C2*: minimum 60.0 per cent,
- *disregard limit*: the area of the peak due to gramicidin A1 in the chromatogram obtained with reference solution (b).

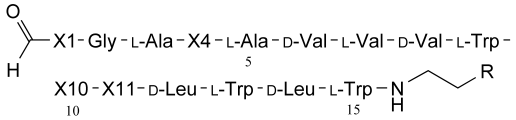
Related substances. Liquid chromatography (*2.2.29*) as described in the test for composition.

Limit:

- *any impurity*: maximum 2.0 per cent and not more than 1 peak is more than 1.0 per cent; disregard the peaks due to gramicidins A1, A2, B1, C1 and C2.

Loss on drying (*2.2.32*): maximum 3.0 per cent, determined on 1.000 g by drying over *diphosphorus pentoxide R* at 60 °C at a pressure not exceeding 0.1 kPa for 3 h.

Sulphated ash (*2.4.14*): maximum 1.0 per cent, determined on 1.0 g.



ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*), using the turbidimetric method. Use *gramicidin CRS* as the reference substance.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Impurity	X1	X4	X10	X11	R
A	L-Val	Met	D-Leu	L-Trp	OH
B	L-Val	D-Leu	D-Leu	L-Trp	CH_2-OH

GRANISETRON HYDROCHLORIDE

Granisetroni hydrochloridum

$C_{18}H_{25}ClN_4O$ M_r 348.9
[107007-99-8]

DEFINITION

1-Methyl-*N*-[(1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide hydrochloride.

Content: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, sparingly soluble in methylene chloride, slightly soluble in methanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *granisetron hydrochloride CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 0.2 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 4.0 to 6.5 for solution S.

Impurity E. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.25 g of the substance to be examined in a mixture of 20 volumes of *water R* and 80 volumes of *acetonitrile R* and dilute to 5 ml with the same mixture of solvents.

Reference solution. Dissolve 5 mg of *granisetron impurity E CRS* in a mixture of 20 volumes of *water R* and 80 volumes of *acetonitrile R* and dilute to 20 ml with the same mixture of solvents.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *concentrated ammonia R, 2-propanol R, ethyl acetate R* (6.5:30:50 *V/V/V*).

Application: 2 µl.

Development: over half of the plate.

Drying: in air.

Detection: expose to iodine vapour for 30 min.

Limit:

– *impurity E*: any spot due to impurity E is not more intense than the principal spot in the chromatogram obtained with the reference solution (0.5 per cent).

Related substances. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (b). Transfer 2 ml of the test solution to a colourless glass vial, stopper and expose the solution either to sunlight for 4 h or under a UV lamp for 16 h (partial degradation of granisetron to impurity C). A degradation of at least about 0.3 per cent of granisetron to impurity C must be obtained as shown by appearance of a corresponding peak in the chromatogram. If not, expose the solution once again to sunlight or under a UV lamp.

Reference solution (c). Dissolve 50.0 mg of *granisetron hydrochloride CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (d). Dissolve the contents of a vial of *granisetron impurity A CRS* in 1 ml of the mobile phase.

Reference solution (e). Dissolve the contents of a vial of *granisetron impurity B CRS* in 1 ml of the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: spherical *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm),
– *temperature*: 40 °C.

Mobile phase: dilute 1.6 ml of *phosphoric acid R* to 800 ml with *water R*, add 200 ml of *acetonitrile R* and mix. Add 1.0 ml of *hexylamine R* and mix. Adjust to pH 7.5 ± 0.05 with freshly distilled *triethylamine R* (about 4 ml).

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 305 nm.

Injection: 10 µl of the test solution and reference solutions (a), (b), (d) and (e).

Run time: twice the retention time of granisetron.

Relative retention with reference to granisetron (retention time = about 7 min): impurity D = about 0.4; impurity B = about 0.5; impurity A = about 0.7; impurity C = about 0.8.

System suitability:

– *resolution*: minimum 3.5 between the peaks due to impurity C and granisetron in the chromatogram obtained with reference solution (b),
– *symmetry factor*: maximum 2.0 for the peak due to granisetron.

Limits:

– *correction factor*: for the calculation of content, multiply the peak area of impurity B by 1.7,
– *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
– *impurity C*: not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
– *impurity D*: not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
– *any other impurity*: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),

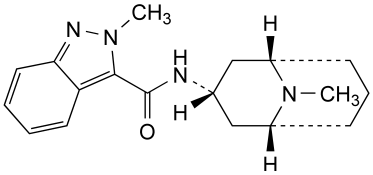
– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent); disregard any peak due to the blank.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

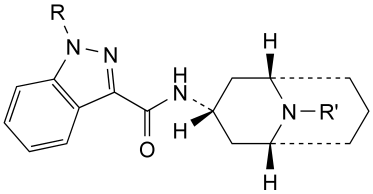
ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.



Injection: test solution and reference solution (c).

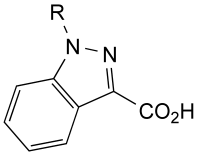
Calculate the percentage content of $C_{18}H_{25}ClN_4O$ using the declared content of *granisetron hydrochloride CRS*.



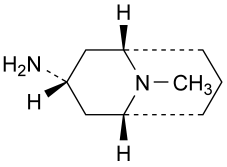
IMPURITIES

Specified impurities: *A, B, C, D, E.*

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F, G, H, I.*

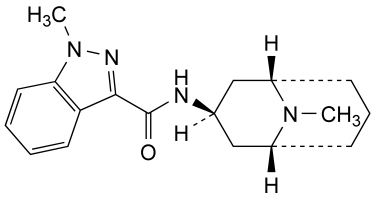


A. 2-methyl-*N*-[(1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-2*H*-indazole-3-carboxamide,

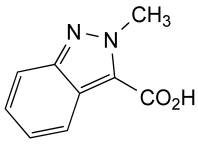


B. R = H, R′ = CH_3: *N*-[(1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide,

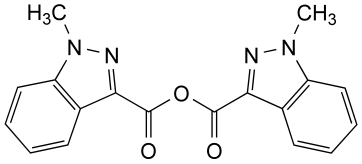
C. R = CH_3, R′ = H: *N*-[(1*R*,3*r*,5*S*)-9-azabicyclo[3.3.1]non-3-yl]-1-methyl-1*H*-indazole-3-carboxamide,



D. R = CH_3: 1-methyl-1*H*-indazole-3-carboxylic acid,



H. R = H: 1*H*-indazole-3-carboxylic acid,



E. (1*R*,3*r*,5*S*)-9-methyl-9-azabicyclo[3.3.1]nonan-3-amine,

F. 1-methyl-*N*-[(1*R*,3*s*,5*S*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide (*exo*-granisetron),

G. 2-methyl-2*H*-indazole-3-carboxylic acid,

I. 1-methyl-1*H*-indazole-3-carboxylic anhydride.

corrected 6.0

GREATER CELANDINE

Chelidonii herba

DEFINITION

Dried, whole or cut aerial parts of *Chelidonium majus* L. collected during flowering.

Content: minimum 0.6 per cent of total alkaloids, expressed as chelidonine ($C_{20}H_{19}NO_5$; M_r 353.4) (dried drug).

IDENTIFICATION

A. The stems are rounded, ribbed, yellowish or greenish-brown, somewhat pubescent, about 3-7 mm in diameter, hollow and mostly collapsed. The leaves are thin, irregularly pinnate, the leaflets ovate to oblong with coarsely dentate margins, the terminal leaflet often three-lobed; the adaxial surface is bluish-green and glabrous, the abaxial surface paler and pubescent, especially on the veins. The flowers have 2 deeply concavo-convex sepals, readily removed, and 4 yellow, broadly ovate, spreading petals about 8-10 mm long; the stamens are numerous, yellow, and a short style arises from a superior ovary; long, capsular, immature fruits are rarely present.

B. Reduce to a powder (355) (*2.9.12*). The powder is dark greyish-green or brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous fragments of leaves in surface view, the epidermal cells with sinuous walls; anomocytic stomata (*2.8.3*) occur on the abaxial surface only; covering trichomes long, uniseriate, with thin walls and usually fragmented; vascular tissue from the leaves and stems with groups of fibres, pitted and spirally thickened vessels and associated latex tubes with yellowish-brown contents; occasional fragments of the corolla with thin-walled, partly papillose cells containing numerous pale yellow droplets of oil; spherical pollen grains about 30-40 µm in diameter with 3 pores and a finely pitted exine.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 0.4 g of the powdered drug (710) (*2.9.12*) add 50 ml of *dilute acetic acid R*. Boil in a water-bath under a reflux condenser for 30 min. Cool and filter. To the filtrate add *concentrated ammonia R* until a strong alkaline reaction is produced. Shake with 30 ml of *methylene chloride R*. Dry the organic layer over *anhydrous sodium sulphate R*, filter and evaporate *in vacuo* to dryness. Dissolve the residue in 1.0 ml of *methanol R*.

Reference solution. Dissolve 2 mg of *papaverine hydrochloride R* and 2 mg of *methyl red R* in 10 ml of *ethanol (96 per cent) R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, water R, propanol R* (1:9:90 *V/V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with *potassium iodobismuthate solution R* and dry in air; spray with *sodium nitrite solution R* and allow to dry in air; examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weaker zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
———	———
Methyl red: a red zone	A brown zone
	A brown zone
Papaverine: a greyish-brown zone	A greyish-brown zone
———	———
	2 brown zones
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 10.0 per cent.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 13.0 per cent.

ASSAY

Test solution. To 0.750 g of the powdered drug (710) (*2.9.12*), add 200 ml of *dilute acetic acid R* and heat on a water-bath for 30 min, shaking frequently. Cool and dilute to 250.0 ml with *dilute acetic acid R*. Filter. Discard the first 20 ml of the filtrate. To 30.0 ml of the filtrate add 6.0 ml of *concentrated ammonia R* and 100.0 ml of *methylene chloride R*. Shake for 30 min. Separate the organic layer, place 50.0 ml in a 100 ml round-bottomed flask and evaporate to dryness *in vacuo* at a temperature not exceeding 40 °C. Dissolve the residue in about 2-3 ml of *ethanol (96 per cent) R*, warming slightly. Transfer the solution to a 25 ml volumetric flask by rinsing the round-bottomed flask with *dilute sulphuric acid R* and dilute to 25.0 ml with the same solvent. To 5.0 ml of the solution, add 5.0 ml of a 10 g/l solution of *chromotropic acid, sodium salt R* in *sulphuric acid R* in a 25 ml volumetric flask, stopper the flask and mix carefully. Dilute to 25.0 ml with *sulphuric acid R* and stopper the flask.

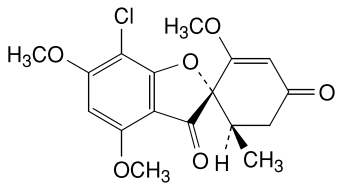
Compensation liquid. Prepare at the same time and in the same manner as for the test solution: place in a 25 ml volumetric flask 5.0 ml of *dilute sulphuric acid R* and 5.0 ml of a 10 g/l solution of *chromotropic acid, sodium salt R* in *sulphuric acid R*, stopper the flask and mix carefully. Dilute to 25.0 ml with *sulphuric acid R* and stopper the flask.

Place both solutions on a water-bath for 10 min. Cool to about 20 °C and dilute if necessary to 25.0 ml with *sulphuric acid R*. Measure the absorbance (*2.2.25*) of the test solution at 570 nm by comparison with the compensation liquid.

Calculate the percentage content of total alkaloids, expressed as chelidonine, using the following expression:

$$\frac{A \times 2.23}{m}$$

i.e. taking the specific absorbance of chelidonine to be 933.



A = absorbance at 570 nm,

m = mass of the substance to be examined, in grams.

GRISEOFULVIN

Griseofulvinum

$C_{17}H_{17}ClO_6$ M_r 352.8
[126-07-8]

DEFINITION

(1′*S*,3-6′*R*)-7-Chloro-2′,4,6-trimethoxy-6′-methylspiro[benzofuran-2(3*H*),1′-[2]cyclohexene]-3,4′-dione.

Substance produced by the growth of certain strains of *Penicillium griseofulvum* or obtained by any other means.

Content: 97.0 per cent to 102.0 per cent (dried substance).

PRODUCTION

The method of manufacture is validated to demonstrate that the product if tested would comply with the following test.

Abnormal toxicity. To each of 5 healthy mice, each weighing 17-22 g, administer orally a suspension of 0.1 g of the substance to be examined in 0.5-1 ml of *water R*. None of the mice dies within 48 h.

CHARACTERS

Appearance: white or yellowish-white, microfine powder, the particles of which generally have a maximum dimension of up to 5 µm, although larger particles that may exceed 30 µm may occasionally be present.

Solubility: practically insoluble in water, freely soluble in dimethylformamide and in tetrachloroethane, slightly soluble in anhydrous ethanol and in methanol.

mp: about 220 °C.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *griseofulvin CRS*.

B. Dissolve about 5 mg in 1 ml of *sulphuric acid R* and add about 5 mg of powdered *potassium dichromate R*. A dark red colour develops.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_4 (*2.2.2, Method II*).

Dissolve 0.75 g in *dimethylformamide R* and dilute to 10 ml with the same solvent.

Acidity. Suspend 0.25 g in 20 ml of *ethanol (96 per cent) R* and add 0.1 ml of *phenolphthalein solution R*. Not more than 1.0 ml of *0.02 M sodium hydroxide* is required to change the colour of the indicator.

Specific optical rotation (*2.2.7*): + 354 to + 364 (dried substance).

Dissolve 0.250 g in *dimethylformamide R* and dilute to 25.0 ml with the same solvent.

Related substances. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 0.2 g of *diphenylanthracene R* in *acetone R* and dilute to 100.0 ml with the same solvent.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *acetone R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 0.10 g of the substance to be examined in *acetone R*, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *acetone R*.

Reference solution. Dissolve 5.0 mg of *griseofulvin CRS* in *acetone R*, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *acetone R*.

Column:

– *material*: glass;
– *size*: *l* = 1 m, Ø = 4 mm;
– *stationary phase*: *diatomaceous earth for gas chromatography R* impregnated with 1 per cent *m/m* of *poly[(cyanopropyl)(methyl)][(phenyl)(methyl)]-siloxane R*.

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 50-60 ml/min.

Temperature:

– *column*: 250 °C;
– *injection port*: 270 °C;
– *detector*: 300 °C.

Detection: flame ionisation.

Run time: 3 times the retention time of griseofulvin.

Relative retention with reference to griseofulvin (retention time = about 11 min): dechloro-griseofulvin = about 0.6; dehydrogriseofulvin = about 1.4.

Calculate the ratio (*R*) of the area of the peak due to griseofulvin to the area of the peak due to the internal standard in the chromatogram obtained with the reference solution.

Limits:

– *dechloro-griseofulvin*: calculate the ratio of the area of the peak due to dechloro-griseofulvin to the area of the peak due to the internal standard in the chromatogram obtained with test solution (b): this ratio is not greater than 0.6 *R* (3.0 per cent);
– *dehydrogriseofulvin*: calculate the ratio of the area of the peak due to dehydrogriseofulvin to the area of the peak due to the internal standard in the chromatogram obtained with test solution (b): this ratio is not greater than 0.15 *R* (0.75 per cent).

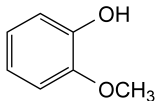
Substances soluble in light petroleum: maximum 0.2 per cent.

Shake 1.0 g with 20 ml of *light petroleum R*. Boil under a reflux condenser for 10 min. Cool, filter and wash with 3 quantities, each of 15 ml, of *light petroleum R*. Combine the filtrate and washings, evaporate to dryness on a water-bath and dry at 100-105 °C for 1 h. The residue weighs not more than 2 mg.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.00 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY



Dissolve 80.0 mg in *anhydrous ethanol R* and dilute to 200.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *anhydrous ethanol R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 291 nm.

Calculate the content of $C_{17}H_{17}ClO_6$, taking the specific absorbance to be 686.

01/2008:1978

GUAIACOL

Guaiacolum

$C_7H_8O_2$ M_r 124.1

DEFINITION

2-Methoxyphenol.

Content: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: crystalline mass or colourless or yellowish liquid, hygroscopic.

Solubility: sparingly soluble in water, very soluble in methylene chloride, freely soluble in ethanol (96 per cent).

mp: about 28 °C.

IDENTIFICATION

First identification: A.

Second identification: B.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *guaiacol CRS*.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.5 g of the substance to be examined in *methanol R* and dilute to 25 ml with the same solvent.

Reference solution. Dissolve 0.5 g of *guaiacol CRS* in *methanol R* and dilute to 25 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous acetic acid R, methanol R, toluene R* (6:14:80 *V/V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with *ferric chloride solution R1*.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Solution S. Dissolve 1.00 g in *ethanol (96 per cent) R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method I*).

Acidity or alkalinity. To 5.0 ml of solution S, add 10 ml of *carbon dioxide-free water R* and 0.1 ml of *methyl red mixed solution R*. Not more than 0.05 ml of *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Impurity A. Liquid chromatography (*2.2.29*).

Solvent mixture: *phosphoric acid R, water R, methanol R* (0.1:49.9:50 *V/V/V*).

Test solution (a). Dissolve 1.0 g of the substance to be examined in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Test solution (b). Dissolve 0.200 g of the substance to be examined in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 20.0 ml with the solvent mixture.

Reference solution (b). Dissolve 0.200 g of *pyrocatechol R* (impurity A) and 0.200 g of *phenol R* (impurity B) in the solvent mixture and dilute to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Reference solution (c). Dissolve 0.200 g of *guaiacol CRS* in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *mobile phase*: *phosphoric acid R, methanol R, water R* (1:150:849 *V/V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 270 nm.

Injection: 20 µl of test solution (a) and reference solutions (a) and (b).

Run time: 1.5 times the retention time of guaiacol.

Retention time: guaiacol = about 20 min.

System suitability: reference solution (b):

– *resolution*: minimum 5 between the peaks due to impurity A (1st peak) and impurity B (2nd peak).

Limit:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Related substances. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Dissolve 1.00 g of the substance to be examined in *acetonitrile R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 0.200 g of *phenol R* (impurity B) and 0.400 g of *methyl benzoate R* (impurity E) in *acetonitrile R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of this solution to 20.0 ml with *acetonitrile R*.

Reference solution (b). Dilute 0.5 ml of the test solution to 100.0 ml with *acetonitrile R*. Dilute 1.0 ml of this solution to 10.0 ml with *acetonitrile R*.

Reference solution (c). Dissolve 10 mg of *veratrole R* (impurity C) in *acetonitrile R* and dilute to 10 ml with the same solvent.

Column:

– *material*: fused silica;
– *size*: *l* = 25 m, Ø = 0.53 mm;
– *stationary phase*: *poly(cyanopropyl)(7)(phenyl)-(7)(methyl)(86)siloxane R* (film thickness 2 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 6 ml/min.

Split ratio: 1:5.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15	110
	15 - 21	110 → 128
	21 - 35	128 → 200
	35 - 37	200
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 1 µl.

Relative retention with reference to guaiacol (retention time = about 14 min): impurity E = 0.86; impurity B = about 0.88; impurity C = about 1.2.

System suitability: reference solution (a):

– *resolution*: minimum 1.0 between the peaks due to impurity E (1st peak) and impurity B (2nd peak).

Limits:

– *impurity B*: maximum 0.1 per cent;
– *impurity C*: maximum 0.4 per cent;
– *impurity E*: maximum 0.2 per cent;
– *unspecified impurities*: for each impurity, maximum 0.10 per cent;
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b).

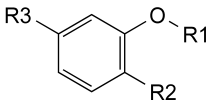
Water (*2.5.12*): maximum 0.5 per cent, determined on 2.000 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for impurity A with the following modifications.

Injection: test solution (b) and reference solution (c).

Calculate the percentage content of $C_7H_8O_2$ from the declared content of *guaiacol CRS*.



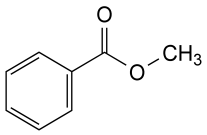
STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, E.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034).* It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *D.*

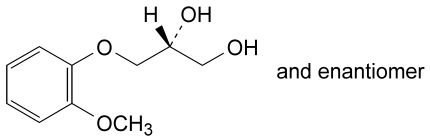


A. R1 = R3 = H, R2 = OH: benzene-1,2-diol (pyrocatechol),

B. R1 = R2 = R3 = H: phenol,

C. R1 = CH_3, R2 = OCH_3, R3 = H: 1,2-dimethoxybenzene (veratrole),

D. R1 = H, R2 = R3 = OCH_3: 2,5-dimethoxyphenol,



E. methyl benzoate.

01/2008:0615

GUAIFENESIN

Guaifenesinum

$C_{10}H_{14}O_4$ M_r 198.2
[93-14-1]

DEFINITION

(2*RS*)-3-(2-Methoxyphenoxy)propane-1,2-diol.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: sparingly soluble in water, soluble in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Melting point (*2.2.14*): 79 °C to 83 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *guaifenesin CRS.*

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 30 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 30 mg of *guaifenesin CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: *methylene chloride R, propanol R* (20:80 *V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with a mixture of equal volumes of a 10 g/l solution of *potassium ferricyanide R*, a 200 g/l solution of *ferric chloride R* and *alcohol R*.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R*, heating gently if necessary, and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of *phenolphthalein solution R1*. Not more than 0.1 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator. To 10 ml of solution S add 0.15 ml of *methyl red solution R*. Not more than 0.1 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to red.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in *acetonitrile R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 20.0 ml with *acetonitrile R*. Dilute 1.0 ml of this solution to 10.0 ml with *acetonitrile R*.

Reference solution (b). Dissolve 10.0 mg of *guaiacol R* in *acetonitrile R* and dilute to 50.0 ml with the same solvent. Dilute 0.5 ml of this solution to 50.0 ml with *acetonitrile R*.

Reference solution (c). Dissolve 50.0 mg of *guaiacol R* in *acetonitrile R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of this solution to 10.0 ml with the test solution.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: *glacial acetic acid R, water R* (10:990 *V/V*),
– *mobile phase B*: *acetonitrile R,*

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 32	80 → 50	20 → 50
32 - 33	50 → 80	50 → 20
33 - 40	80	20

Flow rate: 1 ml/min.

Detection: spectrophotometer at 276 nm.

Injection: 10 µl.

Relative retention with reference to guaifenesin (retention time = about 8 min): impurity B = about 0.9; impurity A = about 1.4; impurity C = about 3.1; impurity D = about 3.7.

System suitability: reference solution (c):

– *resolution*: minimum 3.0 between the peaks due to guaifenesin and impurity A.

Limits:

- *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *impurity B*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
- *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *total (excluding impurity B)*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
- *disregard level*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Chlorides and monochlorhydrins: maximum of 250 ppm.

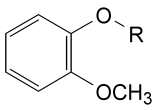
To 10 ml of solution S add 2 ml of *dilute sodium hydroxide solution R* and heat on a water-bath for 5 min. Cool and add 3 ml of *dilute nitric acid R*. The resulting solution complies with the limit test for chlorides (*2.4.4*).

Heavy metals (*2.4.8*): maximum of 25 ppm.

Dissolve 2.0 g in a mixture of 1 volume of *water R* and 9 volumes of *alcohol R* and dilute to 25 ml with the same mixture of solvents. 12 ml of the solution complies with limit test B. Prepare the standard using lead standard solution (2 ppm Pb) prepared by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 1 volume of *water R* and 9 volumes of *alcohol R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

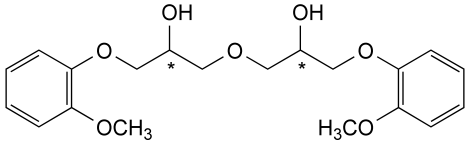
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.



ASSAY

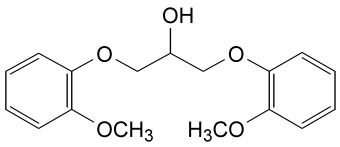
To 0.500 g (*m* g) add 10.0 ml of a freshly prepared mixture of 1 volume of *acetic anhydride R* and 7 volumes of *pyridine R*. Boil under a reflux condenser for 45 min. Cool and add 25 ml of *water R*. Using 0.25 ml of *phenolphthalein solution R* as indicator, titrate with *1 M sodium hydroxide* (n_1 ml). Carry out a blank titration (n_2 ml).

Calculate the percentage content of $C_{10}H_{14}O_4$ from the expression:



$$\frac{19.82\,(n_2 - n_1)}{2m}$$

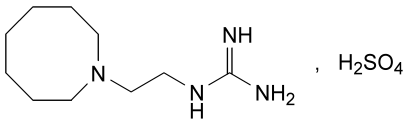
IMPURITIES



A. R = H: 2-methoxyphenol (guaiacol),

B. R = $CH(CH_2OH)_2$: 2-(2-methoxyphenoxy)propane-1,3-diol (B-isomer),

C. 1,1′-oxybis[3-(2-methoxyphenoxy)propan-2-ol] (bisether),



D. 1,3-bis(2-methoxyphenoxy)propan-2-ol.

corrected 6.0

GUANETHIDINE MONOSULPHATE

Guanethidini monosulfas

$C_{10}H_{24}N_4O_4S$ M_r 296.4
[645-43-2]

DEFINITION

1-[2-(Hexahydroazocin-1(2*H*)-yl)ethyl]guanidine monosulphate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: colourless, crystalline powder.

Solubility: freely soluble in water, practically insoluble in ethanol (96 per cent).

mp: about 250 °C, with decomposition.

IDENTIFICATION

A. Dissolve about 25 mg in 25 ml of *water R*, add 20 ml of *picric acid solution R* and filter. The precipitate, washed with *water R* and dried at 100-105 °C, melts (*2.2.14*) at about 154 °C.

B. Dissolve about 25 mg in 5 ml of *water R*. Add 1 ml of *strong sodium hydroxide solution R*, 1 ml of *α-naphthol solution R* and, dropwise with shaking, 0.5 ml of *strong sodium hypochlorite solution R*. A bright pink precipitate is formed and becomes violet-red on standing.

C. It gives the reactions of sulphates (*2.3.1*).

TESTS

Solution S. Dissolve 0.4 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is not more intensely coloured than reference solution GY_6 (*2.2.2, Method II*).

pH (*2.2.3*): 4.7 to 5.5 for solution S.

Oxidisable substances. In a conical, ground-glass-stoppered flask, dissolve 1.0 g in 25 ml of *water R* and add 25 ml of *dilute sodium hydroxide solution R*. Allow to stand for 10 min and add 1 g of *potassium bromide R* and 1 ml of *0.0083 M potassium bromate*. Acidify with 30 ml of *dilute hydrochloric acid R*. Mix and allow to stand in the dark for 5 min. Add 2 g of *potassium iodide R* and shake. Allow to stand for 2 min and titrate the liberated iodine with *0.05 M sodium thiosulphate*, using *starch solution R* as indicator. Not less than 0.3 ml of *0.05 M sodium thiosulphate* is required to decolorise the solution.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.00 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g, warming if necessary, in 30 ml of *anhydrous acetic acid R* and add 15 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 29.64 mg of $C_{10}H_{24}N_4O_4S$.

STORAGE

Protected from light.

corrected 6.0

GUAR

Cyamopsidis seminis pulvis

DEFINITION

Guar is obtained by grinding the endosperms of seeds of *Cyamopsis tetragonolobus* (L.) Taub. It consists mainly of guar galactomannan.

CHARACTERS

A white or almost white powder, yielding a mucilage of variable viscosity when dissolved in water, practically insoluble in alcohol.

IDENTIFICATION

A. Examined under a microscope in *glycerol R*, the substance to be examined (125) (*2.9.12*) shows pyriform to ovoid cells, usually isolated, having very thick walls around a central somewhat elongated lumen with granular contents, and smaller polyhedral cells, isolated or in clusters, with thinner walls.

B. In a conical flask place 2 g, add rapidly 45 ml of *water R* and stir vigorously for 30 s. After 5-10 min a stiff gel forms which does not flow when the flask is inverted.

C. Mix a suspension of 0.1 g in 10 ml of *water R* with 1 ml of a 10 g/l solution of *disodium tetraborate R*; the mixture soon gels.

D. Examine by thin-layer chromatography (*2.2.27*), using a suitable silica gel as the coating substance.

Test solution. To 10 mg in a thick-walled, centrifuge test tube add 2 ml of a 100 g/l solution of *trifluoroacetic acid R*, shake vigorously to dissolve the forming gel, stopper the test tube and heat the mixture at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant liquid carefully into a 50 ml flask, add 10 ml of *water R* and evaporate the solution to dryness under reduced pressure. To the resulting clear film add 0.1 ml of *water R* and 0.9 ml of *methanol R*. Centrifuge to separate the amorphous precipitate. Dilute the supernatant liquid, if necessary, to 1 ml with *methanol R*.

Reference solution. Dissolve 10 mg of *galactose R*, 10 mg of *mannose R* in 2 ml of *water R* and dilute to 20 ml with *methanol R*.

Apply separately to the plate as bands 5 µl of each solution. Develop over a path of 15 cm using a mixture of 15 volumes of *water R* and 85 volumes of *acetonitrile R*. Spray with *aminohippuric acid reagent R* and dry the plate at 120 °C for 5 min. The chromatogram obtained with the reference solution shows in the lower part, two clearly separated brownish zones (galactose and mannose in order of increasing R_F value). The chromatogram obtained with the test solution shows two zones corresponding to galactose and mannose.

TESTS

Tragacanth, sterculia gum, agar, alginates, carrageenan. To a small amount of the substance to be examined add 0.2 ml of freshly prepared *ruthenium red solution R*. Examined under a microscope the cell walls do not stain red.

Protein. Not more than 8.0 per cent. Carry out the determination of nitrogen by the method of sulphuric acid digestion (*2.5.9*) using 0.170 g. Multiply the result by 6.25.

Apparent viscosity. Moisten 1.00 g calculated with reference to the dried substance with 2.5 ml of *2-propanol R*. While stirring, dilute to 100.0 ml with *water R*. After 1 h, determine the viscosity (*2.2.10*) using a rotating viscometer at 20 °C and a shear rate of 100 s^{-1}. The apparent viscosity is not less than 85 per cent and not more than 115 per cent of the value stated on the label.

Loss on drying (*2.2.32*). Not more than 15.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 5 h.

Total ash (*2.4.16*). Not more than 1.8 per cent.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^4 micro-organisms per gram, determined by plate count. It complies with the tests for *Escherichia coli* and for *Salmonella* (*2.6.13*).

LABELLING

The label states the apparent viscosity in millipascal seconds for a 10 g/l solution.

01/2008:0908
corrected 6.0

GUAR GALACTOMANNAN

Guar galactomannanum

DEFINITION

Guar galactomannan is obtained from the seeds of *Cyamopsis tetragonolobus* (L.) Taub. by grinding of the endosperms and subsequent partial hydrolysis. The main components are polysaccharides composed of D-galactose and D-mannose at molecular ratios of 1:1.4 to 1:2. The molecules consist of a linear main chain of β-(1→4)-glycosidically linked mannopyranoses and single α-(1→6)-glycosidically linked galactopyranoses.

CHARACTERS

A yellowish-white powder, soluble in cold water and in hot water, practically insoluble in organic solvents.

IDENTIFICATION

A. Mix 5 g of solution S (see Tests) with 0.5 ml of a 10 g/l solution of *disodium tetraborate R*. A gel forms within a short time.

B. Heat 20 g of solution S in a water-bath for 10 min. Allow to cool and adjust to the original mass with *water R*. The solution does not gel.

C. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution. To 10 mg of the substance to be examined in a thick-walled centrifuge tube add 2 ml of a 230 g/l solution of *trifluoroacetic acid R*, shake vigorously to dissolve the forming gel, stopper the test tube and heat the mixture at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant liquid carefully into a 50 ml flask, add 10 ml of *water R* and evaporate the solution to dryness under reduced pressure. Take up the residue in 10 ml of *water R* and evaporate again to dryness under reduced pressure. To the resulting clear film, which has no odour of acetic acid, add 0.1 ml of *water R* and 1 ml of *methanol R*. Centrifuge to separate the amorphous precipitate. Dilute the supernatant liquid, if necessary, to 1 ml with *methanol R*.

Reference solution. Dissolve 10 mg of *galactose R* and 10 mg of *mannose R* in 2 ml of *water R* and dilute to 10 ml with *methanol R*.

Apply separately to the plate, as bands 20 mm by 3 mm, 5 µl of each solution. Develop over a path of 15 cm using a mixture of 15 volumes of *water R* and 85 volumes of *acetonitrile R*. Spray with *aminohippuric acid reagent R* and heat at 120 °C for 5 min. The chromatogram obtained with the reference solution shows in the lower part two clearly separated brownish zones (galactose and mannose in order of increasing R_F value). The chromatogram obtained with the test solution shows two zones corresponding to galactose and mannose.

TESTS

Solution S. Moisten 1.0 g with 2 ml of *2-propanol R*. While stirring, dilute with *water R* to 100 g and stir until the substance is uniformly dispersed. Allow to stand for at least 1 h. If the apparent viscosity is below 200 mPa·s, use 3.0 g of substance instead of 1.0 g.

pH (*2.2.3*). The pH of solution S is 5.5 to 7.5.

Apparent viscosity. Moisten a quantity of the substance to be examined equivalent to 2.00 g of the dried substance with 2.5 ml of *2-propanol R* and, while stirring, dilute to 100.0 ml with *water R*. After 1 h, determine the viscosity (*2.2.10*) using a rotating viscometer at 20 °C and a shear rate of 100 s^{-1}. The apparent viscosity is not less than 75 per cent and not more than 140 per cent of the value stated on the label.

Insoluble matter. In a 250 ml flask disperse, while stirring, 1.50 g in a mixture of 1.6 ml of *sulphuric acid R* and 150 ml of *water R* and weigh. Immerse the flask in a water-bath and heat under a reflux condenser for 6 h. Adjust to the original mass with *water R*. Filter the hot solution through a tared, sintered-glass filter (160) (*2.1.2*). Rinse the filter with hot *water R* and dry at 100 °C to 105 °C. The residue weighs not more than 105 mg (7.0 per cent).

Protein. Not more than 5.0 per cent. Carry out the determination of nitrogen by sulphuric acid digestion (*2.5.9*), using 0.400 g of substance. Multiply the result by 6.25.

Tragacanth, sterculia gum, agar, alginates and carrageenan. To a small amount of the substance to be examined, add 0.2 ml of freshly prepared *ruthenium red solution R*. Examined under a microscope, none of the structures are stained red.

Loss on drying (*2.2.32*). Not more than 15.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 5 h.

Total ash (*2.4.16*). Not more than 1.8 per cent, determined on 1.00 g after wetting with 10 ml of *water R*.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 micro-organisms per gram, determined by plate-count. It complies with the tests for *Escherichia coli* and for *Salmonella* (*2.6.13*).

LABELLING

The label states the apparent viscosity in millipascal seconds for a 20 g/l solution.

HAEMODIALYSIS SOLUTIONS, CONCENTRATED, WATER FOR DILUTING

Aqua ad dilutionem solutionum concentratarum ad haemodialysim

The following monograph is given for information.

The analytical methods described and the limits proposed are intended to be used for validating the procedure for obtaining the water.

DEFINITION

Water for diluting concentrated haemodialysis solutions is obtained from potable water by distillation, by reverse osmosis, by ion exchange or by any other suitable method. The conditions of preparation, transfer and storage are designed to minimise the risk of chemical and microbial contamination.

When water obtained by one of the methods described above is not available, potable water may be used for home dialysis. Because the chemical composition of potable water varies considerably from one locality to another, consideration must be given to its chemical composition to enable adjustments to be made to the content of ions so that the concentrations in the diluted solution correspond to the intended use.

Attention has also to be paid to the possible presence of residues from water treatment (for example, chloramines) and volatile halogenated hydrocarbons.

For the surveillance of the quality of water for diluting concentrated haemodialysis solutions, the following methods may be used to determine the chemical composition and/or to detect the presence of possible contaminants together with suggested limits to be obtained.

CHARACTERS

Clear, colourless, tasteless liquid.

TESTS

Acidity or alkalinity. To 10 ml of the water to be examined, freshly boiled and cooled in a borosilicate glass flask, add 0.05 ml of *methyl red solution R*. The solution is not red. To 10 ml of the water to be examined add 0.1 ml of *bromothymol blue solution R1*. The solution is not blue.

Oxidisable substances. To 100 ml of the water to be examined add 10 ml of *dilute sulphuric acid R* and 0.1 ml of *0.02 M potassium permanganate* and boil for 5 min. The solution remains faintly pink.

Total available chlorine: maximum 0.1 ppm.

In a 125 ml test-tube (A), place successively 5 ml of *buffer solution pH 6.5 R*, 5 ml of *diethylphenylenediamine sulphate solution R* and 1 g of *potassium iodide R*. In a second 125 ml test-tube (B), place successively 5 ml of *buffer solution pH 6.5 R* and 5 ml of *diethylphenylenediamine sulphate solution R*. Add as simultaneously as possible to tube A 100 ml of the water to be examined and to tube B a reference solution prepared as follows: to 1 ml of a 10 mg/l solution of *potassium iodate R*, add 1 g of *potassium iodide R* and 1 ml of *dilute sulphuric acid R*; allow to stand for 1 min, add 1 ml of *dilute sodium hydroxide solution R* and dilute to 100 ml with *water R*. Any colour in the mixture obtained with the water to be examined is not more intense than that in the mixture obtained with the reference solution.

Chlorides (*2.4.4*): maximum 50 ppm.

Dilute 1 ml of the water to be examined to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Fluorides: maximum 0.2 ppm.

Potentiometry (*2.2.36, Method I*): use as indicator electrode a fluoride-selective solid-membrane electrode and as reference electrode a silver-silver chloride electrode.

Test solution. The water to be examined.

Reference solutions. Dilute 2.0 ml, 4.0 ml and 10.0 ml of *fluoride standard solution (1 ppm F) R* respectively to 20.0 ml with *total-ionic-strength-adjustment buffer R1*.

Carry out the measurement of each solution.

Nitrates: maximum 2 ppm.

Dilute 2 ml of the water to be examined to 100 ml with *nitrate-free water R*. Place 5 ml of the dilution in a test-tube immersed in iced water, add 0.4 ml of a 100 g/l solution of *potassium chloride R* and 0.1 ml of *diphenylamine solution R* and then, dropwise and with shaking, 5 ml of *sulphuric acid R*. Transfer the tube to a water-bath at 50 °C. Allow to stand for 15 min. Any blue colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using a mixture of 0.1 ml of *nitrate standard solution (2 ppm NO_3) R* and 4.9 ml of *nitrate-free water R*.

Sulphates (*2.4.13*): maximum 50 ppm.

Dilute 3 ml of the water to be examined to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates.

Aluminium (*2.4.17*): maximum 10 µg/l.

Prescribed solution. To 400 ml of the water to be examined add 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Reference solution. Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Ammonium: maximum 0.2 ppm.

To 20 ml of the water to be examined in a flat-bottomed and transparent tube, add 1 ml of *alkaline potassium tetraiodomercurate solution R*. Allow to stand for 5 min. The solution is not more intensely coloured than a standard prepared at the same time and in the same manner using a mixture of 4 ml of *ammonium standard solution (1 ppm NH_4) R* and 16 ml of *ammonium-free water R*. Examine the solutions along the vertical axis of the tube.

Calcium: maximum 2.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. The water to be examined.

Reference solutions. Prepare reference solutions (1 ppm to 5 ppm) using *calcium standard solution (400 ppm Ca) R*.

Source: calcium hollow-cathode lamp.

Wavelength: 422.7 nm.

Atomisation device: oxidising air-acetylene flame.

Magnesium: maximum 2.0 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dilute 10 ml of the water to be examined to 100 ml with *distilled water R*.

Reference solutions. Prepare reference solutions (0.1 ppm to 0.5 ppm) using *magnesium standard solution (100 ppm Mg) R*.

Source: magnesium hollow-cathode lamp.

Wavelength: 285.2 nm.

Atomisation device: oxidising air-acetylene flame.

Mercury: maximum 0.001 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Add 5 ml of *nitric acid R* per litre of the water to be examined. In a 50 ml borosilicate glass flask with a ground-glass-stopper, place 20 ml of the water to be examined and add 1 ml of *dilute nitric acid R* and shake. Add 0.3 ml of *bromine water R1*. Stopper the flask, shake and heat the stoppered flask at 45 °C for 4 h. Allow to cool. If the solution does not become yellow, add 0.3 ml of *bromine water R1* and re-heat at 45 °C for 4 h. Add 0.5 ml of a freshly prepared 10 g/l solution of *hydroxylamine hydrochloride R*. Shake. Allow to stand for 20 min.

Reference solutions. Use freshly prepared reference solutions (0.0005 ppm to 0.002 ppm) obtained by diluting *mercury standard solution (1000 ppm Hg) R* with a 5 per cent *V/V* solution of *dilute nitric acid R* and treat as described for the test solution.

To a volume of solution suitable for the instrument to be used, add *stannous chloride solution R2* equal to 1/5 of this volume. Fit immediately the device for the entrainment of the mercury vapour. Wait 20 s and pass through the device a stream of *nitrogen R* as the carrier gas.

Source: mercury hollow-cathode tube or a discharge lamp.

Wavelength: 253.7 nm.

Atomisation device: flameless system whereby the mercury can be entrained in the form of cold vapour.

Potassium: maximum 2.0 ppm.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution (a). Dilute 50.0 ml of the water to be examined to 100 ml with *distilled water R*. Carry out a determination using this solution. If the potassium content is more than 0.75 mg/l, further dilute the water to be examined with *distilled water R*.

Test solution (b). Take 50.0 ml of the water to be examined or, if necessary, the water to be examined diluted as described in the preparation of test solution (a). Add 1.25 ml of *potassium standard solution (20 ppm K) R* and dilute to 100.0 ml with *distilled water R*.

Reference solutions. Prepare reference solutions (0 ppm; 0.25 ppm; 0.50 ppm; 0.75 ppm; 1 ppm) using *potassium standard solution (20 ppm K) R*.

Wavelength: 766.5 nm.

Calculate the potassium content of the water to be examined in parts per million from the expression:

$$\frac{p \times n_1 \times 0.5}{n_2 - n_1}$$

p = dilution factor used for the preparation of test solution (a),

n_1 = measured value of test solution (a),

n_2 = measured value of test solution (b).

Sodium: maximum 50.0 ppm.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution. The water to be examined. If the sodium content is more than 10 mg/l, dilute with *distilled water R* to obtain a concentration suitable for the apparatus used.

Reference solutions. Prepare reference solutions (0 ppm; 2.5 ppm; 5.0 ppm; 7.5 ppm; 10 ppm) using *sodium standard solution (200 ppm Na) R*.

Wavelength: 589 nm.

Zinc: maximum 0.1 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*): use sampling and analytical equipment free from zinc or not liable to yield zinc under the conditions of use.

Test solution. The water to be examined.

Reference solutions. Prepare reference solutions (0.05 ppm to 0.15 ppm) using *zinc standard solution (100 ppm Zn) R*.

Source: zinc hollow-cathode lamp.

Wavelength: 213.9 nm.

Atomisation device: oxidising air-acetylene flame.

Heavy metals (*2.4.8*): maximum 0.1 ppm.

Heat 200 ml of the water to be examined in a glass evaporating dish on a water-bath until the volume is reduced to 20 ml. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^2 micro-organisms per millilitre, determined by plate count.

Bacterial endotoxins (*2.6.14*): less than 0.25 IU/ml.

01/2008:0128

HAEMODIALYSIS, SOLUTIONS FOR

Solutiones ad haemodialysim

DEFINITION

Solutions for haemodialysis are solutions of electrolytes with a concentration close to the electrolytic composition of plasma. Glucose may be included in the formulation.

Because of the large volumes used, haemodialysis solutions are usually prepared by diluting a concentrated solution with water of suitable quality (see the monograph on *Haemodialysis solutions concentrated, water for diluting (1167)*), using for example an automatic dosing device.

Concentrated solutions for haemodialysis

Concentrated haemodialysis solutions are prepared and stored using materials and methods designed to produce solutions having as low a degree of microbial contamination as possible. In certain circumstances, it may be necessary to use sterile solutions.

During dilution and use, precautions are taken to avoid microbial contamination. Diluted solutions are to be used immediately after preparation.

Concentrated solutions for haemodialysis are supplied in:

– rigid, semi-rigid or flexible plastic containers,

– glass containers.

Three types of concentrated solutions are used:

1. Concentrated solutions with acetate or lactate

Several formulations of concentrated solutions are used. The concentrations of the components in the solutions are such that after dilution to the stated volume the concentrations of the components per litre are usually in the following ranges:

Table 0128.-1.

	Expression in mmol	Expression in mEq
Sodium	130 - 145	130 - 145
Potassium	0 - 3.0	0 - 3.0
Calcium	0 - 2.0	0 - 4.0
Magnesium	0 - 1.2	0 - 2.4
Acetate or lactate	32 - 45	32 - 45
Chloride	90 - 120	90 - 120
Glucose	0 - 12.0	

Concentrated solutions with acetate or lactate are diluted before use.

2. Concentrated acidic solutions

Several formulations of concentrated solutions are used. The concentrations of the components in the solutions are such that after dilution to the stated volume and before neutralisation with sodium hydrogen carbonate the concentrations of the components per litre are usually in the following ranges:

Table 0128.-2.

	Expression in mmol	Expression in mEq
Sodium	80 - 110	80 - 110
Potassium	0 - 3.0	0 - 3.0
Calcium	0 - 2.0	0 - 4.0
Magnesium	0 - 1.2	0 - 2.4
Acetic acid	2.5 - 10	2.5 - 10
Chloride	90 - 120	90 - 120
Glucose	0 - 12.0	

Sodium hydrogen carbonate must be added immediately before use to a final concentration of not more than 45 mmol/l. The concentrated solution of sodium hydrogen carbonate is supplied in a separate container. The concentrated acidic solutions and the concentrated solutions of sodium hydrogen carbonate are diluted and mixed immediately before use using a suitable device. Alternatively, solid sodium hydrogen carbonate may be used to prepare the solution.

3. Concentrated solutions without buffer

Several formulations of concentrated solutions without buffer are used. The concentrations of the components in the solutions are such that after dilution to the stated volume, the concentrations of the components per litre are usually in the following ranges:

Table 0128.-3.

	Expression in mmol	Expression in mEq
Sodium	130 - 145	130 - 145
Potassium	0 - 3.0	0 - 3.0
Calcium	0 - 2.0	0 - 4.0
Magnesium	0 - 1.2	0 - 2.4
Chloride	130 - 155	130 - 155
Glucose	0 - 12.0	

Concentrated solutions without buffer are used together with parenteral administration of suitable hydrogen carbonate solutions.

IDENTIFICATION

According to the stated composition, the solution to be examined gives the following identification reactions (*2.3.1*):

- potassium: reaction (b);
- calcium: reaction (a);
- sodium: reaction (b);
- chlorides: reaction (a);
- lactates;
- carbonates and hydrogen carbonates;
- acetates:
  - if the solution is free from glucose, use reaction (b),
  - if the solution contains glucose, use the following method: to 5 ml of the solution to be examined add 1 ml of *hydrochloric acid R* in a test tube fitted with a stopper and a bent tube, heat and collect a few millilitres of distillate; carry out reaction (b) of acetates on the distillate;
- magnesium: to 0.1 ml of *titan yellow solution R* add 10 ml of *water R*, 2 ml of the solution to be examined and 1 ml of a 4.2 g/l solution of *sodium hydroxide R*; a pink colour is produced;
- glucose: to 5 ml of the solution to be examined, add 2 ml of *dilute sodium hydroxide solution R* and 0.05 ml of *copper sulphate solution R*; the solution is blue and clear; heat to boiling; an abundant red precipitate is formed.

TESTS

Appearance of solution. The solution to be examined is clear (*2.2.1*). If it does not contain glucose, it is colourless (*2.2.2, Method I*). If it contains glucose, it is not more intensely coloured than reference solution Y_7 (*2.2.2, Method I*).

Aluminium (*2.4.17*): maximum 0.1 mg/l.

Prescribed solution. Take 20 ml of the solution to be examined, adjust to pH 6.0 and add 10 ml of *acetate buffer solution pH 6.0 R*.

Reference solution. Mix 1 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 9 ml of *water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 10 ml of *water R*.

Extractable volume (*2.9.17*). The volume measured is not less than the nominal volume stated on the label.

Sterility (*2.6.1*). If the label states that the concentrated haemodialysis solution is sterile, it complies with the test for sterility.

Bacterial endotoxins (*2.6.14*): less than 0.5 IU/ml in the solution diluted for use.

Pyrogens (*2.6.8*). Solutions for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Dilute the solution to be examined with *water for injections R* to the concentration prescribed for use. Inject 10 ml of the solution per kilogram of the rabbit's mass.

ASSAY

Determine the density (2.2.5) of the concentrated solution and calculate the content in grams per litre and in millimoles per litre.

Sodium: 97.5 per cent to 102.5 per cent of the content of sodium (Na) stated on the label.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution. Dilute 5.0 ml of the solution to be examined to 100.0 ml with *water R*. Dilute 2.0 ml of this solution to 50.0 ml with *water R*. To 1.0 ml of this solution add 10 ml of *lanthanum chloride solution R* and dilute to 100.0 ml with *water R*.

Reference solutions. Into 4 identical volumetric flasks each containing 10 ml of *lanthanum chloride solution R*, introduce respectively 1.0 ml, 2.0 ml, 4.0 ml and 5.0 ml of *sodium standard solution (10 ppm Na) R* and dilute to 100.0 ml with *water R*.

Wavelength: 589.0 nm.

Potassium: 95.0 per cent to 105.0 per cent of the content of potassium (K) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dilute with *water R* an accurately weighed quantity of the solution to be examined to a concentration suitable for the instrument to be used. To 100 ml of this solution add 10 ml of a 22 g/l solution of *sodium chloride R*.

Reference solutions. Prepare the reference solutions using *potassium standard solution (100 ppm K) R*. To 100 ml of each reference solution add 10 ml of a 22 g/l solution of *sodium chloride R*.

Source: potassium hollow-cathode lamp.

Wavelength: 766.5 nm.

Atomisation device: air-acetylene flame.

Calcium: 95.0 per cent to 105.0 per cent of the content of calcium (Ca) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dilute 5.0 ml of the solution to be examined to 100.0 ml with *water R*. To 3.0 ml of this solution add 5 ml of *lanthanum chloride solution R* and dilute to 50.0 ml with *water R*.

Reference solutions. Into 4 keep volumetric flasks each containing 5 ml of *lanthanum chloride solution R*, introduce respectively 2.5 ml, 5.0 ml, 7.0 ml and 10.0 ml of *calcium standard solution (10 ppm Ca) R* and dilute to 50.0 ml with *water R*.

Source: calcium hollow-cathode lamp.

Wavelength: 422.7 nm.

Atomisation device: air-acetylene flame.

Magnesium: 95.0 per cent to 105.0 per cent of the content of magnesium (Mg) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dilute 5.0 ml of the solution to be examined to 100.0 ml with *water R*. To 2.0 ml of this solution add 5 ml of *lanthanum chloride solution R* and dilute to 50.0 ml with *water R*.

Reference solutions. Into 4 identical volumetric flasks each containing 5 ml of *lanthanum chloride solution R*, introduce respectively 1.0 ml, 2.0 ml, 3.0 ml and 4.0 ml of *magnesium standard solution (10 ppm Mg) R* and dilute to 50.0 ml with *water R*.

Source: magnesium hollow-cathode lamp.

Wavelength: 285.2 nm.

Atomisation device: air-acetylene flame.

Total chloride: 95.0 per cent to 105.0 per cent of the content of chloride (Cl) stated on the label.

Dilute to 50 ml with *water R* an accurately measured volume of the solution to be examined containing the equivalent of about 60 mg of chloride. Add 5 ml of *dilute nitric acid R*, 25.0 ml of *0.1 M silver nitrate* and 2 ml of *dibutyl phthalate R*. Shake. Using 2 ml of *ferric ammonium sulphate solution R2* as indicator, titrate with *0.1 M ammonium thiocyanate* until a reddish-yellow colour is obtained.

1 ml of *0.1 M silver nitrate* is equivalent to 3.545 mg of Cl.

Acetate: 95.0 per cent to 105.0 per cent of the content of acetate stated on the label.

To a volume of the solution to be examined, corresponding to about 0.7 mmol of acetate, add 10.0 ml of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of acetate.

Lactate: 95.0 per cent to 105.0 per cent of the content of lactate stated on the label.

To a volume of the solution to be examined, corresponding to about 0.7 mmol of lactate, add 10.0 ml of *0.1 M hydrochloric acid*. Then add 50 ml of *acetonitrile R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of lactate.

Sodium hydrogen carbonate: 95.0 per cent to 105.0 per cent of the content of sodium hydrogen carbonate stated on the label.

Titrate with *0.1 M hydrochloric acid* a volume of the solution to be examined corresponding to about 0.1 g of sodium hydrogen carbonate, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M hydrochloric acid* is equivalent to 8.40 mg of $NaHCO_3$.

Reducing sugars (expressed as anhydrous glucose): 95.0 per cent to 105.0 per cent of the content of glucose stated on the label.

Transfer a volume of the solution to be examined containing the equivalent of 25 mg of glucose to a 250 ml conical flask with a ground-glass neck and add 25.0 ml of *cupri-citric solution R*. Add a few grains of pumice, fit a reflux condenser, heat so that boiling occurs within 2 min and maintain boiling for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 ml of *water R*. Carefully add, in small amounts, 25 ml of a 25 per cent *m/m* solution of *sulphuric acid R*. Titrate with *0.1 M sodium thiosulphate* using *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration using 25.0 ml of *water R*.

Calculate the content of reducing sugars, expressed as anhydrous glucose ($C_6H_{12}O_6$), using Table 0128.-4:

Table 0128.-4.

Volume of *0.1 M sodium thiosulphate* (ml)	Anhydrous glucose (mg)
8	19.8
9	22.4
10	25.0
11	27.6
12	30.3
13	33.0
14	35.7
15	38.5
16	41.3

STORAGE

Store at a temperature not below 4 °C.

LABELLING

The label states:

- the formula of the concentrated solution for haemodialysis expressed in grams per litre and in millimoles per litre,
- the nominal volume of the solution in the container,
- where applicable, that the concentrated solution is sterile,
- the storage conditions,
- that the concentrated solution is to be diluted immediately before use,
- the dilution to be made,
- that the volume taken for use is to be measured accurately,
- the ionic formula for the diluted solution ready for use in millimoles per litre,
- that any unused portion of solution is to be discarded,
- where applicable, that sodium hydrogen carbonate is to be added before use.

01/2008:0861

HAEMOFILTRATION AND FOR HAEMODIAFILTRATION, SOLUTIONS FOR

Solutiones ad haemocolaturam haemodiacolaturamque

DEFINITION

Solutions for haemofiltration and for haemodiafiltration are preparations for parenteral use containing electrolytes with a concentration close to the electrolytic composition of plasma. Glucose may be included in the formulation.

Solutions for haemofiltration and for haemodiafiltration are supplied in:

- rigid or semi-rigid plastic containers,
- flexible plastic containers inside closed protective envelopes,
- glass containers.

The containers and closures comply with the requirements for containers for preparations for parenteral use (*3.2. Containers*).

In haemofiltration and haemodiafiltration, the following formulations are used. The concentrations of the components per litre of solution are usually in the following range:

Table 0861.-1.

	Expression in mmol	Expression in mEq
Sodium	125 - 150	125 - 150
Potassium	0 - 4.5	0 - 4.5
Calcium	1.0 - 2.5	2.0 - 5.0
Magnesium	0.25 - 1.5	0.50 - 3.0
Acetate and/or lactate and/or hydrogen carbonate	30 - 60	30 - 60
Chloride	90 - 120	90 - 120
Glucose	0 - 25	

When hydrogen carbonate is present, the solution of sodium hydrogen carbonate is supplied in a container or a separate compartment and is added to the electrolyte solution immediately before use.

In haemofiltration and in haemodiafiltration, the following formulations may also be used:

Table 0861.-2.

	Expression in mmol	Expression in mEq
Sodium	130 - 167	130 - 167
Potassium	0 - 4.0	0 - 4.0
Hydrogen carbonate	20 - 167	20 - 167
Chloride	0 - 147	0 - 147

Antioxidants such as metabisulphite salts are not added to the solutions.

IDENTIFICATION

According to the stated composition, the solution to be examined gives the following identification reactions (*2.3.1*):

- potassium: reaction (b);
- calcium: reaction (a);
- sodium: reaction (b);
- chlorides: reaction (a);
- acetates:

  if the solution is free from glucose, use reaction (b),

  if the solution contains glucose, use the following method: to 5 ml of the solution to be examined add 1 ml of *hydrochloric acid R* in a test-tube fitted with a stopper and a bent tube, heat and collect a few millilitres of distillate; carry out reaction (b) of acetates on the distillate;
- lactates;
- carbonates and hydrogen carbonates;
- magnesium: to 0.1 ml of *titan yellow solution R* add 10 ml of *water R*, 2 ml of the solution to be examined and 1 ml of *1 M sodium hydroxide*; a pink colour is produced;
- glucose: to 5 ml of the solution to be examined, add 2 ml of *dilute sodium hydroxide solution R* and 0.05 ml of *copper sulphate solution R*; the solution is blue and clear; heat to boiling; an abundant red precipitate is formed.

TESTS

Appearance of solution. The solution is clear (*2.2.1*). If it does not contain glucose, it is colourless (*2.2.2, Method I*). If it contains glucose, it is not more intensely coloured than reference solution Y_7 (*2.2.2, Method I*).

pH (*2.2.3*). The pH of the solution is 5.0 to 7.5. If the solution contains glucose, the pH is 4.5 to 6.5. If the solution contains hydrogen carbonate, the pH is 7.0 to 8.5.

Hydroxymethylfurfural. To a volume of the solution containing the equivalent of 25 mg of glucose, add 5.0 ml of a 100 g/l solution of *p-toluidine R* in *2-propanol R* containing 10 per cent *V/V* of *glacial acetic acid R* and 1.0 ml of a 5 g/l solution of *barbituric acid R*. The absorbance (*2.2.25*), determined at 550 nm after allowing the mixture to stand for 2 min to 3 min, is not greater than that of a standard prepared at the same time in the same manner using a solution containing 10 µg of *hydroxymethylfurfural R* in the same volume as the solution to be examined. If the solution contains hydrogen carbonate, use as the standard a solution containing 20 µg of *hydroxymethylfurfural R*.

Aluminium (*2.4.17*). Take 200 ml, adjust to pH 6.0 and add 10 ml of *acetate buffer solution pH 6.0 R*. The solution complies with the limit test for aluminium (10 µg/l). Use as the reference solution a mixture of 1 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 9 ml of *water R*. To prepare the blank use a mixture of 10 ml of *acetate buffer solution pH 6.0 R* and 10 ml of *water R*.

Particulate contamination. Carry out the test for sub-visible particles (*2.9.19*) using 50 ml of solution.

Table 0861.-3.

Particles larger than	10 µm	25 µm
Maximum number of particles per millilitre	25	3

Extractable volume (*2.9.17*). The solution complies with the test prescribed for parenteral infusions.

Sterility (*2.6.1*). The solution complies with the test for sterility.

Bacterial endotoxins (*2.6.14*): less than 0.25 IU/ml.

Pyrogens (*2.6.8*). Solutions for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 ml of the solution.

ASSAY

Sodium: 97.5 per cent to 102.5 per cent of the content of sodium (Na) stated on the label, determined by atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions. Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*.

Measure the absorbance at 589.0 nm using a sodium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Potassium. 95.0 per cent to 105.0 per cent of the content of potassium (K) stated on the label, determined by atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used. To 100 ml of the solution add 10 ml of a 22 g/l solution of *sodium chloride R*.

Reference solutions. Prepare the reference solutions using *potassium standard solution (100 ppm K) R*. To 100 ml of each reference solution add 10 ml of a 22 g/l solution of *sodium chloride R*.

Measure the absorbance at 766.5 nm using a potassium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Calcium. 95.0 per cent to 105.0 per cent of the content of calcium (Ca) stated on the label, determined by atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions. Prepare the reference solutions using *calcium standard solution (400 ppm Ca) R*.

Measure the absorbance at 422.7 nm using a calcium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Magnesium. 95.0 per cent to 105.0 per cent of the content of magnesium (Mg) stated on the label, determined by atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions. Prepare the reference solutions using *magnesium standard solution (100 ppm Mg) R*.

Measure the absorbance at 285.2 nm using a magnesium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Total chloride: 95.0 per cent to 105.0 per cent of the content of chloride (Cl) stated on the label. Dilute to 50 ml with *water R* an accurately measured volume of the solution to be examined containing the equivalent of about 60 mg of chloride. Add 5 ml of *dilute nitric acid R*, 25.0 ml of *0.1 M silver nitrate* and 2 ml of *dibutyl phthalate R*. Shake. Using 2 ml of *ferric ammonium sulphate solution R2* as indicator, titrate with *0.1 M ammonium thiocyanate* until a reddish–yellow colour is obtained.

1 ml of *0.1 M silver nitrate* is equivalent to 3.545 mg of Cl.

Acetate: 95.0 per cent to 105.0 per cent of the content of acetate stated on the label. To a volume of the solution to be examined, corresponding to about 0.7 mmol of acetate, add 10.0 ml of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of acetate.

Lactate: 95.0 per cent to 105.0 per cent of the content of lactate stated on the label. To a volume of the solution to be examined, corresponding to about 0.7 mmol of lactate, add 10.0 ml of *0.1 M hydrochloric acid*. Add 50 ml of *acetonitrile R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of lactate.

Sodium hydrogen carbonate: 95.0 per cent to 105.0 per cent of the content of sodium hydrogen carbonate stated on the label. Titrate with *0.1 M hydrochloric acid*, a volume of the solution to be examined corresponding to about 0.1 g of sodium hydrogen carbonate, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M hydrochloric acid* is equivalent to 8.40 mg of $NaHCO_3$.

Lactate and hydrogen carbonate: 95.0 per cent to 105.0 per cent of the content of lactates and/or hydrogen carbonates stated on the label. Examine by liquid chromatography (*2.2.29*).

Test solution. Solution to be examined.

Reference solution. Dissolve in 100 ml of *water for chromatography R* quantities of lactates and bicarbonates, accurately weighed, in order to obtain solutions having concentrations representing about 90 per cent, 100 per cent and 110 per cent of the concentrations indicated on the label.

The chromatographic procedure may be carried out using:

- a column 0.30 m long and 7.8 mm in internal diameter packed with *cation exchange resin R* (9 µm),
- as mobile phase at a flow rate of 0.6 ml/min *0.005 M sulphuric acid* previously degassed with *helium R*,
- a differential refractometer detector,

maintaining the temperature of the column at 85 °C.

Inject in duplicate 20 µl of test solution and 20 µl of each reference solution. When the chromatograms are recorded in the prescribed conditions, the peaks elute in the following order: lactates then hydrogen carbonates.

Determine the concentration of lactates and hydrogen carbonates in the test solution by interpolating the peak area for lactate and the peak height for hydrogen carbonate from the linear regression curve obtained with the reference solutions.

Reducing sugars (expressed as anhydrous glucose). 95.0 per cent to 105.0 per cent of the content of glucose stated on the label. Transfer a volume of the solution to be examined containing the equivalent of 25 mg of glucose to a 250 ml conical flask with a ground-glass neck and add 25.0 ml of *cupri-citric solution R*. Add a few grains of pumice, fit a reflux condenser, heat so that boiling occurs within 2 min and boil for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 ml of *water R*. Carefully add, in small amounts, 25 ml of a 25 per cent *m/m* solution of *sulphuric acid R*. Titrate with *0.1 M sodium thiosulphate* using *starch solution R*, added towards the end of titration, as indicator. Carry out a blank titration using 25.0 ml of *water R*.

Calculate the content of reducing sugars expressed as anhydrous glucose ($C_6H_{12}O_6$), using Table 0861.-4:

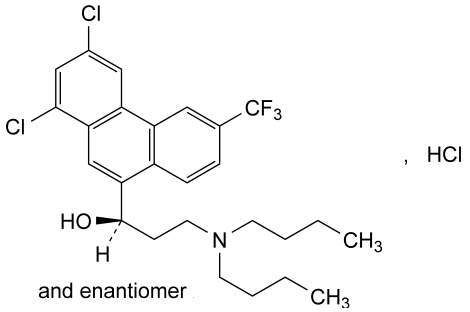
Table 0861.-4.

Volume of 0.1 M sodium thiosulphate (ml)	Anhydrous glucose (mg)
8	19.8
9	22.4
10	25.0
11	27.6
12	30.3
13	33.0
14	35.7
15	38.5
16	41.3

STORAGE

Store at a temperature not lower than 4 °C.

LABELLING



The label states:

- the formula of the solution for haemofiltration or haemodiafiltration, expressed in grams per litre and in millimoles per litre,
- the calculated osmolarity, expressed in milliosmoles per litre,
- the nominal volume of the solution for haemofiltration or haemodiafiltration in the container,
- that the solution is free from bacterial endotoxins, or where applicable, that it is apyrogenic,
- the storage conditions,
- that any unused portion of solution is to be discarded.

HALOFANTRINE HYDROCHLORIDE

Halofantrini hydrochloridum

$C_{26}H_{31}Cl_3F_3NO$ M_r 536.9
[36167-63-2]

DEFINITION

(1*RS*)-3-(Dibutylamino)-1-[1,3-dichloro-6-(trifluoromethyl)phenanthren-9-yl]propan-1-ol hydrochloride.

Content: 97.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in methanol, sparingly soluble in alcohol.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *halofantrine hydrochloride CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methyl ethyl ketone R*, evaporate to dryness and record new spectra using the residues.

B. It gives reaction (b) of chlorides (*2.3.1*).

TESTS

Optical rotation (*2.2.7*): – 0.10° to + 0.10°.

Dissolve 1.00 g in *alcohol R* and dilute to 100.0 ml with the same solvent.

Absorbance (*2.2.25*): maximum 0.085 at 450 nm.

Dissolve 0.200 g in *methanol R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 40.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 40.0 mg of *halofantrine hydrochloride CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of test solution (a) to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (d). Dissolve 10.0 mg of *halofantrine impurity C CRS* in the mobile phase and dilute to 25 ml with the mobile phase. To 5.0 ml of the solution, add 5.0 ml of reference solution (a) and dilute to 50.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.30 m, Ø = 3.9 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (10 µm) of irregular type, with a specific surface of 330 m^2/g, a pore size of 12.5 nm and a carbon loading of 9.8 per cent .

Mobile phase: mix 250 ml of a 2.0 g/l solution of *sodium hydroxide R*, previously adjusted to pH 2.5 with *perchloric acid R* and 750 ml of *acetonitrile R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 260 nm.

Injection: 20 µl; inject the test solution (a) and reference solutions (c) and (d).

Run time: 5 times the retention time of halofantrine which is about 6 min.

System suitability:

– *resolution*: minimum 3.3 between the peaks due to halofantrine and impurity C in the chromatogram obtained with reference solution (d).

Limits:

– *any impurity*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent),

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

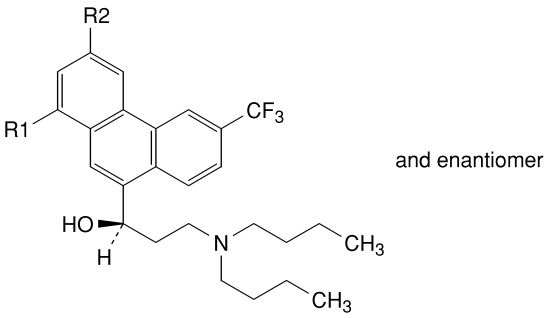
1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

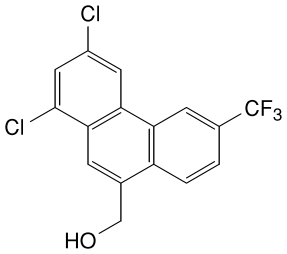
Liquid chromatography (*2.2.29*) as described in the test for related substances.



Injection: test solution (b) and reference solution (b).

Calculate the percentage content of halofantrine hydrochloride.

STORAGE

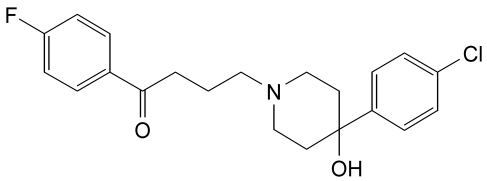


Protected from light.

IMPURITIES

A. R1 = H, R2 = Cl: (1*RS*)-1-[3-chloro-6-(trifluoromethyl)phenanthren-9-yl]-3-(dibutylamino)propan-1-ol (1-dechlorohalofantrine),

B. R1 = Cl, R2 = H: (1*RS*)-1-[1-chloro-6-(trifluoromethyl)phenanthren-9-yl]-3-(dibutylamino)propan-1-ol (3-dechlorohalofantrine),



C. [1,3-dichloro-6-(trifluoromethyl)phenanthren-9-yl]methanol.

corrected 6.0

HALOPERIDOL

Haloperidolum

$C_{21}H_{23}ClFNO_2$ M_r 375.9
[52-86-8]

DEFINITION

4-[4-(4-Chlorophenyl)-4-hydroxypiperidin-1-yl]-1-(4-fluorophenyl)butan-1-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, slightly soluble in ethanol (96 per cent), in methanol and in methylene chloride.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

A. Melting point (*2.2.14*): 150 °C to 153 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *haloperidol CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *haloperidol CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *haloperidol CRS* and 10 mg of *bromperidol CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC octadecylsilyl silica gel plate R.*

Mobile phase: *tetrahydrofuran R, methanol R,* 58 g/l solution of *sodium chloride R* (10:45:45 *V/V/V*).

Application: 1 µl.

Development: in an unsaturated tank, over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 2 spots which may, however, not be completely separated.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 10 mg in 5 ml of *anhydrous ethanol R*. Add 0.5 ml of *dinitrobenzene solution R* and 0.5 ml of *2 M alcoholic potassium hydroxide R*. A violet colour is produced and becomes brownish-red after 20 min.

E. To 0.1 g in a porcelain crucible add 0.5 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Dissolve 0.2 g in 20 ml of a 1 per cent *V/V* solution of *lactic acid R*.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use and protect from light.*

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *haloperidol CRS* and 2.5 mg of *bromperidol CRS* in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

Column:

– *size*: *l* = 0.1 m, Ø = 4.6 mm;

– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:

– *mobile phase A*: 17 g/l solution of *tetrabutylammonium hydrogen sulphate R1*;

– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	90 → 50	10 → 50
15 - 20	50	50
20 - 25	90	10

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 10 µl; inject *methanol R* as a blank.

Retention time: haloperidol = about 5.5 min; bromperidol = about 6 min.

System suitability: reference solution (a):

– *resolution*: minimum 3.0 between the peaks due to haloperidol and bromperidol; if necessary, adjust the concentration of acetonitrile in the mobile phase or adjust the time programme for the linear-gradient elution.

Limits:

– *impurities A, B, C, D, E, F*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent);

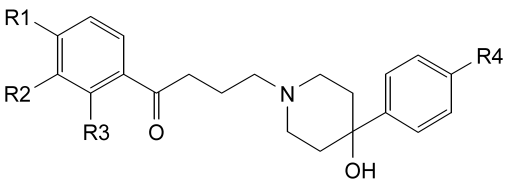
– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g using a platinum crucible.

ASSAY

Dissolve 0.300 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid*, using 0.2 ml of *naphtholbenzein solution R* as indicator.

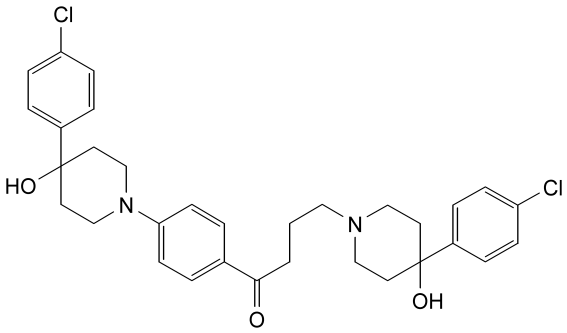


1 ml of *0.1 M perchloric acid* is equivalent to 37.59 mg of $C_{21}H_{23}ClFNO_2$.

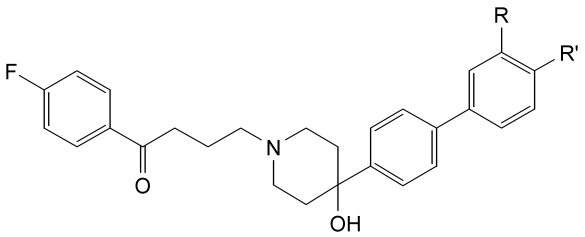
STORAGE

Protected from light.

IMPURITIES



Specified impurities: A, B, C, D, E, F.

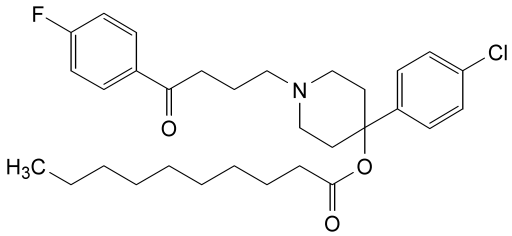


A. R1 = F, R2 = R3 = R4 = H: 1-(4-fluorophenyl)-4-(4-hydroxy-4-phenylpiperidin-1-yl)butan-1-one,

B. R1 = R2 = H, R3 = F, R4 = Cl: 4-[4-(4-chlorophenyl)-4-hydroxypiperidin-1-yl]-1-(2-fluorophenyl)butan-1-one,

C. R1 = F, R2 = C_2H_5, R3 = H, R4 = Cl: 4-[4-(4-chlorophenyl)-4-hydroxypiperidin-1-yl]-1-(3-ethyl-4-fluorophenyl)butan-1-one,

D. 4-[4-(4-chlorophenyl)-4-hydroxypiperidin-1-yl]-1-[4-[4-(4-chlorophenyl)-4-hydroxypiperidin-1-yl]phenyl]butan-1-one,



E. R = H, R′ = Cl: 4-[4-(4′-chlorobiphenyl-4-yl)-4-hydroxypiperidin-1-yl]-1-(4-fluorophenyl)butan-1-one,

F. R = Cl, R′ = H: 4-[4-(3′-chlorobiphenyl-4-yl)-4-hydroxypiperidin-1-yl]-1-(4-fluorophenyl)butan-1-one.

01/2008:1431

HALOPERIDOL DECANOATE

Haloperidoli decanoas

$C_{31}H_{41}ClFNO_3$ M_r 530.1
[74050-97-8]

DEFINITION

4-(4-Chlorophenyl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl decanoate.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, very soluble in ethanol (96 per cent), in methanol and in methylene chloride.

mp: about 42 °C.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Preparation: mulls in *liquid paraffin R*.
Comparison: *haloperidol decanoate CRS*.

B. To 0.1 g in a porcelain crucible add 0.5 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution B_5 (*2.2.2, Method II*).

Dissolve 2.0 g in *methylene chloride R* and dilute to 20 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use and protect from light.*

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2.5 mg of *bromperidol decanoate CRS* and 2.5 mg of *haloperidol decanoate CRS* in *methanol R*, then dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

Column:

– *size*: *l* = 0.1 m, Ø = 4.0 mm;
– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:

– *mobile phase A*: 27 g/l solution of *tetrabutylammonium hydrogen sulphate R*;
– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 30	80 → 40	20 → 60
30 - 35	40	60
35 - 40	40 → 80	60 → 20

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 230 nm.

Equilibration: with *acetonitrile R* for at least 30 min and then with the mobile phase at the initial composition for at least 5 min.

Injection: 10 µl; inject *methanol R* as a blank.

Retention time: haloperidol decanoate = about 24 min; bromperidol decanoate = about 24.5 min.

System suitability: reference solution (a):

– *resolution*: minimum 1.5 between the peaks due to haloperidol decanoate and bromperidol decanoate; if necessary, adjust the gradient or the time programme for the linear gradient elution.

Limits:

– *impurities A, B, C, D, E, F, G, H, I, J, K*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

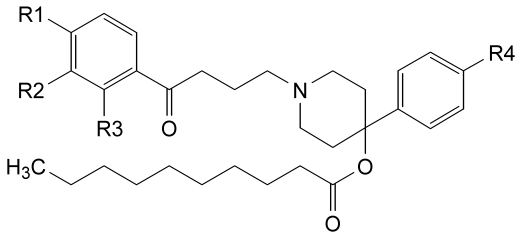
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 30 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.425 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid* using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of *0.1 M perchloric acid* is equivalent to 53.01 mg of $C_{31}H_{41}ClFNO_3$.

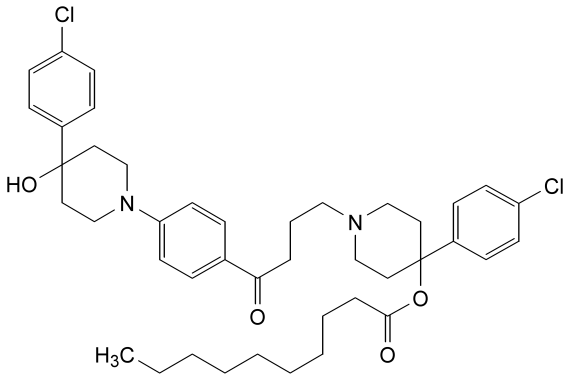


STORAGE

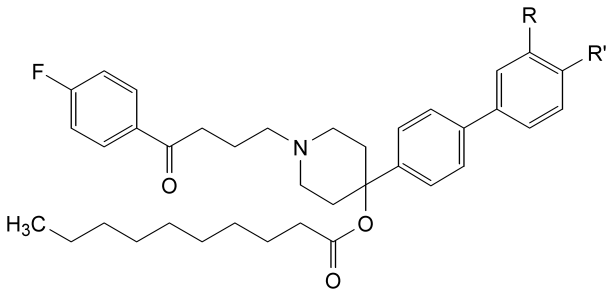
Protected from light, at a temperature below 25 °C.

IMPURITIES

Specified impurities: *A, B, C, D, E, F, G, H, I, J, K.*



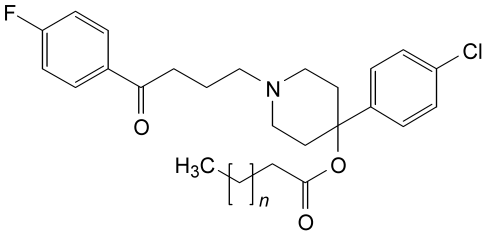
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *L.*



A. R1 = F, R2 = R3 = R4 = H: 1-[4-(4-fluorophenyl)-4-oxobutyl]-4-phenylpiperidin-4-yl decanoate,

B. R1 = R2 = H, R3 = F, R4 = Cl: 4-(4-chlorophenyl)-1-[4-(2-fluorophenyl)-4-oxobutyl]piperidin-4-yl decanoate,

C. R1 = F, R2 = C_2H_5, R3 = H, R4 = Cl: 4-(4-chlorophenyl)-1-[4-(3-ethyl-4-fluorophenyl)-4-oxobutyl]piperidin-4-yl decanoate,

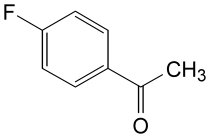


D. 4-(4-chlorophenyl)-1-[4-[4-[4-(4-chlorophenyl)-4-hydroxypiperidin-1-yl]phenyl]-4-oxobutyl]piperidin-4-yl decanoate,

E. R = H, R′ = Cl: 4-(4′-chlorobiphenyl-4-yl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl decanoate,

F. R = Cl, R′ = H: 4-(3′-chlorobiphenyl-4-yl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl decanoate,

G. haloperidol,

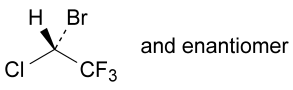


H. *n* = 5: 4-(4-chlorophenyl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl octanoate,

I. *n* = 6: 4-(4-chlorophenyl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl nonanoate,

J. *n* = 8: 4-(4-chlorophenyl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl undecanoate,

K. *n* = 9: 4-(4-chlorophenyl)-1-[4-(4-fluorophenyl)-4-oxobutyl]piperidin-4-yl dodecanoate,



L. 1-(4-fluorophenyl)ethanone.

01/2008:0393

HALOTHANE

Halothanum

$C_2HBrClF_3$ M_r 197.4
[151-67-7]

DEFINITION

(*RS*)-2-Bromo-2-chloro-1,1,1-trifluoroethane to which 0.01 per cent *m/m* of thymol has been added.

CHARACTERS

Appearance: clear, colourless, mobile, heavy, non-flammable liquid.

Solubility: slightly soluble in water, miscible with anhydrous ethanol and with trichloroethylene.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Distillation range (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: examine the substance in a 0.1 mm cell.

Comparison: *Ph. Eur. reference spectrum of halothane.*

C. Add 0.1 ml to 2 ml of *2-methyl-2-propanol R* in a test-tube. Add 1 ml of *copper edetate solution R*, 0.5 ml of *concentrated ammonia R* and a mixture of 0.4 ml of *strong hydrogen peroxide solution R* and 1.6 ml of *water R* (solution A). Prepare a blank at the same time (solution B). Place both tubes in a water-bath at 50 °C for 15 min, cool and add 0.3 ml of *glacial acetic acid R*. To 1 ml of each of solutions A and B add 0.5 ml of a mixture of equal volumes of freshly prepared *alizarin S solution R* and *zirconyl nitrate solution R*. Solution A is yellow and solution B is red.

To 1 ml of each of solutions A and B add 1 ml of *buffer solution pH 5.2 R*, 1 ml of *phenol red solution R* diluted 1 to 10 with *water R* and 0.1 ml of *chloramine solution R*. Solution A is bluish-violet and solution B is yellow.

To 2 ml of each of solutions A and B add 0.5 ml of a mixture of 25 volumes of *sulphuric acid R* and 75 volumes of *water R*, 0.5 ml of *acetone R* and 0.2 ml of a 50 g/l solution of *potassium bromate R* and shake. Warm the tubes in a water-bath at 50 °C for 2 min, cool and add 0.5 ml of a mixture of equal volumes of *nitric acid R* and *water R* and 0.5 ml of *silver nitrate solution R2*. Solution A is opalescent and a white precipitate is formed after a few minutes; solution B remains clear.

TESTS

Acidity or alkalinity. To 20 ml add 20 ml of *carbon dioxide-free water R*, shake for 3 min and allow to stand. Separate the aqueous layer and add 0.2 ml of *bromocresol purple solution R*. Not more than 0.1 ml of *0.01 M sodium hydroxide* or 0.6 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator.

Relative density (*2.2.5*): 1.872 to 1.877.

Distillation range (*2.2.11*): it distils completely between 49.0 °C and 51.0 °C and 95 per cent distills within a range of 1.0 °C.

Volatile related substances. Gas chromatography (*2.2.28*).

Internal standard: *trichlorotrifluoroethane CRS.*

Test solution (a). The substance to be examined.

Test solution (b). Dilute 5.0 ml of *trichlorotrifluoroethane CRS* to 100.0 ml with the substance to be examined. Dilute 1.0 ml of the solution to 100.0 ml with the substance to be examined. Dilute 1.0 ml of this solution to 10.0 ml with the substance to be examined.

Column:

– *size*: *l* = 2.75 m, Ø = 5 mm;
– *stationary phase*: *silanised diatomaceous earth for gas chromatography R1* (180-250 µm), the first 1.8 m being impregnated with 30 per cent *m/m* of *macrogol 400 R* and the remainder with 30 per cent *m/m* of *dinonyl phthalate R*;
– *temperature*: 50 °C.

Carrier gas: *nitrogen for chromatography R.*

Flow rate: 30 ml/min.

Detection: flame ionisation.

Injection: 5 µl.

Limit: test solution (b):

– *total*: not more than the area of the peak due to the internal standard, corrected if necessary for any impurity with the same retention time as the internal standard (0.005 per cent).

Thymol. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 0.10 g of *menthol R* in *methylene chloride R* and dilute to 100.0 ml with the same solvent.

Test solution. To 20.0 ml of the substance to be examined add 5.0 ml of the internal standard solution.

Reference solution. Dissolve 20.0 mg of *thymol R* in *methylene chloride R* and dilute to 100.0 ml with the same solvent. To 20.0 ml of this solution, add 5.0 ml of the internal standard solution.

Column:

– *material*: fused silica;
– *size*: *l* = 15 m, Ø = 0.53 mm;
– *stationary phase*: *poly(dimethyl)siloxane R* (film thickness 1.5 µm).

Carrier gas: *nitrogen for chromatography R.*

Flow rate: 15 ml/min.

Temperature:

– *column*: 150 °C;
– *injection port*: 170 °C;
– *detector*: 200 °C.

Detection: flame ionisation.

Injection: 1.0 µl.

Limit:

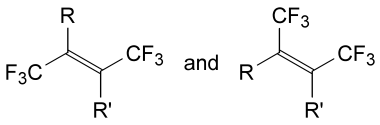
– *thymol*: 0.75 times to 1.15 times the area of the corresponding peak in the chromatogram obtained with the reference solution (0.008 per cent *m/m* to 0.012 per cent *m/m*).

Bromides and chlorides. To 10 ml add 20 ml of *water R* and shake for 3 min. To 5 ml of the aqueous layer add 5 ml of *water R*, 0.05 ml of *nitric acid R* and 0.2 ml of *silver nitrate solution R1*. The solution is not more opalescent than a mixture of 5 ml of the aqueous layer and 5 ml of *water R*.

Bromine and chlorine. To 10 ml of the aqueous layer obtained in the test for bromides and chlorides add 1 ml of *potassium iodide and starch solution R*. No blue colour is produced.

Non-volatile matter: maximum 20 mg/l.

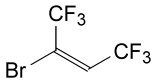
Evaporate 50 ml to dryness on a water-bath and dry the residue in an oven at 100-105 °C for 2 h. The residue weighs a maximum of 1 mg.



STORAGE

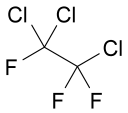
In an airtight container, protected from light, at a temperature not exceeding 25 °C. The choice of material for the container is made taking into account the particular reactivity of halothane with certain metals.

IMPURITIES

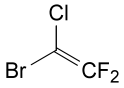


A. (*E*)-1,1,1,4,4,4-hexafluorobut-2-ene,

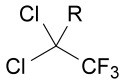
B. R = Cl, R′ = H: (*EZ*)-2-chloro-1,1,1,4,4,4-hexafluorobut-2-ene (*cis* and *trans*),



C. R = R′ = Cl: (*EZ*)-2,3-dichloro-1,1,1,4,4,4-hexafluorobut-2-ene (*cis* and *trans*),

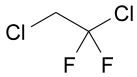


D. (*E*)-2-bromo-1,1,1,4,4,4-hexafluorobut-2-ene,



E. 2-chloro-1,1,1-trifluoroethane,

F. 1,1,2-trichloro-1,2,2-trifluoroethane,



G. 1-bromo-1-chloro-2,2-difluoroethene,

H. R = H: 2,2-dichloro-1,1,1-trifluoroethane,

I. R = Br: 1-bromo-1,1-dichloro-2,2,2-trifluoroethane,

J. 1,2-dichloro-1,1-difluoroethane.

HAMAMELIS LEAF

Hamamelidis folium

DEFINITION

Whole or cut, dried leaf of *Hamamelis virginiana* L.

Content: minimum 3 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

IDENTIFICATION

A. The leaf is green or greenish-brown, often broken, crumpled and compressed into more or less compact masses. The lamina is broadly ovate or obovate; the base is oblique and asymmetric and the apex is acute or, rarely, obtuse. The margins of the lamina are roughly crenate or dentate. The venation is pinnate and prominent on the abaxial surface. Usually, 4-6 pairs of secondary veins are attached to the main vein, emerging at an acute angle and curving gently to the marginal points where there are fine veins often at right angles to the secondary veins.

B. Reduce to a powder (355) (*2.9.12*). The powder is brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of adaxial epidermis with wavy anticlinal walls; abaxial epidermis with stomata mainly paracytic (*2.8.3*); star-shaped covering trichomes, either entire or broken, composed of 4-12 unicellular branches that are united by their bases, elongated, conical and curved, usually up to 250 µm long, thick-walled and with a clearly visible lumen whose contents are often brown; fibres are lignified and thick-walled, isolated or in groups, and accompanied by a sheath of prismatic calcium oxalate crystals; small, cylindrical parenchymatous cells of palisade; irregular-shaped cells of spongy mesophyll; sclereids, frequently enlarged at one or both ends, 150-180 µm long, whole or fragmented; fragments of annular or spiral vessels; isolated prisms of calcium oxalate.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *ethanol (60 per cent V/V) R*, shake for 15 min and filter.

Reference solution (a). Dissolve 30 mg of *tannic acid R* in 5 ml of *ethanol (60 per cent V/V) R*.

Reference solution (b). Dissolve 5 mg of *gallic acid R* in 5 ml of *ethanol (60 per cent V/V) R*.

Plate: *TLC silica gel G plate R*.

Mobile phase: *anhydrous formic acid R, water R, ethyl formate R* (10:10:80 *V/V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: at 100-105 °C for 10 min, then allow to cool.

Detection: spray with *ferric chloride solution R2* until bluish-grey zones (phenolic compounds) appear.

Results: the chromatogram obtained with the test solution shows in its lower third a principal zone similar in position to the principal zone in the chromatogram obtained with reference solution (a) and, in its upper part, a narrow zone similar in position to the principal zone in the chromatogram obtained with reference solution (b). The chromatogram obtained with the test solution shows in addition several slightly coloured zones in the central part.

TESTS

Foreign matter (*2.8.2*): maximum 7 per cent of stems and maximum 2 per cent of other foreign matter, determined on 50 g.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 2.000 g of powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 4 h.

Total ash (*2.4.16*): maximum 7.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 2.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (*2.8.14*). Use 0.750 g of the powdered drug (180) (*2.9.12*).

01/2008:0462

HARD FAT

Adeps solidus

DEFINITION

Mixture of triglycerides, diglycerides and monoglycerides, which may be obtained either by esterification of fatty acids of natural origin with glycerol or by transesterification of natural fats.

Each type of hard fat is characterised by its melting point, its hydroxyl value and its saponification value.

It contains no added substances.

CHARACTERS

Appearance: white or almost white, waxy, brittle mass.

Solubility: practically insoluble in water, slightly soluble in anhydrous ethanol.

When heated to 50 °C, it melts giving a colourless or slightly yellowish liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 1.0 g of the substance to be examined in *ethylene chloride R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R*.

Mobile phase: *ether R, ethylene chloride R* (10:90 *V/V*).

Application: 2 µl.

Development: over a path of 12 cm.

Drying: in air.

Detection: expose to iodine vapour until the spots appear and examine in daylight.

Results: the chromatogram shows a spot with an R_F value of about 0.6 due to triglycerides (R_{st} 1) and spots due to 1,3-diglycerides (R_{st} 0.5) and to 1,2-diglycerides (R_{st} 0.3). A spot due to 1-monoglycerides may also be visible (R_{st} 0.05).

TESTS

Alkaline impurities. Dissolve 2.00 g in a mixture of 1.5 ml of *ethanol (96 per cent) R* and 3.0 ml of *ether R*. Add 0.05 ml of *bromophenol blue solution R*. Not more than 0.15 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to yellow.

Melting point (*2.2.15*): 30 °C to 45 °C, and within 2 °C of the nominal value.

Introduce the melted substance into the capillary tube and allow to stand at a temperature below 10 °C for 24 h.

Acid value (*2.5.1*): maximum 0.5.

Dissolve 5.0 g in 50 ml of the prescribed mixture of solvents.

Hydroxyl value (*2.5.3, Method A*): maximum 50, and within 5 units of the nominal value; maximum 5 if the nominal value is less than 5.

Iodine value (*2.5.4, Method A*): maximum 3.

Peroxide value (*2.5.5, Method A*): maximum 3.

Saponification value (*2.5.6*): 210 to 260, and within 5 per cent of the nominal value, determined on 2.0 g.

Unsaponifiable matter (*2.5.7*): maximum 0.6 per cent, determined on 5.0 g.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test D. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Total ash (*2.4.16*): maximum 0.05 per cent, determined on 2.00 g.

STORAGE

Protected from light and heat.

LABELLING

The label states:

- the nominal melting point,
- the nominal hydroxyl value,
- the nominal saponification value.

corrected 6.0

HAWTHORN BERRIES

Crataegi fructus

DEFINITION

Dried false fruits of *Crataegus monogyna* Jacq. (Lindm.), or *Crataegus laevigata* (Poir.) D.C. (synonym: *Crataegus oxyacantha* L.) or their hybrids or a mixture of these false fruits.

Content: minimum 1.0 per cent of procyanidins, expressed as cyanidin chloride ($C_{15}H_{11}ClO_6$; M_r 322.7) (dried drug).

CHARACTERS

Sweet mucilaginous taste.

IDENTIFICATION

A. The false fruit of *Crataegus monogyna* is obovate or globular, generally 6-10 mm long and 4-8 mm wide, reddish-brown or dark red. The surface is pitted or, more rarely, reticulated. The upper end of the fruit is crowned by the remains of 5 reflexed sepals surrounding a small sunken disc with a shallow, raised rim. The remains of the style occur in the centre of the disc with tufts of stiff, colourless hairs at the base. At the lower end of the fruit is a short length of pedicel or, more frequently, a small pale circular scar where the pedicel was attached. The receptacle is fleshy and encloses a yellowish-brown, ovoid fruit with a hard, thick wall containing a single, elongated, pale brown, smooth and shiny seed.

The false fruit of *Crataegus laevigata* is up to 13 mm long. It contains 2-3 stony fruits, ventrally flattened, with short hairs at the top. Frequently, in the centre of the disc of the false fruit occur the remains of the 2 styles.

B. Reduce to a powder (355) (*2.9.12*). The powder is greyish-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: covering trichomes from inside the disc which are long, unicellular, frequently bent, tapering to a point, with smooth, much thickened and lignified walls; parenchymatous receptacle fragments, the outer layer with red colouring matter, some cells of the inner layers containing small cluster crystals of calcium oxalate; occasional fragments including groups of sclereids and vascular strands with associated files of cells containing prisms of calcium oxalate; pericarp fragments consisting of large thick-walled sclereids with numerous pits, some of which are conspicuously branched; a few fragments of the testa having an epidermal layer composed of hexagonal,

mucilaginous cells beneath which is a yellowish-brown pigment layer containing numerous elongated prisms of calcium oxalate; thin-walled parenchyma of the endosperm and cotyledons containing aleurone grains and globules of fixed oil.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methanol R* and heat in a water bath at 65 °C for 5 min, shaking frequently. Allow to cool to room temperature and filter. Dilute the filtrate to 10 ml with *methanol R*.

Reference solution. Dissolve 2 mg of *chlorogenic acid R*, 2 mg of *caffeic acid R*, 5 mg of *hyperoside R* and 5 mg of *rutin R* in 20 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (10:10:30:50 *V/V/V/V*).

Application: 30 µl of the test solution and 10 µl of the reference solution, as bands.

Development: over a path of 15 cm.

Drying: at 100-105 °C.

Detection: spray whilst hot with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results: the chromatogram obtained with the reference solution shows in the lower half, in order of increasing R_F values, a yellowish-brown fluorescent zone (rutin), a light blue fluorescent zone (chlorogenic acid) and a yellowish-brown fluorescent zone (hyperoside); in the upper third appears a light blue fluorescent zone (caffeic acid). The chromatogram obtained with the test solution shows 3 zones similar in position and fluorescence to the zones due to chlorogenic acid, hyperoside and caffeic acid in the chromatogram obtained with the reference solution, and 3 weak reddish fluorescent zones, one corresponding to the zone due to rutin in the chromatogram obtained with the reference solution and both of the others located above the zone due to hyperoside. Below and above the zone due to caffeic acid some light blue zones appear.

TESTS

Foreign matter (*2.8.2*): maximum 5 per cent of deteriorated false fruit and maximum 2 per cent of other foreign matter. It does not contain fruits of other *Crataegus* species (*C. nigra* Waldst. et Kit., *C. pentagyna* Waldst. et Kit. ex Willd. and *C. azarolus* L.) which are characterised by the presence of more than 3 hard stones.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 5.0 per cent.

ASSAY

To 2.50 g of the powdered drug (355) (*2.9.12*) add 30 ml of *ethanol (70 per cent V/V) R*. Heat under a reflux condenser for 30 min and filter. Wash the residue with 10.0 ml of *ethanol (70 per cent V/V) R*. Add to the filtrate 15.0 ml of *hydrochloric acid R1* and 10.0 ml of *water R*. Heat under a reflux condenser for 80 min. Allow to cool, filter and wash the residue with *ethanol (70 per cent V/V) R* until the filtrate is colourless. Dilute the filtrate to 250.0 ml with *ethanol (70 per cent V/V) R*. Evaporate 50.0 ml of this solution in a round-bottomed flask to about 3 ml and transfer to a separating funnel. Rinse the round-bottomed flask sequentially with 10 ml and 5 ml of *water R* and transfer to the separating funnel. Shake the combined solution with 3 quantities, each of 15 ml, of *butanol R*. Combine the organic layers and dilute to 100.0 ml with *butanol R*.

Measure the absorbance (*2.2.25*) of the solution at 545 nm.

Calculate the percentage content of procyanidins, expressed as cyanidin chloride, using the following expression:

$$\frac{A \times 500}{75 \times m}$$

i.e. taking the specific absorbance of cyanidin chloride to be 75.

A = absorbance at 545 nm,

m = mass of the substance to be examined, in grams.

corrected 6.0

HAWTHORN LEAF AND FLOWER

Crataegi folium cum flore

DEFINITION

Whole or cut, dried flower-bearing branches of *Crataegus monogyna* Jacq. (Lindm.), *C. laevigata* (Poiret) D.C. (*C. oxyacanthoides* Thuill.) or their hybrids or, more rarely, other European *Crataegus* species including *C. pentagyna* Waldst. et Kit. ex Willd., *C. nigra* Waldst. et Kit., *C. azarolus* L.

Content: minimum 1.5 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

A. The stems are dark brown, woody, 1-2.5 mm in diameter, bearing alternate, petiolate leaves with small, often deciduous stipules and corymbs of numerous small white flowers. The leaves are more or less deeply lobed with slightly serrate or almost entire margins; those of *C. laevigata* are pinnately lobed or pinnatifid with 3, 5 or 7 obtuse lobes, those of *C. monogyna* pinnatisect with 3 or 5 acute lobes; the adaxial surface is dark green or brownish-green, the abaxial surface is lighter greyish-green and shows a prominent, dense, reticulate venation. The leaves of *C. laevigata*, *C. monogyna* and *C. pentagyna* are glabrous or bear only isolated trichomes, those of *C. azarolus* and *C. nigra* are densely pubescent. The flowers have a brownish-green tubular calyx composed of 5 free, reflexed sepals, a corolla composed of 5 free, yellowish-white or brownish, rounded or broadly ovate and shortly unguiculate petals and numerous stamens. The ovary is fused to the calyx and consists of 1-5 carpels, each with a long style and containing a single ovule; in *C. monogyna* there is 1 carpel, in *C. laevigata* 2 or 3, in *C. azarolus* 2 or 3, or sometimes only 1, in *C. pentagyna* 5 or, rarely, 4.

B. Reduce to a powder (355) (*2.9.12*). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: unicellular covering trichomes, usually with a thick wall and wide lumen, almost straight or slightly curved, pitted at the base; fragments of leaf epidermis with cells which have sinuous or polygonal anticlinal walls and with large anomocytic stomata (*2.8.3*) surrounded by 4-7 subsidiary cells; parenchymatous cells of the mesophyll containing calcium oxalate clusters, usually measuring 10-20 µm,

those associated with the veins containing groups of small prism crystals; fragments of petals showing rounded polygonal epidermal cells, strongly papillose, with thick walls, the cuticle of which clearly shows wavy striations; fragments of anthers showing endothecium with an arched and regularly thickened margin; fragments of stems containing collenchymatous cells, bordered pitted vessels and groups of lignified sclerenchymatous fibres with narrow lumina; numerous spherical to elliptical or triangular pollen grains up to 45 µm in diameter, with 3 germinal pores and a faintly granular exine.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methanol R* and heat in a water-bath at 65 °C under a reflux condenser for 5 min. Cool and filter.

Reference solution. Dissolve 1.0 mg of *chlorogenic acid R* and 2.5 mg of *hyperoside R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (10:10:30:50 *V/V/V/V*).

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: at 100-105 °C.

Detection: spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow to dry in air for about 30 min and examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate

Chlorogenic acid: a light blue fluorescent zone	A light blue fluorescent zone (chlorogenic acid)
	A yellowish-green fluorescent zone (vitexin-2″-rhamnoside)
_____	_____
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 8 per cent of lignified branches with a diameter greater than 2.5 mm and maximum 2 per cent of other foreign matter.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 10.0 per cent.

ASSAY

Stock solution. Into a 200 ml flask introduce 0.400 g of the powdered drug (250) (*2.9.12*) and 40 ml of *ethanol (60 per cent V/V) R*. Heat in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter through a plug of absorbent cotton into a 100 ml volumetric flask. Transfer the absorbent cotton with the drug residue back into the 200 ml flask, add 40 ml of *ethanol (60 per cent V/V) R* and heat again in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter into the same 100 ml volumetric flask. Rinse the 200 ml flask with a further quantity of *ethanol (60 per cent V/V) R*, filter and transfer to the same 100 ml volumetric flask. Dilute to 100.0 ml with *ethanol (60 per cent V/V) R* and filter.

Test solution. Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 ml volumetric flask. Add 10.0 ml of a solution containing 25.0 g/l of *boric acid R* and 20.0 g/l of *oxalic acid R* in *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Compensation liquid. Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 ml volumetric flask. Add 10.0 ml of *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Measure the absorbance (*2.2.25*) of the test solution after 30 min at 410 nm, by comparison with the compensation liquid.

Calculate the percentage content of total flavonoids, expressed as hyperoside, using the following expression:

$$\frac{A \times 1.235}{m}$$

i.e. taking the value of the specific absorbance of hyperoside to be 405.

A = absorbance at 410 nm,

m = mass of the drug to be examined, in grams.

HAWTHORN LEAF AND FLOWER DRY EXTRACT

Crataegi folii cum flore extractum siccum

DEFINITION

Dry extract produced from *Hawthorn leaf and flower (1432)*.

Content:

– for aqueous extracts: minimum 2.5 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried extract);

– for hydroalcoholic extracts: minimum 6.0 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried extract).

PRODUCTION

The extract is produced from the drug by a suitable procedure using either water or a hydroalcoholic solvent equivalent in strength to a minimum of 45 per cent *V/V* ethanol.

CHARACTERS

Appearance: light brown or greenish-brown powder.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. Suspend 0.2 g of the extract to be examined in 20 ml of *alcohol (70 per cent V/V) R* and filter.

Reference solution. Dissolve 1 mg of *chlorogenic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (10:10:30:50 *V/V/V/V*).

Application: 20 µl of the test solution and 10 µl of the reference solution, as bands.

Development: over a path of 15 cm.

Drying: at 100-105 °C.

Detection: spray the plate whilst hot with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*; subsequently spray the plate with a 50 g/l solution of *macrogol 400 R* in *methanol R*; allow the plate to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A light yellow fluorescent zone
Hyperoside: a yellowish-orange fluorescent zone	A yellowish-orange fluorescent zone (hyperoside)
Chlorogenic acid: a light blue fluorescent zone	A light blue fluorescent zone (chlorogenic acid)
	A yellowish-green fluorescent zone (vitexin 2″-rhamnoside)
Rutin: a yellowish-orange fluorescent zone	A yellowish-orange fluorescent zone (rutin)
Reference solution	**Test solution**

TESTS

Methanol (*2.9.11*): maximum 0.05 per cent *V/V*.

Loss on drying (*2.2.32*): maximum 6.0 per cent, determined on 0.500 g of the extract to be examined by drying in an oven at 105 °C for 2 h.

ASSAY

Stock solution. Dissolve 0.100 g of the extract to be examined in *alcohol (60 per cent V/V) R* and dilute to 100.0 ml with the same solvent.

Test solution. Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Dissolve the residue in 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the 25 ml volumetric flask. Add 10.0 ml of a solution containing 25.0 g/l of *boric acid R* and 20.0 g/l of *oxalic acid R* in *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Compensation liquid. Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Dissolve the residue in 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the 25 ml volumetric flask. Add 10.0 ml of *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

After 30 min measure the absorbance (*2.2.25*) of the test solution at 410 nm by comparison with the compensation liquid.

Calculate the percentage content of total flavonoids, calculated as hyperoside, from the expression:

$$\frac{A \times 1.235}{m}$$

i.e. taking the specific absorbance to be 405.

A = absorbance at 410 nm,

m = mass of the extract to be examined, in grams.

01/2008:1864

HAWTHORN LEAF AND FLOWER LIQUID EXTRACT, QUANTIFIED

Crataegi folii cum flore extractum fluidum quantificatum

DEFINITION

Quantified liquid extract produced from *Hawthorn leaf with flower (1432)*.

Content: 0.8 per cent to 3.0 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4).

PRODUCTION

The extract is produced from the herbal drug and ethanol (30 per cent *V/V* to 70 per cent *V/V*) by an appropriate procedure.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. Dilute 1.0 g in *methanol R* and dilute to 5 ml with the same solvent. Shake and filter.

Reference solution. Dissolve 1.0 mg of *chlorogenic acid R* and 2.5 mg of *hyperoside R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase: *anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (10:10:30:50 *V/V/V/V*).

Application: 20 µl [or 5 µl] as bands.

Development: over a path of 15 cm [or 6 cm].

Drying: at 100-105 °C.

Detection: spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for about 30 min. Examine in ultraviolet light at 365 nm.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
———	———
	A yellowish-green fluorescent zone
Hyperoside: a yellowish-orange fluorescent zone	A yellowish-orange fluorescent zone (hyperoside)
Chlorogenic acid: a light blue fluorescent zone	A light blue fluorescent zone (chlorogenic acid)
	A yellowish-green fluorescent zone

Reference solution	**Test solution**

TESTS

Ethanol (*2.9.10*): 95 per cent *V/V* to 105 per cent *V/V* of the quantity stated on the label.

ASSAY

Stock solution. Dilute about 0.400 g, accurately weighed, in *ethanol (60 per cent V/V) R* and dilute to 100.0 ml with the same solvent.

Test solution. Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the 25 ml volumetric flask. Add 10.0 ml of a solution containing 25.0 g/l of *boric acid R* and 20.0 g/l of *oxalic acid R* in *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Compensation liquid. Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the 25 ml volumetric flask. Add 10.0 ml of *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

After 30 min measure the absorbance (*2.2.25*) of the test solution at 410 nm.

Calculate the percentage content of total flavonoids, expressed as hyperoside, from the following expression:

$$\frac{A \times 1.235}{m}$$

i.e. taking the value of the specific absorbance of hyperoside to be 405.

A = absorbance at 410 nm,

m = mass of the extract to be examined, in grams.

01/2008:2155

HELIUM

Helium

He A_r 4.00

DEFINITION

Content: minimum 99.5 per cent *V/V* of He.

This monograph applies to helium obtained by separation from natural gas and intended for medicinal use.

CHARACTERS

Appearance: colourless, inert gas.

IDENTIFICATION

Examine the chromatograms obtained in the assay. The retention time of the principal peak in the chromatogram obtained with the substance to be examined is approximately the same as that of the principal peak in the chromatogram obtained with the reference gas.

TESTS

Methane: maximum 50.0 ppm *V/V*.

Infrared analyser.

Gas to be examined. The substance to be examined. It must be filtered to avoid stray light phenomena (3 µm filter).

Reference gas (a): *helium for chromatography R*.

Reference gas (b): mixture containing 50.0 ppm *V/V* of *methane R* in *helium for chromatography R*.

The infrared analyser generally comprises an infrared source emitting broadband infrared radiation, an optical device, a sample cell, a detector and in some analysers a reference cell. The optical device may be positioned either before or after the sample cell. It consists of one or more optical filters, through which the broadband radiation is passed. The optical device is selected for methane determination. The measurement light beam passes through the sample cell and may also pass through a reference cell if the analyser integrates such a feature. When methane is present in the sample cell, absorption of energy in the measurement light beam will occur according to the Beer-Lambert law, and this produces a change in the detector signal. This measurement signal is compared to a reference signal to generate an output related to the concentration of methane. The generated signal is linearised in order to determine the methane content.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the methane content in the gas to be examined.

Oxygen: maximum 50.0 ppm *V/V*, determined using an oxygen analyser equipped with an electrochemical cell and a detector scale ranging from 0-100 ppm *V/V*.

The gas to be examined passes through a detection cell containing an aqueous solution of an electrolyte, generally potassium hydroxide. The presence of oxygen in the gas to be examined produces a variation in the electric signal recorded at the outlet of the cell that is proportional to the oxygen content.

Calibrate the analyser according to the instructions of the manufacturer. Pass the gas to be examined through the analyser using a suitable pressure regulator and airtight metal tubes and operating at the prescribed flow rates until constant readings are obtained.

Water (*2.5.28*): maximum 67 ppm *V/V*.

ASSAY

Gas chromatography (*2.2.28*).

Gas to be examined. The substance to be examined.

Reference gas: *helium for chromatography R*.

Column:

– *size*: *l* = 2 m, Ø = 4.5 mm;

– *stationary phase*: *molecular sieve for chromatography R* (0.5 nm).

Carrier gas: *argon for chromatography R*.

Flow rate: 60 ml/min.

Temperature:

– *column*: 50 °C;

– *detector*: 150 °C.

Detection: thermal conductivity.

Injection: 0.5 ml.

Inject the reference gas. Adjust the injected volumes and operating conditions so that the height of the peak due to helium in the chromatogram obtained is at least 35 per cent of the full scale of the recorder.

System suitability: reference gas:

– *symmetry factor*: minimum 0.6.

Calculate the content of He in the gas to be examined.

STORAGE

As compressed gas or liquid at cryogenic temperature, in appropriate containers, complying with the legal regulations.

IMPURITIES

Specified impurities: *A, B, C.*

A. methane,

B. oxygen,

C. water.

01/2008:0332

HEPARIN CALCIUM

Heparinum calcicum

DEFINITION

Heparin calcium is a preparation containing the calcium salt of a sulphated glucosaminoglycan present in mammalian tissues. On complete hydrolysis, it liberates D-glucosamine, D-glucuronic acid, L-iduronic acid, acetic acid and sulphuric acid. It has the characteristic property of delaying the clotting of freshly shed blood. The potency of heparin calcium intended for parenteral administration is not less than 150 IU/mg, calculated with reference to the dried substance. The potency of heparin calcium not intended for parenteral administration is not less than 120 IU/mg, calculated with reference to the dried substance.

PRODUCTION

It is prepared from the lungs of oxen or from the intestinal mucosae of oxen, pigs or sheep.

It is produced by methods of manufacturing designed to minimise or eliminate substances lowering blood pressure.

CHARACTERS

A white or almost white powder, hygroscopic, freely soluble in water.

IDENTIFICATION

A. It delays the clotting of recalcified citrated sheep plasma (see Assay).

B. Dissolve 0.40 g in *water R* and dilute to 10.0 ml with the same solvent. The specific optical rotation (*2.2.7*) is not less than + 35.

C. Examine by zone electrophoresis (*2.2.31*) using *agarose for electrophoresis R* as the supporting medium. To equilibrate the agarose and as electrolyte solution use a mixture of 50 ml of *glacial acetic acid R* and 800 ml of *water R* adjusted to pH 3 by addition of *lithium hydroxide R* and diluted to 1000.0 ml with *water R*.

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution. Dilute *heparin sodium BRP* with an equal volume of *water R*.

Apply separately to the strip 2 µl to 3 µl of each solution. Pass a current of 1 mA to 2 mA per centimetre of strip width at a potential difference of 300 V for about 10 min. Stain the strips using a 1 g/l solution of *toluidine blue R* and remove the excess by washing. The ratio of the mobility of the principal band or bands in the electropherogram obtained with the test solution to the mobility of the band in the electropherogram obtained with the reference solution is 0.9 to 1.1.

D. It gives the reactions of calcium (*2.3.1*).

TESTS

Appearance of solution. Dissolve a quantity equivalent to 50 000 IU in *water R* and dilute to 10 ml with the same solvent. The solution is clear (*2.2.1*) and not more intensely coloured than degree 5 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

pH (*2.2.3*). Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 5.5 to 8.0.

Protein and nucleotidic impurities. Dissolve 40 mg in 10 ml of *water R*. The absorbance (*2.2.25*) measured at 260 nm is not greater than 0.20 and that measured at 280 nm is not greater than 0.15.

Nitrogen. Not more than 2.5 per cent, calculated with reference to the dried substance. Carry out the determination of nitrogen by sulphuric acid digestion (*2.5.9*), using 0.100 g.

Calcium: 9.5 per cent to 11.5 per cent of Ca, calculated with reference to the dried substance. Determine the calcium by complexometric titration (*2.5.11*), using 0.200 g.

Heavy metals (*2.4.8*). 0.5 g complies with limit test C for heavy metals (30 ppm). Prepare the reference solution using 1.5 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 8.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 670 Pa for 3 h.

Sulphated ash (*2.4.14*): 32 per cent to 40 per cent, determined on 0.20 g and calculated with reference to the dried substance.

Bacterial endotoxins (*2.6.14*): less than 0.01 IU per IU of heparin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins. The addition of divalent cations may be necessary in order to fulfil the validation criteria.

ASSAY

Carry out the assay of heparin (*2.7.5*). The estimated potency is not less than 90 per cent and not more than 111 per cent of the stated potency. The confidence limits of the estimated potency (P = 0.95) are not less than 80 per cent and not more than 125 per cent of the stated potency.

STORAGE

Store in an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

– the number of International Units per milligram,

– the name and quantity of any added substance.

01/2008:0333

HEPARIN SODIUM

Heparinum natricum

DEFINITION

Heparin sodium is a preparation containing the sodium salt of a sulphated glucosaminoglycan present in mammalian tissues. On complete hydrolysis, it liberates D-glucosamine, D-glucuronic acid, L-iduronic acid, acetic acid and sulphuric acid. It has the characteristic property of delaying the clotting of freshly shed blood. The potency of heparin sodium intended for parenteral administration is not less than 150 IU/mg, calculated with reference to the dried substance. The potency of heparin sodium not intended for parenteral administration is not less than 120 IU/mg, calculated with reference to the dried substance.

PRODUCTION

It is prepared from the lungs of oxen or from the intestinal mucosae of oxen, pigs or sheep.

It is produced by methods of manufacturing designed to minimise or eliminate substances lowering blood pressure.

CHARACTERS

A white or almost white powder, hygroscopic, freely soluble in water.

IDENTIFICATION

A. It delays the clotting of recalcified citrated sheep plasma (see Assay).

B. Dissolve 0.40 g in *water R* and dilute to 10.0 ml with the same solvent. The specific optical rotation (*2.2.7*) is not less than + 35.

C. Examine by zone electrophoresis (*2.2.31*) using *agarose for electrophoresis R* as the supporting medium. To equilibrate the agarose and as electrolyte solution use a mixture of 50 ml of *glacial acetic acid R* and 800 ml of *water R* adjusted to pH 3 by addition of *lithium hydroxide R* and diluted to 1000.0 ml with *water R*.

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution. Dilute *heparin sodium BRP* with an equal volume of *water R*.

Apply separately to the strip 2 µl to 3 µl of each solution. Pass a current of 1 mA to 2 mA per centimetre of strip width at a potential difference of 300 V for about 10 min. Stain the strips using a 1 g/l solution of *toluidine blue R* and remove the excess by washing. The ratio of the mobility of the principal band or bands in the electropherogram obtained with the test solution to the mobility of the band in the electropherogram obtained with the reference solution is 0.9 to 1.1.

D. The residue obtained in the test for sulphated ash (see Tests) gives reaction (a) of sodium (*2.3.1*).

TESTS

Appearance of solution. Dissolve a quantity equivalent to 50 000 IU in *water R* and dilute to 10 ml with the same solvent. The solution is clear (*2.2.1*) and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

pH (*2.2.3*). Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 5.5 to 8.0.

Protein and nucleotidic impurities. Dissolve 40 mg in 10 ml of *water R*. The absorbance (*2.2.25*) measured at 260 nm is not greater than 0.20 and that measured at 280 nm is not greater than 0.15.

Nitrogen. Not more than 2.5 per cent, calculated with reference to the dried substance. Carry out the determination of nitrogen by sulphuric acid digestion (*2.5.9*), using 0.100 g.

Sodium: 9.5 per cent to 12.5 per cent of Na, calculated with reference to the dried substance and determined by atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 50 mg of the substance to be examined in *0.1 M hydrochloric acid* containing 1.27 mg of *caesium chloride R* per millilitre and dilute to 100.0 ml with the same solvent.

Reference solutions. Prepare reference solutions containing 25 ppm, 50 ppm and 75 ppm of Na, using *sodium standard solution (200 ppm Na) R* diluted with *0.1 M hydrochloric acid* containing 1.27 mg of *caesium chloride R* per millilitre.

Measure the absorbance at 330.3 nm using a sodium hollow-cathode lamp as the source of radiation and a flame of suitable composition (for example 11 litres of air and 2 litres of acetylene per minute).

Heavy metals (*2.4.8*). 0.5 g complies with limit test C for heavy metals (30 ppm). Prepare the reference solution using 1.5 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 8.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 670 Pa for 3 h.

Sulphated ash (*2.4.14*): 30 per cent to 43 per cent, determined on 0.20 g and calculated with reference to the dried substance.

Bacterial endotoxins (*2.6.14*): less than 0.01 IU per IU of heparin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Carry out the assay of heparin (*2.7.5*). The estimated potency is not less than 90 per cent and not more than 111 per cent of the stated potency. The confidence limits of the estimated potency (P = 0.95) are not less than 80 per cent and not more than 125 per cent of the stated potency.

STORAGE

Store in an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

– the number of International Units per milligram,

– the name and quantity of any added substance.

01/2008:0828

HEPARINS, LOW-MOLECULAR-MASS

Heparina massae molecularis minoris

DEFINITION

Salts of sulphated glucosaminoglycans having a mass-average relative molecular mass less than 8000 and for which at least 60 per cent of the total mass has a relative molecular mass less than 8000. Low-molecular-mass heparins display different chemical structures at the reducing, or the non-reducing end of the polysaccharide chains.

The potency is not less than 70 IU of anti-factor Xa activity per milligram, calculated with reference to the dried substance. The ratio of anti-factor Xa activity to anti-factor IIa activity, determined as described under Assay, is not less than 1.5.

PRODUCTION

Low-molecular-mass heparins are obtained by fractionation or depolymerisation of heparin of natural origin that complies with the monograph on *Heparin sodium (0333)* or *Heparin calcium (0332)*, whichever is appropriate, for parenteral use, unless otherwise justified and authorised. For each type of low-molecular-mass heparin the batch-to-batch consistency is ensured by demonstrating, for example, that the mass-average relative molecular mass and the mass percentage within defined relative molecular-mass ranges lower than 8000 are not less than 75 per cent and not more than 125 per cent of the mean value stated as type specification. The same limits apply also to the ratio of anti-factor Xa activity to anti-factor IIa activity.

Nucleotide and protein impurities of the source material. Dissolve 40 mg of the source material before fractionation in 10 ml of *water R*. The absorbance (*2.2.25*) measured at 260 nm and 280 nm is not greater than 0.20 and 0.15, respectively.

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: freely soluble in water.

IDENTIFICATION

A. Nuclear magnetic resonance spectrometry (*2.2.33*).

Preparation: dissolve 0.200 g of the substance to be examined in a mixture of 0.2 ml of *deuterium oxide R* and 0.8 ml of *water R*.

Comparison: dissolve 0.200 g of the appropriate specific low-molecular-mass heparin reference standard in a mixture of 0.2 ml of *deuterium oxide R* and 0.8 ml of *water R*.

Operating conditions: use a pulsed (Fourier transform) spectrometer operating at 75 MHz for ^{13}C. Record the spectra at 40 °C, using cells 5 mm in diameter. Use *deuterated methanol R* as internal reference at δ = 50.0 ppm.

Results: the spectrum obtained is similar to the appropriate specific low-molecular-mass heparin reference standard.

B. The ratio of anti-factor Xa activity to anti-factor IIa activity, determined as described under Assay, is not less than 1.5.

C. Size-exclusion chromatography (*2.2.30*).

Test solution. Dissolve 20 mg of the substance to be examined in 2 ml of the mobile phase.

Reference solution. Dissolve 20 mg of *heparin low-molecular-mass for calibration CRS* in 2 ml of the mobile phase.

Column:

– *size*: *l* = 0.30 m, Ø = 7.5 mm;

– *stationary phase*: appropriate porous silica beads (5 µm) with a fractionation range for proteins of approximately 15 000 to 100 000;

– *number of theoretical plates*: minimum of 20 000 per metre.

Mobile phase: 28.4 g/l solution of *anhydrous sodium sulphate R* adjusted to pH 5.0 using *dilute sulphuric acid R*.

Flow rate: 0.5 ml/min.

Detection: differential refractometer.

Injection: 25 µl.

Calibration. For detection, use a differential refractometer (RI) detector connected in series to a ultraviolet spectrophotometer (UV) set at 234 nm such that the UV monitor is connected to the column outlet, and the RI detector to the UV-monitor outlet.

It is necessary to measure the time lapse between the 2 detectors accurately, so that their chromatograms can be aligned correctly. The retention times used in the calibration must be those from the RI detector.

The normalisation factor used to calculate the relative molecular mass from the RI/UV ratio is obtained as follows: calculate the total area under the UV_{234} (ΣUV_{234}) and the RI (ΣRI) curves by numerical integration over the range of interest (i.e. excluding salt and solvent peaks at the end of the chromatogram). Calculate the ratio *r* using the following expression:

$$\frac{\sum \mathrm{RI}}{\sum \mathrm{UV}_{234}}$$

Calculate the factor *f* using the following expression:

$$\frac{M_{na}}{r}$$

M_{na} = assigned number-average relative molecular mass of the *Heparin low-molecular-mass for calibration CRS* found in the leaflet supplied with the CRS.

Provided the UV_{234} and the RI responses are aligned, the relative molecular mass *M* at any point is calculated using the following expression:

$$f\frac{\mathrm{RI}}{\mathrm{UV}_{234}}$$

The resulting table of retention times and relative molecular masses may be used to derive a calibration for the chromatographic system by fitting a suitable mathematical relationship to the data. A polynomial of the 3rd degree is recommended. *It must be stressed that the extrapolation of this fitted calibration curve to higher molecular masses is not valid.*

Inject 25 µl of the test solution and record the chromatogram for a period of time, ensuring complete elution of sample and solvent peaks.

The mass-average relative molecular mass is defined by the following expression:

$$\frac{\sum(\mathrm{RI}_i M_i)}{\sum \mathrm{RI}_i}$$

RI_i = mass of substance eluting in the fraction i;

M_i = relative molecular mass corresponding to fraction i.

Any low-molecular-mass heparin covered by a specific monograph complies with the requirements for identification C prescribed in the corresponding monograph.

Where no specific monograph exists for the low-molecular-mass heparin to be examined, the mass-average relative molecular mass is not greater than 8000 and at least 60 per cent of the total mass has a relative molecular mass lower than 8000. In addition, the molecular mass parameters (mass-average molecular mass and mass percentages of chains comprised between specified values) correspond to that of the manufacturer's reference preparation.

D. It gives reaction (a) of sodium or the reactions of calcium (as appropriate) (*2.3.1*).

TESTS

pH (*2.2.3*): 5.5 to 8.0.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Nitrogen (*2.5.9*): 1.5 per cent to 2.5 per cent (dried substance).

Calcium (*2.5.11*): 9.5 per cent to 11.5 per cent (dried substance), if prepared from heparin complying with the monograph on *Heparin calcium (0332)*. Use 0.200 g.

Sodium: 9.5 per cent to 12.5 per cent (dried substance), if prepared from heparin complying with the monograph on *Heparin sodium (0333)*.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 50 mg in *0.1 M hydrochloric acid* containing 1.27 mg of *caesium chloride R* per millilitre and dilute to 100.0 ml with the same solvent.

Reference solutions. Prepare reference solutions (25 ppm, 50 ppm and 75 ppm) using *sodium standard solution (200 ppm Na) R* diluted with *0.1 M hydrochloric acid* containing 1.27 mg of *caesium chloride R* per millilitre.

Source: sodium hollow-cathode lamp.

Wavelength: 330.3 nm.

Atomisation device: flame of suitable composition (for example, 11 litres of air and 2 litres of acetylene per minute).

Molar ratio of sulphate ions to carboxylate ions (*2.2.38*): minimum 1.8.

The sample of heparin used in this titration must be free from ionisable impurities, particularly salts.

Weigh 0.100 g of the substance to be examined taking the necessary measures to avoid the problems linked to hygroscopicity.

Take up into about 20 ml of double-glass-distilled *water R*. Cool to 4 °C and apply 2.0 ml of this solution to a pre-cooled column (approximately 10 × 1 cm), packed with a suitable *cation exchange resin R*. Wash through with double-glass-distilled *water R* into the titration vessel up to a final volume of about 10-15 ml (*the titration vessel must be just large enough to hold the electrodes from the conductivity meter, a small stirrer bar and a fine flexible tube from the outlet of a 2 ml burette).* Stir magnetically.

When the conductivity reading is constant, note it and titrate with *0.05 M sodium hydroxide* added in approximately 50 µl portions. Record the burette level and the conductivity meter reading a few seconds after each addition until the end-point is reached.

For each measured figure, calculate the number of milliequivalents of sodium hydroxide added from the volume and the known concentration of the sodium hydroxide solution. Plot on a graph the figures for conductivity (as *y*-axis) against the figures of milliequivalent of sodium hydroxide (as *x*-axis). The graph will have 3, approximately linear sections: an initial steep downward slope, a middle slight rise and a final steep rise. Estimate the best straight lines through these 3 parts of the graph. At the points where the 1st and 2nd lines intersect, and where the 2nd and 3rd lines intersect, draw perpendiculars to the *x*-axis to estimate the milliequivalents of sodium hydroxide taken up by the sample at those points. The point where the 1st and 2nd lines intersect will give the number of milliequivalents of sodium hydroxide taken up by the sulphate groups, and the point where the 2nd and 3rd lines intersect will give the number of milliequivalents taken up by the sulphate and carboxylate groups together. The difference between the 2 will therefore give the number of milliequivalents taken up by the carboxylate groups.

Heavy metals (*2.4.8*): maximum 30 ppm.

0.5 g complies with test C. Prepare the reference solution using 1.5 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.67 kPa for 3 h.

Bacterial endotoxins (*2.6.14*): less than 0.01 IU per International Unit of anti-Xa activity, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins. The addition of divalent cations may be necessary to fulfil the validation criteria.

ASSAY

The anticoagulant activity of low-molecular-mass heparins is determined *in vitro* by 2 assays which determine its ability to accelerate the inhibition of factor Xa (anti-Xa assay) and thrombin, factor IIa (anti-IIa assay), by antithrombin III.

The International Units for anti-Xa and anti-IIa activity are the activities contained in a stated amount of the International Standard for low-molecular-mass heparin.

Heparin low-molecular-mass for assay BRP, calibrated in International Units by comparison with the International Standard using the 2 assays given below, is used as reference preparation.

ANTI-FACTOR Xa ACTIVITY

Reference and test solutions

Prepare 4 independent series of 4 dilutions each, of the substance to be examined and of the reference preparation of low-molecular-mass heparin in *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R*; the concentration range should be within 0.025 IU to 0.2 IU of anti-factor Xa activity per millilitre and the dilutions chosen should give a linear response when results are plotted as absorbance against log concentration.

Procedure

Label 16 tubes in duplicate: T_1, T_2, T_3, T_4 for the dilutions of the substance to be examined and S_1, S_2, S_3, S_4 for the dilutions of the reference preparation. To each tube add 50 µl of *antithrombin III solution R1* and 50 µl of the appropriate dilution of the substance to be examined, or the reference preparation. After each addition, mix but do not allow

bubbles to form. Treating the tubes in the order S_1, S_2, S_3, S_4, T_1, T_2, T_3, T_4, T_1, T_2, T_3, T_4, S_1, S_2, S_3, S_4, allow to equilibrate at 37 °C (water-bath or heating block) for 1 min and add to each tube 100 µl of *bovine factor Xa solution R*. Incubate for exactly 1 min and add 250 µl of *chromogenic substrate R1*. Stop the reaction after exactly 4 min by adding 375 µl of *acetic acid R*. Transfer the mixtures to semi-micro cuvettes and measure the absorbance (*2.2.25*) at 405 nm using a suitable reading device. Determine the blank amidolytic activity at the beginning and at the end of the procedure in a similar manner, using *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R* instead of the reference and test solutions; the 2 blank values do not differ significantly. Calculate the regression of the absorbance on log concentrations of the solutions of the substance to be examined and of the reference preparation of low-molecular-mass heparins and calculate the potency of the substance to be examined in International Units of anti-factor Xa activity per millilitre using the usual statistical methods for parallel-line assays.

ANTI-FACTOR IIa ACTIVITY

Reference and test solutions

Prepare 4 independent series of 4 dilutions each, of the substance to be examined and of the reference preparation of low molecular-mass heparin in *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R*; the concentration range should be within 0.015 IU to 0.075 IU of anti-factor IIa activity per millilitre and the dilutions chosen should give a linear response when results are plotted as absorbance against log concentration.

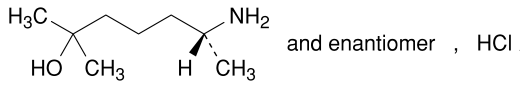
Procedure

Label 16 tubes in duplicate: T_1, T_2, T_3, T_4 for the dilutions of the substance to be examined and S_1, S_2, S_3, S_4 for the dilutions of the reference preparation. To each tube add 50 µl of *antithrombin III solution R2* and 50 µl of the appropriate dilution of the substance to be examined or the reference preparation. After each addition, mix but do not allow bubbles to form. Treating the tubes in the order S_1, S_2, S_3, S_4, T_1, T_2, T_3, T_4, T_1, T_2, T_3, T_4, S_1, S_2, S_3, S_4, allow to equilibrate at 37 °C (water-bath or heating block) for 1 min and add to each tube 100 µl of *human thrombin solution R*. Incubate for exactly 1 min and add 250 µl of *chromogenic substrate R2*. Stop the reaction after exactly 4 min by adding 375 µl of *acetic acid R*. Transfer the mixtures to semi-micro cuvettes and measure the absorbance (*2.2.25*) at 405 nm using a suitable reading device. Determine the blank amidolytic activity at the beginning and at the end of the procedure in a similar manner, using *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R* instead of the reference and test solutions; the 2 blank values do not differ significantly. Calculate the regression of the absorbance on log concentrations of the solutions of the substance to be examined and of the reference preparation of low-molecular-mass heparins, and calculate the potency of the substance to be examined in International Units of anti-factor IIa activity per millilitre using the usual statistical methods for parallel-line assays.

LABELLING

The label states:

- the number of International Units of anti-factor Xa activity per milligram;
- the number of International Units of anti-factor IIa activity per milligram;
- the mass-average molecular mass and the percentage of molecules within defined molecular mass ranges;
- where applicable, that the contents are the sodium salt;
- where applicable, that the contents are the calcium salt.



STORAGE

In an airtight tamper-proof container. If the product is sterile and free of bacterial endotoxins, store in a sterile and apyrogenic container.

corrected 6.0

HEPTAMINOL HYDROCHLORIDE

Heptaminoli hydrochloridum

$C_8H_{20}ClNO$ M_r 181.7
[543-15-7]

DEFINITION

(6*RS*)-6-Amino-2-methylheptan-2-ol hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. To 1 ml of solution S (see Tests) add 4 ml of *water R* and 2 ml of a 200 g/l solution of *ammonium and cerium nitrate R* in *4 M nitric acid*. An orange-brown colour develops.

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *heptaminol hydrochloride CRS*.

C. Examine the chromatograms obtained in the test for related substances.
Detection: examine in daylight.
Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (b).

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *methyl red solution R* and 0.3 ml of *0.01 M hydrochloric acid*. The solution is red. Add 0.6 ml of *0.01 M sodium hydroxide*. The solution is yellow.

Related substances. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 0.50 g of the substance to be examined in *methanol R* and dilute to 5.0 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dilute 3.0 ml of test solution (a) to 10.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 50.0 ml with *methanol R*.

Reference solution (b). Dissolve 0.10 g of *heptaminol hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dissolve 10.0 mg of *heptaminol impurity A CRS* in *methanol R* and dilute to 5.0 ml with the same solvent.

Reference solution (d). Dilute 1.0 ml of reference solution (c) to 10.0 ml with *methanol R*.

Reference solution (e). To 2.5 ml of reference solution (c) add 0.5 ml of test solution (b) and dilute to 5 ml with *methanol R*.

Plate: *TLC silica gel G plate R*.

Mobile phase: *concentrated ammonia R, dioxan R, 2-propanol R* (10:50:50 *V/V/V*).

Application: 10 µl; apply test solutions (a) and (b) and reference solutions (a), (b), (d) and (e).

Development: over 2/3 of the plate.

Drying: in air.

Detection: expose the plate to iodine vapour for at least 15 h.

System suitability: the chromatogram obtained with reference solution (e) shows 2 clearly separated principal spots and the chromatogram obtained with reference solution (a) shows a single principal spot.

Limits: in the chromatogram obtained with test solution (a):

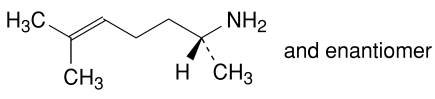
– *impurity A*: any spot corresponding to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (d) (0.2 per cent),

– *any other impurity*: any spot, apart from the principal spot and any spot corresponding to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.6 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.



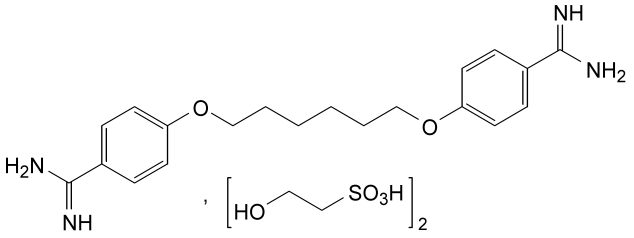
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.140 g in 50 ml of *alcohol R* and add 5.0 ml of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 18.17 mg of $C_8H_{20}ClNO$.

IMPURITIES



A. (2*RS*)-6-methylhept-5-en-2-amine.

01/2008:1436
corrected 6.0

HEXAMIDINE DIISETIONATE

Hexamidini diisetionas

$C_{24}H_{38}N_4O_{10}S_2$ M_r 607
[659-40-5]

DEFINITION

4,4′-(Hexane-1,6-diylbisoxy)dibenzimidamide bis(2-hydroxyethanesulphonate).

Content: 98.5 per cent to 101.5 per cent (dried substance).

PRODUCTION

The production method must be evaluated to determine the potential for formation of alkyl isetionates, which is particularly likely to occur if the reaction medium contains lower alcohols. Where necessary, the production method is validated to demonstrate that alkyl isetionates are not detectable in the final product.

CHARACTERS

Appearance: white or slightly yellow powder, hygroscopic.

Solubility: sparingly soluble in water, slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *hexamidine diisetionate CRS*.

B. Dissolve about 40 mg in 5 ml of *water R* and add dropwise with shaking 1 ml of a 100 g/l solution of *sodium chloride R*. Allow to stand for 5 min. An abundant, shimmering white precipitate is slowly formed.

TESTS

Appearance of solution. Dissolve 0.50 g in *carbon dioxide-free water R*, heating at about 70 °C and dilute to 10 ml with the same solvent. Allow to cool to room temperature for 10-15 min. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

Acidity or alkalinity. Dissolve 2.0 g in *water R* heating at about 50 °C and dilute to 20 ml with *water R* heating at about 50 °C. Allow to cool to about 35 °C, add 0.1 ml of *methyl red solution R*. Not more than 0.25 ml of *0.05 M hydrochloric acid* or *0.05 M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in mobile phase A and dilute to 100.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with mobile phase A.

Reference solution (c). Dissolve 5 mg of the substance to be examined and 5 mg of *pentamidine diisetionate CRS* in mobile phase A and dilute to 100 ml with mobile phase A. Dilute 2 ml of the solution to 5 ml with mobile phase A.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *styrene-divinylbenzene copolymer R* (8 µm).

Mobile phase:

– *mobile phase A*: mix 20 volumes of *acetonitrile R* and 80 volumes of a 6.8 g/l solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.0 using *phosphoric acid R*,

– *mobile phase B*: mix equal volumes of *acetonitrile R* and of a 6.8 g/l solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.0 using *phosphoric acid R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 30	100 → 0	0 → 100
30 - 35	0	100
35 - 40	0 → 100	100 → 0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 263 nm.

Injection: 20 µl.

Relative retention with reference to hexamidine (retention time = about 6 min): impurity B = about 1.7; impurity A = about 2.0; impurity C = about 3.7; impurity D = about 4.7.

System suitability: reference solution (c):

– *resolution*: minimum 5.0 between the peaks due to hexamidine and pentamidine.

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),

– *impurity B*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),

– *impurities C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *any other impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent),

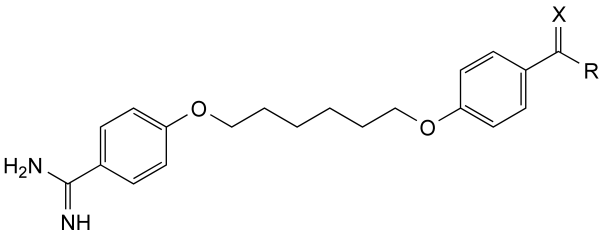
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *dimethylformamide R*. Titrate with *0.1 M tetrabutylammonium hydroxide* under a current of *nitrogen R*, determining the end-point potentiometrically (*2.2.20*).

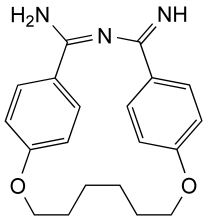


1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 30.35 mg of $C_{24}H_{38}N_4O_{10}S_2$.

STORAGE

In an airtight container.

IMPURITIES

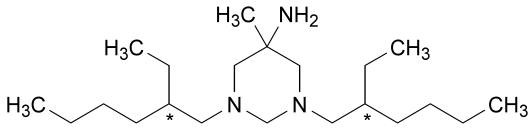


Specified impurities: A, B, C, D.

A. X = O, R′ = NH_2: 4-[[6-(4-carbamimidoylphenoxy)hexyl]oxy]benzamide,

B. X = NH, R′ = OC_2H_5: ethyl 4-[[6-(4-carbamimidoylphenoxy)hexyl]oxy]benzimidoate,

D. X = O, R′ = OC_2H_5: ethyl 4-[[6-(4-carbamimidoylphenoxy)hexyl]oxy]benzoate,



C. 4-imino-9,16-dioxa-3-azatricyclo[15.2.2.2^{5,8}]tricosa-1(19),2,5,7,17,20,22-heptaen-2-amine.

01/2008:1221

HEXETIDINE

Hexetidinum

$C_{21}H_{45}N_3$ M_r 339.6

[141-94-6]

DEFINITION

Hexetidine contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 1,3-bis(2-ethylhexyl)]-5-methylhexahydropyrimidin-5-amine.

CHARACTERS

An oily liquid, colourless or slightly yellow, very slightly soluble in water, very soluble in acetone, in alcohol and in methylene chloride. It dissolves in dilute mineral acids.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *hexetidine CRS*.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. To 0.2 ml add 2 ml of *sulphuric acid R* and 2 mg of *chromotropic acid, sodium salt R*. Heat in a water-bath at 60 °C. A violet colour develops.

D. Dissolve 0.2 ml in 1 ml of *methylene chloride R*. Add 0.5 ml of *copper sulphate solution R*, 0.05 ml of *0.25 M alcoholic sulphuric acid R* and 5 ml of *water R*. Shake, then allow to stand. The lower layer becomes deep blue.

TESTS

Appearance. The substance to be examined is clear (*2.2.1*)and not more intensely coloured than reference solution Y_5 or reference solution GY_5 (*2.2.2, Method II*).

Relative density (*2.2.5*): 0.864 to 0.870.

Refractive index (*2.2.6*): 1.461 to 1.467.

Optical rotation (*2.2.7*). Dissolve 1.0 g in *ethanol R* and dilute to 10.0 ml with the same solvent. The angle of optical rotation is – 0.10° to + 0.10°.

Absorbance (*2.2.25*). Dissolve 0.50 g in *heptane R* and dilute to 50.0 ml with the same solvent. At wavelengths from 270 nm to 350 nm, the absorbance of the solution is not greater than 0.1.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel H R* as the coating substance. *Prepare the solutions immediately before use.*

Test solution (a). Dissolve 2.0 g of the substance to be examined in *heptane R* and dilute to 20 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *heptane R*.

Reference solution (a). Dissolve 20 mg of *hexetidine CRS* in *heptane R* and dilute to 2 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (a) to 100 ml with *heptane R*.

Reference solution (c). Dilute 5 ml of reference solution (b) to 10 ml with *heptane R*.

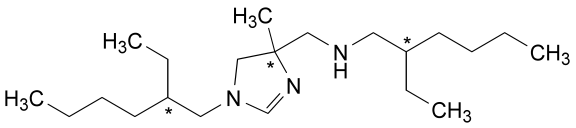
Reference solution (d). Dissolve 10 mg of *dehydrohexetidine CRS* in test solution (a) and dilute to 10 ml with the same solution.

Apply separately to the plate 1 µl of each solution. At the bottom of a chromatography tank, place an evaporating dish containing *concentrated ammonia R1*. Place the dried plate in the tank and close the tank. Leave the plate in contact with the ammonia vapour for 15 min. Withdraw the plate and place it in a current of air to remove the ammonia vapour. Develop over a path of 15 cm using a mixture of 20 volumes of *methanol R* and 80 volumes of *toluene R*. Allow the plate to dry in air. Expose the plate to iodine vapour for 30 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1 per cent) and at most two such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots.

Heavy metals (*2.4.8*). Dissolve 2.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *acetone R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with limit test B for heavy metals (10 ppm). Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *acetone R*.

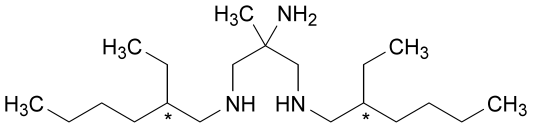
Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



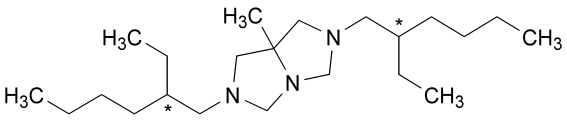
Dissolve 0.150 g in 80 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 16.98 mg of $C_{21}H_{45}N_3$.

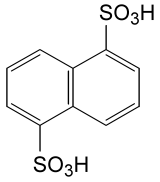


STORAGE

Store protected from light.



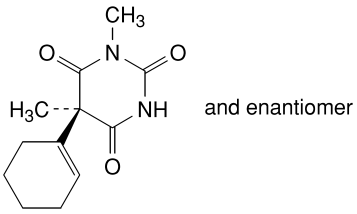
IMPURITIES



A. 2-ethyl-*N*-[[1-(2-ethylhexyl)-4-methyl-4,5-dihydro-1*H*-imidazol-4-yl]methyl]hexan-1-amine (dehydrohexetidine),

B. *N*^{1},*N*^{3}-bis(2-ethylhexyl)-2-methylpropane-1,2,3-triamine (triamine),

C. 2,6-bis(2-ethylhexyl)-7a-methylhexahydro-1*H*-imidazo[1,5-*c*]imidazole (hexedine),



D. naphthalene-1,5-disulphonic acid.

01/2008:0183
corrected 6.0

HEXOBARBITAL

Hexobarbitalum

$C_{12}H_{16}N_2O_3$ M_r 236.3
[56-29-1]

DEFINITION

Hexobarbital contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (5*RS*)-5-(cyclohex-1-enyl)-1,5-dimethylpyrimidine-2,4,6(1*H*,3*H*,5*H*)-trione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very slightly soluble in water, sparingly soluble in alcohol. It forms water-soluble compounds with alkali hydroxides and carbonates and with ammonia.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Determine the melting point (*2.2.14*) of the substance to be examined. Mix equal parts of the substance to be examined and *hexobarbital CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 146 °C) is not greater than 2 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *hexobarbital CRS*.

C. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in *chloroform R* and dilute to 100 ml with the same solvent.

Reference solution. Dissolve 0.1 g of *hexobarbital CRS* in *chloroform R* and dilute to 100 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 18 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. To about 10 mg add 1.0 ml of a 10 g/l solution of *vanillin R* in *alcohol R* and 2 ml of a cooled mixture of 1 volume of *water R* and 2 volumes of *sulphuric acid R*. Shake and allow to stand for 5 min. A greenish-yellow colour develops. Heat on a water-bath for 10 min. The colour becomes dark red.

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 4 ml of *dilute sodium hydroxide solution R* and 6 ml of *water R*. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Acidity. Boil 1.0 g with 50 ml of *water R* for 2 min, allow to cool and filter. To 10 ml of the filtrate add 0.15 ml of *methyl red solution R*. The solution is orange-yellow. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to produce a pure yellow colour.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *chloroform R* and dilute to 100 ml with the same solvent.

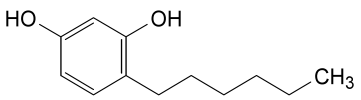
Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *chloroform R*.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.200 g in 5 ml of *pyridine R*. Add 0.5 ml of *thymolphthalein solution R* and 10 ml of *silver nitrate solution in pyridine R*. Titrate with *0.1 M ethanolic sodium hydroxide* until a pure blue colour is obtained. Carry out a blank titration.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 23.63 mg of $C_{12}H_{16}N_2O_3$.

01/2008:1437

HEXYLRESORCINOL

Hexylresorcinolum

$C_{12}H_{18}O_2$ M_r 194.3
[136-77-6]

DEFINITION

4-Hexylbenzene-1,3-diol.

Content: 98.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: colourless, yellowish or reddish, crystalline powder or needles, turning brownish-pink on exposure to light or air.

Solubility: very slightly soluble in water, freely soluble in ethanol (96 per cent) and in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 66 °C to 68 °C, melting may occur at about 60 °C, followed by solidification and a second melting between 66 °C and 68 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *hexylresorcinol CRS.*

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dilute 0.1 ml of solution S (see Tests) to 10 ml with *ethanol (96 per cent) R.*

Reference solution (a). Dissolve 10 mg of *hexylresorcinol CRS* in *ethanol (96 per cent) R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *hexylresorcinol CRS* and 10 mg of *resorcinol R* in *ethanol (96 per cent) R*, then dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: *methyl ethyl ketone R, pentane R* (50:50 *V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air for 5 min.

Detection: spray with 3 ml of *anisaldehyde solution R* and heat at 100-105 °C for 5 min.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve 0.1 g in 1 ml of *ethanol (96 per cent) R.* Add one drop of *ferric chloride solution R1.* A green colour is produced. Add *dilute ammonia R1.* The solution becomes brown.

TESTS

Solution S. Dissolve 1.0 g in *ethanol (96 per cent) R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*).

Acidity. Dissolve 0.5 g in a mixture of 25 ml of *carbon dioxide-free water R* and 25 ml of *ether R* previously neutralised to *phenolphthalein solution R1* and titrate with *0.1 M sodium hydroxide*, shaking vigorously after each addition. Not more than 0.4 ml is required to change the colour of the solution.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.1 g of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). Dissolve 20.0 mg of *phenol R* (impurity A) in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 20.0 mg of *resorcinol R* (impurity B) in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (d). To 8.0 ml of reference solution (a) add 2.0 ml of reference solution (b), 2.0 ml of reference solution (c) and dilute to 20.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 25 volumes of a 3.0 g/l solution of *glacial acetic acid R* adjusted to pH 5.9 with *dilute ammonia R1*, and 75 volumes of *methanol R.*

Flow rate: 1 ml/min.

Detection: spectrophotometer at 281 nm.

Injection: 20 µl.

Run time: twice the retention time of hexylresorcinol.

System suitability: reference solution (d):

– *resolution*: minimum 5.0 between the peaks due to impurity A (2nd peak) and hexylresorcinol (3rd peak).

Limits:

– *impurities A, B*: for each impurity, not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.2 per cent);

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (*2.5.12*): maximum 0.5 per cent, determined on 1.000 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 10 ml of *methanol R* in a ground-glass-stoppered flask, add 30.0 ml of *0.0167 M potassium bromate* and 2 g of *potassium bromide R*. Shake to dissolve the substance and add 15 ml of *dilute sulphuric acid R*. Stopper the flask, shake and allow to stand in the dark for 15 min, stirring continuously. Add 5 ml of *methylene chloride R* and a solution of 1 g of *potassium iodide R* in 10 ml of *water R*, allow to stand in the dark for 15 min, stirring continuously. Titrate with *0.1 M sodium thiosulphate*, using 1 ml of *starch solution R*, shaking thoroughly. Carry out a blank titration under the same conditions.

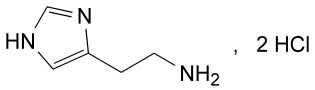
1 ml of *0.0167 M potassium bromate* is equivalent to 4.857 mg of $C_{12}H_{18}O_2$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B.



A. phenol,

B. resorcinol.

HISTAMINE DIHYDROCHLORIDE

Histamini dihydrochloridum

$C_5H_{11}Cl_2N_3$ M_r 184.1
[56-92-8]

DEFINITION

Histamine dihydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 2-(1*H*-imidazol-4-yl)ethanamine dihydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, hygroscopic, very soluble in water, soluble in alcohol.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *histamine dihydrochloride CRS*. Examine as discs prepared using 1 mg of substance.

B. Examine the chromatograms obtained in the test for histidine. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in 7 ml of *water R* and add 3 ml of a 200 g/l solution of *sodium hydroxide R*. Dissolve 50 mg of *sulphanilic acid R* in a mixture of 0.1 ml of *hydrochloric acid R* and 10 ml of *water R* and add 0.1 ml of *sodium nitrite solution R*. Add the second solution to the first and mix. A red colour is produced.

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

pH (*2.2.3*). The pH of solution S is 2.85 to 3.60.

Histidine. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel G plate R*.

Test solution (a). Dissolve 0.5 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 2 ml of test solution (a) to 10 ml with *water R*.

Reference solution (a). Dissolve 0.1 g of *histamine dihydrochloride CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 50 mg of *histidine monohydrochloride R* in *water R* and dilute to 100 ml with the same solvent.

Reference solution (c). Mix 1 ml of test solution (a) and 1 ml of reference solution (b).

Apply to the plate 1 µl of test solution (a), 1 µl of test solution (b), 1 µl of reference solution (a), 1 µl of reference solution (b) and 2 µl of reference solution (c). Develop over a path of 15 cm using a mixture of 5 volumes of *concentrated ammonia R*, 20 volumes of *water R* and 75 volumes of *acetonitrile R*. Dry the plate in a current of air. Repeat the development in the same direction, dry the plate in a current of air and spray with *ninhydrin solution R1*. Heat the plate at 110 °C for 10 min. Any spot corresponding to histidine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (1 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows 2 clearly separated spots.

Sulphates (*2.4.13*). 3 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (0.1 per cent).

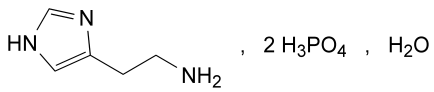
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 0.20 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 0.5 g.

ASSAY

Dissolve 0.080 g in a mixture of 5.0 ml of *0.01 M hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the first and third points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 9.203 mg of $C_5H_{11}Cl_2N_3$.



STORAGE

Store in an airtight container, protected from light.

01/2008:0144

HISTAMINE PHOSPHATE

Histamini phosphas

$C_5H_{15}N_3O_8P_2,H_2O$ M_r 325.2

DEFINITION

Histamine phosphate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 2-(1*H*-imidazol-4-yl)ethanamine diphosphate, calculated with reference to the anhydrous substance.

CHARACTERS

Colourless, long prismatic crystals, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *histamine phosphate CRS*. Examine as discs prepared using 1 mg of substance.

B. Examine the chromatograms obtained in the test for histidine. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in 7 ml of *water R* and add 3 ml of a 200 g/l solution of *sodium hydroxide R*. Dissolve 50 mg of *sulphanilic acid R* in a mixture of 0.1 ml of *hydrochloric acid R* and 10 ml of *water R* and add 0.1 ml of *sodium nitrite solution R*. Add the second solution to the first and mix. A red colour is produced.

D. It gives reaction (a) of phosphates (*2.3.1*).

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

pH (*2.2.3*). The pH of solution S is 3.75 to 3.95.

Histidine. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.5 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 2 ml of test solution (a) to 10 ml with *water R*.

Reference solution (a). Dissolve 0.1 g of *histamine phosphate CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 50 mg of *histidine monohydrochloride R* in *water R* and dilute to 100 ml with the same solvent.

Reference solution (c). Mix 1 ml of test solution (a) and 1 ml of reference solution (b).

Apply separately to the plate 1 µl of test solution (a), 1 µl of test solution (b), 1 µl of reference solution (a), 1 µl of reference solution (b) and 2 µl of reference solution (c). Develop over a path of 15 cm using a mixture of 5 volumes of *concentrated ammonia R*, 20 volumes of *water R* and 75 volumes of *acetonitrile R*. Dry the plate in a current of air. Repeat the development in the same direction, dry the plate in a current of air and spray with *ninhydrin solution R1*. Heat at 110 °C for 10 min. Any spot corresponding to histidine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (1 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows 2 clearly separated spots.

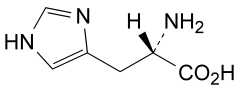
Sulphates (*2.4.13*). 3 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (0.1 per cent).

Water (*2.5.12*). 5.0 per cent to 6.2 per cent, determined on 0.30 g by the semi-micro determination of water.

ASSAY

Dissolve 0.140 g in 5 ml of *anhydrous formic acid R* and add 20 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid,* determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 15.36 mg of $C_5H_{15}N_3O_8P_2$.



STORAGE

Store protected from light.

01/2008:0911
corrected 6.0

HISTIDINE

Histidinum

$C_6H_9N_3O_2$ M_r 155.2
[71-00-1]

DEFINITION

(*S*)-2-Amino-3-(imidazol-4-yl)propanoic acid.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. It complies with the test for specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *histidine CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *water R*, evaporate to dryness at 60 °C and record new spectra using the residues.

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve 0.1 g in 7 ml of *water R* and add 3 ml of a 200 g/l solution of *sodium hydroxide R*. Dissolve 50 mg of *sulphanilic acid R* in a mixture of 0.1 ml of *hydrochloric acid R* and 10 ml of *water R* and add 0.1 ml of *sodium nitrite solution R*. Add the second solution to the first and mix. An orange-red colour develops.

TESTS

Solution S. Dissolve 2.5 g in *distilled water R*, heating in a water-bath and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*): + 11.4 to + 12.4 (dried substance).

Dissolve 2.75 g in 12.0 ml of *hydrochloric acid R1* and dilute to 25.0 ml with *water R*.

Ninhydrin-positive substances. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 0.10 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *histidine CRS* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *histidine CRS* and 10 mg of *proline CRS* in *water R* and dilute to 25 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *glacial acetic acid R, water R, butanol R* (20:20:60 *V/V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with *ninhydrin solution R* and heat at 100-105 °C for 15 min.

System suitability: the chromatogram obtained with reference solution (c) shows 2 clearly separated spots.

Limits:

– *any impurity*: any spots in the chromatogram obtained with test solution (a), apart from the principal spot, are not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Chlorides (*2.4.4*): maximum 200 ppm.

Dilute 5 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 300 ppm.

Dilute 10 ml of solution S to 15 ml with *distilled water R*.

Ammonium (*2.4.1, Method B*): maximum 200 ppm, determined on 50 mg.

Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (*2.4.9*): maximum 10 ppm.

In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron.

Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in a mixture of 3 ml of *dilute hydrochloric acid R* and 15 ml of *water R*, with gentle warming if necessary, and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

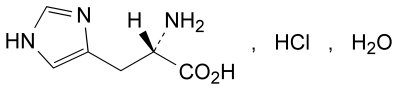
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.130 g in 50 ml of *water R*. Titrate with *0.1 M hydrochloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M hydrochloric acid* is equivalent to 15.52 mg of $C_6H_9N_3O_2$.



STORAGE

Protected from light.

corrected 6.0

HISTIDINE HYDROCHLORIDE MONOHYDRATE

Histidini hydrochloridum monohydricum

$C_6H_{10}ClN_3O_2,H_2O$ M_r 209.6
[5934-29-2]

DEFINITION

Histidine hydrochloride monohydrate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of the hydrochloride of (*S*)-2-amino-3-(imidazol-4-yl)propanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, B, C, F.

Second identification: A, B, D, E, F.

A. It complies with the test for specific optical rotation (see Tests).

B. It complies with the test for the pH (see Tests).

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *histidine hydrochloride monohydrate CRS*. Examine the substances prepared as discs.

D. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

E. Dissolve 0.1 g in 7 ml of *water R* and add 3 ml of a 200 g/l solution of *sodium hydroxide R*. Dissolve 50 mg of *sulphanilic acid R* in a mixture of 0.1 ml of *hydrochloric acid R* and 10 ml of *water R* and add 0.1 ml of *sodium nitrite solution R*. Add the second solution to the first and mix. An orange-red colour develops.

F. About 20 mg gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

pH (*2.2.3*). The pH of solution S is 3.0 to 5.0.

Specific optical rotation (*2.2.7*). Dissolve 2.75 g in 12.0 ml of *hydrochloric acid R1* and dilute to 25.0 ml with *water R*. The specific optical rotation is + 9.2 to + 10.6, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *histidine hydrochloride monohydrate CRS* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *histidine hydrochloride monohydrate CRS* and 10 mg of *proline CRS* in *water R* and dilute to 25 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Dry the plate in a current of air. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Sulphates (*2.4.13*). Dilute 10 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (*2.4.1*). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (*2.4.9*). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (*2.4.8*). Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

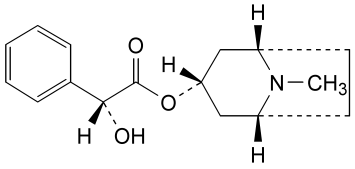
Loss on drying (*2.2.32*): 7.0 per cent to 10.0 per cent, determined on 1.000 g by drying in an oven at 145 °C to 150 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.160 g in 50 ml of *carbon dioxide-free water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M sodium hydroxide* is equivalent to 19.16 mg of $C_6H_{10}ClN_3O_2$.



STORAGE

Store protected from light.

01/2008:0500
corrected 6.0

HOMATROPINE HYDROBROMIDE

Homatropini hydrobromidum

and enantiomer , HBr

$C_{16}H_{22}BrNO_3$ M_r 356.3
[51-56-9]

DEFINITION

(1*R*,3*r*,5*S*)-8-Methyl-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-2-hydroxy-2-phenylacetate hydrobromide.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: freely soluble in water, sparingly soluble in alcohol.

mp: about 215 °C, with decomposition.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *homatropine hydrobromide CRS*.

B. Dissolve 50 mg in 1 ml of *water R* and add 2 ml of *dilute acetic acid R*. Heat and add 4 ml of *picric acid solution R*. Allow to cool, shaking occasionally. Collect the crystals, wash with 2 quantities, each of 3 ml, of iced *water R* and dry at 100-105 °C. The crystals melt (*2.2.14*) at 182 °C to 186 °C.

C. It gives reaction (a) of bromides (*2.3.1*).

TESTS

Solution S. Dissolve 1.25 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 5.0 to 6.5 for solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with the mobile phase.

Reference solution (c). Dissolve 5.0 mg of *hyoscine hydrobromide CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. To 10.0 ml of this solution add 0.5 ml of the test solution and dilute to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.1 m, Ø = 4.6 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm),

– *temperature*: 40 °C.

Mobile phase: mix 33 volumes of *methanol R2* and 67 volumes of a solution prepared as follows: dissolve 6.8 g of *potassium dihydrogen phosphate R* and 7.0 g of *sodium heptanesulphonate monohydrate R* in 1000 ml of *water R* and adjust to pH 2.7 with a 330 g/l solution of *phosphoric acid R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 µl.

Run time: 3 times the retention time of homatropine.

Relative retention with reference to homatropine (retention time = about 6.8 min): impurity C = about 0.2; impurity A = about 0.9; impurity B = about 1.1; impurity D = about 1.9.

System suitability: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to homatropine and impurity B,

– *symmetry factor*: maximum 2.5 for the peak due to homatropine.

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),

– *impurities B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent); disregard the peak due to the bromide ion which appears close to the peak due to the solvent,

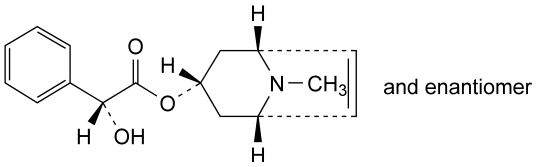
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 5.0 ml of *0.01 M hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

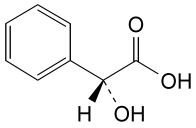


1 ml of *0.1 M sodium hydroxide* is equivalent to 35.63 mg of $C_{16}H_{22}BrNO_3$.

STORAGE

Protected from light.

IMPURITIES



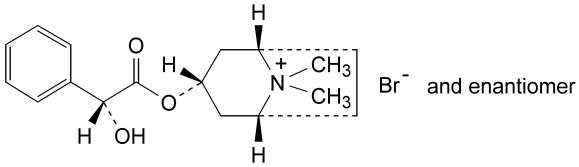
Specified impurities: A, B, C, D.

and enantiomer

A. (1*R*,3*s*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-6-en-3-yl (2*RS*)-2-hydroxy-2-phenylacetate (dehydrohomatropine),

B. hyoscine,

and enantiomer



C. (2*RS*)-2-hydroxy-2-phenylacetic acid (mandelic acid),

D. atropine.

HOMATROPINE METHYLBROMIDE

Homatropini methylbromidum

and enantiomer

$C_{17}H_{24}BrNO_3$ M_r 370.3
[80-49-9]

DEFINITION

(1*R*,3*r*,5*S*)-3-[[(2*RS*)-2-hydroxy-2-phenylacetyl]oxy]-8,8-dimethyl-8-azoniabicyclo[3.2.1]octane bromide.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: freely soluble in water, soluble in alcohol.

mp: about 190 °C.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*), *Comparison*: *homatropine methylbromide CRS*.

B. Dissolve 50 mg in 1 ml of *water R* and add 2 ml of *dilute acetic acid R*. Heat and add 4 ml of *picric acid solution R*. Allow to cool, shaking occasionally. The crystals, washed with 2 quantities, each of 3 ml, of iced *water R* and dried at 100-105 °C melt (*2.2.14*) at 132 °C to 138 °C.

C. It gives reaction (a) of bromides (*2.3.1*).

TESTS

Solution S. Dissolve 1.25 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 4.5 to 6.5 for solution S.

Related substances. Liquid chromatography (*2.2.29*).

Solvent mixture: *acetonitrile R*, mobile phase A (9:41 *V/V*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with the solvent mixture.

Reference solution (c). Dissolve 5.0 mg of *homatropine hydrobromide CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture. To 10.0 ml of the solution add 0.5 ml of the test solution and dilute to 100.0 ml with the solvent mixture.

Column:

- *size*: *l* = 0.15 m, Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm),
- *temperature*: 25 °C.

Mobile phase:

- *mobile phase A*: dissolve 3.4 g of *potassium dihydrogen phosphate R* and 5.0 g of *sodium heptanesulphonate monohydrate R* in 1000 ml of *water R*, and adjust to pH 3.0 with a 330 g/l solution of *phosphoric acid R*,
- *mobile phase B*: mix 400 ml of mobile phase A and 600 ml of *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 2	70	30
2 - 15	70 → 30	30 → 70
15 - 20	30 → 70	70 → 30

Flow rate: 1.4 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 µl.

Relative retention with reference to homatropine methylbromide (retention time = about 4.8 min): impurity C = about 0.7; impurity A = about 0.9; impurity B = about 1.2; impurity D = about 1.3; impurity E = about 1.4; impurity F = about 1.7.

System suitability: reference solution (c):

- *resolution*: minimum 2.5 between the peaks due to homatropine methylbromide and impurity B,
- *symmetry factor*: maximum 2.5 for the peak due to homatropine methylbromide.

Limits:

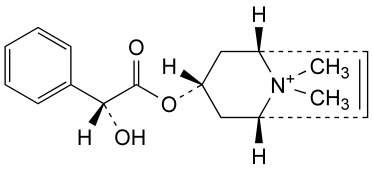
- *impurities A, B*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *impurities C, D, E, F*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent); disregard the peak due to the bromide ion which appears close to the peak due to the solvent,
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 10 ml of *water R*. Titrate with *0.1 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*), using a silver indicator electrode and a silver-silver chloride reference electrode.

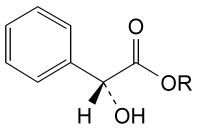


1 ml of *0.1 M silver nitrate* is equivalent to 37.03 mg of $C_{17}H_{24}BrNO_3$.

STORAGE

Protected from light.

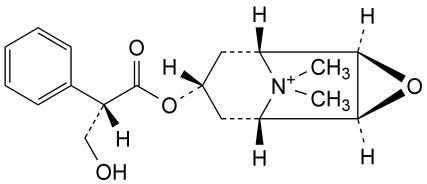
IMPURITIES



Specified impurities: A, B, C, D, E, F.

and enantiomer

A. (1*R*,3*s*,5*S*)-3-[[(2*RS*)-2-hydroxy-2-phenylacetyl]oxy]-8,8-dimethyl-8-azoniabicyclo[3.2.1]oct-6-ene (methyldehydrohomatropine),



B. homatropine,

and enantiomer

C. R = H: (2*RS*)-2-hydroxy-2-phenylacetic acid (mandelic acid),

F. R = CH_3: methyl (2*RS*)-2-hydroxy-2-phenylacetate (methyl mandelate),

D. (1*R*,2*R*,4*S*,5*S*,7*s*)-7-[[(2*S*)-3-hydroxy-2-phenylpropanoyl]oxy]-9,9-dimethyl-3-oxa-9-azoniatricyclo[3.3.1.$0^{2,4}$]nonane (methylhyoscine),

E. methylatropine.

01/2008:2051

HONEY

Mel

DEFINITION

Honey is produced by bees (*Apis mellifera* L.) from the nectar of plants or from secretions of living parts of plants which the bees collect, transform by combining with specific substances of their own, deposit, dehydrate, store and leave in the honey comb to ripen and mature.

PRODUCTION

If the bee has been exposed to treatment to prevent or cure diseases or to any substance intended for preventing, destroying or controlling any pest, unwanted species of plants or animals, appropriate steps are taken to ensure that the levels of residues are as low as possible.

CHARACTERS

Appearance: viscous liquid which may be partly crystalline, almost white to dark brown.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.6 g of the substance to be examined in 50 ml of *ethanol (30 per cent V/V) R*.

Reference solution. Dissolve 0.5 g of *fructose R*, 0.5 g of *glucose R* and 0.1 g of *sucrose R* in 100 ml of *ethanol (30 per cent V/V) R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *water R, acetonitrile R* (13:87 *V/V*).

Application: 5 µl as bands.

Development: 3 times over a path of 15 cm.

Drying: in warm air.

Detection: spray with a solution prepared as follows: dissolve 2 g of *diphenylamine R* and 2 ml of *aniline R* in 100 ml of *acetone R*. Add a 850 g/l solution of *phosphoric acid R* until the precipitate formed dissolves again (about 15-20 ml). Examine in daylight after heating at 100-105 °C for 5-10 min.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, the weak brown zone due to sucrose in the chromatogram obtained with the reference solution may be present in the chromatogram obtained with the test solution. One or more other weak zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
———	———
Fructose: an intense brown zone	An intense brown zone (fructose)
Glucose: an intense greyish-blue zone	An intense greyish-blue zone (glucose)
———	———
Sucrose: a brown zone	
	2 to 3 brownish-grey zones
Reference solution	**Test solution**

TESTS

Refractive index (*2.2.6*): minimum 1.487 (equivalent to a maximum water content of 20 per cent).

Homogenise 100 g and transfer into a flask. Close tightly and place in a water-bath at 50 ± 0.2 °C until all sugar crystals have dissolved. Cool the solution to 20 °C and rehomogenise. Immediately after rehomogenisation, cover the surface of the refractometer prism evenly with the sample. Determine the refractive index after 2 min if using an Abbe refractometer and after 4 min if using a digital refractometer. Use the average value of 2 determinations.

Conductivity (*2.2.38*): maximum 800 $\mu S \cdot cm^{-1}$.

Using the value obtained for the refractive index, determine the water content of the substance to be examined from Table 2051.-1. Using this information, dissolve an amount of the substance to be examined equivalent to 20.0 g of honey dry solids, in *water R* to produce 100.0 ml.

Optical rotation (*2.2.7*): maximum + 0.6°.

Using the value obtained for the refractive index, determine the water content of the substance to be examined from Table 2051.-1. Using this information, dissolve an amount of the substance to be examined, equivalent to 20.0 g of honey dry solids, in 50 ml of *water R*. Add 0.2 ml of *concentrated ammonia R* and dilute to 100.0 ml with *water R*. If necessary decolourise the solution with *activated charcoal R*.

Table 2051.-1. – *Relationship of water content of honey to refractive index*

Water content (per cent *m/m*)	Refractive index at 20 °C
15.0	1.4992
15.2	1.4987
15.4	1.4982
15.6	1.4976
15.8	1.4971

20.0	1.4865

5-Hydroxymethylfurfural: maximum 80 ppm, calculated on dry solids.

Using the value obtained for the refractive index, determine the water content of the substance to be examined from Table 2051.-1. Using this information, dissolve an amount of the substance to be examined, equivalent to 5.0 g of honey dry solids, in 25 ml of *water R* and transfer to a 50.0 ml volumetric flask with the same solvent. Add 0.5 ml of a 150 g/l solution of *potassium ferrocyanide R* and mix. Add 0.5 ml of a 300 g/l solution of *zinc acetate R*, mix and dilute to 50.0 ml with *water R* (a drop of *anhydrous ethanol R* may be added to avoid foaming). Filter. Transfer 5.0 ml of the filtered solution into each of 2 tubes. To one tube add 5.0 ml of *water R* (test solution). To the other tube add 5.0 ml of a 2.0 g/l solution of *sodium hydrogensulphite R* (reference solution). Determine the absorbance (*2.2.25*) of the test solution against the reference solution at 284 nm and 336 nm within 60 min. If the absorbance at 284 nm is greater than 0.8, dilute to the same extent the test solution with *water R* and the reference solution with a 2.0 g/l solution of *sodium hydrogensulphite R* so as to obtain an absorbance of less than 0.8.

Calculate the content of 5-hydroxymethylfurfural from the expression:

$$(A_1 - A_2) \times D \times 149.7$$

A_1 = absorbance at 284 nm,

A_2 = absorbance at 336 nm,

D = dilution factor, where applicable.

Chlorides (*2.4.4*): maximum 350 ppm, determined on 15 ml of a 10 g/l solution.

Sulphates (*2.4.13*): maximum 250 ppm, determined on 15 ml of a 40 g/l solution.

01/2008:1222
corrected 6.0

HOP STROBILE

Lupuli flos

DEFINITION

Dried, generally whole, female inflorescences of *Humulus lupulus* L.

CHARACTERS

Characteristic, aromatic odour.

IDENTIFICATION

A. Hop strobiles are generally isolated and 2-5 cm long, petiolate, ovoid, made up of many oval, greenish-yellow, sessile, membranous, overlapping bracts. The external bracts are flattened and symmetrical. The internal bracts are longer and asymmetrical at the base because of a fold generally encircling an induviate fruit (achene). The ovary or rarely the fruit, the base of the bracts and especially the induvial fold, are covered with small orange-yellow glands.

B. Reduce to a powder (355) (*2.9.12*). The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of bracts and bracteoles covered by polygonal, irregular epidermal cells with wavy walls; unicellular, conical, straight or curved covering trichomes with thin, smooth walls; rare anomocytic stomata (*2.8.3*); fragments of mesophyll containing small calcium oxalate cluster crystals; many characteristic orange-yellow glandular trichomes with short, bicellular biseriate stalks, bearing a part widening into a cup, 150-250 µm in diameter, made up of a hemispherical layer of secretory cells with a cuticle that has been detached and distended by the accumulation of oleoresinous secretions; fragments of elongated sclerenchymatous cells of the testa with thick walls showing striations and numerous pits.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the freshly powdered drug (355) (*2.9.12*) add 10 ml of a mixture of 3 volumes of *water R* and 7 volumes of *methanol R*; shake for 15 min and filter.

Reference solution. Dissolve 1.0 mg of *Sudan orange R*, 2.0 mg of *curcumin R* and 2.0 mg of *dimethylaminobenzaldehyde R* in 20 ml of *methanol R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *anhydrous acetic acid R, ethyl acetate R, cyclohexane R* (2:38:60 *V/V/V*).

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the chromatogram obtained with the reference solution shows 3 quenching bands; in the lower quarter is the faint band due to curcumin, somewhat below the middle is the band due to dimethylaminobenzaldehyde and above the band due to Sudan orange. The chromatogram obtained with the test solution shows a number of quenching bands similar in position to the bands in the chromatogram obtained with the reference solution: at about the level of the band due to curcumin is a faint band due to xanthohumol, near the level of the band due to dimethylaminobenzaldehyde are bands due to humulones, and near the level of the band due to Sudan orange are bands due to lupulones.

Detection B: examine in ultraviolet light at 365 nm.

Results B: in the chromatogram obtained with the test solution the bands due to lupulones show blue fluorescence, the bands due to humulones brown fluorescence and the band due to xanthohumol dark brown fluorescence.

Detection C: spray with *dilute phosphomolybdotungstic reagent R*. Expose to ammonia vapour. Examine in daylight.

Results C: in the chromatogram obtained with the test solution, the bands due to humulones and to lupulones are bluish-grey and the band due to xanthohumol is greenish-grey. In the chromatogram obtained with the reference solution, the bands are bluish-grey or brownish-grey.

TESTS

Matter extractable by ethanol (70 per cent *V/V*): minimum 25.0 per cent.

To 10.0 g of the powdered drug (355) (*2.9.12*) add 300 ml of *ethanol (70 per cent V/V) R* and heat for 10 min on a water bath under a reflux condenser. Allow to cool, filter and discard the first 10 ml of the filtrate. Evaporate 30.0 ml of the filtrate to dryness on a water-bath and dry in an oven at 100-105 °C for 2 h. The residue weighs a minimum of 0.250 g.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 12.0 per cent.

01/2008:0255

HUMAN ALBUMIN SOLUTION

Albumini humani solutio

DEFINITION

Human albumin solution is an aqueous solution of protein obtained from plasma that complies with the requirements of the monograph on *Plasma for fractionation, human (0853)*.

PRODUCTION

Separation of the albumin is carried out under controlled conditions, particularly of pH, ionic strength and temperature so that in the final product not less than 95 per cent of the total protein is albumin. Human albumin solution is prepared as a concentrated solution containing 150-250 g/l of total protein or as an isotonic solution containing 35-50 g/l of total protein. A suitable stabiliser against the effects of heat, such as sodium caprylate (sodium octanoate) or *N*-acetyltryptophan or a combination of these 2, at a suitable concentration, may be added but no antimicrobial preservative is added at any stage during preparation. The solution is passed through a bacteria-retentive filter and distributed aseptically into sterile containers which are then closed so as to prevent contamination. The solution in its final container is heated to 60 ± 1.0 °C and maintained at this temperature for not less than 10 h. The containers are then incubated at 30-32 °C for not less than 14 days or at 20-25 °C for not less than 4 weeks and examined visually for evidence of microbial contamination.

CHARACTERS

A clear, slightly viscous liquid; it is almost colourless, yellow, amber or green.

IDENTIFICATION

Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted to contain 10 g/l of protein. The main component of the preparation to be examined corresponds to the main component of normal human serum. The preparation may show the presence of small quantities of other plasma proteins.

TESTS

pH (*2.2.3*): 6.7 to 7.3.

Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing 10 g/l of protein.

Total protein. Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2.0 ml of this solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the quantity of protein by multiplying by 6.25. The preparation contains not less than 95 per cent and not more than 105 per cent of the quantity of protein stated on the label.

Protein composition. Zone electrophoresis (*2.2.31*).

Use strips of suitable cellulose acetate gel or agarose gel as the supporting medium and *barbital buffer solution pH 8.6 R1* as the electrolyte solution.

If cellulose acetate is the supporting material, the method described below can be used. If agarose gels are used, and because they are normally part of an automated system, the manufacturer's instructions are followed instead.

Test solution. Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to a protein concentration of 20 g/l.

Reference solution. Dilute *human albumin for electrophoresis BRP* with a 9 g/l solution of *sodium chloride R* to a protein concentration of 20 g/l.

To a strip apply 2.5 µl of the test solution as a 10 mm band or apply 0.25 µl per millimetre if a narrower strip is used. To another strip, apply in the same manner the same volume of the reference solution. Apply a suitable electric field such that the most rapid band migrates at least 30 mm. Treat the strips with *amido black 10B solution R* for 5 min. Decolorise with a mixture of 10 volumes of *glacial acetic acid R* and 90 volumes of *methanol R* until the background is just free of colour. Develop the transparency of the strips with a mixture of 19 volumes of *glacial acetic acid R* and 81 volumes of *methanol R*. Measure the absorbance of the bands at 600 nm in an instrument having a linear response over the range of measurement. Calculate the result as the mean of 3 measurements of each strip.

System suitability: in the electropherogram obtained with the reference solution on cellulose acetate or on agarose gels, the proportion of protein in the principal band is within the limits stated in the leaflet accompanying the reference preparation.

Results: in the electropherogram obtained with the test solution on cellulose acetate or on agarose gels, not more than 5 per cent of the protein has a mobility different from that of the principal band.

Molecular size distribution. Liquid chromatography (*2.2.29*).

Test solution. Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to a concentration suitable for the chromatographic system used. A concentration in the range of 4-12 g/l and injection of 50-600 µg of protein are usually suitable.

Column:

- *size*: *l* = 0.6 m, Ø = 7.5 mm, or *l* = 0.3 m, Ø = 7.8 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins with relative molecular masses in the range 10 000 to 500 000.

Mobile phase: dissolve 4.873 g of *disodium hydrogen phosphate dihydrate R*, 1.741 g of *sodium dihydrogen phosphate monohydrate R*, 11.688 g of *sodium chloride R* and 50 mg of *sodium azide R* in 1 litre of *water R*.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 280 nm.

The peak due to polymers and aggregates is located in the part of the chromatogram representing the void volume. Disregard the peak due to the stabiliser. The area of the peak

due to polymers and aggregates is not greater than 10 per cent of the total area of the chromatogram (corresponding to about 5 per cent of polymers and aggregates).

Haem. Dilute the preparation to be examined using a 9 g/l solution of *sodium chloride R* to obtain a solution containing 10 g/l of protein. The absorbance (*2.2.25*) of the solution measured at 403 nm using *water R* as the compensation liquid is not greater than 0.15.

Prekallikrein activator (*2.6.15*): maximum 35 IU/ml.

Aluminium: maximum 2.0×10^2 µg/l.

Atomic absorption spectrometry (*2.2.23, Method I or II*).

Use a furnace as atomic generator.

Use plastic containers for preparation of the solutions and use plastic equipment where possible. Wash glassware (or equipment) in nitric acid (200 g/l HNO_3) before use.

Test solution. Use the preparation to be examined, diluted if necessary.

Reference solutions. Prepare at least 3 reference solutions in a range spanning the expected aluminium concentration of the preparation to be examined, for example by diluting *aluminium standard solution (10 ppm Al) R* with a 1 g/l solution of *octoxinol 10 R*.

Monitor solution. Add *aluminium standard solution (10 ppm Al) R* or a suitable certified reference material to the test solution in a sufficient amount to increase the aluminium concentration by 20 µg/l.

Blank solution. 1 g/l solution of *octoxinol 10 R*.

Wavelength: 309.3 nm or other suitable wavelength.

Slit width: 0.5 nm.

Tube: pyrolytically coated, with integrated platform.

Background corrector: off.

Atomisation device: furnace; fire between readings.

The operating conditions in Table 0255.-1 are cited as an example of conditions found suitable for a given apparatus; they may be modified to obtain optimum conditions.

Table 0255.-1. – *Operating conditions found suitable, cited as an example*

Step	Final temperature (°C)	Ramp time (s)	Hold time (s)	Gas
1	120	10	80	argon
2	200	5	20	argon
3	650	5	10	argon
4	1300	5	10	argon
5	1300	1	10	no gas
6	2500	0.7	4	no gas
7	2600	0.5	3	argon
8	20	12.9	3	no gas

Injection: each of the following solutions 3 times: blank solution, reference solutions, test solution and monitor solution.

System suitability:

– the recovery of aluminium added in preparation of the monitor solution is within the range 80-120 per cent.

Prepare a calibration curve from the mean of the readings obtained with the reference solutions and determine the aluminium content of the preparation to be examined using the calibration curve.

Potassium: maximum 0.05 mmol of K per gram of protein.

Atomic emission spectrometry (*2.2.22, Method I*).

Wavelength: 766.5 nm.

Sodium: maximum 1.60×10^2 mmol/l and not less than 95 per cent and not more than 105 per cent of the content of Na stated on the label.

Atomic emission spectrometry (*2.2.22, Method I*).

Wavelength: 589 nm.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. For a solution containing 35-50 g/l of protein, inject per kilogram of the rabbit's mass 10 ml of the preparation to be examined. For a solution containing 150-250 g/l of protein, inject per kilogram of the rabbit's mass 5 ml of the preparation to be examined.

STORAGE

Protected from light.

LABELLING

The label states:

– the name of the preparation;
– the volume of the preparation;
– the content of protein expressed in grams per litre;
– the content of sodium expressed in millimoles per litre;
– that the product is not to be used if it is cloudy or if a deposit has formed;
– the name and concentration of any added substance (for example stabiliser).

01/2008:0557

HUMAN ANTI-D IMMUNOGLOBULIN

Immunoglobulinum humanum anti-D

DEFINITION

Human anti-D immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It contains specific antibodies against erythrocyte D-antigen and may also contain small quantities of other blood-group antibodies. *Human normal immunoglobulin (0338)* and/or *Human albumin solution (0255)* may be added.

It complies with the monograph *Human normal immunoglobulin (0338)*, except for the minimum number of donors and the minimum total protein content. For products prepared by a method that eliminates immunoglobulins with specificities other than anti-D, where authorised, the test for antibodies to hepatitis B surface antigen is not required.

PRODUCTION

Human anti-D immunoglobulin is preferably obtained from the plasma of donors with a sufficient titre of previously acquired anti-D antibodies. Where necessary, in order to ensure an adequate supply of human anti-D immunoglobulin, it is obtained from plasma derived from donors immunised with D-positive erythrocytes that are compatible in relevant blood group systems in order to avoid formation of undesirable antibodies.

ERYTHROCYTE DONORS

Erythrocyte donors comply with the requirements for donors prescribed in the monograph *Human plasma for fractionation (0853)*.

IMMUNISATION

Immunisation of the plasma donor is carried out under proper medical supervision. Recommendations concerning donor immunisation, including testing of erythrocyte donors, have been formulated by the World Health Organisation (*Requirements for the collection, processing and quality control of blood, blood components and plasma derivatives*, WHO Technical Report Series, No. 840, 1994 or subsequent revision).

POOLED PLASMA

To limit the potential B19 virus burden in plasma pools used for the manufacture of anti-D immunoglobulin, the plasma pool is tested for B19 virus using validated nucleic acid amplification techniques (*2.6.21*).

B19 virus DNA: maximum 10.0 IU/µl.

A positive control with 10.0 IU of B19 virus DNA per microlitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors.

B19 virus DNA for NAT testing BRP is suitable for use as a positive control.

If *Human normal immunoglobulin (0338)* and/or *Human albumin solution (0255)* are added to the preparation, the plasma pool or pools from which they are derived comply with the above requirement for B19 virus DNA.

POTENCY

Carry out the assay of human anti-D immunoglobulin (*2.7.13, Method A*). The estimated potency is not less than 90 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Method B or C (*2.7.13*) may be used for potency determination if a satisfactory correlation with the results obtained by Method A has been established for the particular product.

STORAGE

See *Human normal immunoglobulin (0338)*.

LABELLING

See *Human normal immunoglobulin (0338)*.

The label states the number of International Units per container.

01/2008:1527

HUMAN ANTI-D IMMUNOGLOBULIN FOR INTRAVENOUS ADMINISTRATION

Immunoglobulinum humanum anti-D ad usum intravenosum

DEFINITION

Human anti-D immunoglobulin for intravenous administration is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. It contains specific antibodies against erythrocyte D-antigen and may also contain small quantities of other blood-group antibodies. *Human normal immunoglobulin for intravenous administration (0918)* and/or *Human albumin solution (0255)* may be added.

It complies with the monograph *Human normal immunoglobulin for intravenous administration (0918)*, except for the minimum number of donors, the minimum total protein content, the limit for osmolality and the limit for prekallikrein activator.

The test for anti-D antibodies (*2.6.26*) prescribed in the monograph *Human normal immunoglobulin for intravenous administration (0918)* is not carried out, since it is replaced by the assay of human anti-D immunoglobulin (*2.7.13*) as prescribed below under Potency.

For products prepared by a method that eliminates immunoglobulins with specificities other than anti-D: where authorised, the test for antibodies to hepatitis B surface antigen is not required; a suitable test for Fc function is carried out instead of that described in chapter *2.7.9*, which is not applicable to such a product.

PRODUCTION

Human anti-D immunoglobulin is preferably obtained from the plasma of donors with a sufficient titre of previously acquired anti-D antibodies. Where necessary, in order to ensure an adequate supply of human anti-D immunoglobulin, it is obtained from plasma derived from donors immunised with D-positive erythrocytes that are compatible in relevant blood group systems in order to avoid formation of undesirable antibodies.

ERYTHROCYTE DONORS

Erythrocyte donors comply with the requirements for donors prescribed in the monograph *Human plasma for fractionation (0853)*.

IMMUNISATION

Immunisation of the plasma donor is carried out under proper medical supervision. Recommendations concerning donor immunisation, including testing of erythrocyte donors, have been formulated by the World Health Organisation (*Requirements for the collection, processing and quality control of blood, blood components and plasma derivatives*, WHO Technical Report Series, No. 840, 1994 or subsequent revision).

POOLED PLASMA

To limit the potential B19 virus burden in plasma pools used for the manufacture of anti-D immunoglobulin, the plasma pool is tested for B19 virus using validated nucleic acid amplification techniques (*2.6.21*).

B19 virus DNA: maximum 10.0 IU/µl.

A positive control with 10.0 IU of B19 virus DNA per microlitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors.

B19 virus DNA for NAT testing BRP is suitable for use as a positive control.

If *Human normal immunoglobulin for intravenous administration (0918)* and/or *Human albumin solution (0255)* are added to the preparation, the plasma pool or pools from which they are derived comply with the above requirement for B19 virus DNA.

POTENCY

Carry out the assay of human anti-D immunoglobulin (*2.7.13, Method A*). The estimated potency is not less than 90 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Method B or C (*2.7.13*) may be used for potency determination if a satisfactory correlation with the results obtained by Method A has been established for the particular product.

STORAGE

See *Human normal immunoglobulin for intravenous administration (0918)*.

LABELLING

See *Human normal immunoglobulin for intravenous administration (0918)*.

The label states the number of International Units per container.

HUMAN ANTITHROMBIN III CONCENTRATE

Antithrombinum III humanum densatum

DEFINITION

Human antithrombin III concentrate is a preparation of a glycoprotein fraction obtained from human plasma that inactivates thrombin in the presence of an excess of heparin. It is obtained from plasma that complies with the requirements of the monograph on *Human plasma for fractionation (0853)*.

When reconstituted in the volume of solvent stated on the label, the potency is not less than 25 IU of antithrombin III per millilitre.

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

The antithrombin III is purified and concentrated and a suitable stabiliser may be added. The specific activity is not less than 3 IU of antithrombin III per milligram of total protein, excluding albumin. The antithrombin III concentrate is passed through a bacteria-retentive filter, distributed aseptically into its final, sterile containers and immediately frozen. It is then freeze-dried and the containers are closed under vacuum or in an atmosphere of inert gas. No antimicrobial preservative is added at any stage of production.

VALIDATION TEST

It shall be demonstrated that the manufacturing process yields a product that consistently complies with the following test.

Heparin-binding fraction. Examine by agarose gel electrophoresis (*2.2.31*). Prepare a 10 g/l solution of *agarose for electrophoresis R* containing 15 IU of *heparin R* per millilitre in *barbital buffer solution pH 8.4 R*. Pour 5 ml of this solution onto a glass plate 5 cm square. Cool at 4 °C for 30 min. Cut 2 wells 2 mm in diameter 1 cm and 4 cm from the side of the plate and 1 cm from the cathode. Introduce into one well 5 µl of the preparation to be examined, diluted to an activity of about 1 IU of antithrombin III per millilitre. Introduce into the other well 5 µl of a solution of a marker dye such as *bromophenol blue R*. Allow the electrophoresis to proceed at 4 °C, using a constant electric field of 7 V/cm, until the dye reaches the anode.

Cut across the agarose gel 1.5 cm from that side of the plate on which the preparation to be examined was applied and remove the larger portion of the gel leaving a band 1.5 cm wide containing the material to be examined. Replace the removed portion with an even layer consisting of 3.5 ml of a 10 g/l solution of *agarose for electrophoresis R* in *barbital buffer solution pH 8.4 R*, containing a rabbit anti-human antithrombin III antiserum at a suitable concentration, previously determined, to give adequate peak heights of at least 1.5 cm. Place the plate with the original gel at the cathode so that a second electrophoretic migration can occur at right angles to the first. Allow this second electrophoresis to proceed using a constant electric field of 2 V/cm for 16 h. Cover the plates with filter paper and several layers of thick lint soaked in a 9 g/l solution of *sodium chloride R* and compress for 2 h, renewing the saline several times. Rinse with *water R*, dry the plates and stain with *acid blue 92 solution R*.

Calculate the fraction of antithrombin III bound to heparin, which is the peak closest to the anode, with respect to the total amount of antithrombin III, by measuring the area defined by the 2 precipitation peaks.

The fraction of antithrombin III able to bind to heparin is not less than 60 per cent.

CHARACTERS

A white or almost white, hygroscopic, friable solid or a powder.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, the tests (except those for solubility, total protein and water), and the assay.

IDENTIFICATION

It complies with the limits of the assay.

TESTS

pH (*2.2.3*): 6.0 to 7.5.

Solubility. It dissolves completely under gentle swirling within 10 min in the volume of the solvent stated on the label, forming a clear or slightly turbid, colourless solution.

Osmolality (*2.2.35*): minimum 240 mosmol/kg.

Total protein. If necessary, dilute an accurately measured volume of the preparation to be examined with *water R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2.0 ml of the solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25.

Heparin (*2.7.5*): maximum 0.1 IU of heparin activity per International Unit of antithrombin III activity. It is necessary to validate the method for assay of heparin for each specific preparation to be examined to allow for interference by antithrombin III.

Water. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near infrared spectrophotometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a volume of the preparation to be examined equivalent to 50 IU of antithrombin III, calculated from the activity stated on the label.

ASSAY

Assay of human antithrombin III (*2.7.17*).

The estimated potency is not less than 80 per cent and not more than 120 per cent of the potency stated on the label. The confidence limits (P = 0.95) are not less than 90 per cent and not more than 110 per cent of the estimated potency.

STORAGE

Protected from light, in an airtight container.

LABELLING

The label states:

- the content of antithrombin III expressed in International Units per container.
- the name and volume of solvent to be used to reconstitute the preparation,
- where applicable, the amount of albumin present as a stabiliser.

01/2008:1224
corrected 6.0

HUMAN COAGULATION FACTOR VII

Factor VII coagulationis humanus

DEFINITION

Human coagulation factor VII is a plasma protein fraction that contains the single-chain glycoprotein factor VII and may also contain small amounts of the activated form, the two-chain derivative factor VIIa. It may also contain coagulation factors II, IX and X and protein C and protein S. It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*.

The potency of the preparation, reconstituted as stated on the label, is not less than 15 IU of factor VII per millilitre.

PRODUCTION

The method of preparation is designed to minimise activation of any coagulation factor (to minimise potential thrombogenicity) and includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 2 IU of factor VII per milligram of total protein, before the addition of any protein stabiliser.

The factor VII fraction is dissolved in a suitable liquid. Heparin, antithrombin and other auxiliary substances such as a stabiliser may be added. No antimicrobial preservative is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

CONSISTENCY OF THE METHOD OF PRODUCTION

The consistency of the method of production with respect to the activities of factors II, IX and X of the preparation, expressed in International Units relative to the activity of factor VII, shall be demonstrated.

The consistency of the method of production with respect to the activity of factor VIIa of the preparation shall be demonstrated. The activity of factor VIIa may be determined, for example, using a recombinant soluble tissue factor that does not activate factor VII but possesses a cofactor function specific for factor VIIa; after incubation of a mixture of the recombinant soluble tissue factor with phospholipids reagent and the dilution of the test sample in factor VII-deficient plasma, calcium chloride is added and the clotting time determined; the clotting time is inversely related to the factor VIIa activity of the test sample.

CHARACTERS

A hygroscopic powder or friable solid that may be white or almost white, pale yellow, green or blue.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

IDENTIFICATION

It complies with the limits of the assay.

TESTS

Solubility. To a container of the preparation to be examined add the volume of liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear or slightly opalescent solution that may be coloured.

pH (*2.2.3*): 6.5 to 7.5.

Osmolality (*2.2.35*): minimum 240 mosmol/kg.

Total protein. If necessary, dilute an accurately measured volume of the reconstituted preparation with a 9 g/l solution of *sodium chloride R* to obtain a solution expected to contain about 15 mg of protein in 2 ml. To 2.0 ml of the solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25.

Activated coagulation factors (*2.6.22*). For each of the dilutions, the coagulation time is not less than 150 s.

Heparin. If heparin has been added during preparation, determine the amount present by the assay of heparin in coagulation factor concentrates (*2.7.12*). The preparation to be examined contains not more than the amount of heparin stated on the label and in any case not more than 0.5 IU of heparin per International Unit of factor VII.

Thrombin. If the preparation to be examined contains heparin, determine the amount present as described in the test for heparin and neutralise the heparin by addition of *protamine sulphate R* (10 µg of protamine sulphate neutralises 1 IU of heparin). In each of 2 test-tubes, mix equal volumes of the reconstituted preparation and a 3 g/l solution of *fibrinogen R*. Keep one of the tubes at 37 °C for 6 h and the other at room temperature for 24 h. In a third tube, mix a volume of the fibrinogen solution with an equal volume of a solution of *human thrombin R* (1 IU/ml) and place the tube in a water-bath at 37 °C. No coagulation occurs in the tubes containing the preparation to be examined. Coagulation occurs within 30 s in the tube containing thrombin.

Factor II. Carry out the assay of human coagulation factor II (*2.7.18*).

The estimated content is not more than 125 per cent of the stated content. The confidence limits (P = 0.95) are not less than 90 per cent and not more than 111 per cent of the estimated potency.

Factor IX. Carry out the assay of human coagulation factor IX (*2.7.11*).

The estimated content is not more than 125 per cent of the stated content. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

Factor X. Carry out the assay of human coagulation factor X (*2.7.19*).

The estimated content is not more than 125 per cent of the stated content. The confidence limits (P = 0.95) are not less than 90 per cent and not more than 111 per cent of the estimated potency.

Water. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectrometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a volume equivalent to not less than 30 IU of factor VII.

ASSAY

Assay of human coagulation factor VII (*2.7.10*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

STORAGE

In an airtight container, protected from light.

LABELLING

The label states:

- the number of International Units of factor VII per container,
- the maximum content of International Units of factor II, factor IX and factor X per container,
- the amount of protein per container,
- the name and quantity of any added substances, including where applicable, heparin,
- the name and volume of the liquid to be used for reconstitution,
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

01/2008:0275

HUMAN COAGULATION FACTOR VIII

Factor VIII coagulationis humanus

DEFINITION

Human coagulation factor VIII is a preparation of a plasma protein fraction that contains the glycoprotein coagulation factor VIII together with varying amounts of von Willebrand factor, depending on the method of preparation. It is prepared from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*.

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of factor VIII:C per millilitre.

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for the inactivation of viruses, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 1 IU of factor VIII:C per milligram of total protein before the addition of any protein stabiliser.

The factor VIII fraction is dissolved in a suitable liquid. Excipients such as a stabiliser may be added. No antimicrobial preservative is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

VALIDATION STUDIES

Products stated to have von Willebrand factor activity. For products intended for treatment of von Willebrand's disease it shall be demonstrated that the manufacturing process yields a product with a consistent composition with respect to von Willebrand factor. This composition may be characterised in a number of ways. For example, the number and the relative amount of the different multimers may be determined by sodium dodecyl sulphate (SDS) agarose gel electrophoresis (about 1 per cent agarose) with or without Western blot analysis, using a normal human plasma pool as reference; visualisation of the multimeric pattern may be performed using an immunoenzymatic technique and quantitative evaluation may be carried out by densitometric analysis or by other suitable methods.

Products that show flakes or particles after reconstitution for use. If a few small flakes or particles remain when the preparation is reconstituted, it shall be demonstrated during validation studies that the potency is not significantly affected after passage of the preparation through the filter provided.

CHARACTERS

Appearance: white or pale yellow, hygroscopic powder or friable solid.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

IDENTIFICATION

It complies with the limits of the assay.

TESTS

Solubility. To a container of the preparation to be examined add the volume of the solvent stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear or slightly opalescent, colourless or slightly yellow solution.

Where the label states that the product may show a few small flakes or particles after reconstitution, reconstitute the preparation as described on the label and pass it through the filter provided: the filtered solution is clear or slightly opalescent.

pH (*2.2.3*): 6.5 to 7.5.

Osmolality (*2.2.35*): minimum 240 mosmol/kg.

Total protein. If necessary, dilute an accurately measured volume of the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. Place 2.0 ml of this solution in a round-bottomed centrifuge tube and add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25. *For some products, especially those without a protein stabiliser such as albumin, this method may not be applicable and another validated method for protein determination must therefore be performed.*

Anti-A and anti-B haemagglutinins (*2.6.20*). Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to contain 3 IU of factor VIII:C per millilitre. The 1 to 64 dilutions do not show agglutination.

Water. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near infrared spectrophotometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a volume of the preparation to be examined equivalent to not less than 50 IU of factor VIII:C.

ASSAY

Factor VIII (*2.7.4*). The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

von Willebrand factor (*2.7.21*). Carry out the assay of human von Willebrand factor for preparations intended for the treatment of von Willebrand's disease.

The estimated potency is not less than 60 per cent and not more than 140 per cent of the stated potency.

Pending the availability of an International Standard for von Willebrand factor concentrate calibrated for use in the collagen-binding assay, only the ristocetin cofactor assay may be used.

STORAGE

In an airtight container, protected from light.

LABELLING

The label states:

- the number of International Units of factor VIII:C and, where applicable, of von Willebrand factor in the container;
- the amount of protein in the container;
- the name and quantity of any added substance;
- the name and volume of the liquid to be used for reconstitution;
- where applicable, that the preparation may show the presence of a few small flakes or particles after reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

01/2008:1643

HUMAN COAGULATION FACTOR VIII (rDNA)

Factor VIII coagulationis humanus (ADNr)

DEFINITION

Human coagulation factor VIII (rDNA) is a freeze-dried preparation of glycoproteins having the same activity as coagulation factor VIII in human plasma. It acts as a cofactor of the activation of factor X in the presence of factor IXa, phospholipids and calcium ions.

Human coagulation factor VIII circulates in plasma mainly as a two-chain glycosylated protein with 1 heavy (relative molecular mass of about 200 000) and 1 light (relative molecular mass 80 000) chain held together by divalent metal ions. Human coagulation factor VIII (rDNA) is prepared as full-length factor VIII (octocog alfa), or as a shortened two-chain structure (relative molecular mass 90 000 and 80 000), in which the B-domain has been deleted from the heavy chain (moroctocog alfa).

Full-length human rDNA coagulation factor VIII contains 25 potential *N*-glycosylation sites, 19 in the B domain of the heavy chain, 3 in the remaining part of the heavy chain (relative molecular mass 90 000) and 3 in the light chain (relative molecular mass 80 000). The different products are characterised by their molecular size and post-translational modification and/or other modifications.

PRODUCTION

Human coagulation factor VIII (rDNA) is produced by recombinant DNA technology in mammalian cell culture. It is produced under conditions designed to minimise microbial contamination.

Purified bulk factor VIII (rDNA) may contain added human albumin and/or other stabilising agents, as well as other auxiliary substances to provide, for example, correct pH and osmolality.

The specific activity is not less than 2000 IU of factor VIII:C per milligram of total protein before the addition of any protein stabiliser, and varies depending on purity and the type of modification of molecular structure of factor VIII.

The quality of the bulk preparation is controlled using one or more manufacturer's reference preparations as reference.

MANUFACTURER'S REFERENCE PREPARATIONS

During development, reference preparations are established for subsequent verification of batch consistency during production, and for control of bulk and final preparation. They are derived from representative batches of purified bulk factor VIII (rDNA) that are extensively characterised by tests including those described below and whose procoagulant and other relevant functional properties have been ascertained and compared, wherever possible, with the International Standard for factor VIII concentrate. The reference preparations are suitably characterised for their intended purpose and are stored in suitably sized aliquots under conditions ensuring their stability.

PURIFIED BULK FACTOR VIII (rDNA)

The purified bulk complies with a suitable combination of the following tests for characterisation of integrity of the factor VIII (rDNA). Where any substance added during preparation of the purified bulk interferes with a test, the test is carried out before addition of that substance. Where applicable, the characterisation tests may alternatively be carried out on the finished product.

Specific biological activity or ratio of factor VIII activity to factor VIII antigen. Carry out the assay of human coagulation factor VIII (*2.7.4*). The protein content, or where a protein stabiliser is present, the factor VIII antigen content, is determined by a suitable method and the specific biological activity or the ratio of factor VIII activity to factor VIII antigen is calculated.

Protein composition. The protein composition is determined by a selection of appropriate characterisation techniques which may include peptide mapping, Western blots, HPLC, gel electrophoresis, capillary electrophoresis, mass spectrometry or other techniques to monitor integrity and purity. The protein composition is comparable to that of the manufacturer's reference preparation.

Molecular size distribution. Using size-exclusion chromatography (*2.2.30*), the molecular size distribution is comparable to that of the manufacturer's reference preparation.

Peptide mapping (*2.2.55*). There is no significant difference between the test protein and the manufacturer's reference preparation.

Carbohydrates/sialic acid. To monitor batch-to-batch consistency, the monosaccharide content and the degree of sialylation or the oligosaccharide profile are monitored and correspond to those of the manufacturer's reference preparation.

FINAL LOT

It complies with the requirements under Identification, Tests and Assay.

Excipients: 80 per cent to 120 per cent of the stated content, determined by a suitable method, where applicable.

CHARACTERS

Appearance: white or slightly yellow powder or friable mass.

IDENTIFICATION

A. It complies with the limits of the assay.

B. The distribution of characteristic peptide bands corresponds with that of the manufacturer's reference preparation (SDS-PAGE or Western blot).

TESTS

Reconstitute the preparation as stated on the label immediately before carrying out the tests (except those for solubility and water) and assay.

Solubility. It dissolves within 5 min at 20-25 °C, giving a clear or slightly opalescent solution.

pH (*2.2.3*): 6.5 to 7.5.

Osmolality (*2.2.35*): minimum 240 mosmol/kg.

Water. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near infrared spectrophotometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*). It complies with the test for sterility.

Bacterial endotoxins (*2.6.14*): less than 3 IU in the volume that contains 100 IU of factor VIII activity.

ASSAY

Carry out the assay of human coagulation factor VIII (*2.7.4*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

STORAGE

Protected from light.

LABELLING

The label states:

– the factor VIII content in International Units,
– the name and amount of any excipient,
– the composition and volume of the liquid to be used for reconstitution.

01/2008:1223

HUMAN COAGULATION FACTOR IX

Factor IX coagulationis humanus

DEFINITION

Human coagulation factor IX is a plasma protein fraction containing coagulation factor IX, prepared by a method that effectively separates factor IX from other prothrombin complex factors (factors II, VII and X). It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*.

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of factor IX per millilitre.

PRODUCTION

The method of preparation is designed to maintain functional integrity of factor IX, to minimise activation of any coagulation factor (to minimise potential thrombogenicity) and includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 50 IU of factor IX per milligram of total protein, before the addition of any protein stabiliser.

The factor IX fraction is dissolved in a suitable liquid. Heparin, antithrombin and other auxiliary substances such as a stabiliser may be included. No antimicrobial preservative is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

CONSISTENCY OF THE METHOD OF PRODUCTION

The consistency of the method of production is evaluated by suitable analytical procedures that are determined during process development and which normally include:

- assay of factor IX,
- determination of activated coagulation factors,
- determination of activities of factors II, VII and X which shall be shown to be not more than 5 per cent of the activity of factor IX.

CHARACTERS

A white or pale yellow, hygroscopic powder or friable solid.

Reconstitute the preparation to be examined as stated on the label, immediately before carrying out the identification, tests (except those for solubility and water) and assay.

IDENTIFICATION

It complies with the limits of the assay.

TESTS

pH (*2.2.3*): 6.5 to 7.5.

Solubility. To a container of the preparation to be examined add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear or slightly opalescent, colourless solution.

Osmolality (*2.2.35*): minimum 240 mosmol/kg.

Total protein. If necessary, dilute an accurately measured volume of the preparation to be examined with a 9 g/l solution of *sodium chloride R*, to obtain a solution which may be expected to contain about 15 mg of protein in 2 ml. To 2.0 ml of that solution, in a round-bottomed centrifuge tube, add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25.

For some products, especially those without a protein stabiliser such as albumin, this method may not be applicable. Another validated method for protein determination must therefore be performed.

Activated coagulation factors (*2.6.22*). If necessary, dilute the preparation to be examined to contain 20 IU of factor IX per millilitre. For each of the dilutions the coagulation time is not less than 150 s.

Heparin. If heparin has been added during preparation, determine the amount by the assay of heparin in coagulation factor concentrates (*2.7.12*). The preparation to be examined contains not more than the amount of heparin stated on the label and in any case not more than 0.5 IU of heparin per International Unit of factor IX.

Water. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near infrared spectrophotometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a volume equivalent to not less than 50 IU of factor IX.

ASSAY

Assay of human blood coagulation factor IX (*2.7.11*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

STORAGE

In an airtight container, protected from light.

LABELLING

The label states:

- the number of International Units of factor IX per container,
- the amount of protein per container,
- the name and quantity of any added substances including, where applicable, heparin,
- the name and volume of the liquid to be used for reconstitution,
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

01/2008:1644
corrected 6.0

HUMAN COAGULATION FACTOR XI

Factor XI coagulationis humanus

DEFINITION

Human coagulation factor XI is a plasma protein fraction containing coagulation factor XI. It is obtained from *Human plasma for fractionation (0853)*.

When reconstituted as stated on the label, the potency is not less than 50 units of factor XI per millilitre.

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

After preparation, the factor XI fraction is dissolved in a suitable liquid. Heparin, C_1-esterase inhibitor and antithrombin III may be added. The solution is distributed into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under nitrogen. No antimicrobial preservative is added.

CHARACTERS

A white or almost white powder or friable solid.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

IDENTIFICATION

The assay serves also to identify the preparation.

TESTS

Solubility. To a container of the preparation to be examined, add the volume of liquid stated on the label at room temperature. The preparation dissolves completely with gentle swirling within 10 min.

pH (*2.2.3*): 6.8 to 7.4.

Osmolality (*2.2.35*): minimum 240 mosmol/kg.

Total protein. If necessary, dilute an accurately measured volume of the preparation to be examined with a 9 g/l solution of *sodium chloride R*, to obtain a solution that may be expected to contain about 15 mg of protein in 2 ml. To 2.0 ml of that solution, in a round-bottomed centrifuge tube, add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25.

Activated coagulation factors (*2.6.22*). For each of the dilutions, the coagulation time is not less than 150 s.

Heparin (*2.7.12*). If heparin has been added, the preparation to be examined contains not more than the amount of heparin stated on the label and in any case not more than 0.5 IU of heparin per unit of factor XI.

Antithrombin III (*2.7.17*). If antithrombin III has been added, the preparation to be examined contains not more than the amount of antithrombin III stated on the label.

C_1-esterase inhibitor. If C_1-esterase inhibitor has been added, the preparation to be examined contains not more than the amount of C_1-esterase inhibitor stated on the label.

The C_1-esterase inhibitor content of the preparation to be examined is determined by comparing its ability to inhibit C_1-esterase with the same ability of a reference preparation consisting of human normal plasma. 1 unit of C_1-esterase is equal to the activity of 1 ml of human normal plasma. Varying quantities of the preparation to be examined are mixed with an excess of C_1-esterase and the remaining C_1-esterase activity is determined using a suitable chromogenic substrate.

Method. Reconstitute the preparation as stated on the label. Prepare an appropriate series of 3 or 4 independent dilutions from 1 unit/ml of factor XI, for both the preparation to be examined and the reference preparation, using a solution containing 9 g/l of *sodium chloride R* and either 10 g/l of *human albumin R* or 10 g/l of *bovine albumin R*. Warm all solutions to 37 °C in a water bath for 1-2 min before use. Place a suitable amount of C_1-esterase solution in tubes or in microtitre plate wells and incubate at 37 °C. Add a suitable amount of one of the dilutions of the reference preparation or of the preparation to be examined and incubate at 37 °C for 5 min. Add a suitable amount of a suitable chromogenic substrate such as methoxycarbonyl-L-lysyl(ϵ-benzyloxycarbonyl)-glycyl-L-arginine 4-nitroanilide. Read the rate of increase of absorbance (ΔA/min) at 405 nm. Carry out a blank test using *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R* instead of the C_1-esterase and the substrate.

Calculate the C_1-esterase inhibitor content using the usual statistical methods (for example, *5.3.*).

Anti-A and anti-B haemagglutinins (*2.6.20*). The 1 to 64 dilutions do not show agglutination.

Water. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near infrared spectrophotometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*). The reconstituted preparation complies with the test for sterility.

Pyrogens (*2.6.8*). The reconstituted preparation complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a volume of the reconstituted preparation equivalent to 100 units of factor XI, calculated from the activity stated on the label.

ASSAY

Carry out the assay of human coagulation factor XI (*2.7.22*).

The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

STORAGE

Protected from light, at a temperature of 2 °C to 8 °C.

LABELLING

The label states:

- the number of units per container,
- the maximum amount of protein per container,
- where applicable, the amount of heparin per container,
- where applicable, the amount of antithrombin III per container,
- where applicable, the amount of C_1-esterase inhibitor per container,
- the name and volume of the liquid to be used for reconstitution.

01/2008:0024

HUMAN FIBRINOGEN

Fibrinogenum humanum

DEFINITION

Human fibrinogen contains the soluble constituent of human plasma that is transformed to fibrin on the addition of thrombin. It is obtained from *Human plasma for fractionation (0853)*. The preparation may contain excipients such as salts, buffers and stabilisers.

When dissolved in the volume of the solvent stated on the label, the solution contains not less than 10 g/l of fibrinogen.

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

No antibiotic is added to the plasma used and no antimicrobial preservative is included in the preparation. The preparation is freeze-dried.

The method of preparation is such as to obtain fibrinogen with a specific activity (fibrinogen content with respect to total protein content) not less than 80 per cent. The fibrinogen content is determined by a suitable method such as that described under Assay, and the total protein content is determined by a suitable method such as that described under Total protein in *Human albumin solution (0255)*. If a protein stabiliser (for example, human albumin) is added to the preparation, the requirement for specific activity applies to the fibrinogen before addition of the stabiliser. Albumin may also be obtained with fibrinogen during fractionation, in which case a specific determination of albumin is carried out by a suitable immunochemical method (*2.7.1*) and the quantity of albumin determined is subtracted from the total protein content for the calculation of the specific activity.

CHARACTERS

A white or pale yellow, hygroscopic powder or friable solid.

IDENTIFICATION

It complies with the limits of the assay.

TESTS

pH (*2.2.3*): 6.5 to 7.5.

Osmolality (*2.2.35*): minimum 240 mosmol/kg.

Solubility. Add the volume of solvent stated on the label to the contents of one container. The preparation dissolves within 30 min at 20-25 °C, forming an almost colourless, slightly opalescent solution.

Stability of solution. Allow the reconstituted solution to stand at 20-25 °C. No gel formation appears within 60 min of reconstitution.

Water. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near infrared spectrophotometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*). The reconstituted preparation complies with the test for sterility.

Pyrogens (*2.6.8*). The reconstituted preparation complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a volume of the reconstituted preparation equivalent to not less than 30 mg of fibrinogen, calculated from the quantity stated on the label.

ASSAY

Mix 0.2 ml of the reconstituted preparation with 2 ml of a suitable buffer solution (pH 6.6-6.8) containing sufficient thrombin (approximately 3 IU/ml) and calcium (0.05 mol/l). Maintain at 37 °C for 20 min, separate the precipitate by centrifugation (5000 *g*, 20 min) and wash thoroughly with a 9 g/l solution of *sodium chloride R*. Determine the nitrogen content by sulphuric acid digestion (*2.5.9*) and calculate the fibrinogen (clottable protein) content by multiplying the result by 6.0. The content is not less than 70 per cent and not more than 130 per cent of the amount of fibrinogen stated on the label.

STORAGE

In an airtight container, protected from light.

LABELLING

The label states:

- the amount of fibrinogen in the container;
- the name and volume of the solvent to be used to reconstitute the preparation;
- where applicable, the name and quantity of protein stabiliser in the preparation.

corrected 6.0

HUMAN HAEMATOPOIETIC STEM CELLS

Cellulae stirpes haematopoieticae humanae

This monograph provides a standard for the preparation and control of human haematopoietic stem cells for use in therapy. It does not exclude the use of alternative preparation and control methods that are acceptable to the competent authority.

DEFINITION

Human haematopoietic stem cells are primitive multipotent cells capable of self-renewal as well as differentiation and maturation into all haematopoietic lineages. They are found in small numbers in bone marrow, in the mononuclear cell fraction of circulating blood and in umbilical cord blood. The preparation also contains haematopoietic progenitor cells, which are capable of differentiation but not self-renewal. The numbers of haematopoietic stem cells and haematopoietic progenitor cells are correlated.

This monograph applies to haematopoietic stem cells that have not undergone expansion or genetic modification, and that are intended to provide a successful engraftment leading to a permanent restoration of all lineages of blood cell production to a sufficient level and function in a recipient whose haematopoiesis has been compromised by, for example, disease or high doses of chemotherapy and/or radiation therapy, or has to be replaced in certain congenital diseases. The infused haematopoietic stem cells can originate from the recipient (autologous) or from another individual (allogeneic).

Haematopoietic stem cells are recognised by their ability to reconstitute human haematopoiesis *in vivo*. They also have the capacity to differentiate into colony-forming cells, which are able to give rise to colonies in the presence of various growth factors. The membrane marker CD34 is commonly used for the successful isolation/purification of haematopoietic stem cells from crude preparations and as an indicator of haematopoietic stem cell content in routine quality control.

PRODUCTION

DONORS

Where allogeneic cells are used, they are derived from carefully selected donors in accordance with donor selection criteria. Directive 2004/23/EC of the European Union deals with the criteria for donor selection.

COLLECTION

Peripheral blood stem cells. These are collected by cytapheresis after mobilisation from the bone marrow by administration of growth factors and/or treatment of autologous donors with cytotoxic substances. The cells may be processed to select a population of interest and may be cryopreserved.

Bone marrow. Bone marrow is harvested by aspirating the cells from the cavities of hollow bones, then removing bone fragments by filtration and, if necessary, separating the buffy coat cells after centrifugation or with commercial kits based on the cytapheresis principle. The cells may be processed to select a population of interest and may be cryopreserved.

Umbilical cord blood. Placental blood haematopoietic cells are collected from placentae via the vein of the umbilical cord. The cells are then cryopreserved.

CRYOPRESERVATION

Cryopreservation allows storage for long periods. The cells are suspended in a validated medium containing a suitable cryoprotectant (for example, dimethyl sulphoxide) and macromolecules (for example, autologous plasma/albumin) and are frozen in cryobags in a manner designed to maintain viability of the cells by controlled cooling according to a validated method. They are stored at a temperature of – 140 °C or lower. Where cryobags are stored under other conditions of temperature and duration, the functionality of the preparation must be validated. Cryobags from donors that test positive for any infectious disease marker must be stored in such a way as to avoid cross-contamination.

SUBSTANCES USED IN PRODUCTION

The quality of substances used in production may be critical with respect to the quality, safety and efficacy of the final product, particularly for substances of biological origin. This is of particular importance for:

- proteins, including enzymes and antibodies;
- cryopreservation reagents;
- purification reagents.

Quality assurance. All substances must be produced within a recognised quality assurance system using suitable production facilities.

Quality specifications. A suitable quality specification must be presented for each substance, including notably:

- identity;
- potency (where applicable);
- purity;
- determination of bacterial endotoxins (*2.6.14*) (where applicable);
- microbiological quality (total viable count, tests for specified micro-organisms);
- sterility (*2.6.1*) (where applicable).

Viral safety. The requirements of chapter *5.1.7.* apply.

Transmissible spongiform encephalopathies. A risk assessment of the product with respect to transmissible spongiform encephalopathies is carried out, and suitable measures are taken to minimise any such risk (*5.2.8*).

Water. Water used in the preparation of cellular products complies with the relevant monograph (*Water for injections (0169), Water, highly purified (1927), Purified water (0008)*). Water incorporated into the final product complies with the section on Water for injections in bulk in the monograph *Water for injections (0169)*, and in addition is sterile.

TESTS

Target specifications are established for the different tests, but these are not used as rigid acceptance criteria.

Tests carried out include the following (further tests, such as purging, cell depletion, allogeneic application, may be necessary depending on any treatment applied to the cells and on the intended recipient):

Nucleated cell count. Nucleated cells are counted using a validated automated apparatus (automated haematology analyser) or by a manual method (counting chamber).

Viability. Viability is assessed for products that are not infused within 24 h of collection. It is determined either using a validated automated apparatus (for example, by flow cytometry (*2.7.24*) with nucleic acid intercalating agents such as propidium iodide or 7-aminoactinomycin D) or by a manual method (for example, visual observation of trypan blue staining).

CD34+ cell count. For peripheral blood stem cells, CD34+ cell count is determined using a validated automated apparatus to analyse cells labelled with anti-CD34 antibodies. The apparatus and method employed must be able to determine the number of CD34+ cells with a sensitivity, accuracy and reproducibility comparable with those of immunophenotyping (*2.7.23*), where cells are labelled using anti-CD34 and anti-CD45 antibodies conjugated to a fluorochrome and analysed by flow cytometry (*2.7.24*).

Colony-forming cell (CFC) assay. Proliferative capacity is established by a suitable assay. The test is not necessarily carried out on each unit. The correlation between the dose of CD34 and the number of CFCs in a given situation (pathology, packaging, mobilisation) is determined. The CFC assay is carried out periodically; whenever a change that could affect the quality of CD34+ cells is made to the protocol for packaging or mobilisation, it is carried out on a suitable number of units.

Microbiological control. Examine as prescribed in general method *2.6.27. Microbiological control of cellular products*. Where justified, the product may be released before completion of the test.

01/2008:0769

HUMAN HEPATITIS A IMMUNOGLOBULIN

Immunoglobulinum humanum hepatitidis A

DEFINITION

Human hepatitis A immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma from selected donors having antibodies against hepatitis A virus. *Human normal immunoglobulin (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin (0338)*, except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Standard for anti-hepatitis A immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Human hepatitis A immunoglobulin BRP is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 600 IU/ml. The estimated potency is not less than the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent.

STORAGE

See *Human normal immunoglobulin (0338)*.

LABELLING

See *Human normal immunoglobulin (0338)*.

The label states the number of International Units per container.

01/2008:0722

HUMAN HEPATITIS B IMMUNOGLOBULIN

Immunoglobulinum humanum hepatitidis B

DEFINITION

Human hepatitis B immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma from selected and/or immunised donors having antibodies against hepatitis B surface antigen. *Human normal immunoglobulin (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin (0338)*, except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Reference Preparation of hepatitis B immunoglobulin. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organisation.

The stated potency is not less than 100 IU/ml. The estimated potency is not less than the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent.

STORAGE

See *Human normal immunoglobulin (0338)*.

LABELLING

See *Human normal immunoglobulin (0338)*.

The label states the number of International Units per container.

01/2008:1016

HUMAN HEPATITIS B IMMUNOGLOBULIN FOR INTRAVENOUS ADMINISTRATION

Immunoglobulinum humanum hepatitidis B ad usum intravenosum

DEFINITION

Human hepatitis B immunoglobulin for intravenous administration is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. It is obtained from plasma from selected and/or immunised donors having antibodies against hepatitis B surface antigen. *Human normal immunoglobulin for intravenous administration (0918)* may be added.

It complies with the monograph on *Human normal immunoglobulinum for intravenous administration (0918)*, except for the minimum number of donors, the minimum total protein content and the limit for osmolality.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay (*2.7.1*) of suitable sensitivity and specificity.

The International Unit is the activity contained in a stated amount of the International Reference Preparation of hepatitis B immunoglobulin. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organisation.

The stated potency is not less than 50 IU/ml. The estimated potency is not less than the stated potency. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

STORAGE

See *Human normal immunoglobulin for intravenous administration (0918)*.

LABELLING

See *Human normal immunoglobulin for intravenous administration (0918)*.

The label states the minimum number of International Units of hepatitis B immunoglobulin per container.

01/2008:0397

HUMAN MEASLES IMMUNOGLOBULIN

Immunoglobulinum humanum morbillicum

DEFINITION

Human measles immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma containing specific antibodies against the measles virus. *Human normal immunoglobulin (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin (0338)*, except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency of the liquid preparation and of the freeze-dried preparation after reconstitution as stated on the label is not less than 50 IU per millilitre of neutralising antibody against measles virus.

The potency is determined by comparing the antibody titres of the immunoglobulin to be examined and of a reference preparation calibrated in International Units, using a challenge dose of measles virus in a suitable cell culture system. A method of equal sensitivity and precision may be used providing that the competent authority is satisfied that it correlates with neutralising activity for the measles virus by comparison with the reference preparation.

The International Unit is the specific neutralising activity for measles virus contained in a stated amount of the International Standard for human anti-measles serum. The

equivalence in International Units of the International Reference Preparation is stated by the World Health Organisation.

Prepare serial two-fold dilutions of the immunoglobulin to be examined and of the reference preparation. Mix each dilution with an equal volume of a suspension of measles virus containing about 100 $CCID_{50}$ in 0.1 ml and incubate protected from light at 37 °C for 2 h. Using not fewer than six cell cultures per mixture, inoculate 0.2 ml of each mixture into each of the cell cultures allocated to that mixture and incubate for not less than 10 days. Examine the cultures for viral activity and compare the dilution containing the smallest quantity of the immunoglobulin which neutralises the virus with that of the corresponding dilution of the reference preparation.

Calculate the potency of the immunoglobulin to be examined in International Units per millilitre of neutralising antibody against measles virus.

STORAGE

See *Human normal immunoglobulin (0338)*.

LABELLING

See *Human normal immunoglobulin (0338)*.

The label states the number of International Units per container.

01/2008:0338

HUMAN NORMAL IMMUNOGLOBULIN

Immunoglobulinum humanum normale

[232-706-1]

DEFINITION

Human normal immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). Other proteins may be present. Human normal immunoglobulin contains the IgG antibodies of normal subjects. It is intended for intramuscular injection.

Human normal immunoglobulin is obtained from plasma that complies with the requirements of the monograph on *Human plasma for fractionation (0853)*. No antibiotic is added to the plasma used.

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the immunoglobulin.

The product shall have been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated when administered intramuscularly.

Human normal immunoglobulin is prepared from pooled material from at least 1000 donors by a method that has been shown to yield a product that:

– does not transmit infection;
– at a protein concentration of 160 g/l, contains antibodies for at least 2 of which (1 viral and 1 bacterial) an International Standard or Reference Preparation is available, the concentration of such antibodies being at least 10 times that in the initial pooled material.

Human normal immunoglobulin is prepared as a stabilised solution, for example in a 9 g/l solution of sodium chloride, a 22.5 g/l solution of glycine or, if the preparation is to be freeze-dried, a 60 g/l solution of glycine. Multidose preparations contain an antimicrobial preservative. Single-dose preparations do not contain an antimicrobial preservative. Any antimicrobial preservative or stabilising agent used shall have been shown to have no deleterious effect on the final product in the amount present. The solution is passed through a bacteria-retentive filter. The preparation may subsequently be freeze-dried and the containers closed under vacuum or under an inert gas.

The stability of the preparation is demonstrated by suitable tests carried out during development studies.

CHARACTERS

The liquid preparation is clear and pale-yellow or light-brown; during storage it may show formation of slight turbidity or a small amount of particulate matter. The freeze-dried preparation is a hygroscopic, white or slightly yellow powder or solid, friable mass.

For the freeze-dried preparation, reconstitute as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.

IDENTIFICATION

Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted to contain 10 g/l of protein. The main component of the preparation to be examined corresponds to the IgG component of normal human serum. The solution may show the presence of small quantities of other plasma proteins.

TESTS

Solubility. For the freeze-dried preparation, add the volume of the liquid stated on the label. The preparation dissolves completely within 20 min at 20-25 °C.

pH (*2.2.3*): 5.0 to 7.2.

Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing 10 g/l of protein.

Total protein. Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2.0 ml of this solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the content of protein by multiplying the result by 6.25. The preparation contains not less than 100 g/l and not more than 180 g/l of protein and not less than 90 per cent and not more than 110 per cent of the quantity of protein stated on the label.

Protein composition. Examine by zone electrophoresis (*2.2.31*).

Use strips of suitable cellulose acetate gel or suitable agarose gel as the supporting medium and *barbital buffer solution pH 8.6 R1* as the electrolyte solution.

If cellulose acetate is the supporting material, the method described below can be used. If agarose gels are used, and because they are normally part of an automated system, the manufacturer's instructions are followed instead.

Test solution. Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to a protein concentration of 50 g/l.

Reference solution. Reconstitute *human immunoglobulin for electrophoresis BRP* and dilute with a 9 g/l solution of *sodium chloride R* to a protein concentration of 50 g/l.

To a strip apply 2.5 µl of the test solution as a 10 mm band or apply 0.25 µl per millimetre if a narrower strip is used. To another strip apply in the same manner the same volume of the reference solution. Apply a suitable electric field such that the albumin band of normal human serum applied on a control strip migrates at least 30 mm. Stain the strip with *amido black 10B solution R* for 5 min. Decolourise with a mixture of 10 volumes of *glacial acetic acid R* and 90 volumes of *methanol R* so that the background is just free of colour. Develop the transparency of the strips with a mixture of 19 volumes of *glacial acetic acid R* and 81 volumes of *methanol R*. Measure the absorbance of the bands at 600 nm in an instrument having a linear response over the range of measurement. Calculate the result as the mean of 3 measurements of each strip.

System suitability: in the electropherogram obtained with the reference solution on cellulose acetate or on agarose gels, the proportion of protein in the principal band is within the limits stated in the leaflet accompanying the reference preparation.

Results: in the electropherogram obtained with the test solution on cellulose acetate or on agarose gels, not more than 10 per cent of protein has a mobility different from that of the principal band.

Distribution of molecular size. Liquid chromatography (*2.2.29*).

Test solution. Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to a concentration suitable for the chromatographic system used. A concentration in the range of 4-12 g/l and injection of 50-600 µg of protein are usually suitable.

Reference solution. Dilute *human immunoglobulin (molecular size) BRP* with a 9 g/l solution of *sodium chloride R* to the same protein concentration as the test solution.

Column:

– *size*: *l* = 0.6 m, Ø = 7.5 mm; or *l* = 0.3 m, Ø = 7.8 mm;

– *stationary phase*: *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins with relative molecular masses in the range 10 000 to 500 000.

Mobile phase: dissolve 4.873 g of *disodium hydrogen phosphate dihydrate R*, 1.741 g of *sodium dihydrogen phosphate monohydrate R*, 11.688 g of *sodium chloride R* and 50 mg of *sodium azide R* in 1 litre of *water R*.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 280 nm.

In the chromatogram obtained with the reference solution, the principal peak corresponds to the IgG monomer and there is a peak corresponding to the dimer with a relative retention to the principal peak of about 0.85. Identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time shorter than that of the dimer corresponds to polymers and aggregates. The preparation to be examined complies with the test if, in the chromatogram obtained with the test solution:

– *relative retention*: for the monomer and for the dimer, the relative retention to the corresponding peak in the chromatogram obtained with the reference solution is 1 ± 0.02;

– *peak area*: the sum of the peak areas of the monomer and the dimer represent not less than 85 per cent of the total area of the chromatogram and the sum of the peak areas of polymers and aggregates represents not more than 10 per cent of the total area of the chromatogram.

Water. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near infrared spectrophotometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject 1 ml per kilogram of the rabbit's mass.

Antibody to hepatitis B surface antigen. Not less than 0.5 IU/g of immunoglobulin, determined by a suitable immunochemical method (*2.7.1*).

Antibody to hepatitis A virus. If intended for use in the prophylaxis of hepatitis A, it complies with the following additional requirement. Determine the antibody content by comparison with a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Standard for anti-hepatitis A immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Human hepatitis A immunoglobulin BRP is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 100 IU/ml. The estimated potency is not less than the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent.

STORAGE

For the liquid preparation, in a colourless glass container, protected from light. For the freeze-dried preparation, in an airtight colourless glass container, protected from light.

LABELLING

The label states:

– for liquid preparations, the volume of the preparation in the container and the protein content expressed in grams per litre;

– for freeze-dried preparations, the quantity of protein in the container;

– the route of administration;

– for freeze-dried preparations, the name or composition and the volume of the reconstituting liquid to be added;

– where applicable, that the preparation is suitable for use in the prophylaxis of hepatitis A infection;
– where applicable, the anti-hepatitis A virus activity in International Units per millilitre;
– where applicable, the name and amount of antimicrobial preservative in the preparation.

01/2008:0918

HUMAN NORMAL IMMUNOGLOBULIN FOR INTRAVENOUS ADMINISTRATION

Immunoglobulinum humanum normale ad usum intravenosum

DEFINITION

Human normal immunoglobulin for intravenous administration is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). Other proteins may be present. Human normal immunoglobulin for intravenous administration contains the IgG antibodies of normal subjects. This monograph does not apply to products intentionally prepared to contain fragments or chemically modified IgG.

Human normal immunoglobulin for intravenous administration is obtained from plasma that complies with the requirements of the monograph on *Human plasma for fractionation (0853)*. No antibiotic is added to the plasma used.

PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the immunoglobulin.

The product shall have been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated when administered intravenously.

Human normal immunoglobulin for intravenous administration is prepared from pooled material from not fewer than 1000 donors by a method that has been shown to yield a product that:
– does not transmit infection;
– at an immunoglobulin concentration of 50 g/l, contains antibodies for at least 2 of which (1 viral and 1 bacterial) an International Standard or Reference Preparation is available, the concentration of such antibodies being at least 3 times that in the initial pooled material;
– has a defined distribution of immunoglobulin G subclasses;
– complies with the test for Fc function of immunoglobulin (*2.7.9*).

Human normal immunoglobulin for intravenous administration is prepared as a stabilised solution or as a freeze-dried preparation. A stabiliser may be added. In both cases the preparation is passed through a bacteria-retentive filter. The preparation may subsequently be freeze-dried and the containers closed under vacuum or under an inert gas. No antimicrobial preservative is added either during fractionation or at the stage of the final bulk solution.

The stability of the preparation is demonstrated by suitable tests carried out during development studies.

CHARACTERS

The liquid preparation is clear or slightly opalescent and colourless or pale yellow. The freeze-dried preparation is a hygroscopic, white or slightly yellow powder or solid friable mass.

For the freeze-dried preparation, reconstitute as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.

IDENTIFICATION

Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted to contain 10 g/l of protein. The main component of the preparation to be examined corresponds to the IgG component of normal human serum. The preparation to be examined may show the presence of small quantities of other plasma proteins; if human albumin has been added as a stabiliser, it may be seen as a major component.

TESTS

Solubility. For the freeze-dried preparation, add the volume of the liquid stated on the label. The preparation dissolves completely within 30 min at 20-25 °C.

pH (*2.2.3*): 4.0 to 7.4.

Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing 10 g/l of protein.

Osmolality (*2.2.35*): minimum 240 mosmol/kg.

Total protein: minimum 30 g/l and between 90 per cent and 110 per cent of the quantity of protein stated on the label.

Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2.0 ml of this solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the centrifugation residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the content of protein by multiplying the result by 6.25.

Protein composition. Zone electrophoresis (*2.2.31*).

Use strips of suitable cellulose acetate gel or suitable agarose gel as the supporting medium and *barbital buffer solution pH 8.6 R1* as the electrolyte solution.

If cellulose acetate is the supporting material, the method described below can be used. If agarose gels are used, and because they are normally part of an automated system, the manufacturer's instructions are followed instead.

Test solution. Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to an immunoglobulin concentration of 30 g/l.

Reference solution. Reconstitute *human immunoglobulin for electrophoresis BRP* and dilute with a 9 g/l solution of *sodium chloride R* to a protein concentration of 30 g/l.

To a strip apply 4.0 µl of the test solution as a 10 mm band or apply 0.4 µl per millimetre if a narrower strip is used. To another strip apply in the same manner the same volume of the reference solution. Apply a suitable electric field such that the albumin band of normal human serum applied on a control strip migrates at least 30 mm. Stain the strips with *amido black 10B solution R* for 5 min. Decolourise with a mixture of 10 volumes of *glacial acetic acid R* and 90 volumes of *methanol R* so that the background is just free of colour. Develop the transparency of the strips

with a mixture of 19 volumes of *glacial acetic acid R* and 81 volumes of *methanol R*. Measure the absorbance of the bands at 600 nm in an instrument having a linear response over the range of measurement. Calculate the result as the mean of 3 measurements of each strip.

System suitability: in the electropherogram obtained with the reference solution on cellulose acetate or on agarose gels, the proportion of protein in the principal band is within the limits stated in the leaflet accompanying the reference preparation.

Results: in the electropherogram obtained with the test solution on cellulose acetate or on agarose gels, not more than 5 per cent of protein has a mobility different from that of the principal band. This limit is not applicable if albumin has been added to the preparation as a stabiliser; for such preparations, a test for protein composition is carried out during manufacture before addition of the stabiliser.

Distribution of molecular size. Liquid chromatography (*2.2.29*).

Test solution. Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to a concentration suitable for the chromatographic system used. A concentration in the range of 4-12 g/l and injection of 50-600 µg of protein are usually suitable.

Reference solution. Dilute *human immunoglobulin (molecular size) BRP* with a 9 g/l solution of *sodium chloride R* to the same protein concentration as the test solution.

Column:

– *size*: *l* = 0.6 m, Ø = 7.5 mm, or *l* = 0.3 m, Ø = 7.8 mm;

– *stationary phase*: *hydrophilic silica gel for chromatography R* of a grade suitable for fractionation of globular proteins with relative molecular masses in the range 10 000 to 500 000.

Mobile phase: dissolve 4.873 g of *disodium hydrogen phosphate dihydrate R*, 1.741 g of *sodium dihydrogen phosphate monohydrate R*, 11.688 g of *sodium chloride R* and 50 mg of *sodium azide R* in 1 litre of *water R*.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 280 nm.

In the chromatogram obtained with the reference solution, the principal peak corresponds to the IgG monomer and there is a peak corresponding to the dimer with a relative retention to the principal peak of about 0.85. Identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time shorter than that of the dimer corresponds to polymers and aggregates.

Results: in the chromatogram obtained with the test solution:

– *relative retention*: for the monomer and for the dimer, the relative retention to the corresponding peak in the chromatogram obtained with the reference solution is 1 ± 0.02;

– *peak area*: the sum of the peak areas of the monomer and the dimer represent not less than 90 per cent of the total area of the chromatogram and the sum of the peak areas of polymers and aggregates represents not more than 3 per cent of the total area of the chromatogram. This requirement does not apply to products where albumin has been added as a stabiliser; for products stabilised with albumin, a test for distribution of molecular size is carried out during manufacture before addition of the stabiliser.

Anticomplementary activity (*2.6.17*). The consumption of complement is not greater than 50 per cent (1 CH_{50} per milligram of immunoglobulin).

Prekallikrein activator (*2.6.15*): maximum 35 IU/ml, calculated with reference to a dilution of the preparation to be examined containing 30 g/l of immunoglobulin.

Anti-A and anti-B haemagglutinins (*2.6.20*). Carry out the tests for anti-A and anti-B haemagglutinins. If the preparation to be examined contains more than 30 g/l of immunoglobulin, dilute to this concentration before preparing the dilutions to be used in the test. The 1 to 64 dilutions do not show agglutination.

Anti-D antibodies (*2.6.26*). It complies with the test for anti-D antibodies in human immunoglobulin for intravenous administration.

Antibody to hepatitis B surface antigen: minimum 0.5 IU/g of immunoglobulin, determined by a suitable immunochemical method (*2.7.1*).

Water. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near infrared spectrophotometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a volume equivalent to 0.5 g of immunoglobulin but not more than 10 ml per kilogram of body mass.

STORAGE

For the liquid preparation, store in a colourless glass container, protected from light, at the temperature stated on the label. For the freeze-dried preparation, store in an airtight colourless glass container, protected from light, at a temperature not exceeding 25 °C.

LABELLING

The label states:

– for liquid preparations, the volume of the preparation in the container and the protein content expressed in grams per litre;

– for freeze-dried preparations, the quantity of protein in the container;

– the amount of immunoglobulin in the container;

– the route of administration;

– for freeze-dried preparations, the name or composition and the volume of the reconstituting liquid to be added;

– the distribution of subclasses of immunoglobulin G present in the preparation;

– where applicable, the amount of albumin added as a stabiliser;

– the maximum content of immunoglobulin A.

01/2008:0853

HUMAN PLASMA FOR FRACTIONATION

Plasma humanum ad separationem

DEFINITION

Human plasma for fractionation is the liquid part of human blood remaining after separation of the cellular elements from blood collected in a receptacle containing an anticoagulant,

or separated by continuous filtration or centrifugation of anticoagulated blood in an apheresis procedure; it is intended for the manufacture of plasma-derived products.

PRODUCTION

DONORS

Only a carefully selected, healthy donor who, as far as can be ascertained after medical examination, laboratory blood tests and a study of the donor's medical history, is free from detectable agents of infection transmissible by plasma-derived products may be used. Recommendations in this field are made by the Council of Europe [*Recommendation No. R (95) 15 on the preparation, use and quality assurance of blood components,* or subsequent revision]; a directive of the European Union also deals with the matter: *Commission Directive 2004/33/EC of 22 March 2004 implementing Directive 2002/98/EC of the European Parliament and of the Council as regards certain technical requirements for blood and blood components.*

Immunisation of donors. Immunisation of donors to obtain immunoglobulins with specific activities may be carried out when sufficient supplies of material of suitable quality cannot be obtained from naturally immunised donors. Recommendations for such immunisations are formulated by the World Health Organisation (*Requirements for the collection, processing and quality control of blood, blood components and plasma derivatives,* WHO Technical Report Series, No. 840, 1994 or subsequent revision).

Records. Records of donors and donations made are kept in such a way that, while maintaining the required degree of confidentiality concerning the donor's identity, the origin of each donation in a plasma pool and the results of the corresponding acceptance procedures and laboratory tests can be traced.

Laboratory tests. Laboratory tests are carried out for each donation to detect the following viral markers:

1. antibodies against human immunodeficiency virus 1 (anti-HIV-1);
2. antibodies against human immunodeficiency virus 2 (anti-HIV-2);
3. hepatitis B surface antigen (HBsAg);
4. antibodies against hepatitis C virus (anti-HCV).

Pending complete harmonisation of the laboratory tests to be carried out, the competent authority may require that a test for alanine aminotransferase (ALT) also be carried out.

The test methods used are of suitable sensitivity and specificity and comply with the regulations in force. If a repeat-reactive result is found in any of these tests, the donation is not accepted.

INDIVIDUAL PLASMA UNITS

The plasma is prepared by a method that removes cells and cell debris as completely as possible. Whether prepared from whole blood or by plasmapheresis, the plasma is separated from the cells by a method designed to prevent the introduction of micro-organisms. No antibacterial or antifungal agent is added to the plasma. The containers comply with the requirements for glass containers (*3.2.1*) or for plastic containers for blood and blood components (*3.2.3*). The containers are closed so as to prevent any possibility of contamination.

If 2 or more units are pooled prior to freezing, the operations are carried out using sterile connecting devices or under aseptic conditions and using containers that have not previously been used.

When obtained by plasmapheresis or from whole blood (after separation from cellular elements), plasma intended for the recovery of proteins that are labile in plasma is frozen within 24 h of collection by cooling rapidly in conditions validated to ensure that a temperature of – 25 °C or below is attained at the core of each plasma unit within 12 h of placing in the freezing apparatus.

When obtained by plasmapheresis, plasma intended solely for the recovery of proteins that are not labile in plasma is frozen by cooling rapidly in a chamber at – 20 °C or below as soon as possible and at the latest within 24 h of collection.

When obtained from whole blood, plasma intended solely for the recovery of proteins that are not labile in plasma is separated from cellular elements and frozen in a chamber at – 20 °C or below as soon as possible and at the latest within 72 h of collection.

It is not intended that the determination of total protein and factor VIII shown below be carried out on each unit of plasma. They are rather given as guidelines for good manufacturing practice, the test for factor VIII being relevant for plasma intended for use in the preparation of concentrates of labile proteins.

The total protein content of a unit of plasma depends on the serum protein content of the donor and the degree of dilution inherent in the donation procedure. When plasma is obtained from a suitable donor and using the intended proportion of anticoagulant solution, a total protein content complying with the limit of 50 g/l is obtained. If a volume of blood or plasma smaller than intended is collected into the anticoagulant solution, the resulting plasma is not necessarily unsuitable for pooling for fractionation. The aim of good manufacturing practice must be to achieve the prescribed limit for all normal donations.

Preservation of factor VIII in the donation depends on the collection procedure and the subsequent handling of the blood and plasma. With good practice, 0.7 IU/ml can usually be achieved, but units of plasma with a lower activity may still be suitable for use in the production of coagulation factor concentrates. The aim of good manufacturing practice is to conserve labile proteins as much as possible.

Total protein. Carry out the test using a pool of not fewer than 10 units. Dilute the pool with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. To 2.0 ml of this solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the protein content by multiplying the quantity of nitrogen by 6.25. The total protein content is not less than 50 g/l.

Factor VIII. Carry out the test using a pool of not fewer than 10 units. Thaw the samples to be examined, if necessary, at 37 °C. Carry out the assay of factor VIII (*2.7.4*), using a reference plasma calibrated against the International Standard for human coagulation factor VIII in plasma. The activity is not less than 0.7 IU/ml.

STORAGE AND TRANSPORT

Frozen plasma is stored and transported in conditions designed to maintain the temperature at or below – 20 °C; for accidental reasons, the storage temperature may rise above – 20 °C on one or more occasions during storage and transport but the plasma is nevertheless considered suitable for fractionation if all the following conditions are fulfilled:

– the total period of time during which the temperature exceeds – 20 °C does not exceed 72 h;
– the temperature does not exceed – 15 °C on more than one occasion;
– the temperature at no time exceeds – 5 °C.

POOLED PLASMA

During the manufacture of plasma products, the first homogeneous pool of plasma (for example, after removal of cryoprecipitate) is tested for HBsAg and for HIV antibodies using test methods of suitable sensitivity and specificity; the pool must give negative results in these tests.

The plasma pool is also tested for hepatitis C virus RNA using a validated nucleic acid amplification technique (*2.6.21*). A positive control with 100 IU/ml of hepatitis C virus RNA and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors. The plasma pool complies with the test if it is found non-reactive for hepatitis C virus RNA.

CHARACTERS

Before freezing, a clear to slightly turbid liquid without visible signs of haemolysis; it may vary in colour from light yellow to green.

LABELLING

The label enables each individual unit to be traced to a specific donor.

01/2008:1646

HUMAN PLASMA (POOLED AND TREATED FOR VIRUS INACTIVATION)

Plasma humanum coagmentatum conditumque ad exstinguendum virum

DEFINITION

Human plasma (pooled and treated for virus inactivation) is a frozen or freeze-dried, sterile, non-pyrogenic preparation obtained from human plasma derived from donors belonging to the same ABO blood group. The preparation is thawed or reconstituted before use to give a solution for infusion.

The human plasma used complies with the monograph on *Human plasma for fractionation (0853)*.

PRODUCTION

The units of plasma to be used are cooled to – 30 °C or lower within 6 h of separation of cells and in any case within 24 h of collection.

The pool is prepared by mixing units of plasma belonging to the same ABO blood group.

The pool of plasma is tested for hepatitis B surface antigen (HBsAg), for hepatitis C virus antibodies and for HIV antibodies using test methods of suitable sensitivity and specificity; the pool must give negative results in these tests.

The plasma pool is also tested for hepatitis C virus RNA using a validated nucleic acid amplification technique (*2.6.21*). A positive control with 100 IU of hepatitis C virus RNA per millilitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors. The pool complies with the test if it is found non-reactive for hepatitis C virus RNA.

Hepatitis C virus RNA for NAT testing BRP is suitable for use as a positive control.

To limit the potential burden of B19 virus in plasma pools, the plasma pool is also tested for B19 virus using a validated nucleic acid amplification technique (*2.6.21*).

B19 virus DNA. The plasma pool contains not more than 10.0 IU/µl.

A positive control with 10.0 IU of B19 virus DNA per microlitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors.

B19 virus DNA for NAT testing BRP is suitable for use as a positive control.

The method of preparation is designed to minimise activation of any coagulation factor (to minimise potential thrombogenicity) and includes a step or steps that have been shown to inactivate known agents of infection; if substances are used for the inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

A typical method to inactivate enveloped viruses is the solvent-detergent process, which uses treatment with a combination of tributyl phosphate and octoxinol 10; these reagents are subsequently removed by oil extraction or by solid phase extraction so that the amount in the final product is less than 2 µg/ml for tributyl phosphate and less than 5 µg/ml for octoxinol 10.

No antimicrobial preservative is added.

The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen; it may subsequently be freeze-dried.

Plastic containers comply with the requirements for sterile plastic containers for human blood and blood components (*3.2.3*).

Glass containers comply with the requirements for glass containers for pharmaceutical use (*3.2.1*).

CHARACTERS

The frozen preparation, after thawing, is a clear or slightly opalescent liquid free from solid and gelatinous particles. The freeze-dried preparation is an almost white or slightly yellow powder or friable solid.

Thaw or reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests and assay.

IDENTIFICATION

A. Examine by electrophoresis (*2.2.31*) comparing with normal human plasma. The electropherograms show the same bands.
B. It complies with the test for anti-A and anti-B haemagglutinins (see Tests).

TESTS

pH (*2.2.3*): 6.5 to 7.6.

Osmolality (*2.2.35*): minimum 240 mosmol/kg.

Total protein: minimum 45 g/l.

Dilute with a 9 g/l solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 ml. Place

2.0 ml of this solution in a round-bottomed centrifuge tube and add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the quantity of protein by multiplying the result by 6.25.

Activated coagulation factors (*2.6.22*). It complies with the test for activated coagulation factors. Carry out the test with 0.1 ml of the preparation to be examined instead of 1 to 10 and 1 to 100 dilutions. The coagulation time for the tube containing the preparation to be examined is not less than 150 s.

Anti-A and anti-B haemagglutinins (*2.6.20*). The presence of haemagglutinin (anti-A or anti-B) corresponds to the blood group stated on the label.

Hepatitis A virus antibodies: minimum 2 IU/ml, determined by a suitable immunochemical method (*2.7.1*).

Human hepatitis A immunoglobulin BRP is suitable for use as a reference preparation.

Irregular erythrocyte antibodies. The preparation to be examined does not show the presence of irregular erythrocyte antibodies when examined without dilution by an indirect antiglobulin test.

Citrate. Liquid chromatography (*2.2.29*).

Test solution. Dilute the preparation to be examined with an equal volume of a 9 g/l solution of *sodium chloride R*. Filter the solution using a filter with 0.45 µm pores.

Reference solution. Dissolve 0.300 g of *sodium citrate R* in *water R* and dilute to 100.0 ml with the same solvent.

Column:

– *size*: *l* = 0.3 m, Ø = 7.8 mm;

– *stationary phase*: *cation exchange resin R* (9 µm).

Mobile phase: 0.51 g/l solution of *sulphuric acid R*.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 215 nm.

Equilibration: 15 min.

Injection: 10 µl.

Retention time: citrate = about 10 min.

Limit:

– *citrate*: maximum 25 mmol/l.

Calcium: maximum 5.0 mmol/l.

Atomic absorption spectrometry (*2.2.23, Method I*).

Source: calcium hollow-cathode lamp using a transmission band preferably of 0.5 nm.

Wavelength: 622 nm.

Atomisation device: air-acetylene or acetylene-propane flame.

Potassium: maximum 5.0 mmol/l.

Atomic emission spectrometry (*2.2.22, Method I*).

Wavelength: 766.5 nm.

Sodium: maximum 2.00×10^2 mmol/l.

Atomic emission spectrometry (*2.2.22, Method I*).

Wavelength: 589 nm.

Water: for the freeze-dried product: determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectrometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject 3 ml per kilogram of the rabbit's mass.

ASSAY

Factor VIII. Carry out the assay of coagulation factor VIII (*2.7.4*) using a reference plasma calibrated against the International Standard for blood coagulation factor VIII in plasma.

The estimated potency is not less than 0.5 IU/ml. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Factor V. Using *imidazole buffer solution pH 7.3 R*, prepare 3 twofold dilutions of the preparation to be examined, preferably in duplicate, from 1 in 10 to 1 in 40. Test each dilution as follows: mix 0.1 ml of *plasma substrate deficient in factor V R*, 0.1 ml of the dilution to be examined, 0.1 ml of *thromboplastin R* and 0.1 ml of a 3.5 g/l solution of *calcium chloride R*; measure the coagulation times, i.e. the interval between the moment at which the calcium chloride solution is added and the first indication of the formation of fibrin, which may be observed visually or by means of a suitable apparatus.

In the same manner, determine the coagulation time of 4 twofold dilutions (1 in 10 to 1 in 80) of human normal plasma in *imidazole buffer solution pH 7.3 R*. 1 unit of factor V is equal to the activity of 1 ml of human normal plasma. Human normal plasma is prepared by pooling plasma units from not fewer than 30 donors and stored at −30 °C or lower.

Check the validity of the assay and calculate the potency of the test preparation by the usual statistical methods for a parallel-line assay (for example, *5.3*).

The estimated potency is not less than 0.5 IU/ml. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Factor XI. Carry out the assay of human coagulation factor XI (*2.7.22*) using as reference human normal plasma (see above under Factor V).

The estimated potency is not less than 0.5 IU/ml. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

LABELLING

The label states:

– the ABO blood group;

– the method used for virus inactivation.

01/2008:0554

HUMAN PROTHROMBIN COMPLEX

Prothrombinum multiplex humanum

DEFINITION

Human prothrombin complex is a plasma protein fraction containing blood coagulation factor IX together with variable amounts of coagulation factors II, VII and X; the presence and proportion of these additional factors depends on the method of fractionation. It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*.

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of factor IX per millilitre.

If the content of any of the factors is stated as a single value, the estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency; if the content of any of the factors is stated as a range, the estimated potency is not less than the lower limit and not greater than the upper limit of the stated range.

PRODUCTION

The method of preparation is designed to minimise activation of any coagulation factor (to minimise potential thrombogenicity) and includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 0.6 IU of factor IX per milligram of total protein, before the addition of any protein stabiliser.

The prothrombin complex fraction is dissolved in a suitable liquid. Heparin, antithrombin and other auxiliary substances such as a stabiliser may be added. No antimicrobial preservative is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

CHARACTERS

A white or slightly coloured powder or friable solid, very hygroscopic.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

IDENTIFICATION

It complies with the limits of the assays for factor IX and for factor II and, where applicable, those for factors VII and X.

TESTS

Solubility. To a container of the preparation to be examined add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear solution that may be coloured.

pH (*2.2.3*): 6.5 to 7.5.

Osmolality (*2.2.35*): minimum 240 mosmol/kg.

Total protein. If necessary, dilute an accurately measured volume of the reconstituted preparation with a 9 g/l solution of *sodium chloride R* to obtain a solution expected to contain about 15 mg of protein in 2 ml. To 2.0 ml of the solution in a round-bottomed centrifuge tube add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25.

Activated coagulation factors (*2.6.22*). If necessary, dilute the preparation to be examined to contain 20 IU of factor IX per millilitre. For each of the dilutions, the coagulation time is not less than 150 s.

Heparin. If heparin has been added during preparation, determine the amount present by the assay of heparin in coagulation factor concentrates (*2.7.12*). The preparation to be examined contains not more than the amount of heparin stated on the label and in all cases not more than 0.5 IU of heparin per International Unit of factor IX.

Thrombin. If the preparation to be examined contains heparin, determine the amount present as described in the test for heparin and neutralise it by addition of *protamine sulphate R* (10 µg of protamine sulphate neutralises 1 IU of heparin). In each of 2 test tubes, mix equal volumes of the reconstituted preparation and a 3 g/l solution of *fibrinogen R*. Keep one of the tubes at 37 °C for 6 h and the other at room temperature for 24 h. In a 3rd tube, mix a volume of the fibrinogen solution with an equal volume of a solution of *human thrombin R* (1 IU/ml) and place the tube in a water-bath at 37 °C. No coagulation occurs in the tubes containing the preparation to be examined. Coagulation occurs within 30 s in the tube containing thrombin.

Water. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near-infrared spectrometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a volume of the reconstituted preparation equivalent to not less than 30 IU of factor IX.

ASSAY

Factor IX. Carry out the assay of human coagulation factor IX (*2.7.11*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval (P = 0.95) of the estimated potency is not greater than 80 per cent to 125 per cent.

Factor II. Carry out the assay of human coagulation factor II (*2.7.18*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval (P = 0.95) of the estimated potency is not greater than 90 per cent to 111 per cent.

The estimated factor II potency is not less than 70 per cent and not more than 165 per cent of the estimated factor IX potency.

Factor VII. If the label states that the preparation contains factor VII, carry out the assay of human coagulation factor VII (*2.7.10*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval (P = 0.95) of the estimated potency is not greater than 80 per cent to 125 per cent.

Factor X. If the label states that the preparation contains factor X, carry out the assay of human coagulation factor X (*2.7.19*).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval (P = 0.95) of the estimated potency is not greater than 90 per cent to 111 per cent.

STORAGE

In an airtight container, protected from light.

LABELLING

The label states:

- the number of International Units of factor IX, and the number or range of International Units of factor II per container;
- where applicable, the number or range of International Units of factor VII and factor X per container;
- the amount of protein per container;
- the name and quantity of any added substances, including, where applicable, heparin and antithrombin;
- the name and quantity of the liquid to be used for reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

01/2008:0723

HUMAN RABIES IMMUNOGLOBULIN

Immunoglobulinum humanum rabicum

DEFINITION

Human rabies immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma from donors immunised against rabies. It contains specific antibodies neutralising the rabies virus. *Human normal immunoglobulin (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin (0338)*, except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency is determined by comparing the dose of immunoglobulin required to neutralise the infectivity of a rabies virus suspension with the dose of a reference preparation, calibrated in International Units, required to produce the same degree of neutralisation (*2.7.1*). The test is performed in sensitive cell cultures and the presence of unneutralised virus is revealed by immunofluorescence.

The International Unit is the specific neutralising activity for rabies virus in a stated amount of the International Standard for anti-rabies immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Human rabies immunoglobulin BRP is calibrated in International Units by comparison with the International Standard.

Carry out the test in suitable sensitive cells. It is usual to use the BHK 21 cell line, grown in the medium described below, between the 18th and 30th passage levels counted from the ATCC seed lot. Harvest the cells after 2 to 4 days of growth, treat with trypsin and prepare a suspension containing 500 000 cells per millilitre (cell suspension). 10 min before using this suspension add 10 µg of *diethylamino-ethyldextran R* per millilitre, if necessary, to increase the sensitivity of the cells.

Use a fixed virus strain grown in sensitive cells, such as the CVS strain of rabies virus adapted to growth in the BHK 21 cell line (seed virus suspension). Estimate the titre of the seed virus suspension as follows.

Prepare a series of dilutions of the viral suspension. In the chambers of cell-culture slides (8 chambers per slide), place 0.1 ml of each dilution and 0.1 ml of medium and add 0.2 ml of the cell suspension. Incubate in an atmosphere of carbon dioxide at 37 °C for 24 h. Carry out fixation, immunofluorescence staining and evaluation as described below. Determine the end-point titre of the seed virus suspension and prepare the working virus dilution corresponding to 100 $CCID_{50}$ per 0.1 ml.

For each assay, check the amount of virus used by performing a control titration: from the dilution corresponding to 100 $CCID_{50}$ per 0.1 ml, make three tenfold dilutions. Add 0.1 ml of each dilution to four chambers containing 0.1 ml of medium and add 0.2 ml of the cell suspension. The test is not valid unless the titre lies between 30 $CCID_{50}$ and 300 $CCID_{50}$.

Dilute the reference preparation to a concentration of 2 IU/ml using non-supplemented culture medium (stock reference dilution, stored below – 80 °C). Prepare two suitable predilutions (1:8 and 1:10) of the stock reference dilution so that the dilution of the reference preparation that reduces the number of fluorescent fields by 50 per cent lies within the four dilutions of the cell-culture slide. Add 0.1 ml of the medium to each chamber, except the first in each of two rows, to which add respectively 0.2 ml of the two predilutions of the stock reference dilution transferring successively 0.1 ml to the other chambers.

Dilute the preparation to be examined 1 in 100 using non-supplemented medium (stock immunoglobulin dilution) - to reduce to a minimum errors due to viscosity of the undiluted preparation - and make three suitable predilutions so that the dilution of the preparation to be examined that reduces the number of fluorescent fields by 50 per cent lies within the four dilutions of the cell-culture slide. Add 0.1 ml of the medium to all the chambers except the first in each of three rows, to which add respectively 0.2 ml of the three predilutions of the stock immunoglobulin dilution. Prepare a series of twofold dilutions transferring successively 0.1 ml to the other chambers.

To all the chambers containing the dilutions of the reference preparation and the dilutions of the preparation to be examined, add 0.1 ml of the virus suspension corresponding to 100 $CCID_{50}$ per 0.1 ml (working virus dilution), shake manually, allow to stand in an atmosphere of carbon dioxide at 37 °C for 90 min, add 0.2 ml of the cell suspension, shake manually and allow to stand in an atmosphere of carbon dioxide at 37 °C for 24 h.

After 24 h, discard the medium and remove the plastic walls. Wash the cell monolayer with *phosphate buffered saline pH 7.4 R* and then with a mixture of 20 volumes of *water R* and 80 volumes of *acetone R* and fix in a mixture of 20 volumes of *water R* and 80 volumes of *acetone R* at – 20 °C for 3 min. Spread on the slides *fluorescein-conjugated rabies antiserum R* ready for use. Allow to stand in an atmosphere with a high level of moisture at 37 °C for 30 min. Wash with *phosphate buffered saline pH 7.4 R* and dry. Examine twenty fields in each chamber at a magnification of 250 ×, using a microscope equipped for fluorescence readings. Note the number of fields with at least one fluorescent cell. Check the test dose used in the virus titration slide and determine the dilution of the reference preparation and the dilution of the preparation to be examined that reduce the number of fluorescent fields by 50 per cent, calculating the two or three dilutions together using probit analysis. The test is not valid unless the statistical analysis shows a significant slope of the dose-response curve and no evidence of deviation from linearity or parallelism.

The stated potency is not less than 150 IU/ml. The estimated potency is not less than the stated potency and is not greater than twice the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent.

CULTURE MEDIUM FOR GROWTH OF BHK 21 CELLS

Commercially available media that have a slightly different composition from that shown below may also be used.

Sodium chloride	6.4 g
Potassium chloride	0.40 g
Calcium chloride, anhydrous	0.20 g
Magnesium sulphate, heptahydrate	0.20 g
Sodium dihydrogen phosphate, monohydrate	0.124 g
Glucose monohydrate	4.5 g
Ferric nitrate, nonahydrate	0.10 mg
L-Arginine hydrochloride	42.0 mg
L-Cystine	24.0 mg
L-Histidine	16.0 mg
L-Isoleucine	52.0 mg
L-Leucine	52.0 mg
L-Lysine hydrochloride	74.0 mg
L-Phenylalanine	33.0 mg
L-Threonine	48.0 mg
L-Tryptophan	8.0 mg
L-Tyrosine	36.0 mg
L-Valine	47.0 mg
L-Methionine	15.0 mg
L-Glutamine	0.292 g
i-Inositol	3.60 mg
Choline chloride	2.0 mg
Folic acid	2.0 mg
Nicotinamide	2.0 mg
Calcium pantothenate	2.0 mg
Pyridoxal hydrochloride	2.0 mg
Thiamine hydrochloride	2.0 mg
Riboflavine	0.2 mg
Phenol red	15.0 mg
Sodium hydrogen carbonate	2.75 g
Water to	1000 ml

The medium is supplemented with:

Foetal calf serum (heated at 56 °C for 30 min)	10 per cent
Tryptose phosphate broth	10 per cent
Benzylpenicillin sodium	60 mg/l
Streptomycin	0.1 g/l

HUMAN RUBELLA IMMUNOGLOBULIN

Immunoglobulinum humanum rubellae

DEFINITION

Human rubella immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma containing specific antibodies against rubella virus. *Human normal immunoglobulin (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin (0338)*, except for the minimum number of donors and the minimum total protein content.

POTENCY

The potency is determined by comparing the activity of the preparation to be examined in a suitable haemagglutination-inhibition test with that of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard for anti-rubella immunoglobulin. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organisation.

The estimated potency is not less than 4500 IU/ml. The confidence limits (P = 0.95) of the estimate of potency are not less than 50 per cent and not more than 200 per cent of the stated potency.

STORAGE

01/2008:0398

HUMAN TETANUS IMMUNOGLOBULIN

Immunoglobulinum humanum tetanicum

DEFINITION

Human tetanus immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma containing specific antibodies against the toxin of *Clostridium tetani*. *Human normal immunoglobulin (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin (0338)*, except for the minimum number of donors and the minimum total protein content.

PRODUCTION

During development, a satisfactory relationship shall be established between the potency determined by immunoassay as described under Potency and that determined by means of the following test for toxin-neutralising capacity in mice.

Toxin-neutralising capacity in mice. The potency is determined by comparing the quantity necessary to protect mice against the paralytic effects of a fixed quantity of

tetanus toxin with the quantity of a reference preparation of human tetanus immunoglobulin, calibrated in International Units, necessary to give the same protection.

The International Unit of antitoxin is the specific neutralising activity for tetanus toxin contained in a stated amount of the International Standard, which consists of freeze-dried human immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Human tetanus immunoglobulin BRP is calibrated in International Units by comparison with the International Standard.

Selection of animals. Use mice weighing 16 g to 20 g.

Preparation of the test toxin. Prepare the test toxin by a suitable method from the sterile filtrate of a culture in liquid medium of *C. tetani*. The two methods shown below are given as examples and any other suitable method may be used.

(1) To the filtrate of an approximately 9-day culture add 1 to 2 volumes of *glycerol R* and store the mixture in the liquid state at a temperature slightly below 0 °C.

(2) Precipitate the toxin by addition to the filtrate of *ammonium sulphate R*, dry the precipitate *in vacuo* over *diphosphorus pentoxide R*, reduce to a powder and store dry, either in sealed ampoules or *in vacuo* over *diphosphorus pentoxide R*.

Determination of test dose of toxin (Lp/10 dose). Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.5 IU of antitoxin per millilitre. If the test toxin is stored dry, reconstitute it using a suitable liquid. Prepare mixtures of the solution of the reference preparation and the test toxin such that each contains 2.0 ml of the solution of the reference preparation, one of a graded series of volumes of the test toxin and sufficient of a suitable liquid to bring the volume to 5.0 ml. Allow the mixtures to stand, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.5 ml subcutaneously into each mouse. Observe the mice for 96 h. Mice that become paralysed may be euthanised. The test dose of toxin is the quantity in 0.5 ml of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, paralysis in all six mice injected with the mixture, within the observation period.

Determination of potency of the immunoglobulin. Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.5 IU of antitoxin per millilitre. Prepare a solution of the test toxin in a suitable liquid such that it contains five test doses per millilitre. Prepare mixtures of the solution of the test toxin and the immunoglobulin to be examined such that each contains 2.0 ml of the solution of the test toxin, one of a graded series of volumes of the immunoglobulin to be examined and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 2.0 ml of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (2.0 ml) that contains 1 IU and sufficient of a suitable liquid to bring the total volume to 5.0 ml. Allow the mixtures to stand, protected from light, for 60 min. Using six mice for each mixture, inject subcutaneously a dose of 0.5 ml into each mouse. Observe the mice for 96 h. Mice that become paralysed may be euthanised. The mixture that contains the largest volume of immunoglobulin that fails to protect the mice from paralysis contains 1 IU. This quantity is used to calculate the potency of the immunoglobulin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 2.0 ml or less of the solution of the reference preparation show paralysis and all those injected with mixtures containing more do not.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Standard for anti-tetanus immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Human tetanus immunoglobulin BRP is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 100 IU of tetanus antitoxin per millilitre. The estimated potency is not less than the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent.

HUMAN VARICELLA IMMUNOGLOBULIN

Immunoglobulinum humanum varicellae

DEFINITION

Human varicella immunoglobulin is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma from selected donors having antibodies against *Herpesvirus varicellae*. *Human normal immunoglobulin (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin (0338)* except for the minimum number of donors, the minimum total protein content and, where authorised, the test for antibody to hepatitis B surface antigen.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Standard for anti varicella-zoster. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

The stated potency is not less than 100 IU/ml. The estimated potency is not less than the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent.

HUMAN VARICELLA IMMUNOGLOBULIN FOR INTRAVENOUS ADMINISTRATION

Immunoglobulinum humanum varicellae ad usum intravenosum

DEFINITION

Human varicella immunoglobulin for intravenous administration is a liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. It is obtained from plasma from selected donors having antibodies against human herpesvirus 3 (varicella-zoster virus 1). *Human normal immunoglobulin for intravenous administration (0918)* may be added.

It complies with the monograph on *Human normal immunoglobulin for intravenous administration (0918)*, except for the minimum number of donors, the minimum total protein content and the limit for osmolality.

POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (*2.7.1*).

The International Unit is the activity contained in a stated amount of the International Standard for anti varicella-zoster immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

The stated potency is not less than 25 IU/ml. The estimated potency is not less than the stated potency. The confidence limits (P = 0.95) of the estimated potency are not less than 80 per cent and not more than 125 per cent.

STORAGE

01/2008:2298

HUMAN VON WILLEBRAND FACTOR

Factor humanus von Willebrandi

DEFINITION

Human von Willebrand factor is a preparation of a plasma protein fraction that contains the glycoprotein von Willebrand factor with varying amounts of coagulation factor VIII, depending on the method of preparation. It is prepared from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*.

This monograph applies to preparations formulated according to the von Willebrand factor activity.

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of von Willebrand factor per millilitre.

PRODUCTION

The method of preparation includes steps that have been shown to remove or to inactivate known agents of infection; if substances are used for the inactivation of viruses, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 1 IU of von Willebrand factor per milligram of total protein before the addition of any protein stabiliser.

The von Willebrand factor fraction is dissolved in a suitable liquid. Excipients such as a stabiliser may be added. No antimicrobial preservative is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

VALIDATION STUDIES

COMPOSITION. It shall be demonstrated that the manufacturing process yields a product having a consistent composition with respect to von Willebrand factor, factor VIII and the proportions of von Willebrand factor and factor VIII.

von Willebrand factor multimers. The distribution of the different von Willebrand factor multimers is determined by a suitable method such as sodium dodecyl sulphate (SDS) agarose gel electrophoresis with or without Western blot analysis, using a suitable normal human plasma as standard. Visualisation of the multimeric pattern may be performed using, for example, an immunoenzymatic technique and quantitative evaluation may be carried out by densitometric analysis.

von Willebrand factor activity (*2.7.21*). The von Willebrand factor activity is estimated by determining the ristocetin cofactor activity and by one or more other suitable assays such as determination of collagen-binding activity using a suitable reference preparation.

von Willebrand factor activity/antigen ratio. Consistency of the manufacturing process with respect to the ratio of von Willebrand factor activity to von Willebrand factor antigen content is demonstrated.

PRODUCTS THAT SHOW PARTICLES AFTER RECONSTITUTION. If a few particles remain when the preparation is reconstituted, it shall be demonstrated during validation studies that the potency is not significantly affected after passage of the preparation through the filter to be provided with the preparation.

CHARACTERS

Appearance: white or pale yellow, hygroscopic powder or friable solid.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

IDENTIFICATION

The assay for von Willebrand factor serves also to identify the preparation.

TESTS

Solubility. To a container of the preparation to be examined add the volume of the solvent stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear or slightly opalescent, colourless or slightly yellow solution.

In addition, where the label states that the product may show a few particles after reconstitution, reconstitute the preparation as described on the label and pass it through the filter provided: the filtered solution is clear or slightly opalescent.

pH (*2.2.3*): 6.5 to 7.5.

Osmolality (*2.2.35*): minimum 240 mosmol/kg.

Total protein. If necessary, dilute an accurately measured volume of the preparation to be examined with a 9 g/l solution of *sodium chloride R*, to obtain a solution that may be expected to contain about 15 mg of protein in 2 ml. Place 2.0 ml of this solution in a round-bottomed centrifuge tube and add 2 ml of a 75 g/l solution of *sodium molybdate R* and 2 ml of a mixture of 1 volume of *nitrogen-free sulphuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant liquid and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulphuric acid digestion (*2.5.9*) and calculate the amount of protein by multiplying the result by 6.25. *For some products, especially those without a protein stabiliser, this method may not be applicable. Another validated method for protein determination must therefore be performed.*

Anti-A and anti-B haemagglutinins (*2.6.20*). Dilute the preparation to be examined with a 9 g/l solution of *sodium chloride R* to contain 6 IU of von Willebrand factor activity per millilitre. The 1 to 64 dilutions do not show agglutination.

Water. Determined by a suitable method, such as the semi-micro determination of water (*2.5.12*), loss on drying (*2.2.32*) or near infrared spectrophotometry (*2.2.40*), the water content is within the limits approved by the competent authority.

Sterility (*2.6.1*). It complies with the test for sterility.

Pyrogens (*2.6.8*). It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass a volume of the preparation to be examined equivalent to not less than 100 IU of von Willebrand factor activity.

ASSAY

von Willebrand factor (*2.7.21*). The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Pending the availability of an International Standard for von Willebrand factor concentrate calibrated for use in the collagen-binding assay, only the ristocetin cofactor assay may be used.

Factor VIII (*2.7.4*). The assay is carried out where the factor VIII content is greater than 10 IU of factor VIII per 100 IU of von Willebrand factor activity. The estimated potency is not less than 60 per cent and not more than 140 per cent of the stated potency. The confidence limits (P = 0.95) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

STORAGE

In an airtight container, protected from light.

LABELLING

The label states:

- the number of International Units of von Willebrand factor in the container;
- the number of International Units of factor VIII in the container, or that the content of factor VIII is less than or equal to 10 IU of factor VIII per 100 IU of von Willebrand factor activity;
- the amount of protein in the container;
- the name and quantity of any added substance;
- the name and volume of the liquid to be used for reconstitution;
- where applicable, that the preparation may show the presence of a few particles after reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

01/2008:0912

HYALURONIDASE

Hyaluronidasum

[9001-54-1]

DEFINITION

Hyaluronidase is an enzyme extracted from mammalian testes (for example bovine testes) and capable of hydrolysing mucopolysaccharides of the hyaluronic acid type. It contains not less than 300 IU of hyaluronidase activity per milligram, calculated with reference to the dried substance. It may contain a suitable stabiliser.

PRODUCTION

The animals from which hyaluronidase is derived must fulfil the requirements for the health of animals suitable for human consumption.

CHARACTERS

A white or yellowish-white, amorphous powder, soluble in water, practically insoluble in acetone and in ethanol.

IDENTIFICATION

A solution containing the equivalent of 100 IU of hyaluronidase in 1 ml of a 9 g/l solution of *sodium chloride R* depolymerises an equal volume of a 10 g/l solution of *sodium hyaluronate BRP* in 1 min at 20 °C as shown by a pronounced decrease in viscosity. This action is destroyed by heating the hyaluronidase at 100 °C for 30 min.

TESTS

Appearance of solution. Dissolve 0.10 g of the substance to be examined in *water R* and dilute to 10 ml. The solution is clear (*2.2.1*).

pH (*2.2.3*). Dissolve 30 mg in 10 ml of *carbon dioxide-free water R*. The pH of the solution is 4.5 to 7.5.

Loss on drying (*2.2.32*). Not more than 5.0 per cent, determined on 0.500 g by drying at 60 °C at a pressure not exceeding 670 Pa for 2 h.

Bacterial endotoxins (*2.6.14*): less than 0.2 IU per IU of hyaluronidase.

ASSAY

The activity of hyaluronidase is determined by comparing the rate at which it hydrolyses *sodium hyaluronate BRP* with the rate obtained with the International Standard, or a reference preparation calibrated in International Units, using a slope-ratio assay.

Substrate solution. To 0.10 g of *sodium hyaluronate BRP* in a 25 ml conical flask add slowly 20.0 ml of *water R* at 4 °C. The rate of addition must be slow enough to allow the substrate particles to swell (about 5 min). Maintain at 4 °C and stir for at least 12 h. Store at 4 °C and use within 4 days.

For the test solution and the reference solution, prepare the solution and carry out the dilution at 0 °C to 4 °C.

Test solution. Dissolve a suitable amount of the substance to be examined in *hyaluronidase diluent R* so as to obtain a solution containing 0.6 ± 0.3 IU of hyaluronidase per millilitre.

Reference solution. Dissolve a suitable amount of *hyaluronidase BRP* in *hyaluronidase diluent R* so as to obtain a solution containing 0.6 IU of hyaluronidase per millilitre.

In a reaction vessel, mix 1.50 ml of *phosphate buffer solution pH 6.4 R* and 1.0 ml of the substrate solution and equilibrate at 37 ± 0.1 °C. At time t_1 = 0 (first chronometer) add 0.50 ml of the test solution containing E_t mg of the enzyme to be examined, mix, measure the viscosity of the solution using a suitable viscometer maintained at 37 ± 0.1 °C and record the outflow time t_2 using a second chronometer (graduated in 0.1 second intervals), several times during about 20 min (read on the first chronometer). The following viscometer has been found suitable: Ubbelohde microviscometer (DIN 51 562, Part 2), capillary type MII, viscometer constant about 0.1 mm^2/s^2.

Repeat the procedure using 0.50 ml of the reference solution containing E_r mg of *hyaluronidase BRP*.

Calculate the viscosity ratio from the expression:

$$\eta_r = \frac{k \times t_2}{0.6915}$$

k = the viscometer constant in mm^2/s^2 (indicated on the viscometer);

t_2 = the outflow time (in seconds) of the solution;

0.6915 = the kinematic viscosity in mm^2/s of the buffer solution at 37 °C.

Since the enzymatic reaction continues during the outflow time measurements, the real reaction time equals $t_1 + t_2/2$, half of the outflow time ($t_2/2$) for which a certain measurement is valid being added to the time t_1 at which the measurement is started. Plot $(\ln \eta_r)^{-1}$ as a function of the reaction time ($t_1 + t_2/2$) in seconds. A linear relationship is obtained. Calculate the slope for the substance to be examined (b_t) and the reference preparation (b_r).

Calculate the specific activity in International Units per milligram from the expression:

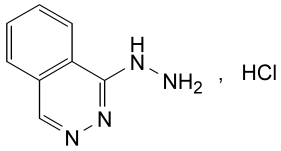
$$\frac{b_t}{b_r} \times \frac{E_r}{E_t} \times A$$

A = the specific activity of *hyaluronidase BRP* in International Units per milligram.

Carry out the complete procedure at least three times and calculate the average activity of the substance to be examined.

STORAGE

Store in an airtight container at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, tamper-proof container.



LABELLING

The label states the activity in International Units per milligram.

01/2008:0829

HYDRALAZINE HYDROCHLORIDE

Hydralazini hydrochloridum

$C_8H_9ClN_4$ M_r 196.6

[304-20-1]

DEFINITION

1-Hydrazinophthalazine hydrochloride.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water, slightly soluble in ethanol (96 per cent), very slightly soluble in methylene chloride.

mp: about 275 °C, with decomposition.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50 mg in *water R* and dilute to 100 ml with the same solvent. Dilute 2 ml of this solution to 100 ml with *water R*.

Spectral range: 220-350 nm.

Absorption maxima: at 240 nm, 260 nm, 303 nm and 315 nm.

Absorbance ratio: A_{240}/A_{303} = 2.0 to 2.2.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *hydralazine hydrochloride CRS*.

C. Dissolve 0.5 g in a mixture of 8 ml of *dilute hydrochloric acid R* and 100 ml of *water R*. Add 2 ml of *sodium nitrite solution R*, allow to stand for 10 min and filter. The precipitate, washed with *water R* and dried at 100-105 °C, melts (*2.2.14*) at 209 °C to 212 °C.

D. Dissolve about 10 mg in 2 ml of *water R*. Add 2 ml of a 20 g/l solution of *nitrobenzaldehyde R* in *ethanol (96 per cent) R*. An orange precipitate is formed.

E. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution GY_6 (*2.2.2, Method II*).

Dilute 4 ml of solution S to 20 ml with *water R*.

pH (*2.2.3*): 3.5 to 4.2 for solution S.

Hydrazine. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.12 g of the substance to be examined in 4 ml of *water R* and add 4 ml of a 150 g/l solution of *salicylaldehyde R* in *methanol R* and 0.2 ml of *hydrochloric acid R*. Mix and keep at a temperature not exceeding 25 °C for 2-4 h, until the precipitate formed has sedimented. Add 4 ml of *toluene R*, shake vigorously and centrifuge. Transfer the clear supernatant liquid to a 100 ml separating funnel and shake vigorously, each time for 3 min, with 2 quantities, each of 20 ml, of a 200 g/l solution of *sodium metabisulphite R* and with 2 quantities, each of 50 ml, of *water R*. Separate the upper toluene layer which is the test solution.

Reference solution (a). Dissolve 12 mg of *hydrazine sulphate R* in *dilute hydrochloric acid R* and dilute to 100.0 ml with the same acid. Dilute 1.0 ml of this solution to 100.0 ml with *dilute hydrochloric acid R*.

Reference solution (b). Prepare the solution at the same time and in the same manner as for the test solution, using 1.0 ml of reference solution (a) and 3 ml of *water R*.

Plate: *TLC silica gel G plate R*.

Mobile phase: *ethanol (96 per cent) R, toluene R* (10:90 *V/V*).

Application: 20 µl of the test solution and reference solution (b).

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in ultraviolet light at 365 nm.

Limit:

– *hydrazine*: any yellow fluorescent spot due to hydrazine is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (10 ppm).

Related substances. Liquid chromatography (*2.2.29*). *The solutions must be injected within one working day.*

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 25.0 mg of *phthalazine R* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 4.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (d). Dilute a mixture of 4.0 ml of the test solution and 10.0 ml of reference solution (c) to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *nitrile silica gel for chromatography R1* (10 µm).

Mobile phase: mix 22 volumes of *acetonitrile R* and 78 volumes of a solution containing 1.44 g/l of *sodium laurilsulfate R* and 0.75 g/l of *tetrabutylammonium bromide R*, then adjust to pH 3.0 with *0.05 M sulphuric acid*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl.

Run time: 3 times the retention time of hydralazine.

Retention time: hydralazine = about 10 min to 12 min; if necessary, adjust the concentration of acetonitrile in the mobile phase.

System suitability:

– the chromatogram obtained with reference solution (d) shows 2 principal peaks;

– *resolution*: minimum 2.5 between the peaks due to hydralazine and phtalazine in the chromatogram obtained with reference solution (d);

– *signal-to-noise ratio*: minimum 3 for the principal peak in the chromatogram obtained with reference solution (b).

Limit:

– *any impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo*.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 80.0 mg in 25 ml of *water R*. Add 35 ml of *hydrochloric acid R* and titrate with *0.05 M potassium iodate*, determining the end-point potentiometrically (*2.2.20*), using a calomel reference electrode and a platinum indicator electrode.

1 ml of *0.05 M potassium iodate* is equivalent to 9.832 mg of $C_8H_9ClN_4$.

STORAGE

Protected from light.

01/2008:0002

HYDROCHLORIC ACID, CONCENTRATED

Acidum hydrochloridum concentratum

HCl M_r 36.46
[7647-01-0]

DEFINITION

Content: 35.0 per cent *m/m* to 39.0 per cent *m/m*.

CHARACTERS

Appearance: clear, colourless, fuming liquid.

Solubility: miscible with water.

Relative density: about 1.18.

IDENTIFICATION

A. Dilute with *water R*. The solution is strongly acid (*2.2.4*).

B. It gives the reactions of chlorides (*2.3.1*).

C. It complies with the limits of the assay.

TESTS

Appearance of solution. To 2 ml add 8 ml of *water R*. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Free chlorine: maximum 4 ppm.

To 15 ml add 100 ml of *carbon dioxide-free water R*, 1 ml of a 100 g/l solution of *potassium iodide R* and 0.5 ml of *iodide-free starch solution R*. Allow to stand in the dark for 2 min. Any blue colour disappears on the addition of 0.2 ml of *0.01 M sodium thiosulphate*.

Sulphates (*2.4.13*): maximum 20 ppm.

To 6.4 ml add 10 mg of *sodium hydrogen carbonate R* and evaporate to dryness on a water-bath. Dissolve the residue in 15 ml of *distilled water R*.

Heavy metals (*2.4.8*): maximum 2 ppm.

Dissolve the residue obtained in the test for residue on evaporation in 1 ml of *dilute hydrochloric acid R* and dilute to 25 ml with *water R*. Dilute 5 ml of this solution to 20 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Residue on evaporation: maximum 0.01 per cent.

Evaporate 100.0 g to dryness on a water-bath and dry at 100-105 °C. The residue weighs a maximum of 10 mg.

ASSAY

Weigh accurately a ground-glass-stoppered flask containing 30 ml of *water R*. Introduce 1.5 ml of the acid to be examined and weigh again. Titrate with *1 M sodium hydroxide*, using *methyl red solution R* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 36.46 mg of HCl.

STORAGE

In a stoppered container made of glass or another inert material, at a temperature not exceeding 30 °C.

01/2008:0003

HYDROCHLORIC ACID, DILUTE

Acidum hydrochloridum dilutum

DEFINITION

Content: 9.5 per cent *m/m* to 10.5 per cent *m/m* of HCl (M_r 36.46).

PREPARATION

To 726 g of *water R* add 274 g of concentrated hydrochloric acid and mix.

IDENTIFICATION

A. It is strongly acid (*2.2.4*).

B. It gives the reactions of chlorides (*2.3.1*).

C. It complies with the limits of the assay.

TESTS

Appearance. It is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Free chlorine: maximum 1 ppm.

To 60 ml add 50 ml of *carbon dioxide-free water R*, 1 ml of a 100 g/l solution of *potassium iodide R* and 0.5 ml of *iodide-free starch solution R*. Allow to stand in the dark for 2 min. Any blue colour disappears on the addition of 0.2 ml of *0.01 M sodium thiosulphate*.

Sulphates (*2.4.13*): maximum 5 ppm.

To 26 ml add 10 mg of *sodium hydrogen carbonate R* and evaporate to dryness on a water-bath. Dissolve the residue in 15 ml of *distilled water R*.

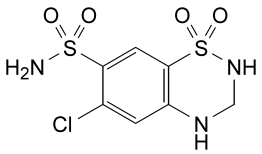
Heavy metals (*2.4.8*): maximum 2 ppm.

Dissolve the residue obtained in the test for residue on evaporation in 1 ml of *dilute hydrochloric acid R* and dilute to 25 ml with *water R*. Dilute 5 ml of this solution to 20 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Residue on evaporation: maximum 0.01 per cent.

Evaporate 100.0 g to dryness on a water-bath and dry at 100-105 °C. The residue weighs a maximum of 10 mg.

ASSAY



To 6.00 g add 30 ml of *water R*. Titrate with *1 M sodium hydroxide*, using *methyl red solution R* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 36.46 mg of HCl.

01/2008:0394

HYDROCHLOROTHIAZIDE

Hydrochlorothiazidum

$C_7H_8ClN_3O_4S_2$ M_r 297.7
[58-93-5]

DEFINITION

6-Chloro-3,4-dihydro-2*H*-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very slightly soluble in water, soluble in acetone, sparingly soluble in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50.0 mg in 10 ml of *0.1 M sodium hydroxide* and dilute to 100.0 ml with *water R*. Dilute 2.0 ml of this solution to 100.0 ml with *0.01 M sodium hydroxide*.

Spectral range: 250-350 nm.

Absorption maxima: at 273 nm and 323 nm.

Absorbance ratio: A_{273}/A_{323} = 5.4 to 5.7.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *hydrochlorothiazide CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *ethanol R1*, evaporate to dryness and record new spectra using the residues.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 50 mg of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of *hydrochlorothiazide CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 25 mg of *chlorothiazide R* in reference solution (a) and dilute to 5 ml with reference solution (a).

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *ethyl acetate R.*

Application: 2 µl.

Development: over a path of 10 cm.

Drying: in a current of air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Gently heat about 1 mg with 2 ml of a freshly prepared 0.5 g/l solution of *chromotropic acid, sodium salt R* in a cooled mixture of 35 volumes of *water R* and 65 volumes of *sulphuric acid R*. A violet colour develops.

TESTS

Acidity or alkalinity. Shake 0.5 g of the powdered substance to be examined with 25 ml of *water R* for 2 min and filter. To 10 ml of the filtrate, add 0.2 ml of *0.01 M sodium hydroxide* and 0.15 ml of *methyl red solution R*. The solution is yellow. Not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to red.

Related substances. Liquid chromatography (*2.2.29*).

Solvent mixture. Dilute 50.0 ml of a mixture of equal volumes of *acetonitrile R* and *methanol R* to 200.0 ml with *phosphate buffer solution pH 3.2 R1*.

Test solution. Dissolve 30.0 mg of the substance to be examined in 5 ml of a mixture of equal volumes of *acetonitrile R* and *methanol R*, using sonication if necessary, and dilute to 20.0 ml with *phosphate buffer solution pH 3.2 R1*.

Reference solution (a). Dissolve 15 mg of *hydrochlorothiazide CRS* and 15 mg of *chlorothiazide CRS* (impurity A) in 25 ml of a mixture of equal volumes of *acetonitrile R* and *methanol R*, using sonication if necessary, and dilute to 100 ml with *phosphate buffer solution pH 3.2 R1*. Dilute 5 ml of this solution to 100 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the solvent mixture. Dilute 5.0 ml of this solution to 20.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.1 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:

– *mobile phase A*: to 940 ml of *phosphate buffer solution pH 3.2 R1* add 60.0 ml of *methanol R* and 10.0 ml of *tetrahydrofuran R* and mix;

– *mobile phase B*: to a mixture of 500 ml of *methanol R* and 500 ml of *phosphate buffer solution pH 3.2 R1* add 50.0 ml of *tetrahydrofuran R* and mix;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 17	100 → 55	0 → 45
17 - 30	55	45
30 - 35	55 → 100	45 → 0
35 - 50	100	0

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 224 nm.

Equilibration: with mobile phase A for at least 20 min.

Injection: 10 µl; inject the solvent mixture as a blank.

Retention time: impurity A = about 7 min; hydrochlorothiazide = about 8 min.

System suitability: reference solution (a):

– *resolution*: minimum 2.5 between the peaks due to impurity A and hydrochlorothiazide; if necessary, adjust slightly the composition of the mobile phase or the time programme of the linear gradient.

Limits:

– *impurities A, B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

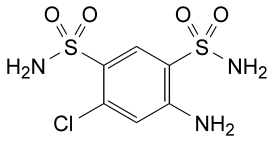
Chlorides (*2.4.4*): maximum 100 ppm.

Dissolve 1.0 g in 25 ml of *acetone R* and dilute to 30 ml with *water R*. Prepare the standard using 5 ml of *acetone R* containing 15 per cent *V/V* of *water R* and 10 ml of *chloride standard solution (5 ppm Cl) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

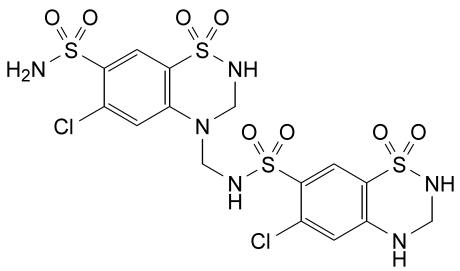
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.120 g in 50 ml of *dimethyl sulphoxide R*. Titrate with *0.1 M tetrabutylammonium hydroxide in 2-propanol*, determining the end-point potentiometrically (*2.2.20*) at the 2nd point of inflexion. Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide in 2-propanol* is equivalent to 14.88 mg of $C_7H_8ClN_3O_4S_2$.

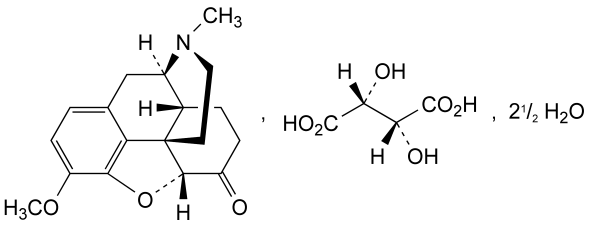


IMPURITIES

Specified impurities: *A, B, C*.

A. chlorothiazide,

B. 4-amino-6-chlorobenzene-1,3-disulphonamide (salamide),



C. 6-chloro-*N*-[(6-chloro-7-sulphamoyl-2,3-dihydro-4*H*-1,2,4-benzothiadiazin-4-yl 1,1-dioxide)methyl]-3,4-dihydro-2*H*-1,2,4-benzothiadiazine-7-sulphonamide 1,1-dioxide.

01/2008:1784

HYDROCODONE HYDROGEN TARTRATE 2.5-HYDRATE

Hydrocodoni hydrogenotartras 2.5-hydricus

$C_{22}H_{27}NO_9,2.5H_2O$ M_r 494.5

DEFINITION

4,5α-Epoxy-3-methoxy-17-methylmorphinan-6-one hydrogen (2*R*,3*R*)-2,3-dihydroxybutanedioate 2.5-hydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, hygroscopic, crystalline powder.

Solubility: freely soluble or soluble in water, sparingly soluble in ethanol (96 per cent), practically insoluble in cyclohexane.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *hydrocodone hydrogen tartrate 2.5-hydrate CRS*.

If the spectra obtained in the solid state show differences, dry the substance to be examined and the reference substance at 105 °C and record new spectra using the residues.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_5 (*2.2.2, Method II*).

Dissolve 0.5 g in *water R* and dilute to 10 ml with the same solvent.

pH (*2.2.3*): 3.2 to 3.8.

Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Specific optical rotation (*2.2.7*): – 87 to – 91 (anhydrous substance).

Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (a). Dissolve 5 mg of *oxycodone hydrochloride CRS* (impurity D) in mobile phase A, add 0.5 ml of the test solution and dilute to 5.0 ml with mobile phase A.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A. Dilute 1.0 ml of this solution to 10.0 ml with mobile phase A.

Reference solution (c). Dissolve 20 mg of *benzophenone CRS* (impurity H) in 50.0 ml of *methanol R*. Dilute 1.0 ml of this solution to 20.0 ml with mobile phase A.

Reference solution (d). Dissolve the contents of a vial of *hydrocodone for peak identification CRS* in 1 ml of mobile phase A.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography end-capped R* (5 µm);

– *temperature*: 40 °C.

Mobile phase:

– *mobile phase A*: dissolve 1.08 g of *sodium octanesulphonate R* in *water R*, adjust to pH 2.0 with *phosphoric acid R* and dilute to 1000 ml with *water R*;

– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	80	20
15 - 30	80 → 70	20 → 30
30 - 40	70 → 40	30 → 60
40 - 42	40	60
42 - 43	40 → 80	60 → 20
43 - 52	80	20

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 283 nm.

Injection: 10 µl.

Identification of impurities: use the chromatogram supplied with *hydrocodone for peak identification CRS* and the chromatogram obtained with reference solution (d) to identify the peaks due to impurities A, B, C, D, E, F and I.

Relative retention with reference to hydrocodone (retention time = about 14 min): impurity A = about 0.3; impurity K = about 0.43; impurity B = about 0.57; impurity C = about 0.61; impurity D = about 0.9; impurity E = about 1.1; impurity F = about 1.5; impurity I = about 2.0; impurity H = about 2.9.

System suitability: reference solution (a):

– *resolution*: minimum 3.0 between the peaks due to hydrocodone and impurity D.

Limits:

– *correction factor*: for the calculation of content, multiply the peak area of impurity I by 0.2;

– *impurity I*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *impurity H*: not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.1 per cent);

– *impurities A, B, C, D, E, F, K*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);

– *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

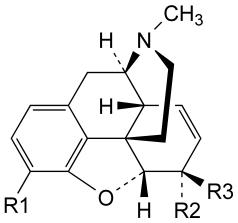
Water (*2.5.12*): 7.0 per cent to 12.0 per cent, determined on 0.100 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 60 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 44.95 mg of $C_{22}H_{27}NO_9$.



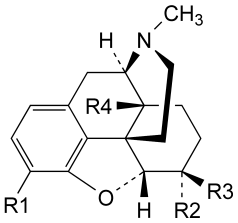
STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F, H, I, K.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *G, J.*



A. R1 = R2 = OH, R3 = H: morphine,

C. R1 = OCH_3, R2 = OH, R3 = H: codeine,

HYDROCORTISONE

Hydrocortisonum

$C_{21}H_{30}O_5$ M_r 362.5
[50-23-7]

DEFINITION

Hydrocortisone contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 11β,17,21-trihydroxypregn-4-ene-3,20-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in acetone and in alcohol, slightly soluble in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

First identification: A, B.

Second identification: C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *hydrocortisone CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *acetone R*, evaporate to dryness on a water-bath and record new spectra using the residues.

B. Examine by thin-layer chromatography (*2.2.27*), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *hydrocortisone CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *prednisolone CRS* in reference solution (a) and dilute to 10 ml with reference solution (a).

Apply to the plate 5 μl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Carry out a second development over a path of 15 cm using a mixture of 5 volumes of *butanol R* saturated with *water R*, 15 volumes of *toluene R* and 80 volumes of *ether R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the chromatograms in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. Examine by thin-layer chromatography (*2.2.27*), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent. This solution is also used to prepare test solution (b). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Test solution (b). Transfer 0.4 ml of the solution obtained during preparation of test solution (a) to a glass tube 100 mm long and 20 mm in diameter and fitted with a ground-glass stopper or a polytetrafluoroethylene cap and evaporate the solvent with gentle heating under a stream of *nitrogen R*. Add 2 ml of a 15 per cent *V/V* solution of *glacial acetic acid R* and 50 mg of *sodium bismuthate R*. Stopper the tube and shake the suspension for 1 h in a mechanical shaker, protected from light. Add 2 ml of a 15 per cent *V/V* solution of *glacial acetic acid R* and filter

into a 50 ml separating funnel, washing the filter with two quantities, each of 5 ml, of *water R*. Shake the clear filtrate with 10 ml of *methylene chloride R*. Wash the organic layer with 5 ml of *1 M sodium hydroxide* and two quantities, each of 5 ml, of *water R*. Dry over *anhydrous sodium sulphate R*.

Reference solution (a). Dissolve 25 mg of *hydrocortisone CRS* in *methanol R* and dilute to 5 ml with the same solvent. This solution is also used to prepare reference solution (b). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Reference solution (b). Transfer 0.4 ml of the solution obtained during preparation of reference solution (a) to a glass tube 100 mm long and 20 mm in diameter and fitted with a ground-glass stopper or a polytetrafluoroethylene cap and evaporate the solvent with gentle heating under a stream of *nitrogen R*. Add 2 ml of a 15 per cent *V/V* solution of *glacial acetic acid R* and 50 mg of *sodium bismuthate R*. Stopper the tube and shake the suspension for 1 h in a mechanical shaker protected from light. Add 2 ml of a 15 per cent *V/V* solution of *glacial acetic acid R* and filter into a 50 ml separating funnel, washing the filter with two quantities, each of 5 ml, of *water R*. Shake the clear filtrate with 10 ml of *methylene chloride R*. Wash the organic layer with 5 ml of *1 M sodium hydroxide* and two quantities, each of 5 ml, of *water R*. Dry over *anhydrous sodium sulphate R*.

Apply to the plate 5 µl of test solution (a), 5 µl of reference solution (a), 25 µl of test solution (b) and 25 µl of reference solution (b), applying the latter two in small quantities to obtain small spots. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Carry out a second development over a path of 15 cm using a mixture of 5 volumes of *butanol R* saturated with *water R*, 15 volumes of *toluene R* and 80 volumes of *ether R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution. Spray with *alcoholic solution of sulphuric acid R* and heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the plate in daylight and in ultraviolet light at 365 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the corresponding reference solution. The principal spots in the chromatograms obtained with test solution (b) and reference solution (b) have an R_F value distinctly higher than that of the principal spots in the chromatograms obtained with test solution (a) and reference solution (a).

D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, an intense brownish-red colour develops with a green fluorescence which is particularly intense when examined in ultraviolet light at 365 nm. Add the solution to 10 ml of *water R* and mix. The colour fades and a clear solution remains. The fluorescence in ultraviolet light does not disappear.

TESTS

Specific optical rotation (*2.2.7*). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 150 to + 156, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 25.0 mg of the substance to be examined in 2 ml of *tetrahydrofuran R* and dilute to 10.0 ml with *water R*.

Reference solution (a). Dissolve 2 mg of *hydrocortisone CRS* and 2 mg of *prednisolone CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm),

– as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: in a 1000 ml volumetric flask mix 220 ml of *tetrahydrofuran R* with 700 ml of *water R* and allow to equilibrate; dilute to 1000 ml with *water R* and mix again,

– as detector a spectrophotometer set at 254 nm,

maintaining the temperature of the column at 45 °C.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 30 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: prednisolone about 14 min and hydrocortisone about 15.5 min. The test is not valid unless the resolution between the peaks due to prednisolone and hydrocortisone is at least 2.2. If necessary, adjust the concentration of *tetrahydrofuran R* in the mobile phase.

Inject separately 20 µl of the solvent mixture of the test solution as a blank, 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography of the test solution for four times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent): the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent). Disregard any peak obtained with the blank run and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

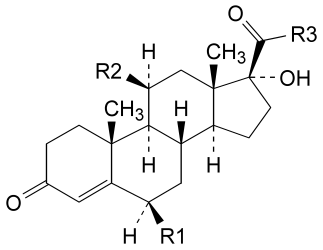
Loss on drying (*2.2.32*). Not more than 1.0 per cent, determined on 0.500 g by drying in an oven at 105 °C.

ASSAY

Dissolve 0.100 g in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *alcohol R*. Measure the absorbance (*2.2.25*) at the maximum at 241.5 nm.

Calculate the content of $C_{21}H_{30}O_5$ taking the specific absorbance to be 440.

STORAGE

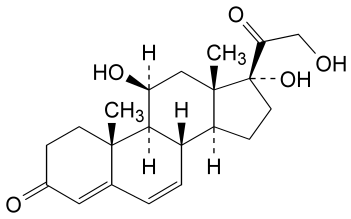


Store protected from light.

IMPURITIES

A. prednisolone,

B. cortisone,

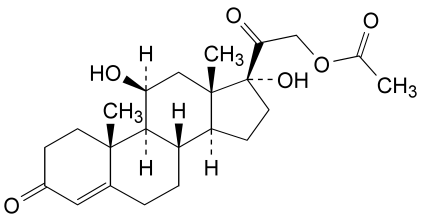


C. hydrocortisone acetate,

D. R1 = R2 = OH, R3 = CH_2OH: 6β,11β,17,21-tetrahydroxypregn-4-ene-3,20-dione (6β-hydroxyhydrocortisone),

F. R1 = R2 = H, R3 = CH_2OH: 17,21-dihydroxypregn-4-ene-3,20-dione (Reichstein's substance),

G. R1 = H, R2 = OH, R3 = CHO: 11β,17-dihydroxy-3,20-dioxopregn-4-en-21-al,



E. 11β,17,21-trihydroxypregna-4,6-diene-3,20-dione (Δ6-hydrocortisone).

corrected 6.0

HYDROCORTISONE ACETATE

Hydrocortisoni acetas

$C_{23}H_{32}O_6$ M_r 404.5
[50-03-3]

DEFINITION

11β,17-Dihydroxy-3,20-dioxopregn-4-en-21-yl acetate.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, slightly soluble in anhydrous ethanol and in methylene chloride.

mp: about 220 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: C, D, E.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *hydrocortisone acetate CRS.*

B. Thin-layer chromatography (*2.2.27*).

Solvent mixture: *methanol R, methylene chloride R* (1:9 *V/V*).

Test solution. Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (a). Dissolve 20 mg of *hydrocortisone acetate CRS* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (b). Dissolve 10 mg of *cortisone acetate R* in reference solution (a) and dilute to 10 ml with reference solution (a).

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: add a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R.*

Application: 5 μl.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

Detection B: spray with *alcoholic solution of sulphuric acid R.* Heat at 120 °C for 10 min or until the spots appear and allow to cool; examine in daylight and in ultraviolet light at 365 nm.

Results B: the principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a).

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

C. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent (solution A). Dilute 2 ml of this solution to 10 ml with *methylene chloride R.*

Test solution (b). Transfer 2 ml of solution A to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a stream of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C protected from light for 2 h 30 min. Allow to cool.

Reference solution (a). Dissolve 25 mg of *hydrocortisone acetate CRS* in *methanol R* and dilute to 5 ml with the same solvent (solution B). Dilute 2 ml of this solution to 10 ml with *methylene chloride R.*

Reference solution (b). Transfer 2 ml of solution B to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated*

methanolic potassium hydrogen carbonate solution R and immediately pass a stream of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C protected from light for 2 h 30 min. Allow to cool.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: add a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*.

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution.

Detection B: spray with *alcoholic solution of sulphuric acid R* and heat at 120 °C for 10 min or until the spots appear and allow to cool; examine in daylight and in ultraviolet light at 365 nm.

Results B: the principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the corresponding reference solution. The principal spots in the chromatograms obtained with test solution (b) and reference solution (b) have an R_F value distinctly lower than that of the principal spots in the chromatograms obtained with test solution (a) and reference solution (a).

D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min an intense brownish-red colour develops with a green fluorescence which is particularly intense when viewed in ultraviolet light at 365 nm. Add this solution to 10 ml of *water R* and mix. The colour fades and the fluorescence in ultraviolet light does not disappear.

E. About 10 mg gives the reaction of acetyl (*2.3.1*).

TESTS

Specific optical rotation (*2.2.7*): + 158 to + 167 (dried substance).

Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of *hydrocortisone acetate CRS* and 2 mg of *cortisone acetate R* in the mobile phase, then dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: in a 1000 ml volumetric flask mix 400 ml of *acetonitrile R* with 550 ml of *water R* and allow to equilibrate; dilute to 1000 ml with *water R* and mix again.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Equilibration: with the mobile phase for about 30 min.

Injection: 20 µl.

Run time: 2.5 times the retention time of hydrocortisone acetate.

Retention time: hydrocortisone acetate = about 10 min; cortisone acetate = about 12 min.

System suitability: reference solution (a):

- *resolution*: minimum 4.2 between the peaks due to hydrocortisone acetate and cortisone acetate; if necessary, adjust the concentration of acetonitrile in the mobile phase.

Limits:

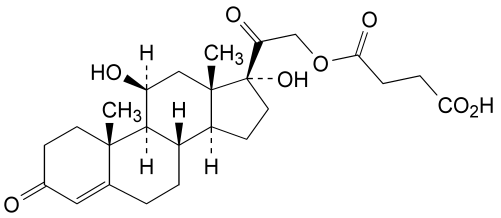
- *any impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), and not more than one such peak has an area greater than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent);
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 0.500 g by drying in an oven at 105 °C.

ASSAY

Dissolve 0.100 g in *ethanol (96 per cent) R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *ethanol (96 per cent) R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 241.5 nm.

Calculate the content of $C_{23}H_{32}O_6$ taking the specific absorbance to be 395.



STORAGE

Protected from light.

HYDROCORTISONE HYDROGEN SUCCINATE

Hydrocortisoni hydrogenosuccinas

$C_{25}H_{34}O_8$ M_r 462.5
[2203-97-6]

DEFINITION

11β,17-Dihydroxy-3,20-dioxopregn-4-en-21-yl hydrogen butanedioate.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, hygroscopic powder.

Solubility: practically insoluble in water, freely soluble in acetone and in anhydrous ethanol. It dissolves in dilute solutions of alkali carbonates and alkali hydroxides.

IDENTIFICATION

First identification: A, B.

Second identification: C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: dry the substances before use at 100-105 °C for 3 h.

Comparison: *hydrocortisone hydrogen succinate CRS*.

B. Thin-layer chromatography (*2.2.27*).

Solvent mixture: *methanol R, methylene chloride R* (1:9 *V/V*).

Test solution. Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (a). Dissolve 20 mg of *hydrocortisone hydrogen succinate CRS* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (b). Dissolve 10 mg of *methylprednisolone hydrogen succinate CRS* in reference solution (a) and dilute to 10 ml with reference solution (a).

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *anhydrous formic acid R, anhydrous ethanol R, methylene chloride R* (0.1:1:15 *V/V/V*).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

Detection B: spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm.

Results B: the principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a).

System suitability: reference solution (b):

– the chromatogram shows 2 spots which may, however, not be completely separated.

C. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 25 mg of the substance to be examined in *methanol R* with gentle heating and dilute to 5 ml with the same solvent (solution A). Dilute 2 ml of this solution to 10 ml with *methylene chloride R*.

Test solution (b). Transfer 2 ml of solution A to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of a 0.8 g/l solution of *sodium hydroxide R* in *methanol R* and immediately pass a stream of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C, protected from light, for 30 min. Allow to cool.

Reference solution (a). Dissolve 25 mg of *hydrocortisone hydrogen succinate CRS* in *methanol R* with gentle heating and dilute to 5 ml with the same solvent (solution B). Dilute 2 ml of this solution to 10 ml with *methylene chloride R*.

Reference solution (b). Transfer 2 ml of solution B to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of a 0.8 g/l solution of *sodium hydroxide R* in *methanol R* and immediately pass a stream of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C, protected from light, for 30 min. Allow to cool.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: add a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*.

Application: 5 µl.

Developpement: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution.

Detection B: spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm

Results B: the principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the corresponding reference solution. The principal spot in each of the chromatograms obtained with test solution (b) and reference solution (b) has an R_F value distinctly higher than that of the principal spot in each of the chromatograms obtained with test solution (a) and reference solution (a).

D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, an intense brownish-red colour develops with a green fluorescence which is particularly intense when viewed in ultraviolet light at 365 nm. Add this solution to 10 ml of *water R* and mix. The colour fades and a clear solution remains. The fluorescence in ultraviolet light does not disappear.

TESTS

Appearance of solution. The solution is clear (*2.2.1*).

Dissolve 0.10 g in 5 ml of *sodium hydrogen carbonate solution R*.

Specific optical rotation (*2.2.7*): + 147 to + 153 (dried substance).

Dissolve 0.250 g in *anhydrous ethanol R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 2 mg of *hydrocortisone hydrogen succinate CRS* and 2 mg of *dexamethasone CRS* in 50 ml of *acetonitrile R*, then dilute to 100.0 ml with *water R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of equal volumes of *acetonitrile R* and *water R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: in a 1000 ml volumetric flask mix 330 ml of *acetonitrile R* with 600 ml of *water R* and 1.0 ml of *phosphoric acid R*, then allow to equilibrate; dilute to 1000 ml with *water R* and mix again.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Equilibration: with the mobile phase for about 30 min.

Injection: 20 µl.

Run time: twice the retention time of hydrocortisone hydrogen succinate.

Retention time: dexamethasone = about 12.5 min; hydrocortisone hydrogen succinate = about 15 min.

System suitability: reference solution (a):

– *resolution*: minimum 5.0 between the peaks due to dexamethasone and hydrocortisone hydrogen succinate; if necessary, adjust the concentration of acetonitrile in the mobile phase.

Limits:

– *impurities A, B*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *total*: not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent);

– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 4.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in *ethanol (96 per cent) R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *ethanol (96 per cent) R*. Measure the absorbance (*2.2.25*) at the absorption maximum at 241.5 nm.

Calculate the content of $C_{25}H_{34}O_8$ taking the specific absorbance to be 353.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: *A, B.*

A. hydrocortisone,

B. hydrocortisone acetate.

01/2008:0395

HYDROGEN PEROXIDE SOLUTION (3 PER CENT)

Hydrogenii peroxidum 3 per centum

DEFINITION

Content: 2.5 per cent *m/m* to 3.5 per cent *m/m* of H_2O_2 (M_r 34.01).

1 volume of hydrogen peroxide solution (3 per cent) corresponds to about 10 times its volume of oxygen.
A suitable stabiliser may be added.

CHARACTERS

Appearance: colourless, clear liquid.

IDENTIFICATION

A. To 2 ml add 0.2 ml of *dilute sulphuric acid R* and 0.2 ml of *0.02 M potassium permanganate*. The solution becomes colourless or slightly pink within 2 min.

B. To 0.5 ml add 1 ml of *dilute sulphuric acid R*, 2 ml of *ether R* and 0.1 ml of *potassium chromate solution R* and shake. The ether layer is blue.

C. It complies with the requirement for the content of H_2O_2.

TESTS

Acidity. To 10 ml add 20 ml of *water R* and 0.25 ml of *methyl red solution R*. Not less than 0.05 ml and not more than 1.0 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Organic stabilisers: maximum 250 ppm.

Shake 20 ml with 10 ml of *chloroform R* and then with 2 quantities, each of 5 ml, of *chloroform R*. Evaporate the combined chloroform layers under reduced pressure at a temperature not exceeding 25 °C and dry in a desiccator. The residue weighs a maximum of 5 mg.

Non-volatile residue: maximum 2 g/l.

Allow 10 ml to stand in a platinum dish until all effervescence has ceased. Evaporate to dryness on a water-bath and dry at 100-105 °C. The residue weighs a maximum of 20 mg.

ASSAY

Dilute 10.0 g to 100.0 ml with *water R*. To 10.0 ml of this solution add 20 ml of *dilute sulphuric acid R*. Titrate with *0.02 M potassium permanganate* until a pink colour is obtained.

1 ml of *0.02 M potassium permanganate* is equivalent to 1.701 mg of H_2O_2 or 0.56 ml of oxygen.

STORAGE

Protected from light, and if the solution does not contain a stabiliser, at a temperature below 15 °C.

LABELLING

If the solution contains a stabiliser, the label states that the contents are stabilised. The competent authority may require that the name of the stabiliser be stated on the label.

CAUTION

It decomposes in contact with oxidisable organic matter and with certain metals and if allowed to become alkaline.

01/2008:0396

HYDROGEN PEROXIDE SOLUTION (30 PER CENT)

Hydrogenii peroxidum 30 per centum

[7722-84-1]

DEFINITION

Content: 29.0 per cent *m/m* to 31.0 per cent *m/m* of H_2O_2 (M_r 34.01).

1 volume of hydrogen peroxyde solution (30 per cent) corresponds to about 110 times its volume of oxygen. A suitable stabiliser may be added.

CHARACTERS

Appearance: colourless, clear liquid.

IDENTIFICATION

A. To 1 ml add 0.2 ml of *dilute sulphuric acid R* and 0.25 ml of *0.02 M potassium permanganate*. The solution becomes colourless with evolution of gas.

B. To 0.05 ml add 2 ml of *dilute sulphuric acid R*, 2 ml of *ether R* and 0.05 ml of *potassium chromate solution R* and shake. The ether layer is blue.

C. It complies with the requirement for the content of H_2O_2.

TESTS

Acidity. To 10 ml add 100 ml of *water R* and 0.25 ml of *methyl red solution R*. Not less than 0.05 ml and not more than 0.5 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Organic stabilisers: maximum 500 ppm.

Shake 20 ml with 10 ml of *chloroform R* and then with 2 quantities, each of 5 ml, of *chloroform R*. Evaporate the combined chloroform layers under reduced pressure at a temperature not exceeding 25 °C and dry in a desiccator. The residue weighs a maximum of 10 mg.

Non-volatile residue: maximum 2 g/l.

Allow 10 ml to stand in a platinum dish until all effervescence has ceased, cooling if necessary. Evaporate to dryness on a water-bath and dry at 100-105 °C. The residue weighs a maximum of 20 mg.

ASSAY

Dilute 1.00 g to 100.0 ml with *water R*. To 10.0 ml of this solution add 20 ml of *dilute sulphuric acid R*. Titrate with *0.02 M potassium permanganate* until a pink colour is obtained.

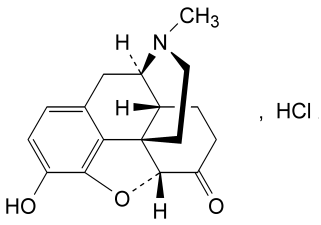
1 ml of *0.02 M potassium permanganate* is equivalent to 1.701 mg of H_2O_2 or 0.56 ml of oxygen.

STORAGE

Protected from light, and if the solution does not contain a stabiliser, at a temperature below 15 °C.

LABELLING

If the solution contains a stabiliser, the label states that the contents are stabilised. The competent authority may require that the name of the stabiliser be stated on the label.



CAUTION

It decomposes vigorously in contact with oxidisable organic matter and with certain metals and if allowed to become alkaline.

HYDROMORPHONE HYDROCHLORIDE

Hydromorphoni hydrochloridum

$C_{17}H_{20}ClNO_3$ M_r 321.8
[71-68-1]

DEFINITION

4,5α-Epoxy-3-hydroxy-17-methylmorphinan-6-one hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, very slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *hydromorphone hydrochloride CRS*.

B. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 1.250 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

Acidity or alkalinity. To 2 ml of solution S add 0.1 ml of *methyl red solution R*. The solution is not yellow. To 2 ml of solution S add 0.05 ml of *bromocresol green solution R*. The solution is not yellow.

Specific optical rotation (*2.2.7*): – 136 to – 140 (dried substance), determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in *water R*, sonicating if necessary and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water R*. Dilute 1.0 ml of this solution to 10.0 ml with *water R*.

Reference solution (b). To 5 ml of the test solution add 5 mg of *naloxone hydrochloride dihydrate CRS* and dilute to 50 ml with *water R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dissolve 18.29 g of *diethylamine R* and 2.88 g of *sodium laurilsulfate R* in *water R* and dilute to 1000 ml with the same solvent. Adjust 800 ml of this solution to pH 3.0 with *phosphoric acid R*. Add 100 ml of *acetonitrile R* and 100 ml of *methanol R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 284 nm.

Injection: 20 µl.

Run time: 4 times the retention time of hydromorphone.

Relative retention with reference to hydromorphone (retention time = about 9 min): impurity D = about 0.72; impurity B = about 0.77; impurity C = about 0.82; impurity A = about 3.2.

System suitability: reference solution (b):

– *resolution*: minimum 4.0 between the peaks due to hydromorphone and naloxone.

Limits:

– *impurity A*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),

– *impurities B, C, D*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),

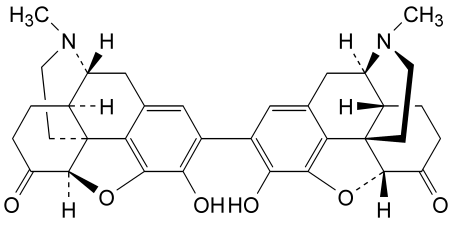
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on the residue obtained in the test for loss on drying.

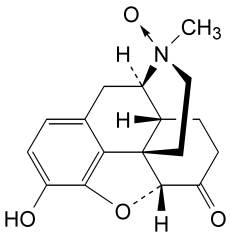
ASSAY

Dissolve 0.250 g in 50 ml of *ethanol (96 per cent) R* and add 5.0 ml of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.



1 ml of *0.1 M sodium hydroxide* is equivalent to 32.18 mg of $C_{17}H_{20}ClNO_3$.

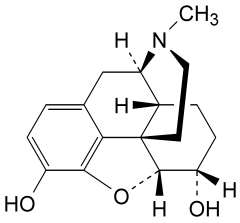
STORAGE



Protected from light.

IMPURITIES

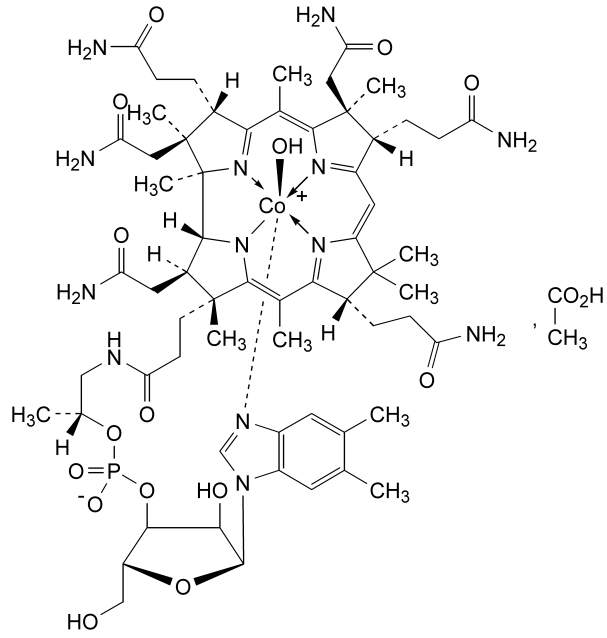
Specified impurities: A, B, C, D.



A. 4,5α:4′,5′α-diepoxy-3,3′-dihydroxy-17,17′-dimethyl-2,2′-bimorphinanyl-6,6′-dione (pseudohydromorphone),

B. 4,5α-epoxy-3-hydroxy-17-methylmorphinan-6-one 17-oxide (hydromorphone *N*-oxide),

C. morphine,



D. 4,5α-epoxy-17-methylmorphinan-3,6α-diol (dihydromorphine).

HYDROXOCOBALAMIN ACETATE

Hydroxocobalamini acetas

$C_{64}H_{93}CoN_{13}O_{17}P$ M_r 1406
[22465-48-1]

DEFINITION

Coα-[α-(5,6-dimethylbenzimidazolyl)]-Coβ-hydroxocobamide acetate.

Content: 96.0 per cent to 102.0 per cent (dried substance).

This monograph applies to hydroxocobalamin acetate produced by fermentation.

CHARACTERS

Appearance: dark red, crystalline powder or dark red crystals, very hygroscopic.

Solubility: soluble in water.

Some decomposition may occur on drying.

IDENTIFICATION

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 2.5 mg in a solution containing 0.8 per cent *V/V* of *glacial acetic acid R* and 10.9 g/l of *sodium acetate R*, then dilute to 100 ml with the same solution.

Spectral range: 260-610 nm.

Absorption maxima: at 274 nm, 351 nm and 525 nm.

Absorbance ratio:

– A_{274}/A_{351} = 0.75 to 0.83;

– A_{525}/A_{351} = 0.31 to 0.35.

B. Thin-layer chromatography (*2.2.27*). *Carry out the test protected from light.*

Test solution. Dissolve 2 mg of the substance to be examined in 1 ml of a mixture of equal volumes of *ethanol 96 per cent R* and *water R*.

Reference solution. Dissolve 2 mg of *hydroxocobalamin CRS* in 1 ml of a mixture of equal volumes of *ethanol 96 per cent R* and *water R*.

Plate: *TLC silica gel G plate R*.

Mobile phase: *dilute ammonia R1, methanol R* (25:75 *V/V*).

Application: 10 µl.

Development: in an unlined tank, over a path of 12 cm.

Drying: in air.

Detection: examine in daylight.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. It gives reaction (a) of acetates (*2.3.1*).

TESTS

Related substances. Liquid chromatography (*2.2.29*). *Use freshly prepared solutions and protect them from bright light.*

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 25 mg of the substance to be examined in 10 ml of *water R*, warming if necessary. Allow to cool and add 1 ml of a 20 g/l solution of *chloramine R* and 0.5 ml of *0.05 M hydrochloric acid*. Dilute this solution to 25 ml with *water R*. Shake and allow to stand for 5 min. Inject immediately.

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm;

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 19.5 volumes of *methanol R* and 80.5 volumes of a solution containing 15 g/l of *citric acid R* and 8.1 g/l of *disodium hydrogen phosphate R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 351 nm.

Injection: 20 µl.

Run time: 4 times the retention time of hydroxocobalamine.

System suitability:

– the chromatogram obtained with reference solution (c) shows 3 principal peaks;

– *resolution*: minimum 3.0 between each pair of adjacent peaks in the chromatogram obtained with reference solution (c);

– *signal-to-noise ratio*: minimum 5 for the principal peak in the chromatogram obtained with reference solution (b).

Limits:

– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (5 per cent);

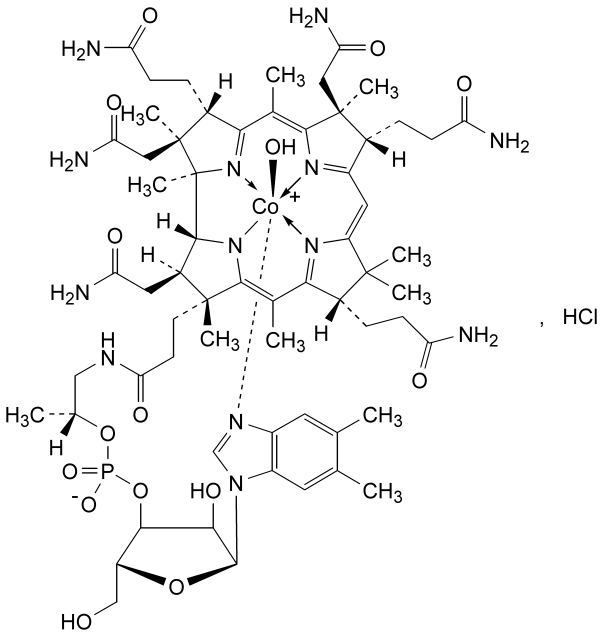
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Loss on drying (*2.2.32*): 8.0 per cent to 12.0 per cent, determined on 0.400 g by drying at 105 °C at a pressure not exceeding 0.7 kPa.

ASSAY

Protect the solutions from light throughout the assay. Dissolve 25.0 mg in a solution containing 0.8 per cent *V/V* of *glacial acetic acid R* and 10.9 g/l of *sodium acetate R*, then dilute to 1000.0 ml with the same solution. Measure the absorbance (*2.2.25*) at the absorption maximum at 351 nm.

Calculate the content of $C_{64}H_{93}CoN_{13}O_{17}P$ taking the specific absorbance to be 187.



STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

HYDROXOCOBALAMIN CHLORIDE

Hydroxocobalamini chloridum

$C_{62}H_{90}ClCoN_{13}O_{15}P$ M_r 1383
[58288-50-9]

DEFINITION

Coα-[α-(5,6-dimethylbenzimidazolyl)]-Coβ-hydroxocobamide chloride.

Fermentation product.

Content: 96.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: dark red crystalline powder or dark red crystals, very hygroscopic.

Solubility: soluble in water.

Some decomposition may occur on drying.

IDENTIFICATION

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 2.5 mg in a solution containing 0.8 per cent *V/V* of *glacial acetic acid R* and 10.9 g/l of *sodium acetate R*, then dilute to 100 ml with the same solution.

Spectral range: 260-610 nm.

Absorption maxima: at 274 nm, 351 nm and 525 nm.

Absorbance ratio:

– A_{274}/A_{351} = 0.75 to 0.83;
– A_{525}/A_{351} = 0.31 to 0.35.

B. Thin-layer chromatography (*2.2.27*). *Carry out the identification test protected from light.*

Test solution. Dissolve 2 mg of the substance to be examined in 1 ml of a mixture of equal volumes of *ethanol 96 per cent R* and *water R*.

Reference solution. Dissolve 2 mg of *hydroxocobalamin CRS* in 1 ml of a mixture of equal volumes of *ethanol 96 per cent R* and *water R*.

Plate: *TLC silica gel G plate R*.

Mobile phase: *dilute ammonia R1, methanol R* (25:75 *V/V*).

Application: 10 µl.

Development: in an unlined tank, over a path of 12 cm.

Drying: in air.

Detection: examine in daylight.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

HYDROXOCOBALAMIN SULPHATE

Hydroxocobalamini sulfas

$C_{124}H_{180}Co_2N_{26}O_{34}P_2S$ M_r 2791

DEFINITION

Di-(Coα-[α-(5,6-dimethylbenzimidazolyl)]-Coβ-hydroxocobamide) sulphate.

Fermentation product.

Content: 96.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: dark red crystalline powder or dark red crystals, very hygroscopic.

Solubility: soluble in water.

Some decomposition may occur on drying.

IDENTIFICATION

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 2.5 mg in a solution containing 0.8 per cent *V/V* of *glacial acetic acid R* and 10.9 g/l of *sodium acetate R*, then dilute to 100 ml with the same solution.

Spectral range: 260-610 nm.

01/2008:1616

HYDROXYCARBAMIDE

Hydroxycarbamidum

$CH_4N_2O_2$ M_r 76.1

[127-07-1]

DEFINITION

N-Hydroxyurea.

Content: 97.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder, hygroscopic.

Solubility: freely soluble in water, practically insoluble in alcohol.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *hydroxycarbamide CRS*.

If the spectra obtained in the solid state show differences dissolve the substance to be examined and the reference substance separately in *alcohol R*, evaporate to dryness and record new spectra using the residues.

B. Examine the chromatograms obtained in the test for urea.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (c).

TESTS

Urea. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 50 mg of the substance to be examined in *water R* and dilute to 1.0 ml with the same solvent.

Reference solution (a). Dissolve 12.5 mg of *urea R* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of the substance to be examined and 5 mg of *urea R* in *water R* and dilute to 20 ml with the same solvent.

Reference solution (c). Dissolve 50 mg of *hydroxycarbamide CRS* in *water R* and dilute to 1 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *pyridine R, water R, ethyl acetate R* (2:2:10 *V/V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with a 10 g/l solution of *dimethylaminobenzaldehyde R* in *1 M hydrochloric acid*.

System suitability: the test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Limit:

- *urea*: any spot corresponding to urea in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (a) (0.5 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 10.0 ml with the same mobile phase.

Test solution (b). Dilute 5.0 ml of test solution (a) to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 0.100 g of *hydroxylamine hydrochloride R* and 5 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase. Prepare immediately before use.

Reference solution (b). Dilute 0.1 ml of test solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 0.100 g of *hydroxycarbamide CRS* in the mobile phase and dilute to 10.0 ml with the same solvent. Dilute 5.0 ml to 50.0 ml with the mobile phase.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *methanol R, water R* (5:95 *V/V*).

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 20 µl; inject test solution (a) and reference solutions (a) and (b).

Run time: 3 times the retention time of hydroxycarbamide which is about 5 min.

System suitability: reference solution (a):

- *resolution*: minimum of 1.0 between the peaks due to impurity A and to hydroxycarbamide.

Limits:

– *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
– *total*: not more than 2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Chlorides (*2.4.4*): maximum 50 ppm.

Dissolve 1.0 g in *water R* and dilute to 15 ml with the same solvent. The solution complies with the limit test for chlorides.

Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): maximum 0.5 per cent, determined on 2.00 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

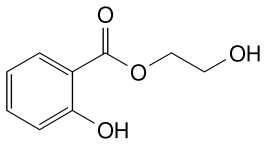
ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances.

Injection: test solution (b) and reference solution (c).

STORAGE

In an airtight container, protected from light.



IMPURITIES

A. H_2N-OH: hydroxylamine.

01/2008:1225

HYDROXYETHYL SALICYLATE

Hydroxyethylis salicylas

$C_9H_{10}O_4$ M_r 182.2
[87-28-5]

DEFINITION

2-Hydroxyethyl 2-hydroxybenzoate.

Content: 98.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: oily, colourless or almost colourless liquid, or colourless crystals.

Solubility: sparingly soluble in water, very soluble in acetone and in methylene chloride, freely soluble in alcohol.

Mp: about 21 °C.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D, E.

A. It complies with the test for refractive index (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: thin films.

Comparison: *hydroxyethyl salicylate CRS*.

C. Examine the chromatograms obtained in the test for related substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To 1 ml of solution S (see Tests), add 1 ml of *water R* and 0.2 ml of *ferric chloride solution R2*. A violet-red colour appears which disappears immediately after the addition of 2 ml of *dilute acetic acid R*. A very faint violet colour may remain.

E. In a test tube 160 mm long, mix 1.0 g with 2.0 g of finely powdered *manganese sulphate R*. Insert 2 cm into the test-tube a strip of filter paper impregnated with a freshly prepared mixture of 1 volume of a 20 per cent *V/V* solution of *diethanolamine R* and 11 volumes of a 50 g/l solution of *sodium nitroprusside R* adjusted to pH 9.8 with *1 M hydrochloric acid*. Heat the test-tube over a naked flame for 1-2 min. The filter paper becomes blue.

TESTS

Solution S. Dissolve 2.5 g in 40 ml of *alcohol R* and dilute to 50 ml with *distilled water R*.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 2 ml of solution S add 0.1 ml of *methyl red solution R* and 0.2 ml of *0.01 M sodium hydroxide*. The solution is yellow. Add 0.3 ml of *0.01 M hydrochloric acid*. The solution is red.

Relative density (*2.2.5*): 1.252 to 1.257.

Refractive index (*2.2.6*): 1.548 to 1.551.

Related substances. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 0.50 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 2 ml of test solution (a) to 50 ml with *methanol R*.

Reference solution (a). Dissolve 50.0 mg of *hydroxyethyl salicylate CRS* in *methanol R* and dilute to 25 ml with the same solvent.

Reference solution (b). Dilute 2.5 ml of test solution (b) to 10 ml with *methanol R*.

Reference solution (c). Dissolve 0.10 g of *ethylene glycol R* in *methanol R* and dilute to 50 ml with the same solvent. Dilute 1.25 ml of the solution to 10 ml with *methanol R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *ethyl acetate R, glacial acetic acid R, cyclohexane R* (20:20:60 *V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in a current of cold air.

Detection A: in ultraviolet light at 254 nm.

Limits A:

– *any impurity*: any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1 per cent).

Detection B: spray the plate with *ammonium vanadate solution R* and heat at 100 °C for 10 min. Allow to cool for 10 min and examine in daylight.

Limits B: in the chromatogram obtained with test solution (a):

– *impurity B*: any spot corresponding to impurity B is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.5 per cent),

– *any other impurity*: any spot, apart from the principal spot and any spot corresponding to impurity B is not more intense than the spot in the chromatogram obtained with reference solution (b) (1 per cent).

System suitability: the chromatogram obtained with reference solution (c) shows a clearly visible spot.

Chlorides (*2.4.4*): maximum 100 ppm.

Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Sulphates (*2.4.13*): maximum 250 ppm.

Dilute 12 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

In a flask with a ground-glass stopper, dissolve 0.125 g in 30 ml of *glacial acetic acid R*. Add 10 ml of *dilute sulphuric acid R*, 1.5 g of *potassium bromide R* and 50.0 ml of *0.0167 M potassium bromate*. Immediately close the flask and allow to stand protected from light for 15 min. Add 1.5 g of *potassium iodide R* immediately after removing the stopper and titrate with *0.1 M sodium thiosulphate*, adding 1 ml of *starch solution R* towards the end of the titration. Carry out a blank titration.

1 ml of *0.0167 M potassium bromate* is equivalent to 4.555 mg of $C_9H_{10}O_4$.

STORAGE

Protected from light.

IMPURITIES

A. salicylic acid,

B. ethane-1,2-diol (ethylene glycol).

01/2008:0336
corrected 6.0

HYDROXYETHYLCELLULOSE

Hydroxyethylcellulosum

[9004-62-0]

DEFINITION

Partly *O*-(2-hydroxyethylated) cellulose.

CHARACTERS

Appearance: white, yellowish-white or greyish-white powder or granules.

Solubility: soluble in hot and cold water giving a colloidal solution, practically insoluble in acetone, in ethanol (96 per cent) and in toluene.

IDENTIFICATION

A. Heat 10 ml of solution S (see Tests) to boiling. The solution remains clear.

B. To 10 ml of solution S add 0.3 ml of *dilute acetic acid R* and 2.5 ml of a 100 g/l solution of *tannic acid R*. A yellowish-white, flocculent precipitate is formed which dissolves in *dilute ammonia R1*.

C. In a test-tube about 160 mm in length, thoroughly mix 1 g with 2 g of finely powdered *manganese sulphate R*. Introduce to a depth of 2 cm into the upper part of the tube a strip of filter paper impregnated with a freshly prepared mixture of 1 volume of a 200 g/l solution of *diethanolamine R* and 11 volumes of a 50 g/l solution of *sodium nitroprusside R*, adjusted to about pH 9.8 with *1 M hydrochloric acid*. Insert the tube 8 cm into a silicone-oil bath and heat at 190-200 °C. The filter paper becomes blue within 10 min. Carry out a blank test.

D. Dissolve 0.2 g completely, without heating, in 15 ml of a 700 g/l solution of *sulphuric acid R*. Pour the solution with stirring into 100 ml of iced *water R* and dilute to 250 ml with iced *water R*. In a test-tube, mix thoroughly while cooling in iced water 1 ml of the solution with 8 ml of *sulphuric acid R*, added dropwise. Heat on a water-bath for exactly 3 min and immediately cool in iced water. While the mixture is cold, carefully add 0.6 ml of *ninhydrin solution R2* and mix well. Allow to stand at 25 °C. A pink colour is produced immediately and does not become violet within 100 min.

TESTS

Solution S. Disperse a quantity of the substance to be examined equivalent to 1.0 g of the dried substance in 50 ml of *carbon dioxide-free water R*. After 10 min, dilute to 100 ml with *carbon dioxide-free water R* and stir until dissolution is complete.

pH (*2.2.3*): 5.5 to 8.5 for solution S.

Apparent viscosity (*2.2.10*): 75 per cent to 140 per cent of the value stated on the label.

While stirring, introduce a quantity of the substance to be examined equivalent to 2.00 g of the dried substance into 50 g of *water R*. Dilute to 100.0 g with *water R* and stir until dissolution is complete. Determine the viscosity using a rotating viscometer at 25 °C and at a shear rate of 100 s^{-1} for substances with an expected viscosity up to 100 mPa·s, at a shear rate of 10 s^{-1} for substances with an expected viscosity between 100 mPa·s and 20 000 mPa·s and at a shear rate of 1 s^{-1} for substances with an expected viscosity above 20 000 mPa·s. If it is impossible to obtain a shear rate of exactly 1 s^{-1}, 10 s^{-1} or 100 s^{-1} respectively, use a rate slightly higher and a rate slightly lower and interpolate.

Chlorides (*2.4.4*): maximum 1.0 per cent.

Dilute 1 ml of solution S to 30 ml with *water R*. 15 ml of the solution complies with the limit test for chlorides.

Nitrates: maximum 3.0 per cent (dried substance), if hydroxyethylcellulose has an apparent viscosity of 1000 mPa·s or less and maximum 0.2 per cent (dried substance), if hydroxyethylcellulose has an apparent viscosity of more than 1000 mPa·s.

Determine potentiometrically (*2.2.36, Method I*) using as indicator a nitrate selective electrode and a silver-silver chloride electrode with a 13.2 g/l solution of *ammonium sulphate R* as reference electrolyte.

Prepare the solutions immediately before use.

Buffer solution. To a mixture of 50 ml of *1 M sulphuric acid* and 800 ml of *water R*, add 135 g of *potassium dihydrogen phosphate R* and dilute to 1000 ml with *water R*.

Buffered water. Dilute 80 ml of buffer solution to 2000 ml with *water R*.

Nitrate standard solution (500 ppm NO_3). Dissolve 0.8154 g of *potassium nitrate R* in 500 ml of buffered water and dilute to 1000.0 ml with the same solvent.

Test solution. Dissolve 0.50 g of the substance to be examined in buffered water and dilute to 100.0 ml with the same solvent.

Reference solutions. If hydroxyethylcellulose has an apparent viscosity of 1000 mPa·s or less, dilute 10.0 ml, 20.0 ml and 40.0 ml of nitrate standard solution (500 ppm NO_3) to 100.0 ml with buffered water and mix.

If hydroxyethylcellulose has an apparent viscosity of more than 1000 mPa·s, dilute 1.0 ml, 2.0 ml and 4.0 ml of nitrate standard solution (500 ppm NO_3) to 100.0 ml with buffered water and mix.

Carry out the measurements for each solution. Calculate the concentration of nitrates using the calibration curve.

Glyoxal: maximum 20 ppm.

Introduce 1.0 g into a test-tube with a ground-glass stopper and add 10.0 ml of *anhydrous ethanol R*. Stopper the tube and stir mechanically for 30 min. Centrifuge. To 2.0 ml of the supernatant liquid add 5.0 ml of a 4 g/l solution of *methylbenzothiazolone hydrazone hydrochloride R* in an 80 per cent *V/V* solution of *glacial acetic acid R* in *water R*. Shake to homogenise. After 2 h, the solution is not more intensely coloured than a standard prepared at the same time and in the same manner using 2.0 ml of *glyoxal standard solution (2 ppm $C_2H_2O_2$) R* instead of the 2.0 ml of supernatant liquid.

Ethylene oxide. Head-space gas chromatography (*2.4.25*).

Test preparation. Place 1.00 g of the substance to be examined in a 5 ml vial (other sizes may be used depending on the operating conditions) and add 1 ml of *water R*. It swells in water but does not dissolve.

Reference preparation (a). Place 1.00 g of the substance to be examined in an identical 5 ml vial. Add 0.1 ml of cooled *ethylene oxide solution R2* and 0.9 ml of *water R*. It swells in water but does not dissolve.

Reference preparation (b). To 0.1 ml of *ethylene oxide solution R2* in a 5 ml vial add 0.1 ml of a freshly prepared 10 mg/l solution of *acetaldehyde R*.

Close the vials immediately with a butyl rubber membrane stopper, coated with aluminium or polytetrafluoroethylene and secured with an aluminium crimped cap.

Limit:

– *ethylene oxide*: maximum 1 ppm.

2-Chloroethanol. Head-space gas chromatography (*2.2.28*).

Test preparation. To 50 mg of the substance to be examined in a 10 ml vial (other sizes may be used depending on the operating conditions), add 2 µl of *2-propanol R*. Seal the flask and mix.

Reference preparation (a). Dissolve 0.125 g of *2-chloroethanol R* and dilute to 50.0 ml with *2-propanol R*. Dilute 1.0 ml of the solution to 10.0 ml with *2-propanol R*.

Reference preparation (b). To 50 mg of the substance to be examined in an identical 10 ml vial, add 2 µl of reference solution (a). Seal the flask and mix.

Close the vials immediately with a butyl rubber membrane stopper, coated with aluminium or polytetrafluoroethylene and secured with an aluminium crimped cap.

Column:

– *size*: *l* = 50 m, Ø = 0.32 mm,

– *stationary phase*: *poly(dimethyl)siloxane R* (1.2 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 25-35 cm/s.

Split ratio: 1:10.

Static head-space conditions which may be used:

– *equilibration temperature*: 110 °C,

– *equilibration time*: 20 min,

– *temperature of injection system*: 115 °C.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 6	60
	6 - 16	60 → 110
	16 - 31	110 → 230
	31 - 36	230
Injection port		150
Detector		250

Detection: flame ionisation.

Injection: 2 ml.

Retention time: 2-chloroethanol = about 7.8 min.

Limit:

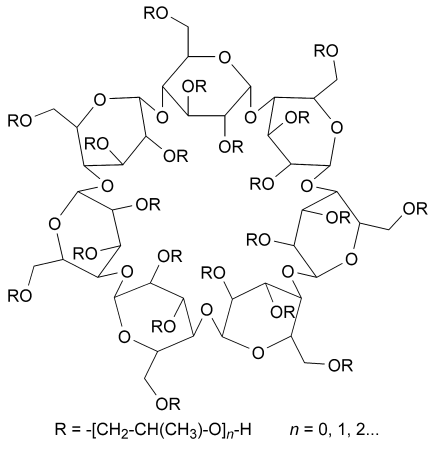
– *2-chloroethanol*: not more than 0.5 times the area of the peak due to 2-chloroethanol in the chromatogram obtained with reference solution (b) (10 ppm).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 4.0 per cent, determined on 1.0 g.



LABELLING

The label states the apparent viscosity, in millipascal seconds for a 2 per cent *m/m* solution.

01/2008:1804

HYDROXYPROPYLBETADEX

Hydroxypropylbetadexum

$C_{42}H_{70}O_{35}(C_3H_6O)_x$ with x = 7 *MS*

[128446-35-5]

DEFINITION

Hydroxypropylbetadex (β-cyclodextrin, 2-hydroxypropyl ether) is a partially substituted poly(hydroxypropyl) ether of betadex. The number of hydroxypropyl groups per

anhydroglucose unit, expressed as Molar Substitution (*MS*), is not less than 0.40 and not more than 1.50 and is within 10 per cent of the value stated on the label.

CHARACTERS

Appearance: white or almost white, amorphous or crystalline powder.

Solubility: freely soluble in water and in propylene glycol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *hydroxypropylbetadex CRS*.

Results: the spectrum obtained with the substance to be examined shows the same absorption bands as the spectrum obtained with *hydroxypropylbetadex CRS*. Due to the difference in the substitution of the substance, the intensity of some absorption bands can vary.

B. It complies with the test for appearance of solution (see Tests).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*) and remains so after cooling at room temperature.

Dissolve 1.0 g in 2.0 ml of *water R*, with heating.

Conductivity (*2.2.38*): maximum 200 µS·cm^{-1}.

Measure the conductivity of solution S, while gently stirring with a magnetic stirrer.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 2.50 g of the substance to be examined in *water R* with heating, cool and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 0.15 g of *betadex CRS* and 0.25 g of *propylene glycol R* in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with *water R*.

Precolumn:

– *stationary phase*: *phenylsilyl silica gel for chromatography R*.

Column:

– *size*: *l* = 0.30 m, Ø = 3.9 mm,
– *stationary phase*: *phenylsilyl silica gel for chromatography R* ,
– *temperature*: 40 °C.

Mobile phase: *water for chromatography R*.

Flow rate: 1.5 ml/min.

Detection: differential refractometer, at 40 °C.

Injection: 20 µl.

Run time: 3 times the retention time of impurity A.

Relative retention with reference to impurity B (retention time = about 2.5 min): impurity A = about 4.2; hydroxypropylbetadex = about 6 for the beginning of the elution.

Hydroxypropylbetadex elutes as a very wide peak or several peaks.

System suitability: reference solution (a):

– *resolution*: minimum 4 between the peaks due to impurity A and impurity B.

Limits:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (1.5 per cent),
– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (2.5 per cent),
– *any other impurity*: not more than 0.04 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.1 per cent),
– *total of other impurities*: not more than 0.4 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (1.0 per cent),
– *disregard limit*: 0.02 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard any peak eluting before impurity B and after impurity A.

Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g by drying in an oven at 120 °C for 2 h.

Molar substitution. Nuclear magnetic resonance spectrometry (*2.2.33*).

The Molar Substitution (*MS*) is calculated from the ratio between the signal from the 3 protons of the methyl group, which is part of the hydroxypropyl group and the signal from the proton attached to the carbon C_1 (glycosidic proton) of the anhydroglucose units.

Use a Fourier transform nuclear magnetic resonance spectrometer of minimum frequency 250 MHz, suited to perform a proton spectrum and to carry out quantitative analysis, at a temperature of at least 25 °C.

Introduce not less than the equivalent of 10.0 mg of the substance to be examined (dried substance) into a 5 mm NMR tube, equipped with a spinner in order to record the spectrum in rotation. Add approximately 0.75 ml of *deuterium oxide R1*. Cap the tube, mix thoroughly and adapt the spinner.

Make the appropriate instrument settings (frequency, gain, digital resolution, sample rotation, shims, probe tuning, resolution/data point, receiver gain etc.) so as to obtain a suitable spectrum for quantitative analysis (good FID (Free Induction Decay), no distortion of the spectrum after Fourier transform and phase corrections). The relaxation delay must be adapted to the pulse angle in order to have sufficient relaxation of the protons concerned between 2 pulses (for example: 10 s for a 90° pulse).

Record the FID, with at least 8 scans, so as to obtain a spectral window comprised, at least, between 0 ppm and 6.2 ppm, referring to the signal of exchangeable protons (solvent) at 4.8 ppm (25 °C).

Make a zero filling of at least 3-fold in size relative to the acquisition data file and transform the FID to the spectrum without any correction of Gaussian broadening factor (GB = 0) and with a line broadening factor up to maximum 0.2 (LB ≤ 0.2). Call the integration sub-routine after phase corrections and baseline correction between 0.5 ppm and 6.2 ppm.

Measure the peak areas of the doublet from the methyl groups at 1.2 ppm (A_1), and of the signals of the glycosidic protons between 5 ppm and 5.4 ppm (A_2).

The molar substitution is obtained using the formula:

$$MS = \frac{A_1}{(3 \times A_2)}$$

A_1 = area of the signal due to the 3 protons of the methyl groups, which are part of the hydroxypropyl groups,

A_2 = area of the signals due to the glycosidic protons.

The degree of substitution is the number of hydroxypropyl groups per molecule of β-cyclodextrin and is obtained by multiplying the *MS* by 7.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 bacteria and 10^2 fungi per gram, determined by plate count. If intended for use in the manufacture of parenteral dosage forms, the total viable aerobic count is not more than 10^2 bacteria and 10^2 fungi per gram. It complies with the tests for *Escherichia coli* and *Salmonella* (*2.6.13*).

Bacterial endotoxins (*2.6.14*): less than 10 IU/g, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

LABELLING

The label states:

– the molar substitution (*MS*),

– where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

IMPURITIES

A. betadex,

B. propylene glycol.

01/2008:0337
corrected 6.0

HYDROXYPROPYLCELLULOSE

Hydroxypropylcellulosum

[9004-64-2]

DEFINITION

Partly *O*-(2-hydroxypropylated) cellulose.

It may contain maximum 0.6 per cent of silica (SiO_2).

CHARACTERS

Appearance: white or yellowish-white powder or granules, hygroscopic after drying.

Solubility: soluble in cold water, in glacial acetic acid, in anhydrous ethanol, in methanol and in propylene glycol and in a mixture of 10 parts of methanol and 90 parts of methylene chloride giving colloidal solutions, sparingly soluble or slightly soluble in acetone depending on the degree of substitution, practically insoluble in hot water, in ethylene glycol and in toluene.

IDENTIFICATION

A. Heat 10 ml of solution S (see Tests) in a water-bath while stirring. At a temperature above 40 °C the solution becomes cloudy or a flocculent precipitate is formed. The solution becomes clear again on cooling.

B. To 10 ml of solution S add 0.3 ml of *dilute acetic acid R* and 2.5 ml of a 100 g/l solution of *tannic acid R*. A yellowish-white flocculent precipitate is formed which dissolves in *dilute ammonia R1*.

C. In a test-tube about 160 mm long, thoroughly mix 1 g with 2 g of finely powdered *manganese sulphate R*. Introduce to a depth of 2 cm into the upper part of the tube a strip of filter paper impregnated with a freshly prepared mixture of 1 volume of a 20 per cent *V/V* solution of *diethanolamine R* and 11 volumes of a 50 g/l solution of *sodium nitroprusside R*, adjusted to about pH 9.8 with *1 M hydrochloric acid*. Insert the tube 8 cm into a silicone-oil bath at 190-200 °C. The filter paper becomes blue within 10 min. Carry out a blank test.

D. Dissolve completely 0.2 g without heating in 15 ml of a 70 per cent *m/m* solution of *sulphuric acid R*. Pour the solution with stirring into 100 ml of iced *water R* and dilute to 250 ml with iced *water R*. In a test-tube, mix thoroughly while cooling in iced water 1 ml of this solution with 8 ml of *sulphuric acid R* added dropwise. Heat in a water-bath for exactly 3 min and immediately cool in iced water. While the mixture is cold, carefully add 0.6 ml of *ninhydrin solution R2* and mix well. Allow to stand at 25 °C. A pink colour is produced immediately and becomes violet within 100 min.

E. Place 1 ml of solution S on a glass plate. After evaporation of the water a thin film is formed.

F. 0.2 g does not dissolve in 10 ml of *toluene R* but dissolves completely in 10 ml of *anhydrous ethanol R*.

TESTS

Solution S. While stirring, introduce a quantity of the substance to be examined equivalent to 1.0 g of the dried substance into 50 g of *carbon dioxide-free water R* heated to 90 °C. Allow to cool, adjust the mass of the solution to 100 g with *carbon dioxide-free water R* and stir until dissolution is complete.

Appearance of solution. Solution S is not more opalescent than reference suspension III (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

pH (*2.2.3*): 5.0 to 8.5 for solution S.

Apparent viscosity (*2.2.10*): 75 per cent to 140 per cent of the value stated on the label.

While stirring, introduce a quantity of the substance to be examined equivalent to 6.00 g of the dried substance into 150 g of *water R* heated to 90 °C. Stir with a propeller-type stirrer for 10 min, place the flask in a bath of iced water, continue the stirring and allow to remain in the bath of iced water for 40 min to ensure that dissolution is complete. Adjust the mass of the solution to 300 g and centrifuge the solution to expel any entrapped air. Adjust the temperature of the solution to 20 ± 0.1 °C. Determine the viscosity with a rotating viscometer at 20 °C and a shear rate of 10 s^{-1}.

For a product of low viscosity, use a quantity of the substance to be examined sufficient to prepare a solution of the concentration stated on the label.

Silica: maximum 0.6 per cent.

To the residue obtained in the test for sulphated ash add sufficient *ethanol (96 per cent) R* to moisten the residue completely. Add 6 ml of *hydrofluoric acid R* in small portions. Evaporate to dryness at 95-105 °C, taking care to avoid loss from sputtering. Cool and rinse the wall of the platinum crucible with 6 ml of *hydrofluoric acid R*. Add 0.5 ml of *sulphuric acid R* and evaporate to dryness. Progressively increase the temperature, ignite at 900 ± 50 °C, allow to cool in a desiccator and weigh. The difference between the mass of the residue obtained in the test for sulphated ash and the mass of the final residue is equal to the amount of silica in the substance to be examined.

Chlorides (*2.4.4*): maximum 0.5 per cent.

Dilute 1 ml of solution S to 15 ml with *water R*.

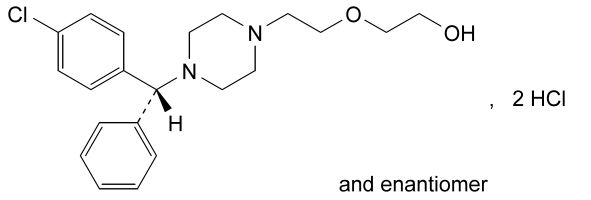
Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 7.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 1.6 per cent, determined on 1.0 g using a platinum crucible.

LABELLING



The label states:

- the apparent viscosity in millipascal seconds for a 2 per cent *m/m* solution,
- for a product of low viscosity, the concentration of the solution to be used and the apparent viscosity in millipascal seconds,
- where applicable, that the substance contains silica.

corrected 6.0

HYDROXYZINE HYDROCHLORIDE

Hydroxyzini hydrochloridum

$C_{21}H_{29}Cl_3N_2O_2$ M_r 447.8
[2192-20-3]

DEFINITION

(*RS*)-2-[2-[4-[(4-Chlorophenyl)phenylmethyl]piperazin-1-yl]ethoxy]ethanol dihydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, hygroscopic, crystalline powder.

Solubility: freely soluble in water and in ethanol (96 per cent), very slightly soluble in acetone.

mp: about 200 °C, with decomposition.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *hydroxyzine hydrochloride CRS*.

B. Thin-layer chromatography (*2.2.27*).

Solvent mixture: *methanol R, methylene chloride R* (50:50 *V/V*).

Test solution. Dissolve 0.50 g of the substance to be examined in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (a). Dissolve 0.50 g of *hydroxyzine hydrochloride CRS* in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (b). Dissolve 0.50 g of *meclozine hydrochloride R* in the solvent mixture and dilute to 10 ml with the solvent mixture. Dilute 1 ml of this solution to 2 ml with reference solution (a).

Plate: *TLC silica gel G plate R*.

Mobile phase: *concentrated ammonia R, ethanol (96 per cent) R, toluene R* (1:24:75 *V/V/V*).

Application: 2 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *potassium iodobismuthate solution R2*.

System suitability: reference solution (b):

- the chromatogram shows 2 clearly separated principal spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in *ethanol (96 per cent) R* and dilute to 15 ml with the same solvent. Add 15 ml of a saturated solution of *picric acid R* in *ethanol (96 per cent) R*. Allow to stand for 15 min. A precipitate is formed. Filter. Recrystallise from *ethanol (96 per cent) R*. Initiate crystallisation, if necessary, by scratching the wall of the tube with a glass rod. The crystals melt (*2.2.14*) at 189 °C to 192 °C.

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 2.0 g in *water R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Optical rotation (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *hydroxyzine hydrochloride CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 3.0 ml of the test solution to 200.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 25.0 ml with the mobile phase.

Column:

- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase: dissolve 0.5 g of *sodium methanesulphonate R* in a mixture of 14 ml of *triethylamine R*, 300 ml of *acetonitrile R* and 686 ml of *water R*, then adjust to pH 2.7 with *sulphuric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl.

Run time: 2.5 times the retention time of hydroxyzine.

System suitability: reference solution (a):

– *peak-to-valley ratio*: minimum 10, where H_p = height above the baseline of the peak immediately before the peak due to hydroxyzine and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to hydroxyzine.

Limits:

– *any impurity*: for each impurity, not more than 1/3 of the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.03 per cent).

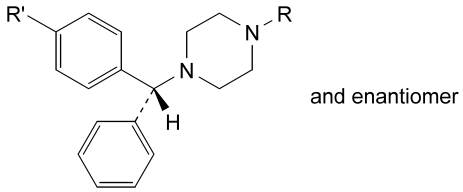
Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.200 g in 10 ml of *anhydrous acetic acid R*. Add 40 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

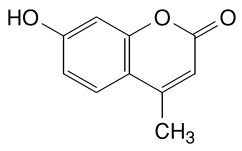
1 ml of *0.1 M perchloric acid* is equivalent to 22.39 mg of $C_{21}H_{29}Cl_3N_2O_2$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

and enantiomer



A. R = H, R′ = Cl: (*RS*)-1-[(4-chlorophenyl)phenylmethyl]-piperazine,

B. R = CH_2-CH_2-O-CH_2-CH_2-OH, R′ = H: 2-[2-[4-(diphenylmethyl)piperazin-1-yl]ethoxy]ethanol (decloxizine).

HYMECROMONE

Hymecromonum

$C_{10}H_8O_3$ M_r 176.2
[90-33-5]

DEFINITION

7-Hydroxy-4-methyl-2*H*-1-benzopyran-2-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: almost white crystalline powder.

Solubility: very slightly soluble in water, sparingly soluble in methanol, slightly soluble in methylene chloride. It dissolves in dilute solutions of ammonia.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *hymecromone CRS*.

TESTS

Absorbance (*2.2.25*). Dissolve 50 mg in 10 ml of *ammonium chloride buffer solution pH 10.4 R* and dilute to 100.0 ml with *water R*. To 1.0 ml of the solution, add 10 ml of *ammonium chloride buffer solution pH 10.4 R* and dilute to 100.0 ml with *water R*. Examined between 200 nm and 400 nm, the solution shows 2 absorption maxima, at 229 nm and 360 nm, and an absorption minimum at 276 nm. The specific absorbance at the maximum at 360 nm is 1020 to 1120.

Related substances. Liquid chromatography (*2.2.29*).

Buffer solution. To 280 ml of a 1.56 g/l solution of *sodium dihydrogen phosphate R*, add 720 ml of a 3.58 g/l solution of *disodium hydrogen phosphate R*. Adjust to pH 7 with a 100 g/l solution of *phosphoric acid R*.

Test solution. Dissolve 10 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 20 mg of *hymecromone CRS*, 10 mg of *hymecromone impurity A CRS* and 10 mg of *hymecromone impurity B CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 200.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm,

– *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (10 µm).

Mobile phase: *methanol R*, buffer solution (465:535 *V/V*).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 270 nm.

Injection: 20 µl.

Run time: 1.5 times the retention time of hymecromone.

Relative retention with reference to hymecromone (retention time = about 6 min): impurity A = about 0.5; impurity B = about 0.7.

System suitability: reference solution (a):

– *resolution*: minimum of 2 between the peaks due to impurity A and to impurity B and minimum of 3 between the peaks due to impurity B and to hymecromone.

Limits:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.05 per cent),

– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.05 per cent),

– *any other impurity*: not more than the area of the peak due to hymecromone in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *total*: not more than twice the area of the peak due to hymecromone in the chromatogram obtained with reference solution (b) (0.2 per cent),
– *disregard limit*: 0.1 times the area of the peak due to hymecromone in the chromatogram obtained with reference solution (b) (0.01 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

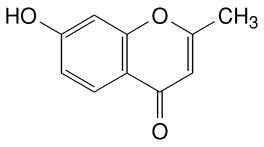
Dissolve 1.5 g in a mixture of 15 volumes of *water R* and 85 volumes of *dimethylformamide R* and dilute to 18 ml with the same mixture of solvents. The solution complies with limit test B. Prepare the standard using a lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *dimethylformamide R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 80 ml of *2-propanol R*. Titrate with *0.1 M tetrabutylammonium hydroxide in 2-propanol* determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.



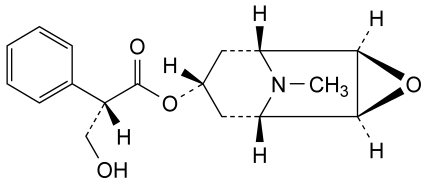
1 ml of *0.1 M tetrabutylammonium hydroxide in 2-propanol* is equivalent to 17.62 mg of $C_{10}H_8O_3$.

STORAGE

Protected from light.

IMPURITIES

A. resorcinol,



B. 7-hydroxy-2-methyl-4*H*-1-benzopyran-4-one.

01/2008:2167

HYOSCINE

Hyoscinum

Scopolaminum

$C_{17}H_{21}NO_4$ M_r 303.4
[51-34-3]

DEFINITION

(1*R*,2*R*,4*S*,5*S*,7*s*)-9-Methyl-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]non-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate.

Content: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: soluble in water, freely soluble in ethanol (96 per cent).

mp: 66 °C to 70 °C.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *hyoscine CRS*.

TESTS

Specific optical rotation (*2.2.7*): – 33 to – 39 (anhydrous substance).

Dissolve 1.00 g in *dilute hydrochloric acid R* and dilute to 25.0 ml with the same acid.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *hyoscine impurity A CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 25.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (d). Mix 2.0 ml of reference solution (b) and 1.0 ml of the test solution and dilute to 10.0 ml with the mobile phase.

Column:
– *size*: *l* = 0.125 m, Ø = 4.0 mm,
– *stationary phase*: *octylsilyl silica gel for chromatography R* (3 µm).

Mobile phase: mix 33 volumes of *acetonitrile R* and 67 volumes of a 2.5 g/l solution of *sodium dodecyl sulphate R* previously adjusted to pH 2.5 with a 346 g/l solution of *phosphoric acid R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 5 µl.

Run time: 3 times the retention time of hyoscine.

Relative retention with reference to hyoscine (retention time = about 5 min): impurity C = about 0.2; impurity A = about 0.9; impurity D = about 1.3; impurity B = about 2.5.

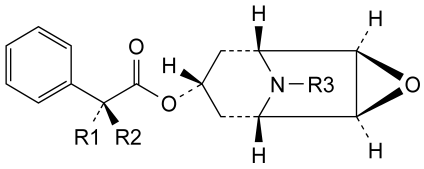
System suitability: reference solution (d):
– *resolution*: minimum 1.5 between the peaks due to impurity A and hyoscine.

Limits:
– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.6; impurity C = 0.3;
– *impurity A*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent);
– *impurities B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (*2.5.12*): maximum 0.5 per cent, determined on 1.000 g.

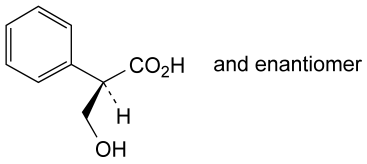
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.



ASSAY

Dissolve 0.250 g in 60 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 30.34 mg of $C_{17}H_{21}NO_4$.

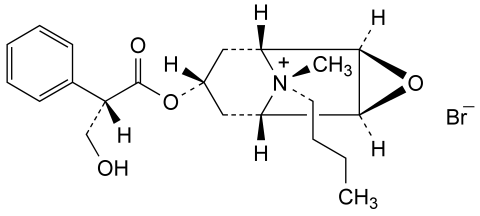


IMPURITIES

Specified impurities: A, B, C, D.

A. R1 = CH_2OH, R2 = R3 = H: (1*R*,2*R*,4*S*,5*S*,7*s*)-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]non-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate (norhyoscine),

B. R1 + R2 = CH_2, R3 = CH_3: (1*R*,2*R*,4*S*,5*S*,7*s*)-9-methyl-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]non-7-yl 2-phenylprop-2-enoate (apohyoscine),



C. (2*RS*)-3-hydroxy-2-phenylpropanoic acid (DL-tropic acid),

D. hyoscyamine.

HYOSCINE BUTYLBROMIDE

Hyoscini butylbromidum
Scopolamini butylbromidum

$C_{21}H_{30}BrNO_4$ M_r 440.4
[149-64-4]

DEFINITION

(1*R*,2*R*,4*S*,5*S*,7*s*,9*r*)-9-Butyl-7-[[(2*S*)-3-hydroxy-2-phenylpropanoyl]oxy]-9-methyl-3-oxa-9-azoniatricyclo[3.3.1.$0^{2,4}$]nonane bromide.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water and in methylene chloride, sparingly soluble in anhydrous ethanol.

IDENTIFICATION

First identification: A, C, F.

Second identification: A, B, D, E, F.

A. It complies with the test for specific optical rotation (see Tests).

B. Melting point (*2.2.14*): 139 °C to 141 °C.

C. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *hyoscine butylbromide CRS*.

D. To about 1 mg add 0.2 ml of *nitric acid R* and evaporate to dryness on a water-bath. Dissolve the residue in 2 ml of *acetone R* and add 0.1 ml of a 30 g/l solution of *potassium hydroxide R* in *methanol R*. A violet colour develops.

E. To 5 ml of solution S (see Tests) add 2 ml of *dilute sodium hydroxide solution R*. No precipitate is formed.

F. It gives reaction (a) of bromides (*2.3.1*).

TESTS

Solution S. Dissolve 1.25 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 5.5 to 6.5 for solution S.

Specific optical rotation (*2.2.7*): – 18 to – 20 (dried substance), determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 20.0 ml with the mobile phase.

Reference solution (c). Dissolve 5.0 mg of *hyoscine butylbromide impurity E CRS* in the mobile phase, add 1.0 ml of the test solution and dilute to 10.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Column:
– *size*: *l* = 0.125 m, Ø = 4.0 mm,
– *stationary phase*: *octylsilyl silica gel for chromatography R* (4 µm),
– *temperature*: 25 ± 1 °C.

Mobile phase: dissolve 5.8 g of *sodium dodecyl sulphate R* in a mixture of 410 ml of *acetonitrile R* and 605 ml of a 7.0 g/l solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.3 with *0.05 M phosphoric acid*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 µl.

Run time: 3.5 times the retention time of butylhyoscine.

Relative retention with reference to butylhyoscine (retention time = about 7.0 min): impurity B = about 0.1; impurity A = about 0.36; impurity C = about 0.40; impurity D = about 0.7; impurity E = about 0.8; impurity F = about 0.9; impurity G = about 3.0.

System suitability: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to butylhyoscine and impurity E,

– *symmetry factor*: maximum 2.5 for the peak due to butylhyoscine.

Limits:

– *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.3; impurity G = 0.6;

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *impurities B, C, D, E, F, G*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

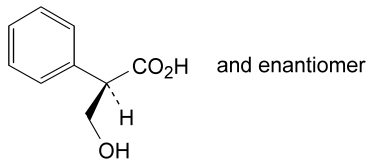
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent); disregard any peak due to the bromide ion which appears close to the solvent peak;

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 2.5 per cent, determined on 0.500 g by drying in an oven at 105 °C.

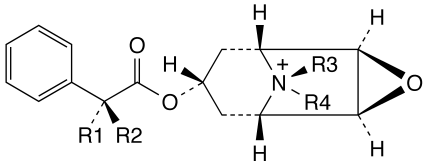
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 0.5 g.

ASSAY



Dissolve 0.400 g in 50 ml of *water R*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*) using a silver indicator electrode and a silver-silver chloride reference electrode.

1 ml of *0.1 M silver nitrate* is equivalent to 44.04 mg of $C_{21}H_{30}BrNO_4$.

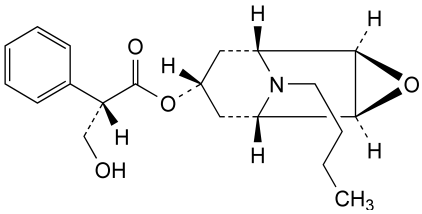


IMPURITIES

Specified impurities: A, B, C, D, E, F, G.

A. hyoscine,

B. (2*RS*)-3-hydroxy-2-phenylpropanoic acid (DL-tropic acid),

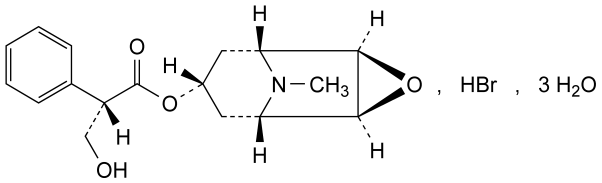


C. R1 = CH_2OH, R2 = H, R3 = R4 = CH_3: (1*R*,2*R*,4*S*,5*S*,7*s*)-7-[[(2*S*)-3-hydroxy-2-phenylpropanoyl]oxy]-9,9-dimethyl-3-oxa-9-azoniatricyclo[3.3.1.$0^{2,4}$]nonane (methylhyoscine),

D. R1 = CH_2OH, R2 = H, R3 = CH_3, R4 = CH_2-CH_2-CH_3: (1*R*,2*R*,4*S*,5*S*,7*s*,9*r*)-7-[[(2*S*)-3-hydroxy-2-phenylpropanoyl]oxy]-9-methyl-9-propyl-3-oxa-9-azoniatricyclo[3.3.1.$0^{2,4}$]nonane (propylhyoscine),

F. R1 = CH_2OH, R2 = H, R3 = CH_2-CH_2-CH_2-CH_3, R4 = CH_3: (1*R*,2*R*,4*S*,5*S*,7*s*,9*s*)-9-butyl-7-[[(2*S*)-3-hydroxy-2-phenylpropanoyl]oxy]-9-methyl-3-oxa-9-azoniatricyclo[3.3.1.$0^{2,4}$]nonane (pseudo-isomer),

G. R1 + R2 = CH_2 , R3 = CH_3, R4 = CH_2-CH_2-CH_2-CH_3: (1*R*,2*R*,4*S*,5*S*,7*s*,9*r*)-9-butyl-9-methyl-7-[(2-phenylprop-2-enoyl)oxy]-3-oxa-9-azoniatricyclo[3.3.1.$0^{2,4}$]nonane (apo-*N*-butylhyoscine);



E. (1*R*,2*R*,4*S*,5*S*,7*s*)-9-butyl-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]nonan-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate (*N*-butylhyoscine).

01/2008:0106

HYOSCINE HYDROBROMIDE

Hyoscini hydrobromidum
Scopolamini hydrobromidum

$C_{17}H_{22}BrNO_4,3H_2O$ M_r 438.3
[6533-68-2]

DEFINITION

(1*R*,2*R*,4*S*,5*S*,7*s*)-9-Methyl-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]non-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate hydrobromide trihydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals, efflorescent.

Solubility: freely soluble in water, soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

A. It complies with the test for specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *hyoscine hydrobromide CRS*.

If the spectra obtained in the solid state show differences, proceed as follows: dissolve 3 mg of the substance to be examined in 1 ml of *ethanol (96 per cent) R* and evaporate to dryness on a water-bath; dissolve the residue in 0.5 ml of *methylene chloride R* and add 0.2 g of *potassium bromide R* and 15 ml of *ether R*; allow to stand for 5 min shaking frequently; decant; dry the residue on a water-bath until the solvents have evaporated; using the

residue prepare a disc and dry at 100-105 °C for 3 h. Repeat the procedure with *hyoscine hydrobromide CRS* and record the spectra.

C. Dissolve about 50 mg in 5 ml of *water R* and add 5 ml of *picric acid solution R* dropwise and with shaking. The precipitate, washed with *water R* and dried at 100-105 °C for 2 h, melts (*2.2.14*) at 188 °C to 193 °C.

D. To about 1 mg add 0.2 ml of *fuming nitric acid R* and evaporate to dryness on a water-bath. Dissolve the residue in 2 ml of *acetone R* and add 0.1 ml of a 30 g/l solution of *potassium hydroxide R* in *methanol R*. A violet colour develops.

E. It gives reaction (a) of bromides (*2.3.1*).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

pH (*2.2.3*): 4.0 to 5.5 for solution S.

Specific optical rotation (*2.2.7*): – 24 to – 27 (anhydrous substance), determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 70.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with the mobile phase.

Reference solution (c). Dissolve 5.0 mg of *hyoscine hydrobromide impurity B CRS* in the mobile phase, add 5.0 ml of the test solution and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.125 m, Ø = 4.0 mm,

– *stationary phase*: *octylsilyl silica gel for chromatography R* (3 µm),

– *temperature*: 25 ± 1 °C.

Mobile phase: mix 330 ml of *acetonitrile R* with 670 ml of a 2.5 g/l solution of *sodium dodecyl sulphate R* previously adjusted to pH 2.5 with *3 M phosphoric acid*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 5 µl.

Run time: 3 times the retention time of hyoscine.

Relative retention with reference to hyoscine (retention time = about 5.0 min): impurity D = about 0.2; impurity B = about 0.9; impurity A = about 1.3; impurity C = about 2.4.

System suitability: reference solution (c):

– *resolution*: minimum 1.5 between the peaks due to impurity B and hyoscine,

– *symmetry factor*: maximum 2.5 for the peak due to hyoscine.

Limits:

– *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity D = 0.3; impurity C = 0.6;

– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);

– *impurities A, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *total*: not more than 1.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.7 per cent); disregard any peak due to the bromide ion which appears close to the solvent peak;

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

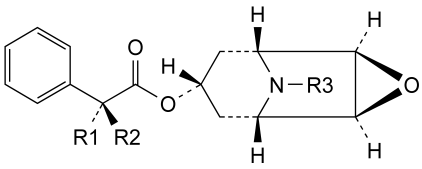
Water (*2.5.12*): 10.0 per cent to 13.0 per cent, determined on 0.20 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 5.0 ml of *0.01 M hydrochloric acid* and 50 ml of *ethanol (96 per cent) R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide* free from carbonate. Read the volume added between the 2 points of inflexion.

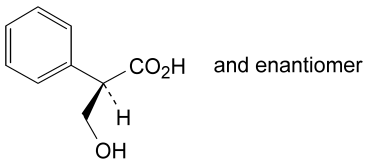
1 ml of *0.1 M sodium hydroxide* is equivalent to 38.43 mg of $C_{17}H_{22}BrNO_4$.



STORAGE

In a well-filled, airtight container of small capacity, protected from light.

IMPURITIES



Specified impurities: A, B, C, D.

A. hyoscyamine,

B. R1 = CH_2OH, R2 = R3 = H: (1*R*,2*R*,4*S*,5*S*,7*s*)-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]non-7-yl (2*S*)-3-hydroxy-2-phenylpropanoate (norhyoscine),

C. R1 + R2 = CH_2, R3 = CH_3: (1*R*,2*R*,4*S*,5*S*,7*s*)-9-methyl-3-oxa-9-azatricyclo[3.3.1.$0^{2,4}$]non-7-yl 2-phenylprop-2-enoate (apohyoscine),

HYOSCYAMINE SULPHATE

Hyoscyamini sulfas

$C_{34}H_{48}N_2O_{10}S,2H_2O$ M_r 713
[620-61-1]

DEFINITION

Bis[(1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate] sulphate dihydrate.

Content: 98.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless needles.

Solubility: very soluble in water, sparingly soluble or soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, B, E.

Second identification: C, D, E.

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *hyoscyamine sulphate CRS*.

C. To 0.5 ml of solution S (see Tests) add 2 ml of *dilute acetic acid R* and heat. To the hot solution add 4 ml of *picric acid solution R*. Allow to cool, shaking occasionally. Collect the crystals, wash with 2 quantities, each of 3 ml, of iced *water R* and dry at 100-105 °C. The crystals melt (*2.2.14*) at 164 °C to 168 °C.

D. To about 1 mg add 0.2 ml of *fuming nitric acid R* and evaporate to dryness on a water-bath. Dissolve the residue in 2 ml of *acetone R* and add 0.2 ml of a 30 g/l solution of *potassium hydroxide R* in *methanol R*. A violet colour develops.

E. It gives reaction (a) of sulphates (*2.3.1*).

TESTS

Solution S. Dissolve 2.50 g in *water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

pH (*2.2.3*): 4.5 to 6.2.

Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Specific optical rotation (*2.2.7*): – 24 to – 29 (anhydrous substance), determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 60.0 mg of the substance to be examined in mobile phase A and dilute to 50.0 ml with mobile phase A. Dilute 10.0 ml of the solution to 50.0 ml with mobile phase A.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with mobile phase A. Dilute 5.0 ml of this solution to 50.0 ml with mobile phase A.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with mobile phase A.

Reference solution (c). Dissolve 5.0 mg of *hyoscyamine impurity E CRS* in the test solution and dilute to 20.0 ml with the test solution. Dilute 5.0 ml of this solution to 25.0 ml with mobile phase A.

Column:
- *size*: *l* = 0.10 m, Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm),
- *temperature*: 25 ± 1 °C.

Mobile phase:
- *mobile phase A*: dissolve 3.5 g of *sodium dodecyl sulphate R* in 606 ml of a 7.0 g/l solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.3 with *0.05 M phosphoric acid* and mix with 320 ml of *acetonitrile R*,
- *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 2.0	95	5
2.0 - 20.0	95 → 70	5 → 30
20.0 - 20.1	70 → 95	30 → 5
20.1 - 25.0	95	5

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 µl.

Relative retention with reference to hyoscyamine (retention time = about 10.5 min): impurity A = about 0.2; impurity B = about 0.67; impurity C = about 0.72; impurity D = about 0.8; impurity E = about 0.9; impurity F = about 1.1; impurity G = about 1.8.

System suitability: reference solution (c):
- *resolution*: minimum 2.5 between the peaks due to hyoscyamine and impurity E,
- *symmetry factor*: maximum 2.5 for the peak due to hyoscyamine.

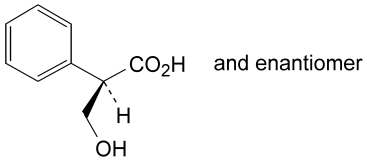
Limits:
- *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.3; impurity G = 0.6;
- *impurity E*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *impurities A, B, C, D, F, G*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (*2.5.12*): 2.0 per cent to 5.5 per cent, determined on 0.500 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

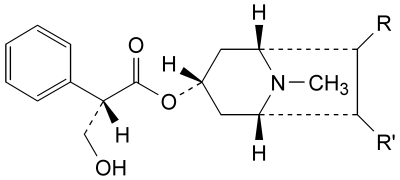
ASSAY

Dissolve 0.500 g in 25 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



1 ml of *0.1 M perchloric acid* is equivalent to 67.7 mg of $C_{34}H_{48}N_2O_{10}S$.

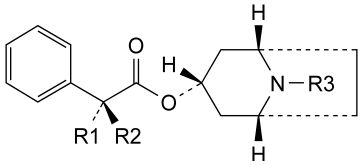
STORAGE



In an airtight container, protected from light.

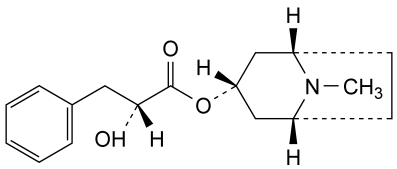
IMPURITIES

Specified impurities: A, B, C, D, E, F, G.



A. (2*RS*)-3-hydroxy-2-phenylpropanoic acid (DL-tropic acid),

B. R = OH, R′ = H: (1*R*,3*S*,5*R*,6*RS*)-6-hydroxy-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (7-hydroxyhyoscyamine),



C. R = H, R′ = OH: (1*S*,3*R*,5*S*,6*RS*)-6-hydroxy-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (6-hydroxyhyoscyamine),

D. hyoscine,

E. R1 = CH_2OH, R2 = R3 = H: (1*R*,3*r*,5*S*)-8-azabicyclo[3.2.1]oct-3-yl (2*S*)-3-hydroxy-2-phenylpropanoate (norhyoscyamine),

G. R1 + R2 = CH_2, R3 = CH_3: (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl 2-phenylprop-2-enoate (apoatropine),

F. (1*R*,3*r*,5*S*)-8-methyl-8-azabicyclo[3.2.1]oct-3-yl (2*R*)-2-hydroxy-3-phenylpropanoate (littorine).

01/2008:0348
corrected 6.0

HYPROMELLOSE

Hypromellosum

[9004-65-3]

DEFINITION

Hydroxypropylmethylcellulose.

Partly *O*-methylated and *O*-(2-hydroxypropylated) cellulose.

CHARACTERS

Appearance: white, yellowish-white or greyish-white powder or granules, hygroscopic after drying.

Solubility: practically insoluble in hot water, in acetone, in anhydrous ethanol and in toluene. It dissolves in cold water giving a colloidal solution.

IDENTIFICATION

A. Evenly distribute 1.0 g on the surface of 100 ml of *water R* in a beaker, tapping the top of the beaker, gently if necessary to ensure a uniform layer on the surface. Allow to stand for 1-2 min: the powdered material aggregates on the surface.

B. Evenly distribute 1.0 g into 100 ml of boiling *water R*, and stir the mixture using a magnetic stirrer with a bar 25 mm long: a slurry is formed and the particles do not dissolve. Allow the slurry to cool to 10 °C and stir using a magnetic stirrer: a clear or slightly turbid solution occurs with its thickness dependent on the viscosity grade.

C. To 0.1 ml of the solution obtained in identification B add 9 ml of a 70 per cent *m/m* solution of *sulphuric acid R*, shake, heat on a water-bath for exactly 3 min, immediately cool in an ice-bath, carefully add 0.6 ml of *ninhydrin solution R*, shake, and allow to stand at 25 °C: a red colour develops at first, and changes to purple within 100 min.

D. Place 2-3 ml of the solution obtained in identification B onto a glass slide as a thin film and allow the water to evaporate: a coherent, clear film forms on the glass slide.

E. Add exactly 50 ml of the solution obtained in identification B to exactly 50 ml of *water R* in a beaker. Insert a thermometer into the solution. Stir the solution on a magnetic stirrer/hot plate and begin heating, increasing the temperature at a rate of 2-5 °C per minute. Determine the temperature at which a turbidity increase begins to occur and designate the temperature as the flocculation temperature: the flocculation temperature is higher than 50 °C.

TESTS

Solution S. While stirring, introduce a quantity of the substance to be examined equivalent to 1.0 g of the dried substance into 50 g of *carbon dioxide-free water R* heated to 90 °C. Allow to cool, adjust the mass of the solution to 100 g with *carbon dioxide-free water R* and stir until dissolution is complete.

Appearance of solution. Solution S is not more opalescent than reference suspension III (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

pH (*2.2.3*): 5.0 to 8.0 for the solution prepared as described under Apparent viscosity.

Carry out the test at 20 ± 2 °C and read the indicated pH value after the probe has been immersed for 5 ± 0.5 min.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test F. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 1 h.

Sulphated ash (*2.4.14*): maximum 1.5 per cent, determined on 1.0 g.

FUNCTIONALITY-RELATED CHARACTERISTICS

This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient. This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. Control of these characteristics can however contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.

The following characteristics may be relevant for hypromellose used as binder, viscosity-increasing agent or film former.

Apparent viscosity: minimum 80 per cent and maximum 120 per cent of the nominal value for samples with a viscosity less than 600 mPa·s (Method 1); minimum 75 per cent and maximum 140 per cent of the nominal value for samples with a viscosity of 600 mPa·s or higher (Method 2).

Method 1, to be applied to samples with a viscosity of less than 600 mPa·s. Weigh accurately a quantity of the substance to be examined equivalent to 4.000 g of the dried substance. Transfer into a wide-mouthed bottle, and adjust the mass to 200.0 g with hot *water R*. Capping the bottle, stir by mechanical means at 400 ± 50 r/min for 10-20 min until the particles are thoroughly dispersed and wetted. Scrape down the insides of the bottle with a spatula if necessary, to ensure that there is no undissolved material on the sides of the bottle, and continue the stirring in a cooling water-bath maintained at a temperature below 10 °C for another 20-40 min. Adjust the solution mass if necessary to 200.0 g using cold *water R*. Centrifuge the solution if necessary to expel any entrapped air bubbles. Using a spatula, remove any foam, if present. Determine the viscosity of this solution using the capillary viscometer method (*2.2.9*) to obtain the kinematic viscosity (ν). Separately, determine the density (ρ) (*2.2.5*) of the solution and calculate the dynamic viscosity (η), as $\eta = \rho\nu$.

Method 2, to be applied to samples with a viscosity of 600 mPa·s or higher. Weigh accurately a quantity of the substance to be examined equivalent to 10.00 g of the dried substance. Transfer into a wide-mouthed bottle, and adjust the mass to 500.0 g with hot *water R*. Capping the bottle, stir by mechanical means at 400 ± 50 r/min for 10-20 min until the particles are thoroughly dispersed and wetted. Scrape down the insides of the bottle with a spatula if necessary, to ensure that there is no undissolved material on the sides of the bottle, and continue the stirring in a cooling water-bath maintained at a temperature below 10 °C for another 20-40 min. Adjust the solution mass if necessary to 500.0 g using cold *water R*. Centrifuge the solution if necessary to expel any entrapped air bubbles. Using a spatula, remove any foam, if present. Determine the viscosity (*2.2.10*) of this solution at 20 ± 0.1 °C using a rotating viscometer.

Apparatus: single-cylinder type spindle viscometer.

Rotor number, revolution and calculation multiplier: apply the conditions specified in Table 0348.-1.

Allow the spindle to rotate for 2 min before taking the measurement. Allow a rest period of 2 min between subsequent measurements. Repeat the measurement twice and determine the mean of the 3 readings.

Table 0348.-1.

Labelled viscosity* (mPa·s)	Rotor number	Revolution (r/min)	Calculation multiplier
600 to less than 1400	3	60	20
1400 to less than 3500	3	12	100
3500 to less than 9500	4	60	100
9500 to less than 99 500	4	6	1000
99 500 or more	4	3	2000

* the nominal viscosity is based on the manufacturer's specifications.

Degree of substitution. Gas chromatography (*2.2.28*).

Apparatus:

- *reaction vial*: a 5 ml pressure-tight vial, 50 mm in height, 20 mm in external diameter and 13 mm in internal diameter at the mouth, equipped with a pressure-tight butyl rubber membrane stopper coated with polytetrafluoroethylene and secured with an aluminium crimped cap or another sealing system providing a sufficient air-tightness;
- *heater*: a heating module with a square aluminium block having holes 20 mm in diameter and 32 mm in depth, so that the reaction vials fit; mixing of the contents of the vial is effected using a magnetic stirrer equipped in the heating module or using a reciprocal shaker that performs approximately 100 cycles/min.

Internal standard solution: 30 g/l solution of *octane R* in *xylene R*.

Test solution. Weigh 65.0 mg of the substance to be examined, place in a reaction vial, add 0.06-0.10 g of *adipic acid R*, 2.0 ml of the internal standard solution and 2.0 ml of a 570 g/l solution of *hydriodic acid R*, immediately cap and seal the vial, and weigh accurately. Mix the contents of the vial continuously for 60 min while heating the block so that the temperature of the contents is maintained at 130 ± 2 °C. If a reciprocal shaker or magnetic stirrer cannot be used, shake the vial well by hand at 5-minute intervals during the initial 30 min of the heating time. Allow the vial to cool, and again weigh accurately. If the loss of mass is less than 0.50 per cent of the contents and there is no evidence of a leak, use the upper layer of the mixture as the test solution.

Reference solution. Place 0.06-0.10 g of *adipic acid R*, 2.0 ml of the internal standard solution and 2.0 ml of *hydroiodic acid R* in another reaction vial, cap and seal the vial, and weigh accurately. Add 15-22 µl of *isopropyl iodide R* through the septum with a syringe, weigh accurately, add 45 µl of *methyl iodide R* in the same manner, and weigh accurately. Shake the reaction vial well, and use the upper layer as the reference solution.

Column:

- *size*: *l* = 1.8-3 m, Ø = 3-4 mm;

– *stationary phase*: *silanised diatomaceous earth for gas chromatography R* impregnated with 10-20 per cent of *poly(dimethyl)siloxane R* (film thickness 125-150 µm);

– *temperature*: 100 °C.

Carrier gas: *helium for chromatography R* (thermal conductivity); *helium for chromatography R* or *nitrogen for chromatography R* (flame ionisation).

Flow rate: adjusted so that the retention time of the internal standard is about 10 min.

Detection: flame ionisation or thermal conductivity.

Injection: 1-2 µl.

System suitability: reference solution:

– *resolution*: well resolved peaks of methyl iodide (1st peak), isopropyl iodide (2nd peak) and internal standard (3rd peak).

Calculation:

– *methoxy and hydroxypropoxy groups*: calculate the ratios (Q_1 and Q_2) of the areas of the peaks due to methyl iodide and isopropyl iodide to the area of the peak due to the internal standard in the chromatogram obtained with the test solution, and the ratios (Q_3 and Q_4) of the areas of the peaks due to methyl iodide and isopropyl iodide to the area of the peak due to the internal standard in the chromatogram obtained with the reference solution.

Calculate the percentage content of methoxy groups using the following expression:

$$\frac{Q_1}{Q_3} \times \frac{m_1}{m} \times 21.864$$

Calculate the percentage content of hydroxypropoxy groups using the following expression:

$$\frac{Q_2}{Q_4} \times \frac{m_2}{m} \times 44.17$$

m_1 = mass of methyl iodide in the reference solution, in milligrams;

m_2 = mass of isopropyl iodide in the reference solution, in milligrams;

m = mass of the sample (dried substance), in milligrams.

Substitution type	Methoxy (per cent)	Hydroxypropoxy (per cent)
1828	16.5 to 20.0	23.0 to 32.0
2208	19.0 to 24.0	4.0 to 12.0
2906	27.0 to 30.0	4.0 to 7.5
2910	28.0 to 30.0	7.0 to 12.0

The following characteristics may be relevant for hypromellose used as matrix former in prolonged-release tablets.

Apparent viscosity: see test above.

Degree of substitution: see test above.

Molecular mass distribution (*2.2.30*).

Particle-size distribution (*2.9.31*).

Powder flow (*2.9.36*).

corrected 6.0

HYPROMELLOSE PHTHALATE

Hypromellosi phthalas

DEFINITION

Hydroxypropylmethylcellulose phtalate.

Monophthalic acid ester of hypromellose, containing methoxy (-OCH_3), 2-hydroxypropoxy (-$OCH_2CHOHCH_3$) and phthaloyl (*o*-carboxybenzoyl $C_8H_5O_3$) groups.

Content: 21.0 per cent to 35.0 per cent of phthaloyl groups (anhydrous substance).

CHARACTERS

Appearance: white or almost white, free-flowing flakes or granular powder.

Solubility: practically insoluble in water, soluble in a mixture of equal volumes of acetone and methanol and in a mixture of equal volumes of methanol and methylene chloride, very slightly soluble in acetone and in toluene, practically insoluble in anhydrous ethanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *hypromellose phthalate CRS*.

TESTS

Free phthalic acid. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.20 g of the substance to be examined in about 50 ml of *acetonitrile R* with the aid of ultrasound. Add 10 ml of *water R*, cool to room temperature, dilute to 100.0 ml with *acetonitrile R* and mix.

Reference solution. Dissolve 12.5 mg of *phthalic acid R* in 125 ml of *acetonitrile R*. Add 25 ml of *water R*, dilute to 250.0 ml with *acetonitrile R* and mix.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5-10 µm).

Mobile phase: *acetonitrile R*, 1 g/l solution of *trifluoroacetic acid R* (1:9 *V/V*).

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 235 nm.

Injection: 10 µl.

System suitability: reference solution:

– *repeatability*: maximum relative standard deviation of 1.0 per cent after 2 injections.

Limit:

– *phthalic acid*: not more than 0.4 times the area of the corresponding peak in the chromatogram obtained with the reference solution (1.0 per cent).

Chlorides: maximum 0.07 per cent.

Dissolve 1.0 g in 40 ml of *0.2 M sodium hydroxide*, add 0.05 ml of *phenolphthalein solution R*, and add *dilute nitric acid R* dropwise and with stirring until the red colour disappears. Add an additional 20 ml of *dilute nitric acid R* with stirring. Heat on a water-bath with stirring until the gel-like precipitate formed becomes granular. Cool and centrifuge. Separate the liquid phase and wash the residue with 3 quantities, each of 20 ml, of *water R*, separating the washings by centrifugation. Combine the liquid phases, dilute to 200 ml with *water R*, mix and filter. To 50 ml of this solution, add 1 ml of *0.1 M silver nitrate*. The solution is not

more opalescent than a standard prepared by mixing 0.5 ml of *0.01 M hydrochloric acid* with 10 ml of *0.2 M sodium hydroxide*, adding 7 ml of *dilute nitric acid R* and 1 ml of *0.1 M silver nitrate*, and diluting to 50 ml with *water R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 5.0 per cent, determined on 0.500 g.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 1.000 g in 50 ml of a mixture of 1 volume of *water R*, 2 volumes of *acetone R* and 2 volumes of *ethanol (96 per cent) R*. Add 0.1 ml of *phenolphthalein solution R* and titrate with *0.1 M sodium hydroxide* until a faint pink colour is obtained. Carry out a blank titration.

Calculate the percentage content of phthaloyl groups using the following expression:

$$\frac{149n}{(100 - a)\,m} - 1.795S$$

a = percentage content of water;

m = mass of the substance to be examined, in grams;

n = volume of *0.1 M sodium hydroxide* used, in millilitres;

S = percentage content of free phthalic acid (see Tests).

STORAGE

In an airtight container.

FUNCTIONALITY-RELATED CHARACTERISTICS

This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient. This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. Control of these characteristics can however contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.

The following characteristics may be relevant for hypromellose phthalate used as a gastro-resistant coating agent.

Apparent viscosity (*2.2.9*): 80 per cent to 120 per cent of the nominal value.

Dissolve 10 g, previously dried at 105 °C for 1 h, in 90 g of a mixture of equal masses of *methanol R* and *methylene chloride R* by mixing and shaking.

Solubility. 0.2 g dissolves quickly and completely in 100 ml of *phosphate buffer solution pH 6.8 R* with stirring.

IBUPROFEN

Ibuprofenum

$C_{13}H_{18}O_2$ M_r 206.3
[15687-27-1]

DEFINITION

(2*RS*)-2-[4-(2-Methylpropyl)phenyl]propanoic acid.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: practically insoluble in water, freely soluble in acetone, in methanol and in methylene chloride. It dissolves in dilute solutions of alkali hydroxides and carbonates.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. Melting point (*2.2.14*): 75 °C to 78 °C.

B. Dissolve 50.0 mg in a 4 g/l solution of *sodium hydroxide R* and dilute to 100.0 ml with the same alkaline solution. Examined between 240 nm and 300 nm (*2.2.25*), using a spectrophotometer with a band width of 1.0 nm and a scan speed of not more than 50 nm/min, the solution shows a shoulder at 258 nm and 2 absorption maxima, at 264 nm and 272 nm. The ratio of the absorbance measured at the maximum at 264 nm to that measured at the shoulder at 258 nm is 1.20 to 1.30. The ratio of the absorbance measured at the maximum at 272 nm to that measured at the shoulder at 258 nm is 1.00 to 1.10.

C. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *ibuprofen CRS*.

D. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 50 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 mg of *ibuprofen CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous acetic acid R, ethyl acetate R, hexane R* (5:24:71 *V/V/V*).

Application: 5 µl.

Development: over a path of 10 cm.

Drying: at 120 °C for 30 min.

Detection: lightly spray with a 10 g/l solution of *potassium permanganate R* in *dilute sulphuric acid R* and heat at 120 °C for 20 min. Examine in ultraviolet light at 365 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Solution S. Dissolve 2.0 g in *methanol R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Angle of optical rotation (*2.2.7*): – 0.05° to + 0.05°.

Dissolve 0.50 g in *methanol R* and dilute to 20.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20 mg of the substance to be examined in 2 ml of *acetonitrile R* and dilute to 10.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). Dissolve 20 mg of *ibuprofen CRS* in 2 ml of *acetonitrile R*, add 1.0 ml of a 0.06 g/l solution of *ibuprofen impurity B CRS* in *acetonitrile R* and dilute to 10.0 ml with mobile phase A.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: mix 0.5 volumes of *phosphoric acid R*, 340 volumes of *acetonitrile R* and 600 volumes of *water R*; allow to equilibrate and dilute to 1000 volumes with *water R*,
– *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 25	100	0
25 - 55	100 → 15	0 → 85
55 - 70	15	85
70 - 75	15 → 100	85 → 0

Flow rate: 2 ml/min.

Detection: spectrophotometer at 214 nm.

Equilibration: for about 45 min with mobile phase A.

Injection: 20 µl.

System suitability: reference solution (b):

– *peak-to-valley ratio*: minimum of 1.5, where H_p = height above the baseline of the peak due to impurity B, and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to ibuprofen. If necessary, adjust the concentration of acetonitrile in mobile phase A.

Limits:

– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
– *any other impurity*: not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
– *total of all impurities apart from impurity B*: not more than 0.7 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.7 per cent),

– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Impurity F. Gas chromatography (*2.2.28*): use the normalisation procedure.

Methylating solution. Dilute 1 ml of *N,N-dimethylformamide dimethyl acetal R* and 1 ml of *pyridine R* to 10 ml with *ethyl acetate R*.

Test solution. Weigh about 50.0 mg of the substance to be examined into a sealable vial, dissolve in 1.0 ml of *ethyl acetate R*, add 1 ml of methylating solution, seal and heat at 100 °C in a block heater for 20 min. Allow to cool. Remove the reagents under a stream of nitrogen at room temperature. Dissolve the residue in 5 ml of *ethyl acetate R*.

Reference solution (a). Dissolve 0.5 mg of *ibuprofen impurity F CRS* in *ethyl acetate R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Weigh about 50.0 mg of *ibuprofen CRS* into a sealable vial, dissolve in 1.0 ml of reference solution (a), add 1 ml of methylating solution, seal and heat at 100 °C in a block heater for 20 min. Allow to cool. Remove the reagents under a stream of nitrogen at room temperature. Dissolve the residue in 5 ml of *ethyl acetate R*.

Column:

– *material*: fused-silica,
– *size*: *l* = 25 m, Ø = 0.53 mm,
– *stationary phase*: *macrogol 20 000 R* (film thickness 2 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 5.0 ml/min.

Temperature:

– *column*: 150 °C,
– *injection port*: 200 °C,
– *detector*: 250 °C.

Detection: flame-ionisation.

Injection: 1 µl; inject the test solution and reference solution (b).

Run time: twice the retention time of ibuprofen.

System suitability:

– *relative retention* with reference to ibuprofen (retention time = about 17 min): impurity F = about 1.5.

Limit:

– *impurity F*: maximum 0.1 per cent.

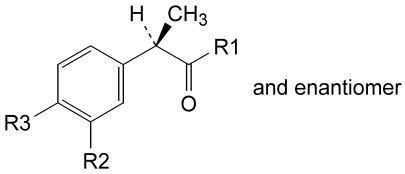
Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with limit test B. Prepare the standard using lead standard solution (1 ppm Pb) prepared by diluting *lead standard solution (100 ppm Pb) R* with *methanol R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* over *diphosphorus pentoxide R*.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



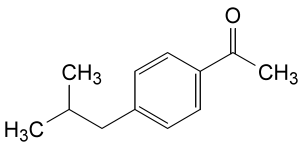
Dissolve 0.450 g in 50 ml of *methanol R*. Add 0.4 ml of *phenolphthalein solution R1*. Titrate with *0.1 M sodium hydroxide* until a red colour is obtained. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 20.63 mg of $C_{13}H_{18}O_2$.

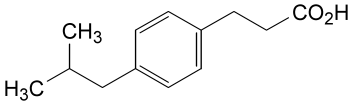
IMPURITIES

Specified impurities: A, B, C, D, E.

Other detectable impurities: F, G, H, I, J, K, L, M, N, O, P, Q, R.

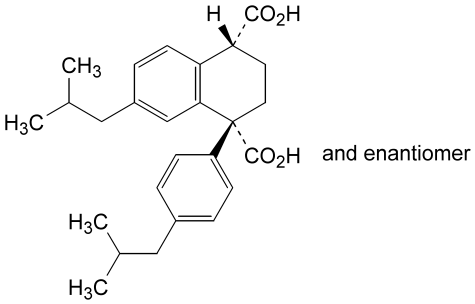


A. R1 = OH, R2 = CH_2-$CH(CH_3)_2$, R3 = H: (2*RS*)-2-[3-(2-methylpropyl)phenyl]propanoic acid,

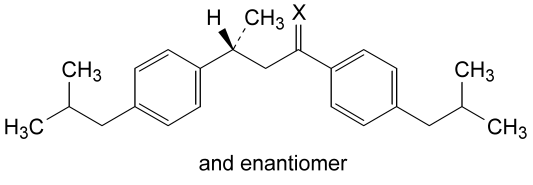


B. R1 = OH, R2 = H, R3 = $[CH_2]_3$-CH_3: (2*RS*)-2-(4-butylphenyl)propanoic acid,

C. R1 = NH_2, R2 = H, R3 = CH_2-$CH(CH_3)_2$: (2*RS*)-2-[4-(2-methylpropyl)phenyl]propanamide,

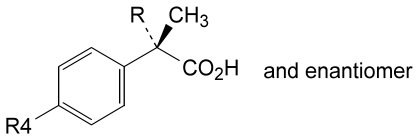


D. R1 = OH, R2 = H, R3 = CH_3: (2*RS*)-2-(4-methylphenyl)propanoic acid,



E. 1-[4-(2-methylpropyl)phenyl]ethanone,

F. 3-[4-(2-methylpropyl)phenyl]propanoic acid,

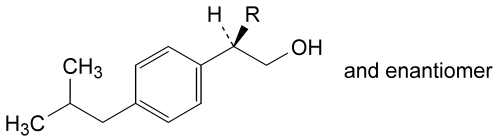


G. *cis*-7-(2-methylpropyl)-1-[4-(2-methylpropyl)phenyl]-1,2,3,4-tetrahydronaphthalene-1,4-dicarboxylic acid,

H. X = O: (3*RS*)-1,3-bis[4-(2-methylpropyl)phenyl]butan-1-one,

I. X = H_2: (3*RS*)-1,3-bis[4-(2-methylpropyl)phenyl]butane,

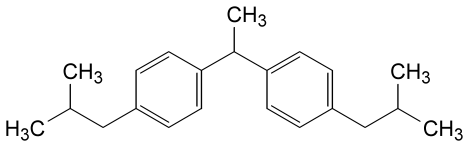
J. R = H, R4 = CO-CH(CH_3)$_2$: (2*RS*)-2-[4-(2-methylpropanoyl)phenyl]propanoic acid,



K. R = H, R4 = CHO: (2*RS*)-2-(4-formylphenyl)propanoic acid,

L. R = H, R4 = CHOH-CH(CH_3)$_2$: 2-[4-(1-hydroxy-2-methylpropyl)phenyl]propanoic acid,

M. R = OH, R4 = CH_2-CH(CH_3)$_2$: (2*RS*)-2-hydroxy-2-[4-(2-methylpropyl)phenyl]propanoic acid,



N. R = H, R4 = C_2H_5: (2*RS*)-2-(4-ethylphenyl)propanoic acid,

O. R = H, R4 = CH(CH_3)-C_2H_5: 2-[4-(1-methylpropyl)phenyl]propanoic acid,

P. R = CH_3: (2*RS*)-2-[4-(2-methylpropyl)phenyl]propan-1-ol,

Q. R = H: 2-[4-(2-methylpropyl)phenyl]ethanol,

R. 1,1-bis[4-(2-methylpropyl)phenyl]ethane.

corrected 6.0

ICELAND MOSS

Lichen islandicus

DEFINITION

Whole or cut, dried thallus of *Cetraria islandica* (L.) Acharius s.l.

IDENTIFICATION

A. The thallus, up to 15 cm long, is irregularly dichotomous and consists of glabrous, groove-shaped or almost flat, stiff, brittle bands, 0.3-1.5 cm wide and about 0.5 mm thick, sometimes serrated with the margin appearing ciliated (pycnidia). The upper surface is greenish or greenish-brown, the lower surface is greyish-white or light brownish and shows whitish, depressed spots (so-called respiratory cavities). On the apices of the terminal lobes, very rarely, there are brown, discoid apothecia.

B. Reduce to a powder (355) (*2.9.12*). The powder is greyish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous fragments of the pseudoparenchyma consisting of narrow-lumened, thick-walled hyphae from the marginal layer and wide-lumened hyphae from the adjacent layer consisting of loosely entwined hyphae, in which, in the medullary zone, greenish or brownish algae cells up to 15 µm in diameter, are embedded; occasionally marginal fragments of the thallus with tube-like or cylindrical spermogonia, up to about 160 µm wide and up to about 400 µm long.

C. To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *water R* and boil for 2-3 min. The greyish-brown solution forms a gel after cooling which gives a blue colour with *iodine solution R*.

D. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 5 ml of *acetone R* and heat in a water-bath under a reflux condenser for 2-3 min. Cool and filter.

Reference solution. Dissolve 5 mg of *anethole R* and 5 mg of *caffeic acid R* in 2 ml of *acetone R*.

Plate: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase: *acetone R, methanol R, anhydrous formic acid R, toluene R* (5:5:10:80 *V/V/V/V*).

Application: 20 µl [or 4 µl] of the test solution and 10 µl [or 2 µl] of the reference solution, as bands.

Development: over a path of 10 cm [or 6 cm].

Drying: in air.

Detection: spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min and examine in daylight.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A greyish-blue zone
Anethole: a blue or bluish-violet zone	
———	———
	2 weak greyish-blue zones
	A weak greyish-brown or grey zone
———	———
	A greyish-violet zone
Caffeic acid: a greyish-blue zone	
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 5 per cent.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 3.0 per cent.

Swelling value (*2.8.4*): minimum 4.5, determined on the powdered drug (355) (*2.9.12*).

01/2008:0917
corrected 6.0

ICHTHAMMOL

Ichthammolum

DEFINITION

Ichthammol is obtained by distillation from certain bituminous schists, sulphonation of the distillate and neutralisation of the product with ammonia.

Content:

- *dry matter*: 50.0 per cent *m/m* to 56.0 per cent *m/m*,
- *total ammonia* (NH_3; M_r 17.03): 4.5 per cent *m/m* to 7.0 per cent *m/m* (dried substance),
- *organically combined sulphur*: minimum 10.5 per cent *m/m* (dried substance),
- *sulphur in the form of sulphate*: maximum 20.0 per cent *m/m*.

CHARACTERS

Appearance: dense, blackish-brown liquid.

Solubility: miscible with water and with glycerol, slightly soluble in ethanol (96 per cent), in fatty oils and in liquid paraffin. It forms homogeneous mixtures with wool fat and soft paraffin.

IDENTIFICATION

A. Dissolve 1.5 g in 15 ml of *water R* (solution A). To 2 ml of solution A add 2 ml of *hydrochloric acid R*. A resinous precipitate is formed. Decant the supernatant liquid. The precipitate is partly soluble in *ether R*.

B. 2 ml of solution A, obtained in identification test A, gives the reaction of ammonium salts and salts of volatile bases (*2.3.1*).

C. Evaporate and ignite the mixture of solution A and *dilute sodium hydroxide solution R* obtained in identification test B. Take up the residue with 5 ml of *dilute hydrochloric acid R*. Gas is evolved which turns *lead acetate paper R* brown or black. Filter the solution. The filtrate gives reaction (a) of sulphates (*2.3.1*).

TESTS

Acidity or alkalinity. To 10.0 ml of the clear filtrate obtained in the assay of total ammonia add 0.05 ml of *methyl red solution R*. Not more than 0.2 ml of *0.02 M hydrochloric acid* or *0.02 M sodium hydroxide* is required to change the colour of the indicator.

Relative density (*2.2.5*): 1.040 to 1.085, determined on a mixture of equal volumes of the substance to be examined and *water R*.

Sulphated ash (*2.4.14*): maximum 0.3 per cent, determined on 1.00 g.

ASSAY

Dry matter. Weigh 1.000 g in a tared flask containing 2 g of *sand R*, previously dried to constant mass, and a small glass rod. Heat on a water-bath for 2 h with frequent stirring and dry in an oven at 100-105 °C until 2 consecutive weighings do not differ by more than 2.0 mg; the 2nd weighing is carried out after drying again for 1 h.

Total ammonia. Dissolve 2.50 g in 25 ml of warm *water R*. Rinse the solution into a 250 ml volumetric flask, add 200 ml of *sodium chloride solution R* and dilute to 250.0 ml with *water R*. Filter the solution, discarding the first 20 ml of filtrate. To 100.0 ml of the clear filtrate add 25 ml of *formaldehyde solution R*, neutralised to *phenolphthalein solution R1*. Titrate with *0.1 M sodium hydroxide* until a faint pink colour is obtained.

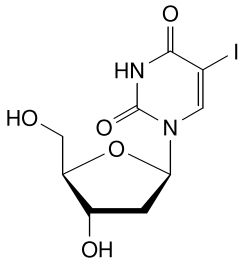
1 ml of *0.1 M sodium hydroxide* is equivalent to 1.703 mg of NH_3.

Organically combined sulphur. Mix 0.500 g with 4 g of *anhydrous sodium carbonate R* and 3 ml of *methylene chloride R* in a porcelain crucible of about 50 ml capacity, warm and stir until all the methylene chloride has evaporated. Add 10 g of coarsely powdered *copper nitrate R*, mix thoroughly and heat the mixture very gently using a small flame. When the initial reaction has subsided, increase the temperature slightly until most of the material has blackened. Cool, place the crucible in a large beaker, add 20 ml of *hydrochloric acid R* and, when the reaction has ceased, add 100 ml of *water R* and boil until all the copper oxide has dissolved. Filter the solution, add 400 ml of *water R*, heat to boiling and add 20 ml of *barium chloride solution R1*. Allow to stand for 2 h, filter, wash with *water R*, dry and ignite at about 600 ± 50 °C until 2 successive weighings do not differ by more than 0.2 per cent of the mass of the residue.

1 g of residue is equivalent to 0.1374 g of total sulphur.

Calculate the percentage content of total sulphur and subtract the percentage content of sulphur in the form of sulphate.

Sulphur in the form of sulphate. Dissolve 2.000 g in 100 ml of *water R*, add 2 g of *cupric chloride R* dissolved in 80 ml of *water R* and dilute to 200.0 ml with *water R*. Shake and filter. Heat 100.0 ml of the filtrate almost to boiling, add 1 ml of *hydrochloric acid R* and 5 ml of *barium chloride solution R1* dropwise and heat on a water-bath. Filter, wash the precipitate with *water R*, dry and ignite at about 600 ± 50 °C until 2 successive weighings do not differ by more than 0.2 per cent of the mass of the residue.



1 g of residue is equivalent to 0.1374 g of sulphur present in the form of sulphate.

Calculate the percentage content of sulphur in the form of sulphate.

01/2008:0669

IDOXURIDINE

Idoxuridinum

$C_9H_{11}IN_2O_5$ M_r 354.1
[54-42-2]

DEFINITION

Idoxuridine contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 5-iodo-1-(2-deoxy-β-D-*erythro*-pentofuranosyl)pyrimidine-2,4(1*H*,3*H*)-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water and in alcohol. It dissolves in dilute solutions of alkali hydroxides.

It melts at about 180 °C, with decomposition.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *idoxuridine CRS*. Examine the substances as discs prepared using 1 mg of the substance to be examined and of the reference substance each in 0.3 g of *potassium bromide R*.

B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (c).

C. Heat about 5 mg in a test-tube over a naked flame. Violet vapour is evolved.

D. Disperse about 2 mg in 1 ml of *water R* and add 2 ml of *diphenylamine solution R2*. Heat in a water-bath for 10 min. A persistent light-blue colour develops.

TESTS

Solution S. Dissolve 0.500 g in *1 M sodium hydroxide* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*). Dissolve 0.10 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent. The pH of the solution is 5.5 to 6.5.

Specific optical rotation (*2.2.7*): + 28 to + 32, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using as coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 0.20 g of the substance to be examined in a mixture of 1 volume of *concentrated ammonia R* and 5 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 1 volume of *concentrated ammonia R* and 5 volumes of *methanol R*.

Reference solution (a). Dissolve 20 mg of *5-iodouracil R*, 20 mg of *2′-deoxyuridine R* and 20 mg of *5-bromo-2′-deoxyuridine R* in a mixture of 1 volume of *concentrated ammonia R* and 5 volumes of *methanol R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (b). Dissolve 0.20 g of the substance to be examined in 5 ml of reference solution (a).

Reference solution (c). Dissolve 20 mg of *idoxuridine CRS* in a mixture of 1 volume of *concentrated ammonia R* and 5 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (d). Dilute 1 ml of test solution (b) to 20 ml with a mixture of 1 volume of *concentrated ammonia R* and 5 volumes of *methanol R*.

Apply separately to the plate 5 µl of each solution. Develop twice over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 40 volumes of *chloroform R* and 50 volumes of *2-propanol R*, drying the plate in a current of cold air after each development. Examine in ultraviolet light at 254 nm. In the chromatogram obtained with test solution (a): any spots corresponding to 5-iodouracil, 2′-deoxyuridine and 5-bromo-2′-deoxyuridine are not more intense than the corresponding spots in the chromatogram obtained with reference solution (a) (0.5 per cent); any spot, apart from the principal spot and the spots corresponding to 5-iodouracil, 2′-deoxyuridine and 5-bromo-2′-deoxyuridine, is not more intense than the spot in the chromatogram obtained with reference solution (d) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows four clearly separated spots.

Iodide. Dissolve 0.25 g in 25 ml of *0.1 M sodium hydroxide*, add 5 ml of *dilute hydrochloric acid R* and dilute to 50 ml with *water R*. Allow to stand for 10 min and filter. To 25 ml of the filtrate add 5 ml of *dilute hydrogen peroxide solution R* and 10 ml of *chloroform R* and shake. Any pink colour in the organic layer is not more intense than that in a standard prepared at the same time in the same manner using 1 ml of a 0.33 g/l solution of *potassium iodide R* instead of the substance to be examined (0.1 per cent).

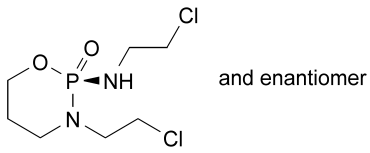
Loss on drying (*2.2.32*). Not more than 1.0 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.3000 g in 20 ml of *dimethylformamide R*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 35.41 mg of $C_9H_{11}IN_2O_5$.



STORAGE

Store protected from light.

01/2008:1529

IFOSFAMIDE

Ifosfamidum

$C_7H_{15}Cl_2N_2O_2P$ M_r 261.1

[3778-73-2]

DEFINITION

Ifosfamide contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (*RS*)-*N*,3-bis(2-chloroethyl)-1,3,2-oxazaphosphinan-2-amine 2-oxide, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, fine, crystalline powder, hygroscopic, soluble in water, freely soluble in methylene chloride.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the *Ph. Eur. reference spectrum of ifosfamide*. Examine the substance prepared as a disc.

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Acidity or alkalinity. Dilute 5 ml of solution S to 50 ml with *carbon dioxide-free water R*. To 10 ml of this solution add 0.1 ml of *methyl red solution R*. Not more than 0.1 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to red. To another 10 ml of the solution add 0.1 ml of *phenolphthalein solution R*. Not more than 0.3 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink.

Optical rotation (*2.2.7*). The angle of optical rotation, determined on solution S, is – 0.10° to + 0.10°.

Related substances

A. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution. Dissolve 1.00 g of the substance to be examined in a mixture of equal volumes of *methanol R* and *water R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 25 mg of *ifosfamide impurity A CRS* and 25 mg of *chloroethylamine hydrochloride R* (impurity C) ina mixture of equal volumes of *methanol R* and *water R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (b). Dissolve 15 mg of *ifosfamide impurity B CRS* ina mixture of equal volumes of *methanol R* and *water R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (c). Dissolve 5 mg of *ethanolamine R* (impurity D), 20 mg of *ifosfamide impurity A CRS* and 80 mg of *chloroethylamine hydrochloride R* (impurity C) in a mixture of equal volumes of *methanol R* and *water R* and dilute to 100 ml with the same mixture of solvents.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *water R*, 15 volumes of *methanol R*, 25 volumes of *anhydrous acetic acid R* and 50 volumes of *methylene chloride R*. Dry the plate at 115 °C for 45 min. At the bottom of a chromatography tank, place an evaporating dish containing a 3.2 g/l solution of *potassium permanganate R* and add an equal volume of *dilute hydrochloric acid R*, close the tank and allow to stand for 10 min. Place the plate whilst still hot in the tank, avoiding contact of the stationary phase with the solution, and close the tank. Leave the plate in contact with the chlorine vapour for 20 min. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed (about 20 min) and an area of coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution R*. Avoid prolonged exposure to cold air. Immerse the plate in a 1 g/l solution of *tetramethylbenzidine R* in *alcohol R* for 5 s. Allow the plate to dry and examine. In the chromatogram obtained with the test solution: any spot corresponding to impurity A or impurity C is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.25 per cent); any spot corresponding to impurity B is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (0.15 per cent); any other spot is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.15 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows 3 clearly separated spots.

B. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution. Dissolve 0.200 g of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 5 mg of *ifosfamide impurity E CRS* and 5 mg of *ifosfamide impurity F CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *ifosfamide impurity E CRS* and 10 mg of *ifosfamide CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 100 ml with the same mixture of solvents.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *methylene chloride R* and 10 volumes of *acetone R*. Dry the plate at 115 °C for 45 min. Proceed as described in Related substances test A. Any spot corresponding to impurity E or impurity F in the chromatogram obtained with the test solution is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Chlorides (*2.4.4*). Dilute 5 ml of solution S to 15 ml with *water R*. The freshly prepared solution complies with the limit test for chlorides (100 ppm).

Heavy metals (*2.4.8*). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*). Not more than 0.5 per cent, determined on 1.00 g by the semi-micro determination of water.

ASSAY

Examine by liquid chromatography (*2.2.29*). *Use the solutions within 24 h.*

Solution A. Dissolve 50.0 mg of *ethyl parahydroxybenzoate R* in 25 ml of *alcohol R*, dilute to 100.0 ml with *water R* and mix.

Test solution. To 0.150 g of the substance to be examined add 10.0 ml of solution A and dilute to 250.0 ml with *water R*.

Reference solution. To 15.0 mg of *ifosfamide CRS* add 1.0 ml of solution A and dilute to 25.0 ml with *water R*.

The chromatography may be carried out using:

– a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),

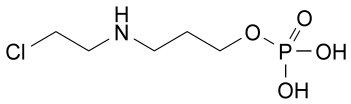
– as mobile phase at a flow rate of 1.5 ml/min a mixture of 30 volumes of *acetonitrile R* and 70 volumes of *water R*,

– as detector a spectrophotometer set at 195 nm.

Inject 1 µl of the reference solution six times. The assay is not valid unless the resolution between the peaks due to ifosfamide and to ethyl parahydroxybenzoate is not less than 6.0 and the relative standard deviation of the peak area for ifosfamide is at most 2.0 per cent.

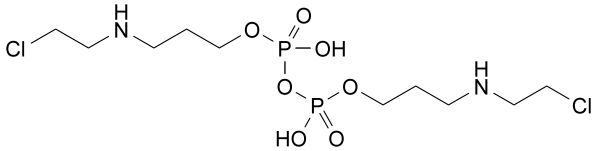
Inject 1 µl of the test solution. Calculate the percentage content of $C_7H_{15}Cl_2N_2O_2P$ from the area of the corresponding peak in the chromatogram obtained and the declared content of *ifosfamide CRS*.

STORAGE



Store in an airtight container.

IMPURITIES

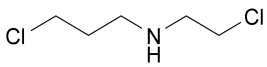


Specified impurities: *A, B, C, E, F.*

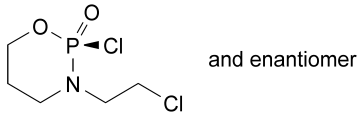
Other detectable impurities: D.

Related substances test A

A. 3-[(2-chloroethyl)amino]propyl dihydrogen phosphate,



B. bis[3-[(2-chloroethyl)amino]propyl] dihydrogen diphosphate,

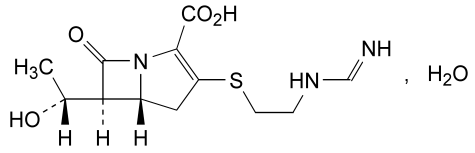


C. R = Cl: 2-chloroethanamine,

D. R = OH: 2-aminoethanol.

Related substances test B

E. 3-chloro-*N*-(2-chloroethyl)propan-1-amine,



F. (*RS*)-2-chloro-3-(2-chloroethyl)-1,3,2-oxazaphosphinane 2-oxide.

corrected 6.0

IMIPENEM

Imipenemum

$C_{12}H_{17}N_3O_4S,H_2O$ M_r 317.4

DEFINITION

(5*R*,6*S*)-6-[(*R*)-1-Hydroxyethyl]-3-[[2-[(iminomethyl)amino]-ethyl]sulphanyl]-7-oxo-1-azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid monohydrate.

Semi-synthetic product derived from a fermentation product.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white or pale yellow powder.

Solubility: sparingly soluble in water, slightly soluble in methanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *imipenem CRS.*

TESTS

Appearance of solution. The solution is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than intensity 6 of the range of the reference solutions of the most appropriate colour (*2.2.2, Method II*).

Dissolve 0.500 g in *phosphate buffer solution pH 7.0 R3* and dilute to 50 ml with the same solution.

pH (*2.2.3*): 4.5 to 7.0.

Dissolve 0.500 g in *carbon dioxide-free water R* and dilute to 100.0 ml with the same solvent.

Specific optical rotation (*2.2.7*): + 84 to + 89 (anhydrous substance), measured at 25 °C.

Dissolve 0.125 g in *phosphate buffer solution pH 7.0 R3* and dilute to 25.0 ml with the same solution.

Related substances. Liquid chromatography (*2.2.29*). *Keep the solutions in an ice-bath and use within 8 h of preparation.*

Solvent mixture. Mix 0.7 volumes of *acetonitrile R* and 99.3 volumes of a 0.135 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 6.8 with *dilute phosphoric acid R.*

Test solution. Dissolve 40.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). Dissolve 40.0 mg of *imipenem CRS* in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (c). Heat 20 ml of the test solution, previously adjusted to pH 10 with *sodium hydroxide solution R*, at 80 °C for 5 min (*in situ* preparation of impurity A).

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 0.7 volumes of *acetonitrile R* and 99.3 volumes of a 8.7 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 7.3 with *dilute phosphoric acid R.*

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl of the test solution and reference solutions (b) and (c).

Run time: twice the retention time of imipenem.

Relative retention with reference to imipenem (retention time = about 9 min): impurity A = about 0.8.

System suitability: reference solution (c):

– *resolution*: minimum 3.5 between the peaks due to impurity A and imipenem.

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent);

- *any other impurity*: for each impurity, not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *sum of impurities other than A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent);
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Water (*2.5.12*): 5.0 per cent to 8.0 per cent, determined on 0.200 g. Use an iodosulphurous reagent containing imidazole instead of pyridine and a clean container for each determination.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

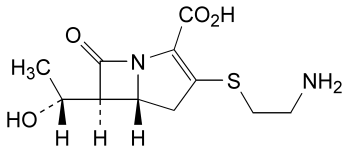
Bacterial endotoxins (*2.6.14*): less than 0.17 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Injection: test solution and reference solution (a).

System suitability: reference solution (a):



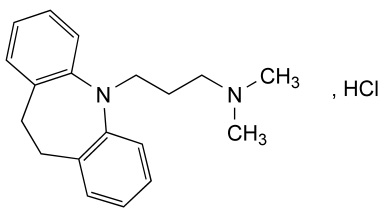
- *repeatability*: maximum relative standard deviation of 1.0 per cent after 6 injections.

STORAGE

In an airtight container, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

IMPURITIES

Specified impurities: *A*.



A. (5*R*,6*S*)-3-[(2-aminoethyl)sulphanyl]-6-[(*R*)-1-hydroxyethyl]-7-oxo-1-azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid (thienamycin).

corrected 6.0

IMIPRAMINE HYDROCHLORIDE

Imipramini hydrochloridum

$C_{19}H_{25}ClN_2$ M_r 316.9
[113-52-0]

DEFINITION

Imipramine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 3-(10,11-dihydro-5*H*-dibenzo[*b,f*]azepin-5-yl)-*N*,*N*-dimethylpropan-1-amine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellow, crystalline powder, freely soluble in water and in alcohol.

IDENTIFICATION

First identification: A, C, F.

Second identification: A, B, D, E, F.

A. Melting point (*2.2.14*): 170 °C to 174 °C.

B. Dissolve 20 mg in *0.01 M hydrochloric acid* and dilute to 100.0 ml with the same acid. Dilute 1.0 ml of the solution to 10.0 ml with *0.01 M hydrochloric acid*. Examined between 230 nm and 350 nm, the solution shows a single absorption maximum (*2.2.25*), at 251 nm, and a shoulder at 270 nm. The specific absorbance at the maximum is about 260.

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *imipramine hydrochloride CRS*. Examine the substances prepared as discs.

D. Dissolve about 5 mg in 2 ml of *nitric acid R*. An intense blue colour develops.

E. Dissolve about 50 mg in 3 ml of *water R* and add 0.05 ml of a 25 g/l solution of *quinhydrone R* in *methanol R*. No red colour develops within 15 min.

F. About 20 mg gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. To 3.0 g add 20 ml of *carbon dioxide-free water R*, dissolve rapidly by shaking and triturating with a glass rod and dilute to 30 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*). Immediately after preparation, dilute solution S with an equal volume of *water R*. This solution is not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

pH (*2.2.3*). The pH of solution S, measured immediately after preparation, is 3.6 to 5.0.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel G plate R*.

Test solution. Dissolve 0.25 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent. Prepare immediately before use.

Reference solution (a). Dilute 1 ml of the test solution to 10 ml with *methanol R*. Dilute 1 ml of this solution to 50 ml with *methanol R*.

Reference solution (b). Dissolve 5 mg of *iminodibenzyl R* in *methanol R* and dilute to 100 ml with the same solvent. Prepare immediately before use.

Apply to the plate 10 µl of each solution. Develop over a path of 12 cm using a mixture of 5 volumes of *hydrochloric acid R*, 5 volumes of *water R*, 35 volumes of *glacial acetic acid R* and 55 volumes of *ethyl acetate R*. Allow the plate to dry in air for 5 min and spray with a 5 g/l solution of *potassium dichromate R* in a mixture of 1 volume of *sulphuric acid R* and 4 volumes of *water R*. Examine the plate immediately. The chromatogram obtained with the test solution shows a blue principal spot. In the chromatogram obtained with the test solution: any spot corresponding

to iminodibenzyl is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent); any spot apart from the principal spot and any spot corresponding to iminodibenzyl, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent).

Heavy metals (*2.4.8*). 2.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 4 ml of *lead standard solution (10 ppm Pb) R*.

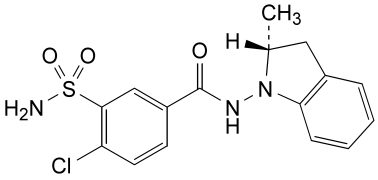
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *alcohol R* and add 5.0 ml of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 31.69 mg of $C_{19}H_{25}ClN_2$.



STORAGE

Store protected from light.

corrected 6.0

INDAPAMIDE

Indapamidum

and enantiomer

$C_{16}H_{16}ClN_3O_3S$ M_r 365.8
[26807-65-8]

DEFINITION

4-Chloro-*N*-[(2*RS*)-2-methyl-2,3-dihydro-1*H*-indol-1-yl]-3-sulphamoylbenzamide.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50.0 mg in *ethanol (96 per cent) R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *ethanol (96 per cent) R*.

Spectral range: 220-350 nm.

Absorption maximum: at 242 nm.

Shoulders: at 279 nm and 287 nm.

Specific absorbance at the absorption maximum: 590 to 630.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs of *potassium bromide R*.

Comparison: *indapamide CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 20 mg of the substance to be examined in *ethanol (96 per cent) R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *indapamide CRS* in *ethanol (96 per cent) R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *indometacin R* in 5 ml of reference solution (a) and dilute to 10 ml with *ethanol (96 per cent) R*.

Plate: *TLC silica gel GF_{254} plate R*.

Mobile phase: *glacial acetic acid R, acetone R, toluene R* (1:20:79 *V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Optical rotation (*2.2.7*): – 0.02° to + 0.02°.

Dissolve 0.250 g in *anhydrous ethanol R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*). *Carry out the test protected from light and prepare the solutions immediately before use or maintain them at 4 °C.*

Test solution. Dissolve 20.0 mg of the substance to be examined in 7 ml of a mixture of equal volumes of *acetonitrile R* and *methanol R* and dilute to 20.0 ml with a 0.2 g/l solution of *sodium edetate R*.

Reference solution (a). Dissolve 3.0 mg of *indapamide impurity B CRS* in 3.5 ml of a mixture of equal volumes of *acetonitrile R* and *methanol R* and dilute to 10.0 ml with a 0.2 g/l solution of *sodium edetate R*. To 1.0 ml of this solution, add 35 ml of a mixture of equal volumes of *acetonitrile R* and *methanol R* and dilute to 100.0 ml with a 0.2 g/l solution of *sodium edetate R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with a mixture of 17.5 volumes of *acetonitrile R*, 17.5 volumes of *methanol R* and 65 volumes of a 0.2 g/l solution of *sodium edetate R*. Dilute 1.0 ml of this solution to 20.0 ml with a mixture of 17.5 volumes of *acetonitrile R*, 17.5 volumes of *methanol R* and 65 volumes of a 0.2 g/l solution of *sodium edetate R*.

Reference solution (c). Dissolve 20.0 mg of *indapamide CRS* in 7 ml of a mixture of equal volumes of *acetonitrile R* and *methanol R* and dilute to 20.0 ml with a 0.2 g/l solution of *sodium edetate R*.

Reference solution (d). Dissolve 25.0 mg of *indapamide CRS* and 45.0 mg of *methylnitrosoindoline CRS* (impurity A) in 17.5 ml of a mixture of equal volumes of *acetonitrile R* and *methanol R* and dilute to 50.0 ml with a 0.2 g/l solution of *sodium edetate R*.

Column:
- *size*: *l* = 0.20 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

Mobile phase: *glacial acetic acid R, acetonitrile R, methanol R,* 0.2 g/l solution of *sodium edetate R* (0.1:17.5:17.5:65 *V/V/V/V*).

Flow rate: 2 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 10 µl.

Run time: 2.5 times the retention time of indapamide.

Retention time: indapamide = about 11 min.

System suitability:
- *resolution*: minimum 4.0 between the peaks due to indapamide and impurity A in the chromatogram obtained with reference solution (d);
- *signal-to-noise ratio*: minimum 6 for the principal peak in the chromatogram obtained with reference solution (b).

Limits:
- *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Impurity A. Liquid chromatography (*2.2.29*). *Carry out the test protected from light.*

Test solution. Dissolve 25.0 mg of the substance to be examined in 1 ml of *acetonitrile R* and dilute to 10.0 ml with *water R*. Shake for 15 min. Allow to stand at 4 °C for 1 h and filter.

Reference solution. Dissolve 25.0 mg of the substance to be examined in 1.0 ml of a 0.125 mg/l solution of *methylnitrosoindoline CRS* (impurity A) in *acetonitrile R* and dilute to 10.0 ml with *water R*. Shake for 15 min. Allow to stand at 4 °C for 1 h and filter.

Column:
- *size*: *l* = 0.15 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 30 °C.

Mobile phase: mix 7 volumes of *acetonitrile R*, 20 volumes of *tetrahydrofuran R* and 73 volumes of a 1.5 g/l solution of *triethylamine R* adjusted to pH 2.8 with *phosphoric acid R*.

Flow rate: 1.4 ml/min.

Detection: spectrophotometer at 305 nm.

Injection: 0.1 ml.

System suitability: reference solution:
- *signal-to-noise ratio*: minimum 3 for the peak due to impurity A appearing just before the peak due to indapamide;
- *peak-to-valley-ratio*: minimum 6.7, where H_p = height above the baseline of the peak due to impurity A and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to indapamide.

Limit:
- *impurity A*: not more than the difference between the areas of the peaks due to impurity A in the chromatograms obtained with the reference solution and the test solution (5 ppm).

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 3.0 per cent, determined on 0.100 g.

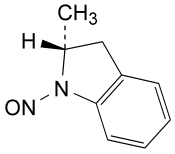
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Injection: the test solution and reference solution (c).

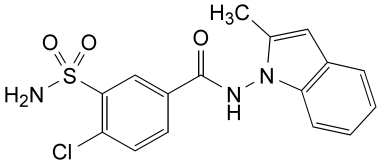
System suitability: reference solution (c):
- *repeatability*: maximum relative standard deviation of 1.0 per cent after 6 injections; if necessary, adjust the integrator parameters.



Calculate the percentage content of $C_{16}H_{16}ClN_3O_3S$ from the declared content of *indapamide CRS*.

STORAGE

Protected from light.



IMPURITIES

Specified impurities: *A, B.*

and enantiomer

A. (2*RS*)-2-methyl-1-nitroso-2,3-dihydro-1*H*-indole,

B. 4-chloro-*N*-(2-methyl-1*H*-indol-1-yl]-3-sulphamoyl-benzamide.

corrected 6.0

INDIAN FRANKINCENSE

Olibanum indicum

DEFINITION

Air-dried gum-resin exudate, obtained by incision in the stem or branches of *Boswellia serrata* Roxb. ex Colebr.

Content:
- *11-keto-β-boswellic acid* ($C_{30}H_{46}O_4$; M_r 470.7): minimum 1.0 per cent (dried drug);
- *acetyl-11-keto-β-boswellic acid* ($C_{32}H_{48}O_5$; M_r 512.7): minimum 1.0 per cent (dried drug).

IDENTIFICATION

A. Indian frankincense consists of translucent, roundish or irregularly shaped, variable size pieces of up to 3 cm. They are yellowish or reddish-brown. Their surface is covered with grey dust. The fracture is dull or slightly glossy.

B. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 90 ml of *methanol R* and sonicate for 10 min. Shake the mixture vigorously 3 or 4 times during this procedure. Dilute to 100 ml with *methanol R*. Centrifuge and use the clear supernatant solution.

Reference solution. Dissolve 2 mg of *11-keto-β-boswellic acid R* and 2 mg of *acetyl-11-keto-β-boswellic acid R* in 20 ml of *methanol R*.

Plate: *TLC silica gel F_{254} plate R* (5-40 µm) [or *TLC silica gel F_{254} plate R* (2-10 µm)].

Mobile phase: *anhydrous formic acid R, heptane R, ethyl acetate R, toluene R* (3:10:20:80 *V/V/V/V*).

Application: 10 µl [or 3 µl] as bands.

Development: over a path of 8 cm [or 5 cm].

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. The zones due to 11-keto-β-boswellic acid and acetyl-11-keto-β-boswellic acid in the test solution are of approximately equivalent intensity. Furthermore, other weak quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate

———	———
Acetyl-11-keto-β-boswellic acid: a quenching zone	A quenching zone (acetyl-11-keto-β-boswellic acid)
11-Keto-β-boswellic acid: a quenching zone	A quenching zone (11-keto-β-boswellic acid)
Reference solution	**Test solution**

TESTS

Loss on drying (*2.2.32*): maximum 8.0 per cent, determined on 1.000 g of powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 3 h.

Total ash (*2.4.16*): maximum 10.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 90 ml of *methanol R* and sonicate for 10 min. Shake the mixture vigorously 3 or 4 times during this procedure. Dilute to 100.0 ml with *methanol R*. Centrifuge for 5 min. Dilute 1.0 ml of the clear solution to 10.0 ml with a mixture of 16 volumes of mobile phase A and 84 volumes of mobile phase B.

Reference solution. Dissolve 1.0 mg of *11-keto-β-boswellic acid R* and 1.0 mg of *acetyl-11-keto-β-boswellic acid R* in 20.0 ml of *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with mobile phase A.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: *phosphoric acid R, water R* (0.1:99.9 *V/V*);

– *phase mobile B*: *phosphoric acid R, acetonitrile R* (0.1:99.9 *V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 12.5	16 → 6	84 → 94
12.5 - 13.5	6 → 0	94 → 100
13.5 - 28	0	100

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 250 nm.

Injection: 20 µl.

Retention time: 11-keto-β-boswellic acid = about 8 min; acetyl-11-keto-β-boswellic acid = about 12 min.

System suitability: reference solution:

– *resolution*: minimum 6.0 between the peaks due to 11-keto-β-boswellic acid and acetyl-11-keto-β-boswellic acid.

Calculate the percentage content of 11-keto-β-boswellic acid using the following expression:

$$\frac{A_1 \times m_1 \times 5 \times p_1}{A_2 \times m}$$

A_1 = area of the peak due to 11-keto-β-boswellic acid in the chromatogram obtained with the test solution;

A_2 = area of the peak due to 11-keto-β-boswellic acid in the chromatogram obtained with the reference solution;

m = mass of the substance to be examined, in grams;

m_1 = mass of *11-keto-β-boswellic acid R* in the reference solution, in grams;

p_1 = percentage content of 11-keto-β-boswellic acid in *11-keto-β-boswellic acid R*.

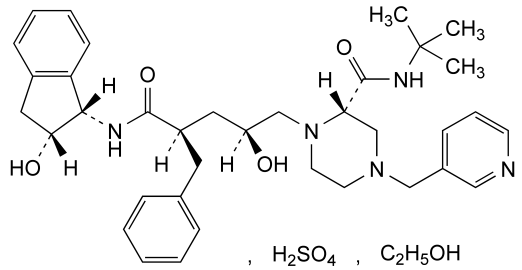
Calculate the percentage content of acetyl-11-keto-β-boswellic acid using the following expression:

$$\frac{A_3 \times m_2 \times 5 \times p_2}{A_4 \times m}$$

A_3 = area of the peak due to acetyl-11-keto-β-boswellic acid in the chromatogram obtained with the test solution;

A_4 = area of the peak due to acetyl-11-keto-β-boswellic acid in the chromatogram obtained with the reference solution;

m = mass of the substance to be examined, in grams;



m_2 = mass of *acetyl-11-keto-β-boswellic acid R* in the reference solution, in grams;

p_2 = percentage content of acetyl-11-keto-β-boswellic acid in *acetyl-11-keto-β-boswellic acid R*.

01/2008:2214

INDINAVIR SULPHATE

Indinaviri sulfas

, H_2SO_4 , C_2H_5OH

$C_{36}H_{49}N_5O_8S,C_2H_6O$ M_r 758
[157810-81-6]

DEFINITION

(2*S*)-1-[(2*S*,4*R*)-4-Benzyl-2-hydroxy-5-[[(1*S*,2*R*)-2-hydroxy-2,3-dihydro-1*H*-inden-1-yl]amino]-5-oxopentyl]-*N*-(1,1-dimethylethyl)-4-(pyridin-3-ylmethyl)piperazine-2-carboxamide sulphate ethanolate.

Content: 98.0 per cent to 102.0 per cent (anhydrous and ethanol-free substance).

PRODUCTION

A test for enantiomeric purity is carried out unless it has been demonstrated that the manufacturing process is enantioselective for the substance.

CHARACTERS

Appearance: white or almost white, hygroscopic powder.

Solubility: freely soluble in water, soluble in methanol, practically insoluble in heptane.

IDENTIFICATION

A. Specific optical rotation (*2.2.7*): + 122 to + 129 (anhydrous and ethanol-free substance), determined at 365 nm and at 25 °C.

Dissolve 0.500 g in *water R* and dilute to 50.0 ml with the same solvent.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of indinavir sulphate*.

C. It gives reaction (a) of sulphates (*2.3.1*).

D. It complies with the test for ethanol (see Tests).

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Solution A. Thoroughly mix equal volumes of mobile phase A and *acetonitrile R1*.

Test solution. Dissolve 50.0 mg of the substance to be examined in solution A and dilute to 100.0 ml with the same solution.

Reference solution (a). Dissolve 4 mg of *indinavir for system suitability CRS* (containing impurities B, C and E) in solution A and dilute to 10 ml with the same solution.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with solution A. Dilute 1.0 ml of this solution to 10.0 ml with solution A.

Reference solution (c). Dissolve 5.0 mg of *cis-aminoindanol R* (impurity A) in solution A and dilute to 10.0 ml with the same solution. Dilute 1.0 ml of the solution to 100.0 ml with solution A. Dilute 1.0 ml of this solution to 10.0 ml with solution A.

Reference solution (d). To 30 mg of the substance to be examined add 0.25 ml of *2 M hydrochloric acid R* and allow to stand at room temperature for 1 h. Dilute to 100 ml with a mixture of 2 volumes of *acetonitrile R1* and 3 volumes of mobile phase A and mix (*in situ* degradation to obtain impurity D).

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: solution containing 0.27 g/l of *potassium dihydrogen phosphate R* and 1.40 g/l of *dipotassium hydrogen phosphate R*; filter and degas;

– *mobile phase B*: *acetonitrile R1*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	80	20
5 - 40	80 → 30	20 → 70
40 - 45	30	70
45 - 47	30 → 80	70 → 20
47 - 52	80	20

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl.

Identification of impurities: use the chromatogram supplied with *indinavir for system suitability CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities B, C and E; use the chromatogram obtained with reference solution (d) to identify the peak due to impurity D.

Relative retention with reference to indinavir (retention time = about 25 min): impurity A = about 0.2; impurity B = about 0.8; impurity C = about 0.98; impurity D = about 1.1; impurity E = about 1.3.

System suitability: reference solution (a):

– *resolution*: minimum 1.8 between the peaks due to impurity C and indinavir.

Limits:

– *correction factor*: for the calculation of content, multiply the peak area of impurity D by 1.8;

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent);

– *impurity D*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *impurities B, C, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent);

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *disregard limit*: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.03 per cent).

Ethanol. Gas chromatography (*2.2.28*).

Internal standard solution. Dilute 1.0 ml of *propanol R* to 200.0 ml with *water R*.

Test solution. Dissolve 0.400 g of the substance to be examined in 50.0 ml of *water R*, add 8.0 ml of the internal standard solution and dilute to 100.0 ml with *water R*.

Reference solution. Dilute 1.0 ml of *anhydrous ethanol R* to 200.0 ml. Dilute 2.0 ml of this solution and 2.0 ml of the internal standard solution to 25.0 ml with *water R*.

Column:
– *material*: fused silica;
– *size*: *l* = 30 m, Ø = 0.53 mm;
– *stationary phase*: *macrogol 20 000 R* (film thickness 1.0 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 10 ml/min.

Split ratio: 1:10.

Temperature:
– *column*: 35 °C;
– *injection port*: 140 °C;
– *detector*: 220 °C.

Detection: flame ionisation.

Injection: 1.0 µl.

System suitability: reference solution:
– *retention time*: ethanol = 2 min to 4 min;
– *resolution*: minimum 5.0 between the peaks due to ethanol and propanol.

Calculate the percentage content of ethanol taking the density (*2.2.5*) to be 0.790 g/ml.

Limit:
– *ethanol*: 5.0 per cent to 8.0 per cent (*m/m*).

Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): maximum 1.5 per cent, determined on 0.500 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*).

Solution B. Add 20 ml of *dibutylammonium phosphate for ion-pairing R* to 1000 ml of *water R*. Adjust to pH 6.5 with *1 M sodium hydroxide*.

Test solution. Dissolve 60.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. Dissolve 50.0 mg of *indinavir CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Column:
– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *base-deactivated octylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

Mobile phase: *acetonitrile R*, solution B (45:55 *V/V*).

Flow rate: 1.0 ml/min.

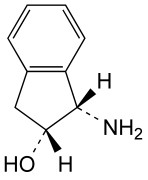
Detection: spectrophotometer at 260 nm.

Injection: 10 µl.

Run time: twice the retention time of indinavir.

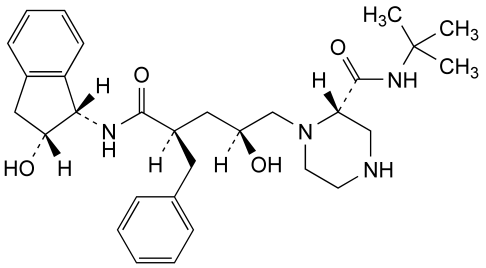
Retention time: indinavir = about 10 min.

Calculate the percentage content of $C_{36}H_{49}N_5O_8S$ using the declared content of *indinavir CRS* and multiplying by a correction factor of 1.1598.



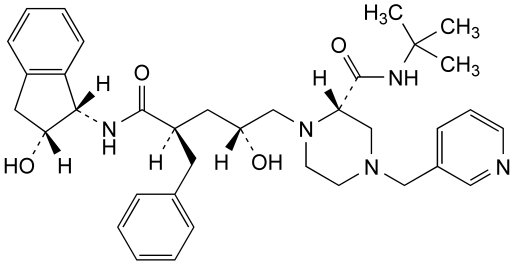
STORAGE

In an airtight container, protected from light.

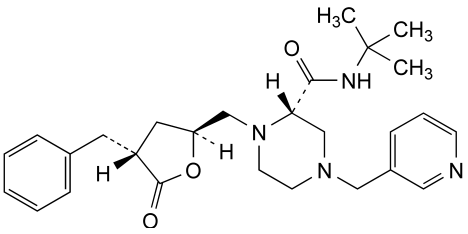


IMPURITIES

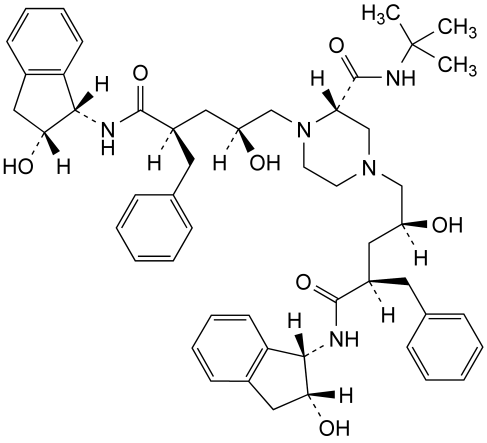
Specified impurities: A, B, C, D, E.



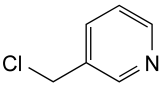
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F.*



A. (1*S*,2*R*)-1-amino-2,3-dihydro-1*H*-inden-2-ol (*cis*-aminoindanol),



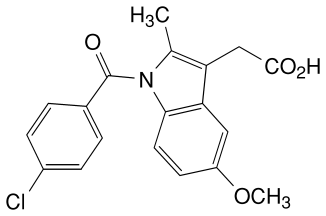
B. (2*S*)-1-[(2*S*,4*R*)-4-benzyl-2-hydroxy-5-[[(1*S*,2*R*)-2-hydroxy-2,3-dihydro-1*H*-inden-1-yl]amino]-5-oxopentyl]-*N*-(1,1-dimethylethyl)piperazine-2-carboxamide,



C. (2*S*)-1-[(2*R*,4*R*)-4-benzyl-2-hydroxy-5-[[(1*S*,2*R*)-2-hydroxy-2,3-dihydro-1*H*-inden-1-yl]amino]-5-oxopentyl]-*N*-(1,1-dimethylethyl)-4-(pyridin-3-ylmethyl)piperazine-2-carboxamide,

D. (3*R*,5*S*)-3-benzyl-5-[[(2*S*)-2-[(1,1-dimethylethyl)carbamoyl]-4-(pyridin-3-ylmethyl)piperazin-1-yl]methyl]-4,5-dihydrofuran-2(3*H*)-one,

E. (2*S*)-1,4-bis[(2*S*,4*R*)-4-benzyl-2-hydroxy-5-[[(1*S*,2*R*)-2-hydroxy-2,3-dihydro-1*H*-inden-1-yl]amino]-5-oxopentyl]-*N*-(1,1-dimethylethyl)piperazine-2-carboxamide,



F. 3-(chloromethyl)pyridine (nicotinyl chloride).

corrected 6.0

INDOMETACIN

Indometacinum

$C_{19}H_{16}ClNO_4$ M_r 357.8
[53-86-1]

DEFINITION

Indometacin contains not less than 98.5 per cent and not more than the equivalent of 100.5 per cent of [1-(4-chlorobenzoyl)-5-methoxy-2-methylindol-3-yl]acetic acid, calculated with reference to the dried substance.

CHARACTERS

A white or yellow, crystalline powder, practically insoluble in water, sparingly soluble in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

A. Melting point (*2.2.14*): 158 °C to 162 °C.

B. Dissolve 25 mg in a mixture of 1 volume of *1 M hydrochloric acid* and 9 volumes of *methanol R* and dilute to 100.0 ml with the same mixture of solvents. Dilute 10.0 ml of the solution to 100.0 ml with a mixture of 1 volume of *1 M hydrochloric acid* and 9 volumes of *methanol R*. Examined between 300 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 318 nm. The specific absorbance at the maximum is 170 to 190.

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *indometacin CRS*. Examine the substances in the solid state without recrystallisation.

D. Dissolve 0.1 g in 10 ml of *alcohol R*, heating slightly if necessary. To 0.1 ml of the solution add 2 ml of a freshly prepared mixture of 1 volume of a 250 g/l solution of *hydroxylamine hydrochloride R* and 3 volumes of *dilute sodium hydroxide solution R*. Add 2 ml of *dilute hydrochloric acid R* and 1 ml of *ferric chloride solution R2* and mix. A violet-pink colour develops.

E. To 0.5 ml of the solution in alcohol prepared in identification test D, add 0.5 ml of *dimethylaminobenzaldehyde solution R2*. A precipitate is formed that dissolves on shaking. Heat on a water-bath. A bluish-green colour is produced. Continue to heat for 5 min and cool in iced water for 2 min. A precipitate is formed and the colour changes to light greyish-green. Add 3 ml of *alcohol R*. The solution is clear and violet-pink in colour.

TESTS

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* HF_{254} *R* as the coating substance. Prepare the slurry using a 46.8 g/l solution of *sodium dihydrogen phosphate R*.

Test solution. Dissolve 0.2 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent. Prepare immediately before use.

Reference solution. Dilute 1 ml of the test solution to 200 ml with *methanol R*.

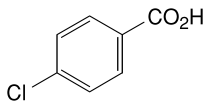
Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *light petroleum R* and 70 volumes of *ether R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Heavy metals (*2.4.8*). 2.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 4 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



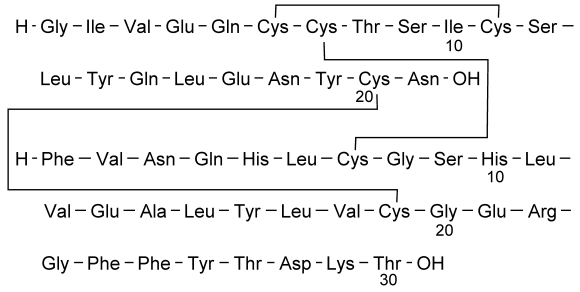
Dissolve 0.300 g in 75 ml of *acetone R*, through which *nitrogen R*, free from carbon dioxide, has been passed for 15 min. Maintain a constant stream of nitrogen through the solution. Add 0.1 ml of *phenolphthalein solution R*. Titrate with *0.1 M sodium hydroxide*. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 35.78 mg of $C_{19}H_{16}ClNO_4$.

STORAGE

Store protected from light.

IMPURITIES



A. 4-chlorobenzoic acid.

01/2008:2084
corrected 6.0

INSULIN ASPART

Insulinum aspartum

$C_{256}H_{381}N_{65}O_{79}S_6$ M_r 5826

DEFINITION

28^B-L-Aspartate insulin (human).

Insulin aspart is a 2-chain peptide containing 51 amino acids. The A-chain is composed of 21 amino acids and the B-chain is composed of 30 amino acids. It is identical in primary structure to human insulin, except that it has aspartic acid instead of proline at position 28 of the B-chain. As in human insulin, insulin aspart contains 2 interchain disulphide bonds and 1 intrachain disulphide bond.

Content: 90.0 per cent to 104.0 per cent of insulin aspart $C_{256}H_{381}N_{65}O_{79}S_6$ plus A21Asp insulin aspart, B3Asp insulin aspart, B3isoAsp insulin aspart and B28isoAsp insulin aspart (dried substance).

By convention, for the purpose of labelling insulin aspart preparations, 0.0350 mg of insulin aspart is equivalent to 1 unit.

PRODUCTION

Insulin aspart is produced by a method based on recombinant DNA (rDNA) technology under conditions designed to minimise the degree of microbial contamination.

Prior to release the following tests are carried out on each batch of the final bulk product, unless exemption has been granted by the competent authority.

Host-cell-derived proteins. The limit is approved by the competent authority.

Single-chain precursor. The limit is approved by the competent authority. Use a suitably sensitive method.

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in ethanol (96 per cent), in methanol and in aqueous solutions with a pH around 5.1. In aqueous solutions below pH 3.5 or above pH 6.5, the solubility is greater than or equal to 25 mg/ml.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

B. Peptide mapping (*2.2.55*).

SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS

Test solution. Prepare a 2.0 mg/ml solution of the substance to be examined in *0.01 M hydrochloric acid* and transfer 25 µl of this solution to a clean tube. Add 100 µl of *HEPES buffer solution pH 7.5 R* and 20 µl of a 1 mg/ml solution of *Staphylococcus aureus strain V8 protease R*. Cap the tube and incubate at 25 °C for 6 h. Stop the reaction by adding 145 µl of *sulphate buffer solution pH 2.0 R*.

Reference solution. Prepare at the same time and in the same manner as for the test solution, but using *insulin aspart CRS* instead of the substance to be examined.

CHROMATOGRAPHIC SEPARATION. Liquid chromatography (*2.2.29*).

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm) with a pore size of 8 nm,
– *temperature*: 40 °C.

Mobile phase:

– *mobile phase A*: mix 100 ml of *acetonitrile for chromatography R*, 200 ml of *sulphate buffer solution pH 2.0 R* and 700 ml of *water R*; filter and degas;
– *mobile phase B*: mix 200 ml of *sulphate buffer solution pH 2.0 R*, 400 ml of *acetonitrile for chromatography R* and 400 ml of *water R*; filter and degas;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 60	90 → 30	10 → 70
60 - 65	30 → 0	70 → 100
65 - 70	0	100

Flow rate: 1 ml/min.

Detection: spectrophotometer at 214 nm.

Equilibration: at initial conditions for at least 15 min. Carry out a blank run using the above-mentioned gradient.

Injection: 50 µl.

System suitability:

– the chromatograms obtained with the test solution and the reference solution are qualitatively similar to the chromatogram of insulin aspart digest supplied with *insulin aspart CRS*,
– in the chromatogram obtained with the reference solution, identify the peaks due to digest fragments I, II and III:

  symmetry factor: maximum 1.5, for the peaks due to fragments II and III,

  resolution minimum 8.0, between the peaks due to fragments II and III.

Results: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

NOTE: the retention times of fragments I, II and IV are the same as for human insulin. The retention time of fragment III differs from human insulin due to substitution of proline by aspartic acid.

TESTS

Impurities with molecular masses greater than that of insulin aspart. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

Test solution. Prepare a solution containing 4 mg/ml of the substance to be examined in *0.01 M hydrochloric acid*. Maintain the solution at 2-8 °C and use within 48 h.

Resolution solution. Use a solution of insulin (about 4 mg/ml), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid* may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about 10 days. Maintain the solution at 2-8 °C and use within 7 days.

Column:

- *size*: *l* = 0.3 m, Ø = 7.8 mm,
- *stationary phase*: *hydrophilic silica gel for chromatography R* (5-10 µm) with a pore size of 12-12.5 nm, of a grade suitable for the separation of insulin monomer from dimer and polymers.

Mobile phase: mix 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile for chromatography R* and 65 volumes of a 1.0 g/l solution of *arginine R*; filter and degas.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 276 nm.

Equilibration: at least 3 injections of the resolution solution; the column is equilibrated when repeatable results are obtained from 2 subsequent injections.

Injection: 100 µl.

Run time: about 35 min.

Retention time: insulin aspart polymers = 13-17 min; insulin aspart dimer = about 17.5 min; insulin aspart monomer = about 20 min; salts = about 22 min.

System suitability: resolution solution:

- *peak-to-valley ratio*: minimum 2.0, where H_p = height above the baseline of the peak due to the dimer and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer.

Limits: the sum of the areas of the peaks with a retention time less than that of the principal peak is not more than 0.5 per cent of the total area of the peaks. Disregard any peak with a retention time greater than that of the peak due to insulin aspart monomer.

Related proteins. Liquid chromatography (*2.2.29*) as described under Assay: use the normalisation procedure.

Limits:

- *B28isoAsp insulin aspart*: maximum 1.0 per cent,
- *total of the peaks due to A21Asp insulin aspart, B3Asp insulin aspart and B3isoAsp insulin aspart*: maximum 2.0 per cent,
- *total of other impurities*: maximum 1.5 per cent.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 105 °C for 24 h.

Sulphated ash (*2.4.14*): maximum 6.0 per cent, determined on 0.200 g (dried substance).

Bacterial endotoxins (*2.6.14*): less than 10 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Dissolve the substance to be examined in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml. Maintain the solution at 2-8 °C and use within 24 h.

Reference solution. Dissolve the contents of a vial of *insulin aspart CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml. Maintain the solution at 2-8 °C and use within 48 h.

Resolution solution. Use an appropriate solution with a content of B3Asp insulin aspart and A21Asp insulin aspart of not less than 1 per cent. This may be achieved by storing reference solution at room temperature for about 1-3 days. Maintain the solution at 2-8 °C and use within 72 h.

Column:

- *size*: *l* = 0.25 m, Ø = 4 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: 40 °C.

Mobile phase:

- *mobile phase A*: dissolve 142.0 g of *anhydrous sodium sulphate R* in *water R*; add 13.5 ml of *phosphoric acid R* and dilute to 5000 ml with *water R*; adjust to pH 3.6, if necessary, with *strong sodium hydroxide solution R*; filter and degas; mix 9 volumes of the solution with 1 volume of *acetonitrile for chromatography R*; filter and degas;
- *mobile phase B*: mix equal volumes of *water R* and *acetonitrile for chromatography R*; filter and degas;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 35	58	42
35 - 40	58 → 20	42 → 80
40 - 45	20	80
45 - 46	20 → 58	80 → 42
46 - 60	58	42

Flow rate: 1 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 10 µl.

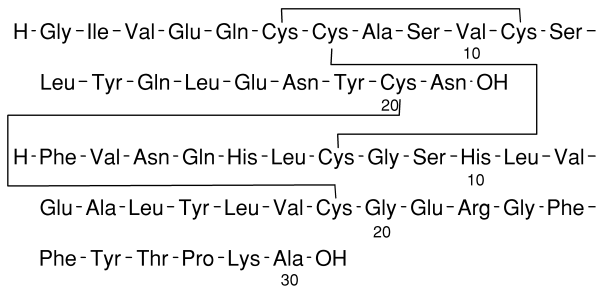
Relative retention with reference to insulin aspart (retention time = 20-24 min): B28isoAsp insulin aspart = about 0.9; B3Asp insulin aspart plus A21Asp insulin aspart (generally coeluted) = about 1.3; B3isoAsp insulin aspart = about 1.5.

System suitability: resolution solution:

- *resolution*: minimum 2.0 between the peak due to insulin aspart and the peak due to A21Asp insulin aspart and to B3Asp insulin aspart.

Calculate the content of insulin aspart $C_{256}H_{381}N_{65}O_{79}S_6$, plus B28isoAsp insulin aspart, A21Asp insulin aspart, B3Asp insulin aspart and B3isoAsp insulin aspart using the areas of the corresponding peaks in the chromatograms obtained with the test solution and reference solution and the declared

content of insulin aspart plus B28isoAsp insulin aspart, A21Asp insulin aspart, B3Asp insulin aspart and B3isoAsp insulin aspart in *insulin aspart CRS*.



STORAGE

In an airtight container, protected from light, at or below – 18 °C until released by the manufacturer. When thawed, insulin aspart is stored at 5 ± 3 °C and used for manufacturing preparations within a short period of time. To avoid absorption of humidity from the air during weighing, insulin aspart must be at room temperature before opening the container.

01/2008:1637

INSULIN, BOVINE

Insulinum bovinum

$C_{254}H_{377}N_{65}O_{75}S_6$ M_r 5734

DEFINITION

Bovine insulin is the natural antidiabetic principle obtained from beef pancreas and purified.

Content:

– *sum of bovine insulin ($C_{254}H_{377}N_{65}O_{75}S_6$) and A21 desamido bovine insulin*: 93.0 per cent to 105.0 per cent (dried subtance).

By convention, for the purpose of labelling insulin preparations, 0.0342 mg of bovine insulin is equivalent to 1 IU of insulin.

PRODUCTION

The animals from which bovine insulin is derived must fulfil the requirements for the health of animals suitable for human consumption.

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water and in ethanol. It dissolves in dilute mineral acids and with decomposition in dilute solutions of alkali hydroxides.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

Results: the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with reference solution (c).

B. Peptide mapping.

Test solution. Prepare a 2.0 mg/ml solution of the substance to be examined in *0.01 M hydrochloric acid* and transfer 500 µl of this solution to a clean tube. Add 2.0 ml of *HEPES buffer solution pH 7.5 R* and 400 µl of a 1 mg/ml solution of *Staphylococcus aureus strain V8 protease R*. Cap the tube and incubate at 25 °C for 6 h. Stop the reaction by adding 2.9 ml of *sulphate buffer solution pH 2.0 R*.

Reference solution. Prepare at the same time and in the same manner as for the test solution but using *bovine insulin CRS* instead of the substance to be examined.

Examine the digests by liquid chromatography (*2.2.29*).

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm);

– *temperature*: 40 °C.

Mobile phase:

– *mobile phase A*: mix 100 ml of *acetonitrile for chromatography R*, 700 ml of *water R* and 200 ml of *sulphate buffer solution pH 2.0 R*; filter and degas;

– *mobile phase B*: mix 400 ml of *acetonitrile for chromatography R*, 400 ml of *water R* and 200 ml of *sulphate buffer solution pH 2.0 R*; filter and degas;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 60	90 → 30	10 → 70
60 - 65	30 → 0	70 → 100
65 - 70	0	100

Flow rate: 1 ml/min.

Detection: spectrophotometer at 214 nm.

Equilibration: at initial conditions for at least 15 min. Carry out a blank run using the above-mentioned gradient.

Injection: 50 µl.

System suitability: the chromatograms obtained with the test solution and the reference solution are qualitatively similar to the chromatogram of bovine insulin digest supplied with *bovine insulin CRS*. In the chromatogram obtained with the reference solution, identify the peaks due to digest fragments I, II and III. The symmetry factor of the peaks due to fragments II and III is not greater than 1.5, and the resolution between the 2 peaks is at least 1.9.

Results: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

NOTE: The retention time of fragment I is the same for porcine insulin and for human insulin. The retention times of fragments II and IV are the same for all insulins. The retention time of fragment III is the same for bovine insulin and for porcine insulin.

TESTS

Impurities with molecular masses greater than that of insulin. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure. *Maintain the solutions at 2-10 °C and use within 7 days. If an automatic injector is used, maintain the temperature at 2-10 °C.*

Test solution. Dissolve 4 mg of the substance to be examined in 1.0 ml of *0.01 M hydrochloric acid*.

Resolution solution. Use a solution of insulin (approximately 4 mg/ml), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid*, may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about 10 days.

Column:

- *size*: *l* = 0.3 m, Ø = at least 7.5 mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R* (5-10 µm), of a grade suitable for the separation of insulin monomer from dimer and polymers.

Mobile phase: mix of 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile R* and 65 volumes of a 1.0 g/l solution of *arginine R*; filter and degas.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 276 nm.

Equilibration: before using a new column for chromatographic analysis, equilibrate by repeated injections of an insulin solution containing high molecular mass proteins. This can be done by at least 3 injections of the resolution solution. The column is equilibrated when repeatable results are obtained from 2 subsequent injections.

Injection: 100 µl.

Run time: about 35 min.

Retention times: polymeric insulin complexes = 13 min to 17 min; covalent insulin dimer = about 17.5 min; insulin monomer = about 20 min; salts = about 22 min.

System suitability: resolution solution:

- *peak-to-valley ratio*: minimum 2.0, where H_p = height above the baseline of the peak due to the dimer and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer.

Limits: the sum of the areas of any peaks with a retention time less than that of the principal peak is not greater than 1.0 per cent of the total area of the peaks; disregard any peak with a retention time greater than that of the insulin peak.

Related proteins. Liquid chromatography (*2.2.29*) as described under Assay, following the elution conditions as described in the table below.

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 30	42	58
30 - 44	42 → 11	58 → 89
44 - 50	11	89

Maintain the solutions at 2-10 °C and use within 24 h. Perform a system suitability test (resolution, linearity) as described under Assay. If necessary, the relative proportions of the mobile phases may be adjusted to ensure complete elution of A21 desamido porcine insulin before commencement of the gradient. The profile of the gradient may also be adjusted to ensure complete elution of all insulin related impurities.

Inject 20 µl of reference solution (c) and 20 µl of the test solution. If necessary, adjust the injection volume to between 10 µl and 20 µl in accordance with the results obtained in the test for linearity as described under Assay. Record the chromatograms for approximately 50 min. In the chromatogram obtained with reference solution (c), A21 desamido bovine insulin appears as a small peak after the principal peak and has a relative retention of about 1.3 with reference to the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to A21 desamido bovine insulin is not greater than 3.0 per cent of the total area of the peaks; the sum of the areas of all the peaks, apart from those due to bovine insulin and A21 desamido bovine insulin, is not greater than 3.0 per cent of the total area of the peaks.

Bovine proinsulin-like immunoreactivity (PLI): maximum 10 ppm (dried substance).

Use a suitably sensitive immunochemical method (*2.7.1*) such as radio-immunoassay, using the International Reference Reagent for bovine proinsulin to calibrate the method.

Zinc: maximum 1.0 per cent (dried substance).

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 50.0 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 25.0 ml with the same acid. Dilute if necessary to a suitable concentration (for example, 0.4 µg to 1.6 µg of Zn per millilitre) with *0.01 M hydrochloric acid*.

Reference solutions. Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/ml Zn) R* with *0.01 M hydrochloric acid*.

Source: zinc hollow-cathode lamp.

Wavelength: 213.9 nm.

Flame: air-acetylene flame of suitable composition (for example, 11 litres of air and 2 litres of acetylene per minute).

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 105 °C for 24 h.

Sulphated ash (*2.4.14*): maximum 2.5 per cent (dried substance), determined on 0.200 g.

Bacterial endotoxins (*2.6.14*): less than 10 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Dissolve a suitable amount of the substance to be examined in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml.

Reference solution (a). Dissolve the contents of a vial of *human insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml.

Reference solution (b). Dissolve the contents of a vial of *porcine insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml.

Reference solution (c). Dissolve the contents of a vial of *bovine insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml.

Reference solution (d). Dilute 1.0 ml of reference solution (c) to 10.0 ml with *0.01 M hydrochloric acid*.

Resolution solution. Mix 1.0 ml of reference solution (a) and 1.0 ml of reference solution (b).

Maintain the solutions at 2-10 °C and use within 48 h. If an automatic injector is used, maintain the temperature at 2-10 °C.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 40 °C.

Mobile phase: mix 42 volumes of mobile phase A and 58 volumes of mobile phase B, adjusting the composition of the mixture if necessary.

Prepare and maintain the following solutions at a temperature of at least 20 °C:

– *mobile phase A*: dissolve 28.4 g of *anhydrous sodium sulphate R* in *water R* and dilute to 1000 ml with the same solvent; add 2.7 ml of *phosphoric acid R*; adjust to pH 2.3, if necessary, with *ethanolamine R*; filter and degas;

– *mobile phase B*: mix 550 ml of mobile phase A with 450 ml of *acetonitrile R*. Warm the solution to a temperature of at least 20 °C in order to avoid precipitation (mixing of mobile phase A with acetonitrile is endothermic); filter and degas.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 214 nm.

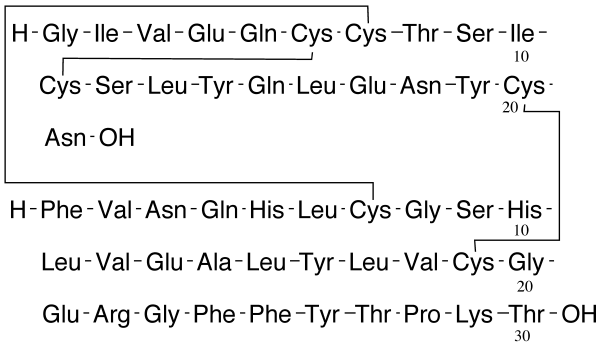
System suitability:

– *resolution*: inject 20 µl of the resolution solution and 20 µl of reference solution (b). Record the chromatogram of the resolution solution until the peak corresponding to the principal peak in the chromatogram obtained with reference solution (b) is clearly visible. In the chromatogram obtained with the resolution solution, identify the peaks due to porcine insulin and human insulin. The test is not valid unless the resolution between the peaks corresponding to human insulin and porcine insulin is at least 1.2. If necessary, adjust the concentration of acetonitrile in the mobile phase until this resolution is achieved;

– *linearity*: inject 20 µl each of reference solutions (c) and (d). The test is not valid unless the area of the principal peak in the chromatogram obtained with reference solution (c) is 10 ± 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (d). If this test fails, adjust the injection volume to between 10 µl and 20 µl, in order that the responses are within the linearity range of the detector.

Injection: 20 µl of the test solution.

Calculate the content of bovine insulin $C_{254}H_{377}N_{65}O_{75}S_6$ plus A21 desamido bovine insulin from the area of the principal peak and the area of the peak corresponding to A21 desamido bovine insulin in the chromatograms obtained with the test solution and reference solution (c) and the declared content of bovine insulin plus A21 desamido bovine insulin in *bovine insulin CRS*.



STORAGE

In an airtight container, protected from light, at – 20 °C until released by the manufacturer. When thawed, insulin may be stored at 5 ± 3 °C and used for manufacturing preparations within a short period of time. To avoid absorption of humidity from the air during weighing, the insulin must be at room temperature.

corrected 6.0

INSULIN, HUMAN

Insulinum humanum

$C_{257}H_{383}N_{65}O_{77}S_6$ M_r 5808

DEFINITION

Human insulin is a 2-chain peptide having the structure of the antidiabetic hormone produced by the human pancreas.

Content: 95.0 per cent to 105.0 per cent of human insulin $C_{257}H_{383}N_{65}O_{77}S_6$ plus A21 desamido human insulin (dried substance).

By convention, for the purpose of labelling insulin preparations, 0.0347 mg of human insulin is equivalent to 1 IU of insulin.

PRODUCTION

Human insulin is produced either by enzymatic modification and suitable purification of insulin obtained from the pancreas of the pig or by a method based on recombinant DNA (rDNA) technology.

Human insulin is produced under conditions designed to minimise the degree of microbial contamination.

For human insulin produced by enzymatic modification of insulin obtained from the pancreas of the pig, the manufacturing process is validated to demonstrate removal of any residual proteolytic activity. The competent authority may require additional tests.

For human insulin produced by a method based on rDNA technology, prior to release the following tests are carried out on each batch of the final bulk product, unless exemption has been granted by the competent authority.

Host-cell-derived proteins. The limit is approved by the competent authority.

Single chain precursor. The limit is approved by the competent authority. Use a suitably sensitive method.

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water and in ethanol (96 per cent). It dissolves in dilute mineral acids and with decomposition in dilute solutions of alkali hydroxides.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

B. Peptide mapping (*2.2.55*).

SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS

Test solution. Prepare a 2.0 mg/ml solution of the substance to be examined in *0.01 M hydrochloric acid* and transfer 500 µl of this solution to a clean tube. Add 2.0 ml of *HEPES buffer solution pH 7.5 R* and 400 µl of a 1 mg/ml solution of *Staphylococcus aureus strain V8 protease R*. Cap the tube and incubate at 25 °C for 6 h. Stop the reaction by adding 2.9 ml of *sulphate buffer solution pH 2.0 R*.

Reference solution. Prepare at the same time and in the same manner as for the test solution but using *human insulin CRS* instead of the substance to be examined.

CHROMATOGRAPHIC SEPARATION. Liquid chromatography (*2.2.29*).

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm) with a pore size of 8 nm,

– *temperature*: 40 °C.

Mobile phase:

– *mobile phase A*: mix 100 ml of *acetonitrile for chromatography R*, 200 ml of *sulphate buffer solution pH 2.0 R* and 700 ml of *water R*; filter and degas;

– *mobile phase B*: mix 200 ml of *sulphate buffer solution pH 2.0 R*, 400 ml of *acetonitrile for chromatography R* and 400 ml of *water R*; filter and degas;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 60	90 → 30	10 → 70
60 - 65	30 → 0	70 → 100
65 - 70	0	100

Flow rate: 1 ml/min.

Detection: spectrophotometer at 214 nm.

Equilibration: at initial conditions for at least 15 min. Carry out a blank run using the above-mentioned gradient.

Injection: 50 µl.

System suitability:

– the chromatograms obtained with the test solution and the reference solution are qualitatively similar to the chromatogram of human insulin digest supplied with *human insulin CRS*,

– in the chromatogram obtained with the reference solution, identify the peaks due to digest fragments I, II and III:

symmetry factor: maximum 1.5 for the peaks due to fragments II and III,

resolution: minimum 3.4 between the peaks due to fragments II and III.

Results: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

NOTE: the retention time of fragment I is the same for porcine insulin and for human insulin. The retention times of fragments II and IV are the same for all insulins. The retention time of fragment III is the same for bovine insulin and for porcine insulin.

TESTS

Impurities with molecular masses greater than that of insulin. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

Test solution. Prepare a solution containing 4 mg/ml of the substance to be examined in *0.01 M hydrochloric acid*.

Resolution solution. Use a solution of insulin (about 4 mg/ml), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid*, may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about 10 days.

Maintain the solutions at 2-8 °C and use within 7 days. If an automatic injector is used, maintain the temperature at 2-8 °C.

Column:

– *size*: *l* = 0.3 m, Ø = minimum 7.5 mm,

– *stationary phase*: *hydrophilic silica gel for chromatography R* (5-10 µm) with a pore size of 12-12.5 nm, of a grade suitable for the separation of insulin monomer from dimer and polymers.

Mobile phase: mix 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile R* and 65 volumes of a 1.0 g/l solution of *arginine R*; filter and degas.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 276 nm.

Equilibration: before using a new column for chromatographic analysis, equilibrate by repeated injections of an insulin solution containing high molecular mass proteins. This can be done by at least 3 injections of the resolution solution. The column is equilibrated when repeatable results are obtained from 2 subsequent injections.

Injection: 100 µl.

Run time: about 35 min.

Retention time: polymeric insulin complexes = 13-17 min; covalent insulin dimer = about 17.5 min; insulin monomer = about 20 min; salts = about 22 min.

System suitability: resolution solution:

– *peak-to-valley ratio*: minimum 2.0, where H_p = height above the baseline of the peak due to the dimer and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer.

Limits: the sum of the areas of any peaks with a retention time less than that of the principal peak is not greater than 1.0 per cent of the total area of the peaks. Disregard any peak with a retention time greater than that of the peak due to insulin.

Related proteins. Liquid chromatography (*2.2.29*) as described under Assay, following the elution conditions as described below:

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 30	42	58
30 - 44	42 → 11	58 → 89
44 - 50	11	89

Maintain the solutions at 2-8 °C and use within 24 h. Perform a system suitability test (resolution, linearity) as described in the assay. If necessary, the relative proportions of the mobile phases may be adjusted to ensure complete elution of A21 desamido porcine insulin before commencement of the gradient. The profile of the gradient may also be adjusted to ensure complete elution of all insulin related impurities.

Inject 20 µl of reference solution (a), 20 µl of reference solution (b), 20 µl of reference solution (c) and 20 µl of the test solution. If necessary, adjust the injection volume to a volume between 10 µl and 20 µl in accordance with the results obtained in the test for linearity as described in the assay. Record the chromatograms for approximately 50 min. In the chromatogram obtained with reference solution (a), A21 desamido human insulin appears as a small peak after the principal peak and has a retention time of about 1.3 relative to the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to A21 desamido human insulin is not greater than 2.0 per cent of the total area of the peaks; the sum of the areas of all peaks, apart from those due to human insulin and that due to A21 desamido human insulin, is not greater than 2.0 per cent of the total area of the peaks. For semisynthetic human insulin only: in the chromatogram obtained with the test solution, the area of any peak corresponding to the principal peak in the chromatogram obtained with reference solution (b) is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (1.0 per cent of porcine insulin in human insulin).

The following test applies only to human insulin produced by enzymatic modification of porcine insulin.

Proinsulin-like immunoreactivity (PLI): maximum 10 ppm, calculated with reference to the dried substance and determined by a suitably sensitive immunochemical method (*2.7.1*) such as radio-immunoassay. Use the International Reference Reagent for porcine proinsulin to calibrate the method.

Zinc: maximum 1.0 per cent (dried substance).

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 50.0 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 25.0 ml with the same acid. Dilute if necessary to a suitable concentration (for example, 0.4-1.6 µg of Zn per millilitre) with *0.01 M hydrochloric acid*.

Reference solutions. Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/ml Zn) R* with *0.01 M hydrochloric acid*.

Source: zinc hollow-cathode lamp.

Wavelength: 213.9 nm.

Atomisation device: air-acetylene flame of suitable composition (for example, 11 litres of air and 2 litres of acetylene per minute).

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 105 °C for 24 h.

Sulphated ash (*2.4.14*): maximum 2.5 per cent, determined on 0.200 g (dried substance).

Bacterial endotoxins (*2.6.14*): less than 10 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Dissolve 40.0 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve the contents of a vial of *human insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml.

Reference solution (b). Dissolve the contents of a vial of *porcine insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 50.0 ml with *0.01 M hydrochloric acid*. To 1.0 ml of this solution add 1.0 ml of reference solution (a).

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 10.0 ml with *0.01 M hydrochloric acid*.

Resolution solution. Mix 1.0 ml of reference solution (a) and 1.0 ml of reference solution (b).

Maintain the solutions at 2-8 °C and use within 48 h. If an automatic injector is used, maintain at 2-8 °C.

Column:

- *size*: *l* = 0.25 , Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: 40 °C.

Mobile phase: mix 42 volumes of mobile phase A and 58 volumes of mobile phase B, adjusting the composition of the mixture if necessary.

Prepare and maintain the following solutions at a temperature of at least 20 °C:

- *mobile phase A*: dissolve 28.4 g of *anhydrous sodium sulphate R* in *water R* and dilute to 1000 ml with the same solvent; add 2.7 ml of *phosphoric acid R*; adjust to pH 2.3, if necessary, with *ethanolamine R*; filter and degas;
- *mobile phase B*: mix 550 ml of mobile phase A with 450 ml of *acetonitrile R*. Warm the solution to a temperature of at least 20 °C in order to avoid precipitation (mixing of mobile phase A with acetonitrile is endothermic); filter and degas.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 214 nm.

System suitability:

- *resolution*: inject 20 µl of the resolution solution and 20 µl of reference solution (b). Record the chromatogram of the resolution solution until the peak corresponding to the principal peak in the chromatogram obtained with reference solution (b) is clearly visible. In the chromatogram obtained with the resolution solution, identify the peaks due to porcine insulin and human insulin. The test is not valid unless the resolution between the peaks due to human insulin and porcine insulin is at least 1.2. If necessary, adjust the concentration of acetonitrile in the mobile phase until this resolution is achieved.
- *linearity*: inject 20 µl each of reference solutions (a) and (d). The test is not valid unless the area of the principal peak in the chromatogram obtained with reference solution (a) is 10 ± 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (d). If this test fails, adjust the injection volume to between 10 µl and 20 µl, in order that the responses are within the linearity range of the detector.

Injection: 20 µl of the test solution and reference solution (a).

Calculate the content of human insulin $C_{257}H_{383}N_{65}O_{77}S_6$ plus A21 desamido human insulin using the areas of the corresponding peaks in the chromatograms obtained with

the test solution and reference solution (a) and the declared content of human insulin plus A21 desamido human insulin in *human insulin CRS*.

STORAGE

In an airtight container, protected from light, at – 18 °C or below, until released by the manufacturer. When thawed, insulin is stored at 5 ± 3 °C and used for manufacturing preparations within a short period of time. To avoid absorption of humidity from the air during weighing, the insulin must be at room temperature.

LABELLING

The label states whether the substance is produced by enzymatic modification of porcine insulin or by rDNA technology.

01/2008:0831
corrected 6.0

INSULIN INJECTION, BIPHASIC

Insulinum biphasicum iniectabile

Biphasic insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.

DEFINITION

Biphasic insulin injection is a sterile suspension of crystals containing bovine insulin in a solution of porcine insulin.

CHARACTERS

A white or almost white suspension. When examined under a microscope, the majority of the particles are seen to be rhombohedral crystals, with a maximum dimension measured from corner to corner through the crystal greater than 10 µm but rarely exceeding 40 µm.

IDENTIFICATION

Examine the chromatograms obtained in the assay. The position of the peaks due to the two insulins in the chromatogram obtained with the test solution correspond to those of the principal peaks in the chromatogram obtained with the appropriate reference solution.

TESTS

pH (*2.2.3*). The pH of the suspension to be examined is 6.6 to 7.2.

Insulin in the supernatant: 22.0 per cent to 28.0 per cent of insulin in solution. Determine by the method described in the test for insulin in the supernatant in the monograph on *Insulin preparations, injectable (0854)*.

Total zinc: 26.0 µg to 37.5 µg per 100 IU of insulin. Determine by the method described in the monograph on *Insulin preparations, injectable (0854)*.

01/2008:0832
corrected 6.0

INSULIN INJECTION, BIPHASIC ISOPHANE

Insulinum isophanum biphasicum iniectabile

Biphasic isophane insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the exception of the test for Insulin in the supernatant and with the amendments prescribed below for the other tests.

DEFINITION

Biphasic isophane insulin injection is a sterile buffered suspension of either porcine or human insulin, complexed with protamine sulphate or another suitable protamine, in a solution of insulin of the same species.

PRODUCTION

Biphasic isophane insulin injection is prepared by carrying out the procedures described in the monograph on *Insulin preparations, injectable (0854)*.

Biphasic isophane insulin injection is produced by mixing, in defined ratios, soluble insulin injection and isophane insulin injection. The defined ratios shall be demonstrated by a test method which has been approved by the competent authority to comply with the label claim.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant liquid; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to be rod-shaped crystals, the majority with a maximum dimension greater than 1 µm but rarely exceeding 60 µm, free from large aggregates.

IDENTIFICATION

Examine the chromatograms obtained in the Assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak obtained with the appropriate reference solution.

TESTS

Total zinc. Not more than 40.0 µg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854)*.

LABELLING

The label states in addition to the indications mentioned in the monograph on *Insulin preparations, injectable (0854)* the ratio of soluble insulin injection to isophane insulin injection used in the manufacturing process of biphasic isophane insulin injection.

01/2008:0833
corrected 6.0

INSULIN INJECTION, ISOPHANE

Insulinum isophanum iniectabile

Isophane insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the modifications prescribed below.

DEFINITION

Isophane insulin injection is a sterile suspension of bovine, porcine or human insulin, complexed with protamine sulphate or another suitable protamine.

PRODUCTION

Isophane insulin injection is prepared by carrying out the procedures described in the monograph on *Insulin preparations, injectable (0854)*.

The amount of protamine is based on the known isophane ratio and is not less than the equivalent of 0.3 mg and not more than the equivalent of 0.6 mg of protamine sulphate for each 100 IU of insulin in the insulin-protamine complex.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant liquid; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to be rod-shaped crystals, the majority with a maximum dimension greater than 1 µm but rarely exceeding 60 µm, free from large aggregates.

IDENTIFICATION

Examine the chromatograms obtained in the Assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution.

TESTS

Total zinc. Not more than 40.0 µg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854)*.

01/2008:0834

INSULIN INJECTION, SOLUBLE

Insulinum solubile iniectabile

Soluble insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.

DEFINITION

Soluble insulin injection is a neutral, sterile solution of bovine, porcine or human insulin.

CHARACTERS

A colourless liquid, free from turbidity and foreign matter; during storage, traces of a very fine sediment may be deposited.

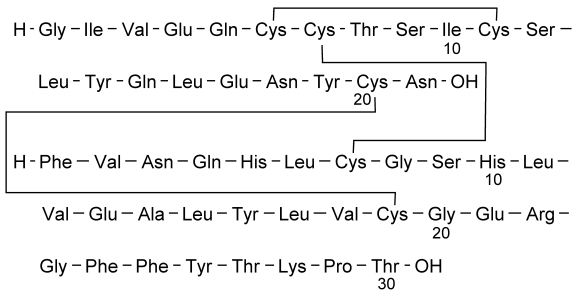
IDENTIFICATION

Examine the chromatograms obtained in the assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak obtained with the appropriate reference solution.

TESTS

Total zinc. Not more than 40.0 µg per 100 IU of insulin.

Determine by the method described in the monograph on *Insulin preparations, injectable (0854)*.



Use the following test solution.

Test solution. Dilute a volume of the gently shaken preparation containing 200 IU to 25.0 ml with *water R*. Dilute if necessary to a suitable concentration (for example, 0.4 µg to 1.6 µg of Zn per millilitre) with *water R*.

01/2008:2085
corrected 6.0

INSULIN LISPRO

Insulinum lisprum

$C_{257}H_{383}N_{65}O_{77}S_6$ M_r 5808

DEFINITION

28^B-L-Lysine-29^B-L-proline insulin (human).

Insulin lispro is a 2-chain peptide containing 51 amino acids. The A-chain is composed of 21 amino acids and the B-chain is composed of 30 amino acids. It is identical in primary structure to human insulin, only differing in amino acid sequence at positions 28 and 29 of the B-chain. Human insulin is Pro(B28), Lys(B29), whereas insulin lispro is Lys(B28), Pro(B29). As in human insulin, insulin lispro contains 2 interchain disulphide bonds and 1 intrachain disulphide bond.

Content: 94.0 per cent to 104.0 per cent (dried substance).

By convention, for the purpose of labelling insulin lispro preparations, 0.0347 mg of insulin lispro is equivalent to 1 unit.

PRODUCTION

Insulin lispro is produced by a method based on recombinant DNA (rDNA) technology under conditions designed to minimise the degree of microbial contamination.

Prior to release the following tests are carried out on each batch of final bulk product, unless exemption has been granted by the competent authority.

Host-cell-derived proteins. The limit is approved by the competent authority.

Single-chain precursor. The limit is approved by the competent authority. Use a suitably sensitive method.

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water and in ethanol (96 per cent). It dissolves in dilute mineral acids and with decomposition in dilute solutions of alkali hydroxides.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

B. Peptide mapping (*2.2.55*).

SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS

Test solution. Prepare a 2.0 mg/ml solution of the substance to be examined in *0.01 M hydrochloric acid* and transfer 500 µl of this solution to a clean tube. Add 2.0 ml of *HEPES buffer solution pH 7.5 R* and 400 µl of a 1 mg/ml solution of *Staphylococcus aureus strain V8 protease R*. Cap the tube and incubate at 25 °C for 6 h. Stop the reaction by adding 2.9 ml of *sulphate buffer solution pH 2.0 R*.

Reference solution. Prepare at the same time and in the same manner as for the test solution but using *insulin lispro CRS* instead of the substance to be examined.

CHROMATOGRAPHIC SEPARATION. Liquid chromatography (*2.2.29*).

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm) with a pore size of 8 nm,
– *temperature*: 40 °C.

Mobile phase:

– *mobile phase A*: mix 100 ml of *acetonitrile for chromatography R*, 200 ml of *sulphate buffer solution pH 2.0 R* and 700 ml of *water R*; filter and degas;
– *mobile phase B*: mix 200 ml of *sulphate buffer solution pH 2.0 R*, 400 ml of *acetonitrile for chromatography R* and 400 ml of *water R*; filter and degas;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 60	90 → 30	10 → 70
60 - 65	30 → 0	70 → 100
65 - 70	0	100

Flow rate: 1 ml/min.

Detection: spectrophotometer at 214 nm.

Equilibration: at initial conditions for at least 15 min. Carry out a blank run using the above-mentioned gradient.

Injection: 50 µl.

System suitability:

– the chromatograms obtained with the test solution and the reference solution are qualitatively similar to the chromatogram of insulin lispro digest supplied with *insulin lispro CRS*,
– in the chromatogram obtained with the reference solution, identify the peaks due to digest fragments I, II and III:

symmetry factor: maximum 1.5 for the peaks due to fragments II and III,

resolution: minimum 8.0 between the peaks due to fragments II and III.

Results: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

NOTE: the retention times of fragments I, II and IV are the same as for human insulin. The retention time of fragment III differs from human insulin due to differences in sequence at positions 28 and 29 of the B-chain.

TESTS

Impurities with molecular masses greater than that of insulin lispro. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure.

Test solution. Prepare a solution containing 4 mg/ml of the substance to be examined in *0.01 M hydrochloric acid*. Maintain the solution at 2-8 °C and use within 48 h.

Resolution solution. Use a solution of insulin (about 4 mg/ml), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid*, may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about 10 days. Maintain the solution at 2-8 °C and use within 8 days.

Column:

– *size*: *l* = 0.30 m, Ø = 7.8 mm,
– *stationary phase*: *hydrophilic silica gel for chromatography R* (5-10 µm) with a pore size of 12-12.5 nm, of a grade suitable for the separation of insulin monomer from dimer and polymers.

Mobile phase: mix 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile for chromatography R* and 65 volumes of a 1.0 g/l solution of *arginine R*; filter and degas.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 276 nm.

Equilibration: at least 3 injections of the resolution solution; the column is equilibrated when repeatable results are obtained for 2 subsequent injections.

Injection: 100 µl.

Run time: about 35 min.

Retention time: insulin lispro polymers = 13-17 min; insulin lispro dimer = about 17.5 min; insulin lispro monomer = about 20 min; salts = about 22 min.

System suitability: resolution solution:

– *peak-to-valley ratio*: minimum 2.0, where H_p = height above the baseline of the peak due to the dimer and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer,
– *symmetry factor*: maximum 2.0 for the peak due to insulin lispro.

Limits: the sum of the areas of the peaks with a retention time less than that of the principal peak is not more than 0.25 per cent of the total area of the peaks. Disregard any peak with a retention time greater than that of the peak due to insulin lispro monomer.

Related proteins. Liquid chromatography (*2.2.29*): use the normalisation procedure.

Test solution. Dissolve 3.5 mg of the substance to be examined in 1.0 ml of *0.01 M hydrochloric acid*. Maintain the solution at 2-8 °C and use within 56 h.

Resolution solution. Dissolve 3.5 mg of the substance to be examined in 1.0 ml of *0.01 M hydrochloric acid*. Allow to stand at room temperature to obtain a solution containing between 0.8 per cent and 11 per cent of A21 desamido insulin lispro.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm,
- *temperature*: 40 °C.

Mobile phase:

- *mobile phase A*: mix 82 volumes of a 28.4 g/l solution of *anhydrous sodium sulphate R* adjusted to pH 2.3 with *phosphoric acid R* and 18 volumes of *acetonitrile for chromatography R*; filter and degas;
- *mobile phase B*: mix equal volumes of a 28.4 g/l solution of *anhydrous sodium sulphate R* adjusted to pH 2.3 with *phosphoric acid R* and *acetonitrile for chromatography R*; filter and degas;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 60	81	19
60 - 83	81 → 51	19 → 49
83 - 84	51 → 81	49 → 19
84 - 94	81	19

Flow rate: 1 ml/min.

Detection: spectrophotometer at 214 nm.

Injection: 20 µl.

Retention time: adjust the mobile phase composition to obtain a retention time of about 41 min for insulin lispro; A21 desamido insulin lispro elutes near the start of the gradient elution.

System suitability: resolution solution:

- *resolution*: minimum 1.5 between the 1st peak (insulin lispro) and the 2nd peak (A21 desamido insulin lispro),
- *symmetry factor*: maximum 2.0 for the peak due to insulin lispro.

Limits:

- *A21 desamido insulin lispro*: maximum 1.0 per cent,
- *any other impurity*: maximum 0.50 per cent,
- *total (excluding A21)*: maximum 2.0 per cent.

Zinc: maximum 1.0 per cent (dried substance).

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve at least 50 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 25 ml with the same acid. Dilute if necessary to a suitable concentration (for example 0.4-0.6 µg of Zn per millilitre) with *0.01 M hydrochloric acid*.

Reference solutions. Use solutions of concentrations which bracket the expected zinc concentration of the samples, for example, 0.2-0.8 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/ml Zn) R* with *0.01 M hydrochloric acid*.

Source: zinc hollow-cathode lamp.

Wavelength: 213.9 nm.

Atomisation device: air-acetylene flame of suitable composition (for example, 11 litres of air and 2 litres of acetylene per minute).

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 105 °C for 16 h.

Sulphated ash (*2.4.14*): maximum 2.5 per cent, determined on 0.200 g (dried substance).

Bacterial endotoxins (*2.6.14, Method D*): less than 10 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Dissolve the substance to be examined in *0.01 M hydrochloric acid* to obtain a concentration of 0.8 mg/ml. Maintain the solution at 2-8 °C and use within 48 h.

Reference solution. Dissolve the contents of a vial of *insulin lispro CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 0.8 mg/ml. Maintain the solution at 2-8 °C and use within 48 h.

Resolution solution. Dissolve about 10 mg of the substance to be examined in 10 ml of *0.01 M hydrochloric acid*. Allow to stand at room temperature to obtain a solution containing between 0.8 per cent and 11 per cent of A21 desamido insulin lispro. Maintain the solution at 2-8 °C and use within 14 days.

Column:

- *size*: *l* = 0.10 m, Ø = 4.6 mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm) with a pore size of 8 nm,
- *temperature*: 40 °C.

Mobile phase: mix 745 volumes of a 28.4 g/l solution of *anhydrous sodium sulphate R* adjusted to pH 2.3 with *phosphoric acid R* and 255 volumes of *acetonitrile for chromatography R*; filter and degas.

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 214 nm.

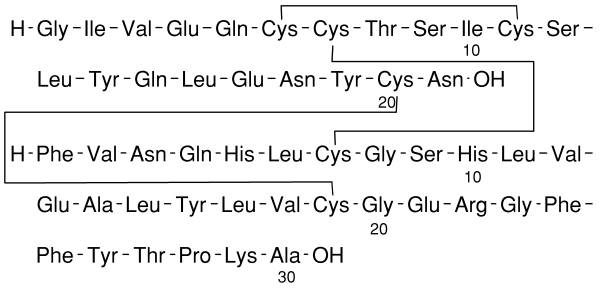
Injection: 20 µl.

Retention time: insulin lispro = about 24 min.

System suitability:

- *resolution*: minimum 1.8 between the 1st peak (insulin lispro) and the 2nd peak (A21 desamido insulin lispro), in the chromatogram obtained with the resolution solution,
- *repeatability*: maximum relative standard deviation of 1.1 per cent after 3 injections of the reference solution.

Calculate the content of insulin lispro $C_{257}H_{383}N_{65}O_{77}S_6$ using the chromatograms obtained with the test solution and the reference solution and the declared content of $C_{257}H_{383}N_{65}O_{77}S_6$ in *insulin lispro CRS*.



STORAGE

In an airtight container, protected from light, at or below – 18 °C. When thawed, insulin lispro is stored and weighed under conditions defined by the manufacturer to maintain the quality attributes of the drug substance and is used for manufacturing preparations within a short period of time. To avoid absorption of humidity from the air during weighing, insulin lispro must be at room temperature before opening the container.

01/2008:1638

INSULIN, PORCINE

Insulinum porcinum

$C_{256}H_{381}N_{65}O_{76}S_6$ M_r 5778

DEFINITION

Porcine insulin is the natural antidiabetic principle obtained from pork pancreas and purified.

Content:

– *sum of porcine insulin ($C_{256}H_{381}N_{65}O_{76}S_6$) and A21 desamido porcine insulin*: 95.0 per cent to 105.0 per cent (dried substance).

By convention, for the purpose of labelling insulin preparations, 0.0345 mg of porcine insulin is equivalent to 1 IU of insulin.

PRODUCTION

The animals from which porcine insulin is derived must fulfil the requirements for the health of animals suitable for human consumption.

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water and in ethanol. It dissolves in dilute mineral acids and with decomposition in dilute solutions of alkali hydroxides.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

Results: the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with reference solution (b).

B. Peptide mapping.

Test solution. Prepare a 2.0 mg/ml solution of the substance to be examined in *0.01 M hydrochloric acid* and transfer 500 µl of this solution to a clean tube. Add 2.0 ml of *HEPES buffer solution pH 7.5 R* and 400 µl of a 1 mg/ml solution of *Staphylococcus aureus strain V8 protease R*. Cap the tube and incubate at 25 °C for 6 h. Stop the reaction by adding 2.9 ml of *sulphate buffer solution pH 2.0 R*.

Reference solution. Prepare at the same time and in the same manner as for the test solution but using *porcine insulin CRS* instead of the substance to be examined.

Examine the digests by liquid chromatography (*2.2.29*).

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm);

– *temperature*: 40 °C.

Mobile phase:

– *mobile phase A*: mix 100 ml of *acetonitrile for chromatography R*, 700 ml of *water R* and 200 ml of *sulphate buffer solution pH 2.0 R*; filter and degas;

– *mobile phase B*: mix 400 ml of *acetonitrile for chromatography R*, 400 ml of *water R* and 200 ml of *sulphate buffer solution pH 2.0 R*; filter and degas;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 60	90 → 30	10 → 70
60 - 65	30 → 0	70 → 100
65 - 70	0	100

Flow rate: 1 ml/min.

Detection: spectrophotometer at 214 nm.

Equilibration: at initial conditions for at least 15 min. Carry out a blank run using the above-mentioned gradient.

Injection: 50 µl.

System suitability: the chromatograms obtained with the test solution and the reference solution are qualitatively similar to the chromatogram of porcine insulin digest supplied with *porcine insulin CRS*. In the chromatogram obtained with the reference solution, identify the peaks due to digest fragments I, II and III. The symmetry factor of the peaks due to fragments II and III is not greater than 1.5, and the resolution between the 2 peaks is at least 1.9.

Results: the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

NOTE: the retention time of fragment I is the same for porcine insulin and for human insulin. The retention times of fragments II and IV are the same for all insulins. The retention time of fragment III is the same for bovine insulin and for porcine insulin.

TESTS

Impurities with molecular masses greater than that of insulin. Size-exclusion chromatography (*2.2.30*): use the normalisation procedure. *Maintain the solutions at 2-10 °C and use within 7 days. If an automatic injector is used, maintain the temperature at 2-10 °C.*

Test solution. Dissolve 4 mg of the substance to be examined in 1.0 ml of *0.01 M hydrochloric acid*.

Resolution solution. Use a solution of insulin (approximately 4 mg/ml), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid*, may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about 10 days.

Column:

– *size*: *l* = 0.3 m, Ø = at least 7.5 mm;

– *stationary phase*: *hydrophilic silica gel for chromatography R* (5-10 µm), of a grade suitable for the separation of insulin monomer from dimer and polymers.

Mobile phase: mix 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile R* and 65 volumes of a 1.0 g/l solution of *arginine R*; filter and degas.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 276 nm.

Equilibration: before using a new column for chromatographic analysis, equilibrate by repeated injections of an insulin solution containing high molecular mass proteins. This can be done by at least 3 injections of the resolution solution. The column is equilibrated when repeatable results are obtained from 2 subsequent injections.

Injection: 100 µl.

Run time: about 35 min.

Retention times: polymeric insulin complexes = 13 min to 17 min; covalent insulin dimer = about 17.5 min; insulin monomer = about 20 min; salts = about 22 min.

System suitability: resolution solution:

– *peak-to-valley ratio*: minimum 2.0, where H_p = height above the baseline of the peak due to the dimer and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer.

Limits: the sum of the areas of any peaks with a retention time less than that of the principal peak is not greater than 1.0 per cent of the total area of the peaks; disregard any peak with a retention time greater than that of the insulin peak.

Related proteins. Liquid chromatography (*2.2.29*) as described under Assay, following the elution conditions as described in the table below.

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 30	42	58
30 - 44	42 → 11	58 → 89
44 - 50	11	89

Maintain the solutions at 2-10 °C and use within 24 h.

Perform a system suitability test (resolution, linearity) as described under Assay. If necessary, the relative proportions of the mobile phases may be adjusted to ensure complete elution of A21 desamido porcine insulin before commencement of the gradient. The profile of the gradient may also be adjusted to ensure complete elution of all insulin related impurities.

Inject 20 µl of reference solution (b) and 20 µl of the test solution. If necessary, adjust the injection volume to between 10 µl and 20 µl in accordance with the results obtained in the test for linearity as described under Assay. Record the chromatograms for approximately 50 min. In the chromatogram obtained with reference solution (b), A21 desamido porcine insulin appears as a small peak after the principal peak and has a relative retention of about 1.3 with reference to the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to A21 desamido porcine insulin is not greater than 2.0 per cent of the total area of the peaks; the sum of the areas of all the peaks, apart from those due to porcine insulin and A21 desamido porcine insulin, is not greater than 2.0 per cent of the total area of the peaks.

Porcine proinsulin-like immunoreactivity (PLI): maximum 10 ppm (dried substance).

Use a suitably sensitive immunochemical method (*2.7.1*) such as radio-immunoassay, using the International Reference Reagent for porcine proinsulin to calibrate the method.

Zinc: maximum 1.0 per cent (dried substance).

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Dissolve 50.0 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 25.0 ml with the same acid. Dilute if necessary to a suitable concentration (for example, 0.4 µg to 1.6 µg of Zn per millilitre) with *0.01 M hydrochloric acid.*

Reference solutions. Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/ml Zn) R* with *0.01 M hydrochloric acid.*

Source: zinc hollow-cathode lamp.

Wavelength: 213.9 nm.

Flame: air-acetylene flame of suitable composition (for example, 11 litres of air and 2 litres of acetylene per minute).

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 105 °C for 24 h.

Sulphated ash (*2.4.14*): maximum 2.5 per cent (dried substance), determined on 0.200 g.

Bacterial endotoxins (*2.6.14*): less than 10 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Dissolve 40.0 mg of the substance to be examined in *0.01 M hydrochloric acid* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve the contents of a vial of *human insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml.

Reference solution (b). Dissolve the contents of a vial of *porcine insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with *0.01 M hydrochloric acid.*

Resolution solution. Mix 1.0 ml of reference solution (a) and 1.0 ml of reference solution (b).

Maintain the solutions at 2-10 °C and use within 48 h. If an automatic injector is used, maintain the temperature at 2-10 °C.

Column:

– *size*: *l* = 0.25 , Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 40 °C.

Mobile phase: mix 42 volumes of mobile phase A and 58 volumes of mobile phase B, adjusting the composition of the mixture if necessary.

Prepare and maintain the following solutions at a temperature of at least 20 °C:

– *mobile phase A*: dissolve 28.4 g of *anhydrous sodium sulphate R* in *water R* and dilute to 1000 ml with the same solvent; add 2.7 ml of *phosphoric acid R*; adjust to pH 2.3, if necessary, with *ethanolamine R*; filter and degas;
– *mobile phase B*: mix 550 ml of mobile phase A with 450 ml of *acetonitrile R*. Warm the solution to a temperature of at least 20 °C in order to avoid precipitation (mixing of mobile phase A with acetonitrile is endothermic); filter and degas.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 214 nm.

System suitability:

– *resolution*: inject 20 µl of the resolution solution and 20 µl of reference solution (b). Record the chromatogram of the resolution solution until the peak corresponding to the principal peak in the chromatogram obtained with reference solution (b) is clearly visible. In the chromatogram obtained with the resolution solution,

identify the peaks due to porcine insulin and human insulin. The test is not valid unless the resolution between the peaks corresponding to human insulin and porcine insulin is at least 1.2. If necessary, adjust the concentration of acetonitrile in the mobile phase until this resolution is achieved.

– *linearity*: inject 20 µl each of reference solutions (b) and (c). The test is not valid unless the area of the principal peak in the chromatogram obtained with reference solution (b) is 10 ± 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c). If this test fails, adjust the injection volume to between 10 µl and 20 µl, in order that the responses are within the linearity range of the detector.

Injection: 20 µl of the test solution.

Calculate the content of porcine insulin $C_{256}H_{381}N_{65}O_{76}S_6$ plus A21 desamido porcine insulin from the area of the principal peak and the area of the peak corresponding to A21 desamido porcine insulin in the chromatograms obtained with the test solution and reference solution (b) and the declared content of porcine insulin plus A21 desamido porcine insulin in *porcine insulin CRS*.

STORAGE

In an airtight container, protected from light, at – 20 °C until released by the manufacturer. When thawed, insulin may be stored at 5 ± 3 °C and used for manufacturing preparations within a short period of time. To avoid absorption of humidity from the air during weighing, the insulin must be at room temperature.

01/2008:0854

INSULIN PREPARATIONS, INJECTABLE

Praeparationes insulini iniectabiles

Injectable insulin preparations comply with the requirements for Injections prescribed in the monograph on Parenteral preparations (0520).

DEFINITION

Injectable insulin preparations are sterile preparations of *Insulin, human (0838)*, *Insulin, bovine (1637)* or *Insulin, porcine (1638)*. They contain not less than 90.0 per cent and not more than the equivalent of 110.0 per cent of the amount of insulin stated on the label. They are either solutions or suspensions or they are prepared by combining solutions and suspensions.

PRODUCTION

The methods of preparation are designed to confer suitable properties with respect to the onset and duration of therapeutic action.

The following procedures are carried out in a suitable sequence, depending on the method of preparation:

– addition of suitable antimicrobial preservatives;
– addition of a suitable substance or substances to render the preparation isotonic with blood;
– addition of a suitable substance or substances to adjust the pH to the appropriate value;
– determination of the strength of the insulin-containing component or components followed, where necessary, by adjustment so that the final preparation contains the requisite number of International Units per millilitre;
– sterilisation by filtration of the insulin-containing component or components; once this procedure has been carried out all subsequent procedures are carried out aseptically using materials that have been sterilised by a suitable method.

In addition, where appropriate, suitable substances are added and suitable procedures carried out to confer the appropriate physical form on the insulin-containing component or components. The final preparation is distributed aseptically into sterile containers which are closed so as to exclude microbial contamination.

TESTS

pH (*2.2.3*). The pH of the solution or suspension is 6.9 to 7.8, unless otherwise prescribed in the specific monograph.

Insulin in the supernatant. For injectable insulin preparations that are suspensions, not more than 2.5 per cent of the total insulin content, unless otherwise stated. Centrifuge 10 ml of the suspension at 1500 *g* for 10 min and carefully separate the supernatant liquid and the residue. Determine the insulin content of the supernatant liquid (*S*) by a suitable method, for example using the chromatographic conditions described under Assay. Calculate the percentage of the insulin in solution from the expression:

$$\frac{100S}{T}$$

where *T* is the total insulin content determined as described under the Assay.

Impurities with molecular masses greater than that of insulin. Examine by size-exclusion chromatography (*2.2.30*).

Test solution. Add 4 µl of *6 M hydrochloric acid R* per millilitre of the preparation to be examined, whether a suspension or a solution, to obtain a clear acid insulin solution. When sampling a suspension, agitate the material prior to sampling in order to obtain a homogeneous sample. If a suspension does not turn clear within 5 min of the initial addition of hydrochloric acid, add small aliquots of acid (less than 4 µl per millilitre) until a solution is obtained. Preparations with concentrations higher than 100 IU/ml need to be diluted with *0.01 M hydrochloric acid* to avoid overloading the column with insulin monomer.

Resolution solution. Use a solution of insulin (approximately 4 mg/ml), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid*, may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about ten days.

Maintain the solutions at 2 °C to 10 °C and use within 30 h (soluble insulin injection) or 7 days (other insulin preparations). If an automatic injector is used, maintain the temperature at 2 °C to 10 °C.

The chromatographic procedure may be carried out using:

– a column 0.3 m long and at least 7.5 mm in internal diameter packed with *hydrophilic silica gel for chromatography R* (5 µm to 10 µm), of a grade suitable for the separation of insulin monomer from dimers and polymers;
– as mobile phase at a flow rate of 0.5 ml/min a mixture consisting of 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile R* and 65 volumes of a 1.0 g/l solution of *arginine R*; filter and degas;

– as detector a spectrophotometer set at 276 nm.

Equilibration of the column. Before using a new column for chromatographic analysis, equilibrate by repeated injections of an insulin solution containing high molecular mass proteins. This can be done by at least three injections of the resolution solution. The column is equilibrated when repeatable results are obtained from two subsequent injections. If protamine-containing samples are to be analysed, the equilibration of the column is performed using a solution containing protamine.

Inject 100 µl of the resolution solution. When the chromatograms are recorded under the prescribed conditions, the retention times are: polymeric insulin complexes or covalent insulin-protamine complex: about 13 min to 17 min, covalent insulin dimer: about 17.5 min, insulin monomer: about 20 min, salts: about 22 min. If the sample solution contains preservatives, for example methyl paraben, *m*-cresol or phenol, these compounds elute later. The test is not valid unless the resolution, defined by the ratio of the height of the dimer peak to the height above the baseline of the valley separating the monomer and dimer peaks, is at least 2.0.

Inject 100 µl of the test solution. Record the chromatogram for approximately 35 min. In the chromatogram obtained, the sum of the areas of any peak with a retention time less than that of the insulin peak is not greater than 3.0 per cent (protamine containing preparations) or 2.0 per cent (non-protamine containing preparations) of the total area of the peaks. Disregard any peak with a retention time greater than that of the insulin peak.

Related proteins. Examine by liquid chromatography (*2.2.29*) as described under Assay, following the elution conditions as described in the table below:

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)	Comment
0 - 30	42	58	isocratic
30 - 44	42 → 11	58 → 89	linear gradient
44 - 50	11	89	isocratic

Maintain the solutions at 2 °C to 10 °C and use within 24 h. Perform a system suitability check (resolution, linearity) as described under Assay. If necessary, the relative proportions of the mobile phases may be adjusted to ensure complete elution of A21 desamido porcine insulin before commencement of the gradient. The profile of the gradient may also be adjusted to ensure complete elution of all insulin related impurities.

Inject 20 µl of the test solution and 20 µl of either reference solution (a), for insulin preparations containing 100 IU/ml, or reference solution (b), for insulin preparations containing 40 IU/ml. If necessary, adjust the injection volume to a volume between 10 µl and 20 µl in accordance with the results obtained in the test for linearity as described under Assay. Record the chromatograms for approximately 50 min. If necessary, make further adjustments to the mobile phase in order to ensure that the antimicrobial preservatives present in the test solution are well separated from the insulin and show a shorter retention time. A small reduction in the concentration of acetonitrile increases the retention time of the insulin peaks relatively more than those of the preservatives. In the chromatogram obtained with either reference solution (a), or reference solution (b), as appropriate, A21 desamido insulin appears as a small peak after the principal peak and has a retention time of about 1.3 relative to the principal peak, due to insulin. In the chromatogram obtained with the test solution the area of the peak due to A21 desamido insulin is not greater than 5.0 per cent of the total area of the peaks; the sum of the areas of any other peaks, apart from those due to insulin and A21 desamido insulin is not greater than 6.0 per cent of the total area of the peaks. Disregard the peaks due to the preservatives and protamine (early eluting peaks).

Total zinc. Not more than the amount stated in the individual monograph, determined by atomic absorption spectrometry (*2.2.23, Method I*).

Use the following method, unless otherwise prescribed in the specific monograph.

Test solution. Shake the preparation gently and dilute a volume containing 200 IU of insulin to 25.0 ml with *0.01 M hydrochloric acid*. Dilute if necessary to a suitable concentration of zinc (for example 0.4 µg to 1.6 µg of Zn per millilitre) with *0.01 M hydrochloric acid*.

Reference solutions. Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/ml Zn) R* with *0.01 M hydrochloric acid*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 litres of air and 2 litres of acetylene per minute).

Zinc in solution. Where applicable, not more than the amount stated in the individual monograph, determined by atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Centrifuge the preparation to be examined and dilute 1 ml of the clear supernatant liquid obtained to 25.0 ml with *water R*. Dilute if necessary to a suitable concentration of zinc (for example 0.4 µg to 1.6 µg of Zn per millilitre) with *water R*.

Reference solutions. Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/ml Zn) R* with *0.01 M hydrochloric acid*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 litres of air and 2 litres of acetylene per minute).

Bacterial endotoxins (*2.6.14*): less than 80 IU per 100 IU of insulin.

ASSAY

Examine by liquid chromatography (*2.2.29*).

Test solution. Add 4 µl of *6 M hydrochloric acid R* per millilitre of the preparation to be examined, whether a suspension or a solution, to obtain a clear solution. When sampling a suspension, shake the material prior to sampling in order to obtain a homogeneous sample. If a suspension does not turn clear within 5 min of the initial addition of acid, add small aliquots of acid (less than 4 µl per millilitre) until a solution is obtained. For a preparation containing more than 100 IU ml, an additional dilution with *0.01 M hydrochloric acid* is necessary to avoid overloading the column.

Reference solution (a). For a preparation containing a single species of insulin, dissolve in *0.01 M hydrochloric acid*, as appropriate, the contents of a vial of *human insulin CRS*, *porcine insulin CRS* or *bovine insulin CRS* to obtain a concentration of 4.0 mg/ml. For a preparation containing both bovine and porcine insulins, mix 1.0 ml of a solution containing 4.0 mg of *bovine insulin CRS* per millilitre of *0.01 M hydrochloric acid* and 1.0 ml of a solution containing 4.0 mg of *porcine insulin CRS* per millilitre of *0.01 M hydrochloric acid. Reference solution (a) is used for the assay of insulin preparations containing 100 IU/ml.*

Reference solution (b). Dilute 4.0 ml of reference solution (a) to 10.0 ml with *0.01 M hydrochloric acid. Reference solution (b) is used for the assay of insulin preparations containing 40 IU/ml.*

Reference solution (c). Dissolve the contents of a vial of *human insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml.

Reference solution (d). Dissolve the contents of a vial of *porcine insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/ml.

Reference solution (e). Dilute 1.0 ml of reference solution (a) to 10.0 ml with *0.01 M hydrochloric acid.*

Reference solution (f). Dilute 1.0 ml of reference solution (b) to 10.0 ml with *0.01 M hydrochloric acid.*

Resolution solution. Mix 1.0 ml of reference solution (c) and 1.0 ml of reference solution (d).

Maintain the solutions at 2 °C to 10 °C and use within 48 h. If an automatic injector is used, maintain the temperature at 2 °C to 10 °C.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm);
– as mobile phase at a flow rate of 1 ml/min the following solutions prepared and maintained at a temperature not lower than 20 °C:

  Mobile phase A. Dissolve 28.4 g of *anhydrous sodium sulphate R* in *water R* and dilute to 1000 ml with the same solvent; add 2.7 ml of *phosphoric acid R*; adjust the pH to 2.3, if necessary, with *ethanolamine R*; filter and degas;

  Mobile phase B. Mix 550 ml of mobile phase A with 450 ml of *acetonitrile R*. Warm the solution to a temperature not lower than 20 °C in order to avoid precipitation (mixing of mobile phase A with acetonitrile is endothermic); filter and degas;
– as detector a spectrophotometer set at 214 nm;

maintaining the temperature of the column at 40 °C.

Elute with a mixture of 42 volumes of mobile phase A and 58 volumes of mobile phase B, adjusted if necessary.

Inject 20 µl of the resolution solution and 20 µl of reference solution (d). Record the chromatogram of the resolution solution until the peak corresponding to the principal peak in the chromatogram obtained with reference solution (d) is clearly visible. In the chromatogram obtained with the resolution solution, identify the peaks due to porcine insulin and human insulin. The test is not valid unless the resolution between the peaks due to human insulin and porcine insulin is at least 1.2. If necessary, adjust the concentration of acetonitrile in the mobile phase until this resolution is achieved.

Inject 20 µl of the test solution and 20 µl of either reference solutions (a) and (e), for insulin preparations containing 100 IU/ml, or 20 µl of reference solutions (b) and (f), for insulin preparations containing 40 IU/ml. If necessary, make further adjustments of the mobile phase in order to ensure that the antimicrobial preservatives present in the test solution are well separated from the insulin and show shorter retention times. A small reduction in the concentration of acetonitrile increases the retention time of the insulin peaks relatively more than those of the preservatives. If necessary, after having carried out the chromatography of a solution wash the column with a mixture of equal volumes of *acetonitrile R* and *water R* for a sufficient time to ensure elution of any interfering substances before injecting the next solution. The test is not valid unless the area of the principal peak in the chromatogram obtained with reference solution (a) or (b) is 10 ± 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) or (f). If this test fails, adjust the injection volume between 10 µl and 20 µl, in order to be in the linearity range of the detector.

Calculate the content of insulin plus A21 desamido insulin from the area of the peak due to the bovine, porcine or human insulin and that of any peak due to the A21 desamido insulin, using the declared content of insulin plus A21 desamido insulin in *bovine insulin CRS*, *porcine insulin CRS* or *human insulin CRS*, as appropriate. For preparations containing both bovine and porcine insulin use the sum of the areas of both the bovine and porcine insulin peaks and of the peaks due to the A21 desamido insulin[(1)] derivatives.

STORAGE

Unless otherwise prescribed, store in a sterile, airtight, tamper-proof container, protected from light, at a temperature of 2 °C to 8 °C. Insulin preparations are not to be frozen.

LABELLING

The label states:

– the potency in International Units per millilitre;
– the concentration in terms of the number of milligrams of insulin per millilitre (for preparations containing both bovine insulin and porcine insulin the concentration is stated as the combined amount of both insulins);
– where applicable, that the substance is produced by enzymatic modification of porcine insulin;
– where applicable, that the substance is produced by recombinant DNA technology;
– where applicable, the animal species of origin;
– that the preparation must not be frozen;
– where applicable, that the preparation must be resuspended before use.

INSULIN ZINC INJECTABLE SUSPENSION

Insulini zinci suspensio iniectabilis

Insulin zinc injectable suspension complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.

DEFINITION

Insulin zinc injectable suspension is a sterile neutral suspension of bovine insulin and/or porcine insulin or of human insulin with a suitable zinc salt; the insulin is in a form which is practically insoluble in water.

PRODUCTION

Insulin zinc injectable suspension is prepared by carrying out the procedures described in the monograph on *Insulin preparations, injectable (0854).*

Insulin zinc injectable suspension is produced by mixing insulin zinc injectable suspension (crystalline) and insulin zinc injectable suspension (amorphous) in a ratio of 7 to 3.

(1) 100 IU are equivalent to 3.47 mg of human insulin, to 3.45 mg of porcine insulin and to 3.42 mg of bovine insulin.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant liquid; the sediment is readily resuspended by gently shaking. When examined under a microscope, the majority of the particles are seen to be rhombohedral crystals with a maximum dimension when measured from corner to corner through the crystal greater than 10 µm but rarely exceeding 40 µm; a considerable proportion of the particles are seen to have no uniform shape and a maximum dimension rarely exceeding 2 µm.

IDENTIFICATION

Examine the chromatograms obtained in the Assay.

For preparations made from a single species of insulin (bovine, porcine or human), the position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution. For preparations made from a mixture of bovine and porcine insulin, the positions of the peaks due to the two insulins in the chromatogram obtained with the test solution correspond to those of the principal peaks in the chromatogram obtained with the appropriate reference solution.

TESTS

Insulin not extractable with buffered acetone solution: 63 per cent to 77 per cent of the total insulin content. Centrifuge a volume of the substance to be examined containing 200 IU of insulin and discard the supernatant liquid. Suspend the residue in 1.65 ml of *water R*, add 3.3 ml of *buffered acetone solution R*, stir for 3 min, again centrifuge, discard the supernatant liquid and repeat all the operations with the residue. Dissolve the residue using a suitable procedure, for example dissolve in *0.1 M hydrochloric acid* to give a final volume of 2.0 ml. Determine the insulin content of the residue (*R*) and determine the total insulin content (*T*) of an equal volume of the suspension by a suitable method. Calculate the percentage of insulin not extractable with buffered acetone solution from the expression:

$$\frac{100R}{T}$$

Total zinc: 0.12 mg to 0.25 mg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854)*.

Zinc in solution: 20 per cent to 65 per cent of the total zinc is in the form of zinc in solution. Determine by the method described in the monograph on *Insulin preparations, injectable (0854)*.

01/2008:0835
corrected 6.0

INSULIN ZINC INJECTABLE SUSPENSION (AMORPHOUS)

Insulini zinci amorphi suspensio iniectabilis

Insulin zinc injectable suspension (amorphous) complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.

DEFINITION

Insulin zinc injectable suspension (amorphous) is a sterile neutral suspension of bovine, porcine or human insulin complexed with a suitable zinc salt; the insulin is in a form which is practically insoluble in water.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant liquid; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to have no uniform shape and a maximum dimension rarely exceeding 2 µm.

IDENTIFICATION

Examine the chromatograms obtained in the Assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution.

TESTS

Total zinc. 0.12 mg to 0.25 mg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854)*.

Zinc in solution. 20 per cent to 65 per cent of the total zinc is in the form of zinc in solution. Determine by the method described in the monograph on *Insulin preparations, injectable (0854)*.

INSULIN ZINC INJECTABLE SUSPENSION (CRYSTALLINE)

Insulini zinci cristallini suspensio iniectabilis

Insulin zinc injectable suspension (crystalline) complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.

DEFINITION

Insulin zinc injectable suspension (crystalline) is a sterile neutral suspension of bovine, porcine or human insulin, complexed with a suitable zinc salt; the insulin is in a form which is practically insoluble in water.

CHARACTERS

A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant liquid; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to be

rhombohedral crystals, the majority having a maximum dimension when measured from corner to corner through the crystal greater than 10 µm but rarely exceeding 40 µm.

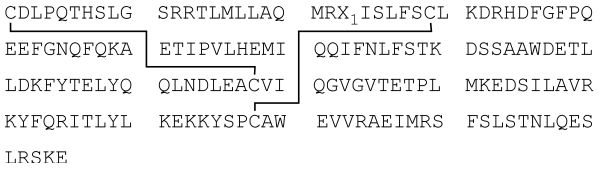
IDENTIFICATION

Examine the chromatograms obtained in the Assay. The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution.

TESTS

Insulin not extractable with buffered acetone solution. Not less than 90 per cent of the total insulin content. Centrifuge a volume of the substance to be examined containing 200 IU of insulin and discard the supernatant liquid. Suspend the residue in 1.65 ml of *water R*, add 3.3 ml of *buffered acetone solution R*, stir for 3 min, again centrifuge, discard the supernatant liquid and repeat all the operations with the residue. Dissolve the residue using a suitable procedure, for example dissolve in *0.1 M hydrochloric acid* to give a final volume of 2.0 ml. Determine the insulin content of the residue (*R*) and determine the total insulin content (*T*) of an equal volume of the suspension by a suitable method. Calculate the percentage of insulin not extractable with buffered acetone solution from the expression:

$$\frac{100R}{T}$$



Total zinc: 0.12 mg to 0.25 mg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854)*.

Zinc in solution: 20 per cent to 65 per cent of the total zinc is in the form of zinc in solution. Determine by the method described in the monograph on *Insulin preparations, injectable (0854)*.

01/2008:1110

INTERFERON ALFA-2 CONCENTRATED SOLUTION

Interferoni alfa-2 solutio concentrata

DEFINITION

Interferon alfa-2 concentrated solution is a solution of a protein that is produced according to the information coded by the alfa-2 sub-species of interferon alfa gene and that exerts non-specific antiviral activity, at least in homologous cells, through cellular metabolic processes involving synthesis of both ribonucleic acid and protein. Interferon alfa-2 concentrated solution also exerts antiproliferative activity. Different types of alfa-2 interferon, varying in the amino acid residue at position 23, are designated by a letter in lower case.

Designation	Residue at position 23 (X_1)
alfa-2a	Lys
alfa-2b	Arg

This monograph applies to interferon alfa-2a and -2b concentrated solutions.

The potency of interferon alfa-2 concentrated solution is not less than 1.4×10^8 IU per milligram of protein. Interferon alfa-2 concentrated solution contains not less than 2×10^8 IU of interferon alfa-2 per millilitre.

PRODUCTION

Interferon alfa-2 concentrated solution is produced by a method based on recombinant DNA (rDNA) technology using bacteria as host cells. It is produced under conditions designed to minimise microbial contamination of the product.

Interferon alfa-2 concentrated solution complies with the following additional requirements.

Host-cell-derived proteins. The limit is approved by the competent authority.

Host-cell- or vector-derived DNA. The limit is approved by the competent authority.

CHARACTERS

A clear, colourless or slightly yellowish liquid.

IDENTIFICATION

A. It shows the expected biological activity (see Assay).

B. Examine by isoelectric focusing.

Test solution. Dilute the preparation to be examined with *water R* to a protein concentration of 1 mg/ml.

Reference solution. Prepare a 1 mg/ml solution of the appropriate *interferon alfa-2 CRS* in *water R*.

Isoelectric point calibration solution pI range 3.0 to 10.0. Prepare and use according to the manufacturer's instructions.

Use a suitable apparatus connected with a recirculating temperature controlled water-bath set at 10 °C and gels for isoelectric focusing with a pH gradient from 3.5 to 9.5. Operate the apparatus in accordance with the manufacturer's instructions. Use as the anode solution *phosphoric acid R* (98 g/l H_3PO_4) and as the cathode solution *1 M sodium hydroxide*. Samples are applied to the gel by filter papers. Place sample application filters on the gel close to the cathode.

Apply 15 µl of the test solution and 15 µl of the reference solution. Start the isoelectric focusing at 1500 V and 50 mA. Turn off the power after 30 min, remove the application filters and reconnect the power supply for 1 h. Keep the power constant during the focusing process. After focusing, immerse the gel in a suitable volume of a solution containing 115 g/l of *trichloroacetic acid R* and 34.5 g/l of *sulphosalicylic acid R* in *water R* and agitate the container gently for 60 min. Transfer the gel to a mixture of 32 volumes of *glacial acetic acid R*, 100 volumes of *anhydrous ethanol R* and 268 volumes of *water R*, and soak for 5 min. Immerse the gel for 10 min in a staining solution prewarmed to 60 °C in which 1.2 g/l of *acid blue 83 R* has been added to the previous mixture of glacial acetic acid, ethanol and water. Wash the gel in several containers with the previous mixture of glacial acetic acid, ethanol and water and keep the gel in this mixture until the background is clear (12 h to 24 h). After adequate destaining, soak the gel for 1 h in a 10 per cent *V/V* solution of *glycerol R* in the previous mixture of glacial acetic acid, ethanol and water.

The principal bands of the electropherogram obtained with the test solution correspond in position to the principal bands of the electropherogram obtained with the reference solution. Plot the migration distances of the

isoelectric point markers versus their isoelectric points and determine the isoelectric points of the principal components of the test solution and the reference solution. They do not differ by more than 0.2 pI units. The test is not valid unless the isoelectric point markers are distributed along the entire length of the gel and the isoelectric points of the principal bands in the electropherogram obtained with the reference solution are between 5.8 and 6.3.

C. Examine the electropherograms obtained under reducing conditions in the test for impurities of molecular masses differing from that of interferon alfa-2. The principal band in the electropherogram obtained with test solution (a) corresponds in position to the principal band in the electropherogram obtained with reference solution (a).

D. Examine by peptide mapping.

Test solution. Dilute the preparation to be examined in *water R* to a protein concentration of 1.5 mg/ml. Transfer 25 µl to a polypropylene or glass tube of 1.5 ml capacity. Add 1.6 µl of *1 M phosphate buffer solution pH 8.0 R*, 2.8 µl of a freshly prepared 1.0 mg/ml solution of *trypsin for peptide mapping R* in *water R* and 3.6 µl of *water R* and mix vigorously. Cap the tube and place it in a water-bath at 37 °C for 18 h, then add 100 µl of a 573 g/l solution of *guanidine hydrochloride R* and mix well. Add 7 µl of 154.2 g/l solution of *dithiothreitol R* and mix well. Place the capped tube in boiling water for 1 min. Cool to room temperature.

Reference solution. Prepare at the same time and in the same manner as for the test solution but use a 1.5 mg/ml solution of the appropriate *interferon alfa-2 CRS* in *water R*.

Examine by liquid chromatography (*2.2.29*).

The chromatographic procedure may be carried out using:

– a stainless steel column 0.10 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm,

– as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. Dilute 1 ml of *trifluoroacetic acid R* to 1000 ml with *water R*,

Mobile phase B. To 100 ml of *water R* add 1 ml of *trifluoroacetic acid R* and dilute to 1000 ml with *acetonitrile for chromatography R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)	Comment
0 - 8	100	0	isocratic
8 - 68	100 → 40	0 → 60	linear gradient
68 - 72	40	60	isocratic
72 - 75	40 → 100	60 → 0	linear gradient
75 - 80	100	0	re-equilibration

– as detector a spectrophotometer set at 214 nm,

maintaining the temperature of the column at 30 °C.

Equilibrate the column with mobile phase A for at least 15 min.

Inject 100 µl of the test solution and 100 µl of the reference solution. The test is not valid unless the chromatogram obtained with each solution is qualitatively similar to the chromatogram of interferon alfa-2 digest supplied with the appropriate *interferon alfa-2 CRS*.

The profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

TESTS

Impurities of molecular masses differing from that of interferon alfa-2. Examine by SDS polyacrylamide gel electrophoresis (*2.2.31*). The test is performed under both reducing and non-reducing conditions, using resolving gels of 14 per cent acrylamide and silver staining as the detection method.

Sample buffer (non-reducing conditions). Mix equal volumes of *water R* and *concentrated SDS PAGE sample buffer R*.

Sample buffer (reducing conditions). Mix equal volumes of *water R* and *concentrated SDS PAGE sample buffer for reducing conditions R* containing 2-mercaptoethanol as the reducing agent.

Test solution (a). Dilute the preparation to be examined in sample buffer to a protein concentration of 0.5 mg/ml.

Test solution (b). Dilute 0.20 ml of test solution (a) to 1 ml with sample buffer.

Reference solution (a). Prepare a 0.625 mg/ml solution of the appropriate *interferon alfa-2 CRS* in sample buffer.

Reference solution (b). Dilute 0.20 ml of reference solution (a) to 1 ml with sample buffer.

Reference solution (c). Dilute 0.20 ml of reference solution (b) to 1 ml with sample buffer.

Reference solution (d). Dilute 0.20 ml of reference solution (c) to 1 ml with sample buffer.

Reference solution (e). Dilute 0.20 ml of reference solution (d) to 1 ml with sample buffer.

Reference solution (f). Use a solution of molecular mass standards suitable for calibrating SDS-PAGE gels in the range 15 kDa to 67 kDa.

Place test and reference solutions, contained in covered test-tubes, on a water-bath for 2 min.

Apply 10 µl of reference solution (f) and 50 µl of each of the other solutions to the stacking gel wells. Perform the electrophoresis under the conditions recommended by the manufacturer of the equipment. Detect proteins in the gel by silver staining.

The test is not valid unless: the validation criteria are met (*2.2.31*); a band is seen in the electropherogram obtained with reference solution (e); and a gradation of intensity of staining is seen in the electropherograms obtained, respectively, with test solution (a) and test solution (b) and with reference solutions (a) to (e).

The electropherogram obtained with test solution (a) under reducing conditions may show, in addition to the principal band, less intense bands with molecular masses lower than the principal band. No such band is more intense than the principal band in the electropherogram obtained with reference solution (d) (1.0 per cent) and not more than 3 such bands are more intense than the principal band in the electropherogram obtained with reference solution (e) (0.2 per cent).

The electropherogram obtained with test solution (a) under non-reducing conditions may show, in addition to the principal band, less intense bands with molecular masses higher than the principal band. No such band is more intense than the principal band in the electropherogram obtained with reference solution (d) (1.0 per cent) and not more than 3 such bands are more intense than the principal band in the electropherogram obtained with reference solution (e) (0.2 per cent).

Related proteins. Examine by liquid chromatography (*2.2.29*).

Test solution. Dilute the preparation to be examined with *water R* to a protein concentration of 1 mg/ml.

0.25 per cent m/m hydrogen peroxide solution. Dilute *dilute hydrogen peroxide solution R* in *water R* in order to obtain a 0.25 per cent *m/m* solution.

Reference solution. To a volume of the test solution, add a suitable volume of 0.25 per cent *m/m* hydrogen peroxide solution to give a final hydrogen peroxide concentration of 0.005 per cent *m/m*, and allow to stand at room temperature for 1 h, or for the length of time that will generate about 5 per cent oxidised interferon. Add 12.5 mg of *L-methionine R* per millilitre of solution. Allow to stand at room temperature for 1 h. Store the solutions for not longer than 24 h at a temperature of 2-8 °C.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm,

– as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. To 700 ml of *water R* add 2 ml of *trifluoroacetic acid R* and 300 ml of *acetonitrile for chromatography R*,

Mobile phase B. To 200 ml of *water R* add 2 ml of *trifluoroacetic acid R* and 800 ml of *acetonitrile for chromatography R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)	Comment
0 - 1	72	28	isocratic
1 - 5	72 → 67	28 → 33	linear gradient
5 - 20	67 → 63	33 → 37	linear gradient
20 - 30	63 → 57	37 → 43	linear gradient
30 - 40	57 → 40	43 → 60	linear gradient
40 - 42	40	60	isocratic
42 - 50	40 → 72	60 → 28	linear gradient
50 - 60	72	28	re-equilibration

– as detector a spectrophotometer set at 210 nm.

Equilibrate the column with the mobile phases in the initial gradient ratio for at least 15 min. Inject 50 µl of each solution.

In the chromatograms obtained, interferon alfa-2 elutes at a retention time of about 20 min. In the chromatogram obtained with the reference solution a peak related to oxidised interferon appears at a retention time of about 0.9 relative to the principal peak. The test is not valid unless the resolution between the peaks corresponding to oxidised interferon and interferon is at least 1.0. Consider only the peaks whose retention time is 0.7 to 1.4 relative to that of the principal peak. In the chromatogram obtained with the test solution, the area of any peak, apart from the principal peak, is not greater than 3.0 per cent of the total area of all of the peaks. The sum of the areas of any peaks other than the principal peak is not greater than 5.0 per cent of the total area of all of the peaks.

Bacterial endotoxins (*2.6.14*): less than 100 IU in the volume that contains 1.0 mg of protein.

ASSAY

Protein

Test solution. Dilute the preparation to be examined with *water R* to obtain a concentration of about 0.5 mg/ml of interferon alfa-2.

Reference solutions. Prepare a stock solution of 0.5 mg/ml of *bovine albumin R*. Prepare 8 dilutions of the stock solution containing between 3 µg/ml and 30 µg/ml of *bovine albumin R*.

Prepare 30-fold and 50-fold dilutions of the test solution. Add 1.25 ml of a mixture prepared the same day by combining 2.0 ml of a 20 g/l solution of *copper sulphate R* in *water R*, 2.0 ml of a 40 g/l solution of *sodium tartrate R* in *water R* and 96.0 ml of a 40 g/l solution of *sodium carbonate R* in *0.2 M sodium hydroxide* to test-tubes containing 1.5 ml of *water R* (blank), 1.5 ml of the different dilutions of the test solution or 1.5 ml of the reference solutions. Mix after each addition. After approximately 10 min, add to each test-tube 0.25 ml of a mixture of equal volumes of *water R* and *phosphomolybdotungstic reagent R*. Mix after each addition. After approximately 30 min, measure the absorbance (*2.2.25*) of each solution at 750 nm using the blank as the compensation liquid. Draw a calibration curve from the absorbances of the 8 reference solutions and the corresponding protein contents and read from the curve the content of protein in the test solution.

Potency

The potency of interferon alfa-2 is estimated by comparing its effect to protect cells against a viral cytopathic effect with the same effect of the appropriate International Standard of human recombinant interferon alfa-2 or of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the appropriate International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Carry out the assay by a suitable method, based on the following design.

Use, in standard culture conditions, an established cell line sensitive to the cytopathic effect of a suitable virus (a human diploid fibroblast cell line, free of microbial contamination, responsive to interferon and sensitive to encephalomyocarditis virus, is suitable).

The following cell cultures and virus have been shown to be suitable: MDBK cells (ATCC No. CCL22), or Mouse L cells (NCTC clone 929; ATCC No. CCL 1) as the cell culture and vesicular stomatitis virus VSV, Indiana strain (ATCC No. VR-158) as the infective agent; or A-549 cells (ATCC No. CCL-185) responsive to interferon as the cell culture, and encephalomyocarditis virus (ATCC No. VR-129B) as the infective agent.

Incubate in at least 4 series, cells with 3 or more different concentrations of the preparation to be examined and the reference preparation in a microtitre plate and include in each series appropriate controls of untreated cells. Choose the concentrations of the preparations such that the lowest concentration produces some protection and the largest concentration produces less than maximal protection against the viral cytopathic effect. Add at a suitable time the cytopathic virus to all wells with the exception of a sufficient number of wells in all series, which are left with uninfected control cells. Determine the cytopathic effect of virus quantitatively with a suitable method. Calculate the potency of the preparation to be examined by the usual statistical methods for a parallel line assay.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits of the estimated potency (P = 0.95) are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

Store in an airtight container, protected from light, at or below – 20 °C.

LABELLING

The label states:

– the type of interferon (alfa-2a or alfa-2b),
– the type of production.

01/2008:1440

INTERFERON GAMMA-1b CONCENTRATED SOLUTION

Interferoni gamma-1b solutio concentrata

$C_{734}H_{1166}N_{204}O_{216}S_5$ M_r 16 465

DEFINITION

Interferon gamma-1b concentrated solution is a solution of the *N*-terminal methionyl form of interferon gamma, a protein which is produced and secreted by human antigen-stimulated T lymphocytes in response to viral infections and various other inducers. It has specific immunomodulatory properties, such as potent phagocyte-activating effects. The protein consists of non-covalent dimers of two identical monomers. The formula of the monomer is as follows:

M

QDPYVKEAEN LKKYFNAGHS DVADNGTLFL GILKNWKEES
DRKIMQSQIV SFYFKLFKNF KDDQSIQKSV ETIKEDMNVK
FFNSNKKKRD DFEKLTNYSV TDLNVQRKAI HELIQVMAEL
SPAAKTGKRK RSQMLFRGR

The potency of interferon gamma-1b is not less than 20×10^6 IU per milligram of protein. Interferon gamma-1b concentrated solution contains not less than 30×10^6 IU of interferon gamma-1b per millilitre.

PRODUCTION

Interferon gamma-1b concentrated solution is produced by a method based on recombinant DNA technology, using bacteria as host-cells. It is produced under conditions designed to minimise microbial contamination.

Interferon gamma-1b concentrated solution complies with the following additional requirements.

Host-cell derived proteins. The limit is approved by the competent authority.

Host-cell- and vector-derived DNA. The limit is approved by the competent authority.

CHARACTERS

A clear, colourless or slightly yellowish liquid.

IDENTIFICATION

A. It shows the expected biological activity when tested as prescribed in the assay.
B. Examine the electropherograms obtained in the test for impurities of molecular masses differing from that of interferon gamma-1b. The principal bands in the electropherogram obtained with the test solution correspond in position to the principal bands in the electropherogram obtained with reference solution (a).
C. Examine by peptide mapping.

Solution A. Prepare a solution containing 1.2 g/l of *tris(hydroxymethyl)aminomethane R*, 8.2 g/l of *anhydrous sodium acetate R*, 0.02 g/l of *calcium chloride R* and adjust to pH 8.3 (*2.2.3*) with *dilute acetic acid R*. Add *polysorbate 20 R* to a concentration of 0.1 per cent *V/V*.

Test solution. Desalt a volume of the preparation to be examined containing 1 mg of protein by a suitable procedure. For example, filter in a microcentrifuge tube and reconstitute with 500 µl of solution A. Add 10 µl of a freshly prepared 1 mg/ml solution of *trypsin for peptide mapping R* in *water R* and mix gently by inversion. Incubate at 30 °C to 37 °C for 24 h, add 100 µl of *phosphoric acid R* per millilitre of digested sample and mix by inversion.

Reference solution. Dilute *interferon gamma-1b CRS* in *water R* to obtain a concentration of 1 mg/ml. Prepare as for the test solution, ensuring that all procedures are carried out simultaneously and under identical conditions.

Examine by liquid chromatography (*2.2.29*).

The chromatographic procedure may be carried out using:

– a stainless steel column, 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (10 µm),
– as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A (*0.05 M sodium phosphate buffer solution pH 3.3*). Solution I: dissolve 7.80 g of *sodium dihydrogen phosphate R* in *water R* and dilute to 1000.0 ml with the same solvent. Solution II: dilute 0.33 ml of *phosphoric acid R* to 100.0 ml with *water R*. Mix 920 ml of solution I and 80 ml of solution II. Adjust the pH (*2.2.3*) if necessary,

Mobile phase B. Acetonitrile for chromatography R,

with the following elution conditions (if necessary, the gradient may be modified to improve the separation of the digest):

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 30	100 → 80	0 → 20
30 - 50	80 → 60	20 → 40
50 - 51	60 → 30	40 → 70
51 - 59	30	70
59 - 60	30 → 100	70 → 0

– as detector a spectrophotometer set at 214 nm,

maintaining the temperature of the column at 40 °C.

Equilibrate the column for at least 15 min at the initial elution composition. Carry out a blank run using the above-mentioned gradient.

Inject 100 µl of the test solution and 100 µl of the reference solution. The test is not valid unless the chromatogram obtained with each solution is qualitatively similar to the chromatogram of interferon gamma-1b digest supplied with *interferon gamma-1b CRS*. The profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

D. Examine by *N*-terminal sequence analysis.

Use an automated solid-phase sequencer, operated in accordance with the manufacturer's instructions.

Equilibrate by a suitable procedure the equivalent of 100 µg of interferon gamma-1b in a 10 g/l solution of *ammonium hydrogen carbonate R*, pH 9.0.

Identify the phenylthiohydantoin (PTH)-amino acids released at each sequencing cycle by reverse-phase liquid chromatography. The procedure may be carried out using the column and reagents recommended by the manufacturer of the sequencing equipment for the separation of PTH-amino acids.

The separation procedure is calibrated using:

– the mixture of PTH-amino acids provided by the manufacturer, with the gradient conditions adjusted as indicated to achieve optimum resolution of all amino acids,

– a sample from a blank sequencing cycle, obtained as recommended by the equipment manufacturer.

The first fifteen amino acids are:

Met-Gln-Asp-Pro-Tyr-Val-Lys-Glu-Ala-Glu-Asn-Leu-Lys-Lys-Tyr.

TESTS

Appearance. The preparation to be examined is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

pH (*2.2.3*). The pH of the preparation to be examined is 4.5 to 5.5.

Covalent dimers and oligomers. Not greater than 2 per cent, determined by size-exclusion chromatography (*2.2.30*).

Test solution. Dilute the preparation to be examined with the mobile phase to a protein concentration of 0.1 mg/ml.

Reference solution (a). Dilute *interferon gamma-1b CRS* with the mobile phase to a protein concentration of 0.1 mg/ml.

Reference solution (b). Prepare a mixture of the following molecular mass standards: bovine albumin, ovalbumin, trypsinogen, lysozyme, at a concentration of 0.1 mg/ml to 0.2 mg/ml for each standard.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.3 m long and 7.8 mm in internal diameter packed with *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins in the molecular weight range of 10 000 to 500 000 (5 µm),

– as mobile phase at a flow rate of 1.0 ml/min a mixture prepared as follows (0.2 M sodium phosphate buffer solution pH 6.8). Solution I: dissolve 31.2 g of *sodium dihydrogen phosphate R* and 1.0 g of *sodium dodecyl sulphate R* in *water R* and dilute to 1000.0 ml with the same solvent. Solution II: dissolve 28.4 g of *anhydrous disodium hydrogen phosphate R* and 1.0 g of *sodium dodecyl sulphate R* in *water R* and dilute to 1000.0 ml with the same solvent. Mix 450 ml of solution I and 550 ml of solution II. Adjust the pH (*2.2.3*) if necessary,

– as detector a spectrophotometer set at 210 nm to 214 nm.

Inject 200 µl of each solution. The test is not valid unless: the molecular mass standards in reference solution (b) are well separated; the retention time of the principal peak in the chromatogram obtained with reference solution (a) is between the retention time of trypsinogen and lysozyme in the chromatogram obtained with reference solution (b).

Compare the chromatograms obtained with the test solution and with reference solution (a). There are no additional shoulders or peaks in the chromatogram obtained with the test solution compared with the chromatogram obtained with reference solution (a).

Calculate the percentage content of covalent dimers and oligomers.

Monomer and aggregates. Examine by size-exclusion chromatography (*2.2.30*). The content of monomer and aggregates is not greater than 2 per cent.

Solution A. Prepare a solution of the following composition: 0.59 g/l of *succinic acid R* and 40 g/l of *mannitol R*, adjusted to pH 5.0 (*2.2.3*) with *sodium hydroxide solution R*.

Test solution. Dilute the preparation to be examined with solution A to a protein concentration of 1 mg/ml.

Reference solution. Dilute *interferon gamma-1b CRS* with solution A to a protein concentration of 1 mg/ml.

Resolution solution. Prepare 500 µl of a mixture consisting of 0.04 mg/ml of *bovine albumin R* and 0.2 mg/ml of *interferon gamma-1b CRS* in solution A. Use this solution within 24 h of preparation.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.3 m long and 7.8 mm in internal diameter packed with *hydrophilic silica gel for chromatography R*, of a grade suitable for fractionation of globular proteins in the molecular weight range of 10 000 - 300 000 (5 µm),

– as mobile phase at a flow rate of 0.8 ml/min a 89.5 g/l solution of *potassium chloride R* (1.2 M),

– as detector a spectrophotometer set at 214 nm.

Inject 20 µl of the resolution solution. In the chromatogram obtained, the retention time of the principal peak, corresponding to the native interferon gamma-1b dimer, is about 10 min. bovine albumin elutes at a relative retention time of about 0.85, relative to the main peak. The test is not valid unless the resolution between the peaks corresponding to bovine albumin and interferon gamma-1b is at least 1.5.

Inject 20 µl of the test solution and 20 µl of the reference solution. The chromatograms obtained show principal peaks with identical retention times. Calculate the percentage content of monomer and aggregates from the peak area of the monomer peak and of peaks which elute prior to the native interferon gamma-1b peak in the chromatogram obtained with the test solution, by the normalisation procedure, disregarding any peak due to the solvent.

Deamidated and oxidised forms and heterodimers. Examine by liquid chromatography (*2.2.29*). The content of deamidated and oxidised forms is not greater than 10 per cent. The content of heterodimers is not greater than 3 per cent.

Test solution. Dilute the preparation to be examined with *water R* to a protein concentration of 1 mg/ml.

Reference solution. Dilute *interferon gamma-1b CRS* with *water R* to a protein concentration of 1 mg/ml.

Resolution solution. Use *interferon gamma-1b validation solution CRS*.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.075 m long and 7.5 mm in internal diameter packed with an appropriate hydrophilic polymethacrylate, strong cation exchange gel (10 µm, 100 nm),

– as mobile phase at a flow rate of 1.2 ml/min:

Mobile phase A (*0.05 M ammonium acetate buffer pH 6.5*). A 3.86 g/l solution of *ammonium acetate R*, adjusted to pH 6.5 with *dilute acetic acid R*,

Mobile phase B (*1.2 M ammonium acetate buffer pH 6.5*). A 92.5 g/l solution of *ammonium acetate R*, adjusted to pH 6.5 with *dilute acetic acid R*,

with the following elution conditions (if necessary, the slope of the gradient may be modified to improve the separation).

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 1	100	0
2 - 30	100 → 0	0 → 100
31 - 35	0	100
36 - 37	0 → 100	100 → 0
38 - 47	100	0

– as detector a spectrophotometer set at 280 nm,

maintaining the temperature of the column at 35 °C.

Inject 25 µl of the resolution solution. In the chromatogram obtained, the retention time of the principal peak is about 26 min. Deamidated and oxidised forms co-elute at a relative retention time of about 0.95, relative to the principal peak. The test is not valid unless the resolution, defined by the ratio of the height of the peak corresponding to the deamidated and oxidised forms to the height above the baseline of the valley separating the two peaks, is at least 1.2.

Inject 25 µl of the test solution and 25 µl of the reference solution. The chromatograms obtained show principal peaks with identical retention times. Calculate the percentage content of deamidated and oxidised interferon gamma-1b as a percentage of the area of the main peak. Heterodimers have relative retention times of 0.7 and 0.85 relative to the main peak. Calculate the percentage of heterodimers as a percentage of the sum of the areas of all peaks.

Impurities of molecular masses differing from that of interferon gamma-1b. Examine by polyacrylamide gel electrophoresis (*2.2.31*). The test is performed under both reducing and non-reducing conditions, using resolving gels of 15 per cent acrylamide and silver staining as the detection method.

Sample buffer (non-reducing conditions). Dissolve 3.78 g of *tris(hydroxymethyl)aminomethane R*, 10.0 g of *sodium dodecyl sulphate R* and 0.100 g of *bromophenol blue R* in *water R*. Add 50.0 ml of *glycerol R* and dilute to 80 ml with *water R*. Adjust the pH (*2.2.3*) to 6.8 with *hydrochloric acid R* and dilute to 100 ml with *water R*.

Sample buffer (reducing conditions). Dissolve 3.78 g of *tris(hydroxymethyl)aminomethane R*, 10.0 g of *sodium dodecyl sulphate R* and 0.100 g of *bromophenol blue R* in *water R*. Add 50.0 ml of *glycerol R* and dilute to 80 ml with *water R*. Adjust the pH (*2.2.3*) to 6.8 with *hydrochloric acid R* and dilute to 100 ml with *water R*. Immediately before use, add *dithiothreitol R* to a final concentration of 250 mM.

Test solution. Dilute the preparation to be examined in *water R* to a protein concentration of 1 mg/ml. Dilute 150 µl of the solution with 38 µl of sample buffer.

Reference solution (a). Prepare in the same manner as for the test solution, but using *interferon gamma-1b CRS* instead of the preparation to be examined.

Reference solution (b) (5 ng control). Mix 50 µl of a 0.01 mg/ml solution of *bovine albumin R* with 2000 µl of *water R* and 450 µl of sample buffer.

Reference solution (c) (2 ng control). Mix 20 µl of a 0.01 mg/ml solution of *bovine albumin R* with 2000 µl of *water R* and 450 µl of sample buffer.

Reference solution (d). Use a solution of molecular mass standards suitable for calibrating SDS-polyacrylamide gels in the range of 10 kDa to 70 kDa.

Leave each solution, contained in a test tube, at ambient temperature for 15 min, then store on ice.

Apply 25 µl of each solution to the stacking gel wells. Perform the electrophoresis under the conditions recommended by the manufacturer of the equipment. Detect proteins in the gel by silver staining.

The test is not valid unless: the validation criteria are met (*2.2.31*); a band is seen in the electropherograms obtained with reference solutions (b) and (c).

The principal band in the electropherogram obtained with the test solution is similar in intensity to the principal band in the electropherogram obtained with reference solution (a). In the electropherogram obtained with the test solution, no significant bands are observed that are not present in the electropherogram obtained with reference solution (a) (0.01 per cent). A significant band is defined as any band whose intensity is greater than or equal to that of the band in the electropherogram obtained with reference solution (c).

Norleucine. Not more than 0.2 mole of norleucine per mole of interferon gamma-1b, determined by amino acid analysis.

Test solution. Add 2.5 ml of the preparation to be examined onto a column suitable for the desalting of proteins previously equilibrated with 25 ml of a 10 per cent *V/V* solution of *acetic acid R*. Elute the sample with another 2.5 ml of a 10 per cent *V/V* solution of *acetic acid R*. Determine the protein content by measuring the absorbance of this solution as described under Protein, in the Assay section. Pipette a volume containing the equivalent of 100 µg of interferon gamma-1b into each of three reaction vials. Evaporate to dryness under reduced pressure.

Perform the hydrolysis of the three samples as follows. Add to each reaction vial 200 µl of a 50 per cent *V/V* solution of *hydrochloric acid R* containing 1 per cent *V/V* of *phenol R*, evacuate the samples, purge with nitrogen and hydrolyse in the gas phase. Heat the reaction vials at 110 °C for 22 h. After hydrolysis evaporate to dryness under reduced pressure.

Perform the derivatisation of the samples as follows. Prepare immediately before use a mixture consisting of two volumes of *ethanol R*, one volume of *water R* and one volume of *triethylamine R*. Add 50 µl of this solution to each reaction vial and shake lightly. Evaporate to dryness under reduced pressure. Add to each vial 50 µl of a mixture consisting of 7 volumes of *ethanol R*, one volume of *water R*, one volume of *triethylamine R* and one volume of *phenyl isothiocyanate R*. Shake lightly and allow to stand at room temperature for about 15 min. Evaporate to dryness under reduced pressure. Reconstitute the samples in 250 µl of mobile phase A.

Norleucine stock solution. Prepare a 250 nmol/ml solution of *DL-norleucine R* in *0.01 M hydrochloric acid. This solution may be kept for two months at 4 °C.*

Leucine stock solution. Prepare a 250 nmol/ml solution of *leucine R* in *0.01 M hydrochloric acid. This solution may be kept at 4 °C for two months.*

Reference solution. Mix 10 µl of norleucine stock solution with 100 µl of leucine stock solution in each of the three reaction vials. Evaporate to dryness under reduced pressure. Perform the derivatisation of the samples as described for the preparation of the test solution.

Examine by liquid chromatography (*2.2.29*).

The chromatographic procedure may be carried out using:

– a stainless steel column 0.15 m long and 3.9 mm in diameter packed with *octadecylsilyl silica gel for chromatography R* (4 µm),

– as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. Mix 70 volumes of a 19 g/l solution of *sodium acetate R* containing 0.05 per cent *V/V* of *triethylamine R* and adjusted to pH 6.4 with *dilute acetic acid R* and 30 volumes of mobile phase B,

Mobile phase B. Mix 40 volumes of *water R* and 60 volumes of *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)	Comment
0 - 7	100	0	isocratic
7 - 7.1	100 → 0	0 → 100	linear gradient
7.1 - 10	0	100	washing step
10 - 10.1	0 → 100	100 → 0	linear gradient
10.1 - 15	100	0	re-equilibration

– as detector a spectrophotometer set at 254 nm,

maintaining the temperature of the column at 43 °C.

Inject 50 µl of each solution.

In the chromatograms obtained with the test solution, identify the peaks corresponding to leucine and norleucine. The retention time of norleucine is 6.2 min to 7 min.

Calculate the content of norleucine (in moles of norleucine per mole of interferon gamma-1b) from the peak areas of leucine and norleucine in the chromatograms obtained with the reference and test solutions, considering that there are 10 moles of leucine per mole of interferon gamma-1b.

Bacterial endotoxins (*2.6.14*): less than 5 IU in the volume that contains 20×10^6 IU of interferon gamma-1b.

ASSAY

Protein (*2.2.25*). Dilute the substance to be examined in *water R* to obtain a concentration of 1 mg/ml. Record the absorbance spectrum between 220 nm and 340 nm. Measure the value at the absorbance maximum of 280 nm, after correction for any light scattering due to turbidity measured at 316 nm. Calculate the concentration of interferon gamma-1b using a specific absorbance value of 7.5.

Potency. The potency of interferon gamma-1b is estimated by evaluating the increase of the expression of human-leukocyte-antigen-DR (HLA-DR) due to the interferon gamma-1b present in test solutions during cultivation of the cells, and comparing this increase with the same effect of the appropriate International Standard of human recombinant interferon gamma or of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the appropriate International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Carry out the assay by a suitable method, based on the following design.

Use COLO 205 cells under standard culture conditions. Trypsinise a 3- to 5-day-old flask of COLO 205 cells and prepare a cell suspension at a concentration of 1.0×10^6 cells/ml.

Add 100 µl of the dilution medium to all wells of a 96-well microtitre plate. Add an additional 100 µl of this solution to the wells designed for the blanks. Add 100 µl of each solution to be tested onto the plate and carry out a series of twofold dilution steps in order to obtain a standard curve. Then add 100 µl of the cell suspension to all wells and incubate the plate under appropriate conditions for cell cultivation.

After cultivation remove the growth medium and wash and fix cells to the plate. Add an antibody able to detect HLA-DR expressed due to the presence of interferon gamma-1b and incubate under appropriate conditions. After washing the plate, incubate with an antibody conjugated to a marker enzyme which is able to detect the anti-HLA-DR antibody. After this incubation step, wash the plate and add an appropriate substrate solution. Stop the reaction. Measure the absorbance of the solution and calculate the potency of the preparation to be examined by the usual statistical methods.

The estimated specific activity is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 70 per cent and not more than 140 per cent of the estimated potency.

STORAGE

Store in an airtight container, protected from light and at a temperature of – 70 °C.

01/2008:0031

IODINE

Iodum

I_2 M_r 253.8

[7553-56-2]

DEFINITION

Content: 99.5 per cent to 100.5 per cent of I.

CHARACTERS

Appearance: greyish-violet, brittle plates or fine crystals with a metallic sheen.

Solubility: very slightly soluble in water, very soluble in concentrated solutions of iodides, soluble in ethanol (96 per cent), slightly soluble in glycerol.

It volatilises slowly at room temperature.

IDENTIFICATION

A. Heat a few fragments in a test-tube. Violet vapour is evolved and a bluish-black crystalline sublimate is formed.

B. To a saturated solution add *starch solution R*. A blue colour is produced. Heat until decolourised. On cooling, the colour reappears.

TESTS

Solution S. Triturate 3.0 g with 20 ml of *water R*, filter, wash the filter with *water R* and dilute the filtrate to 30 ml with the same solvent. To the solution add 1 g of *zinc powder R*. When the solution is decolourised, filter, wash the filter with *water R* and dilute to 40 ml with the same solvent.

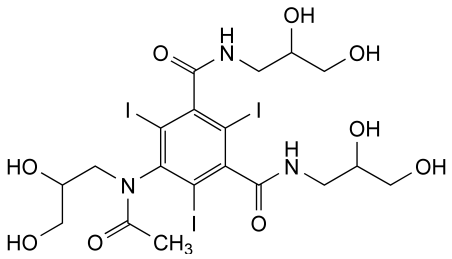
Bromides and chlorides: maximum 250 ppm.

To 10 ml of solution S add 3 ml of *ammonia R* and 6 ml of *silver nitrate solution R2*. Filter, wash the filter with *water R* and dilute the filtrate to 20 ml with the same solvent. To 10 ml of the solution add 1.5 ml of *nitric acid R*. After 1 min, any opalescence in the solution is not more intense than that in a standard prepared at the same time by mixing 10.75 ml of *water R*, 0.25 ml of *0.01 M hydrochloric acid*, 0.2 ml of *dilute nitric acid R* and 0.3 ml of *silver nitrate solution R2*.

Non-volatile substances: maximum 0.1 per cent.

Heat 1.00 g in a porcelain dish on a water-bath until the iodine has volatilised. Dry the residue at 100-105 °C. The residue weighs a maximum of 1 mg.

ASSAY



Introduce 0.200 g into a flask containing 1 g of *potassium iodide R* and 2 ml of *water R* and add 1 ml of *dilute acetic acid R*. When dissolution is complete, add 50 ml of *water R* and titrate with *0.1 M sodium thiosulphate,* using *starch solution R* as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 12.69 mg of I.

01/2008:1114

IOHEXOL

Iohexolum

$C_{19}H_{26}I_3N_3O_9$ M_r 821

[66108-95-0]

DEFINITION

5-[Acetyl(2,3-dihydroxypropyl)amino]-*N,N'*-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide.

The substance is a mixture of diastereoisomers and atropisomers.

Content: 98.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or greyish-white, hygroscopic powder.

Solubility: very soluble in water, freely soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *iohexol CRS*.

B. Examine the chromatograms obtained in test A for related substances (see Tests).

Results: the principal peaks in the chromatogram obtained with reference solution (b) are similar in retention time and size to the peaks due to iohexol in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dissolve 5.0 g in *water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Related substances

A. Liquid chromatography (*2.2.29*).

NOTE: iohexol gives rise to 2 non-resolved peaks in the chromatogram due to endo-exo isomerism. In addition, a small peak (also due to iohexol) usually appears at the leading edge of the 1st principal peak. This small peak has a retention time about 1.2 min less than the 1st principal peak.

Test solution. Dissolve 0.150 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 15.0 mg of *iohexol CRS* and 15.0 mg of *iohexol impurity A CRS* in a mixture of 1-2 drops of *dilute sodium hydroxide solution R* and 10 ml of *water R* and dilute to 100.0 ml with *water R*. Dilute 1.0 ml of this solution to 10.0 ml with *water R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *water R*.

Reference solution (c). Dissolve 5.0 mg of *iohexol for peak identification CRS* (containing impurities B, C, D and E) in *water R* and dilute to 5.0 ml with the same solvent.

Blank solution: *water R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: *water R*;

– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 60	99 → 87	1 → 13
60 - 65	87 → 99	13 → 1

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Equilibration: at the initial eluent composition for at least 10 min.

Injection: 10 µl.

Retention times: impurity A and impurity H = about 17 min; iohexol (peaks corresponding to *endo-exo* isomerism) = about 20 min.

System suitability: reference solution (a):

– *resolution*: minimum 5.0 between the peak due to impurity A and the 2nd and greater peak due to iohexol.

Limits:

– *sum of impurities B, C, D and E* (relative retention with reference to the 2nd and greater peak due to iohexol between 1.1 and 1.4): not more than 0.6 times the total area of the principal peaks in the chromatogram

obtained with reference solution (b) (0.6 per cent); use the chromatogram obtained with reference solution (c) to identify the corresponding peaks;

- *sum of impurities A and H*: not more than 0.5 times the total area of the principal peaks in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *impurities M, N, O, P, Q*: for each impurity, not more than 0.1 times the total area of the principal peaks in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *any other impurity*: for each impurity, not more than 0.1 times the total area of the principal peaks in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *total*: not more than 1.5 times the total area of the principal peaks in the chromatogram obtained with reference solution (b) (1.5 per cent);
- *disregard limit*: 0.03 times the total area of the principal peaks in the chromatogram obtained with reference solution (b) (0.03 per cent); disregard any peak observed with the blank.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of *iohexol impurity J CRS* and 50 mg of *iohexol CRS* in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with *water R*. Dilute 1.0 ml of this solution to 50.0 ml with *water R*.

Plate: *TLC silica gel F_{254} plate R*.

Preconditioning: wash the plate with the mobile phase, dry at room temperature for 30 min, then at 90 °C for 1 h.

Mobile phase: *concentrated ammonia R, methanol R, 2-propanol R, acetone R* (16:16:28:40 *V/V/V/V*).

Application: 10 µl.

Development: over half of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (a):

- the chromatogram shows 2 clearly separated spots.

Limits:

- *any impurity*: any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

3-Chloropropane-1,2-diol. Gas chromatography (*2.2.28*).

Test solution. Dissolve 1.0 g of the substance to be examined in 1.0 ml of *water R*. Shake with 4 quantities, each of 2 ml, of *methyl acetate R*. Dry the combined upper layers over *anhydrous sodium sulphate R*. Filter and concentrate to about 0.7 ml using a warm water bath at 60 °C and a stream of nitrogen and dilute to 1.0 ml with *methyl acetate R*.

Reference solution. Dissolve 0.25 g of *3-chloropropane-1,2-diol R* in 100.0 ml of *methyl acetate R*. Dilute 1.0 ml of this solution with 100.0 ml of *methyl acetate R*.

Column:

- *material*: fused silica,
- *size*: *l* = 25 m, Ø = 0.33 mm,
- *stationary phase*: *polymethylphenylsiloxane R* (film thickness 1 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	80
	2 - 8	80 → 170
	8 - 10	170
Injection port		230
Detector		250

Detection: flame ionisation.

Injection: 2 µl (splitless for 30 s).

System suitability: reference solution:

- *retention time*: 3-chloropropane-1,2-diol = about 8 min.

Limit:

- *3-chloropropane-1,2-diol*: not more than the area of the principal peak in the chromatogram obtained with the reference solution (25 ppm).

Free aromatic amine: maximum 500 ppm.

Test solution. Transfer 0.200 g of the substance to be examined to a 25 ml volumetric flask and dissolve in 15.0 ml of *water R*.

Reference solution. Dissolve 5.0 mg of *iohexol impurity J CRS* in *water R* and dilute to 5.0 ml with *water R*. Dilute 1.0 ml of this solution to 100.0 ml with *water R*. Mix 10.0 ml of this solution with 5.0 ml of *water R* in a 25 ml volumetric flask.

Blank solution. Transfer 15.0 ml of *water R* to a 25 ml volumetric flask.

In conducting the following steps, keep the flasks in iced water and protected as much as possible from light until all of the reagents have been added.

Place the 3 flasks containing respectively the test solution, the reference solution and the blank solution in iced water, protected from light, for 5 min. Add 1.5 ml of *hydrochloric acid R1* and mix by swirling. Add 1.0 ml of a 20 g/l solution of *sodium nitrite R*, mix and allow to stand for 4 min. Add 1.0 ml of a 40 g/l solution of *sulphamic acid R*, swirl gently until gas liberation has ceased and allow to stand for 1 min. *(CAUTION: considerable pressure is produced).* Add 1.0 ml of a freshly prepared 3 g/l solution of *naphthylethylenediamine dihydrochloride R* in a mixture of 30 volumes of *water R* and 70 volumes of *propylene glycol R* and mix. Remove the flasks from the iced water, dilute to 25.0 ml with *water R*, mix and allow to stand for 5 min. Simultaneously determine the absorbance (*2.2.25*) at 495 nm of the solutions obtained from the test solution and the reference solution in 5 cm cells, using the blank as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution.

Iodide: maximum 10 ppm.

Dissolve 6.000 g in *water R* and dilute to 20 ml with the same solvent. Add 2.0 ml of *0.001 M potassium iodide*. Titrate with *0.001 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*), using a silver indicator electrode and an appropriate reference electrode. Subtract the volume of titrant corresponding to the 2.0 ml of *0.001 M potassium iodide*, determined by titrating a blank to which is added 2.0 ml of *0.001 M potassium iodide* and use the residual value to calculate the iodide content.

1 ml of *0.001 M silver nitrate* is equivalent to 126.9 µg of I^-.

Ionic compounds (*2.2.38*): maximum 0.01 per cent *m/m* calculated as sodium chloride.

Rinse all glassware with distilled water R 5 times before use.

Test solution. Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution. Dissolve 20.0 mg of *sodium chloride R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with *water R*.

Measure the conductivity of the test solution and the reference solution using a suitable conductivity meter. The conductivity of the test solution is not greater than that of the reference solution.

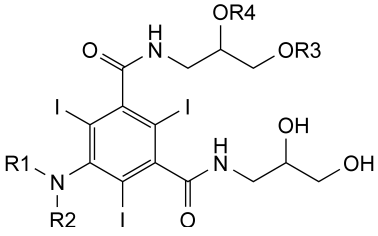
Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): maximum 4.0 per cent, determined on 1.00 g.

ASSAY

To 0.500 g in a 125 ml round-bottomed flask add 25 ml of a 50 g/l solution of *sodium hydroxide R*, 0.5 g of *zinc powder R* and a few glass beads. Boil under a reflux condenser for 30 min. Allow to cool and rinse the condenser with 20 ml of *water R*, adding the rinsings to the flask. Filter through a sintered-glass filter (*2.1.2*) and wash the filter with several quantities of *water R*. Collect the filtrate and washings. Add 5 ml of *glacial acetic acid R* and titrate immediately with *0.1 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*).



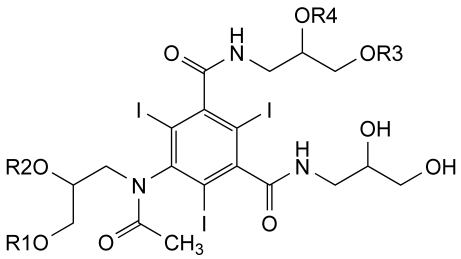
1 ml of *0.1 M silver nitrate* is equivalent to 27.37 mg of $C_{19}H_{26}I_3N_3O_9$.

STORAGE

In an airtight container, protected from light and moisture.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, Q.



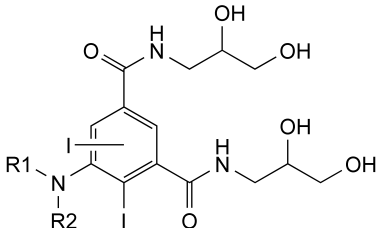
A. R1 = CO-CH_3, R2 = R3 = R4 = H: 5-(acetylamino)-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,

J. R1 = R2 = R3 = R4 = H: 5-amino-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,

P. R1 = R2 = CO-CH_3, R3 = CH_2-CHOH-CH_2OH, R4 = H: 5-(diacetylamino)-*N*-[3-(2,3-dihydroxypropoxy)-2-hydroxypropyl]-*N*′-(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,

Q. R1 = R2 = CO-CH_3, R3 = H, R4 = CH_2-CHOH-CH_2OH: 5-(diacetylamino)-*N*-[2-(2,3-dihydroxypropoxy)-3-hydroxypropyl]-*N*′-(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,

B. R1 = CH_2-CHOH-CH_2OH, R2 = R3 = R4 = H: 5-[acetyl[3-(2,3-dihydroxypropoxy)-2-hydroxypropyl]amino]-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,



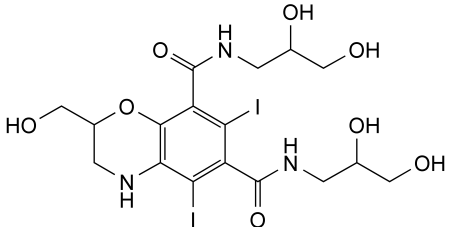
C. R2 = CH_2-CHOH-CH_2OH, R1 = R3 = R4 = H: 5-[acetyl[2-(2,3-dihydroxypropoxy)-3-hydroxypropyl]amino]-*N*,*N*′-bis(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,

D. R3 = CH_2-CHOH-CH_2OH, R1 = R2 = R4 = H: 5-[acetyl(2,3-dihydroxypropyl)amino]-*N*-[3-(2,3-dihydroxypropoxy)-2-hydroxypropyl]-*N*′-(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,

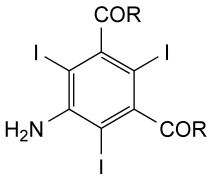
E. R4 = CH_2-CHOH-CH_2OH, R1 = R2 = R3 = H: 5-[acetyl(2,3-dihydroxypropyl)amino]-*N*-[2-(2,3-dihydroxypropoxy)-3-hydroxypropyl]-*N*′-(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,

N. R4 = CO-CH_3, R1 = R2 = R3 = H: 5-[acetyl(2,3-dihydroxypropyl)amino]-*N*-[2-(acetyloxy)-3-hydroxypropyl]-*N*′-(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,

O. R3 = CO-CH_3, R1 = R2 = R4 = H: 5-[acetyl(2,3-dihydroxypropyl)amino]-*N*-[3-(acetyloxy)-2-hydroxypropyl]-*N*′-(2,3-dihydroxypropyl)-2,4,6-triiodobenzene-1,3-dicarboxamide,



F. R1 = R2 = H: 5-amino-*N*,*N*′-bis(2,3-dihydroxypropyl)diiodobenzene-1,3-dicarboxamide,



G. R1 = H, R2 = CO-CH_3: 5-(acetylamino)-*N*,*N*′-bis(2,3-dihydroxypropyl)diiodobenzene-1,3-dicarboxamide,

H. R1 = CH_2-CHOH-CH_2OH, R2 = CO-CH_3: 5-[acetyl(2,3-dihydroxypropyl)amino]-*N*,*N*′-bis(2,3-dihydroxypropyl)diiodobenzene-1,3-dicarboxamide,

M. R1 = CH_2-CHOH-CH_2OH, R2 = H: *N*,*N*′-bis(2,3-dihydroxypropyl)-5-[(2,3-dihydroxypropyl)amino]diiodobenzene-1,3-dicarboxamide,

IOPAMIDOL

Iopamidolum

$C_{17}H_{22}I_3N_3O_8$ M_r 777
[60166-93-0]

DEFINITION

N,N'-Bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,4,6-triiodobenzene-1,3-dicarboxamide.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, very slightly soluble in methanol, practically insoluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *iopamidol CRS*.

B. It complies with the test for loss on drying (see Tests).

C. It complies with the test for specific optical rotation (see Tests).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 1 g in *water R* and dilute to 50 ml with the same solvent.

Acidity or alkalinity. Dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent. Not more than 0.75 ml of *0.01 M hydrochloric acid* or 1.4 ml of *0.01 M sodium hydroxide* is required to adjust to pH 7.0 (*2.2.3*).

Specific optical rotation (*2.2.7*): −4.6 to −5.2 (dried substance), determined at 436 nm.

Dissolve 10.0 g, with heating if necessary, in *water R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.50 g of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *iopamidol impurity H CRS* in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 2.0 ml of the test solution to 20.0 ml with *water R*. Dilute 1.0 ml of this solution to 50.0 ml with *water R*.

Reference solution (c). Add 0.1 ml of the test solution to 20 ml of reference solution (a) and dilute to 50 ml with *water R*.

Column: 2 columns coupled in series,
- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: *phenylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: 60 °C.

Mobile phase:
- *mobile phase A*: *water R*,
- *mobile phase B*: *acetonitrile R, water R* (50:50 *V/V*),

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 18	100	0
18 - 40	100 - 62	0 - 38
40 - 45	62 - 50	38 - 50
45 - 50	50 - 100	50 - 0
50 - 60	100	0

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 20 µl.

Relative retention with reference to iopamidol (retention time = about 14.6 min): impurity D = about 0.1; impurity B = about 0.6; impurities I and H = about 0.9; impurity G = about 1.1; impurity K = about 1.2; impurity C = about 1.3; impurity J = about 1.5; impurity A = about 1.8; impurity E = about 2.2; impurity F = about 2.3.

System suitability: reference solution (c):
- *resolution*: minimum 2.0 between the peaks due to impurity H and iopamidol.

Limits:
- *sum of impurities H and I*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *impurities A, B, C, D, E, F, G, J, K*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *any other impurity*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *sum of impurities other than H and I*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Free aromatic amines: maximum 200 ppm.

Keep the solutions and reagents in iced water, protected from bright light.

Test solution. In a 25 ml volumetric flask, dissolve 0.500 g of the substance to be examined in 20.0 ml of *water R*.

Reference solution. In a 25 ml volumetric flask, mix 4.0 ml of a 25.0 mg/l solution of *iopamidol impurity A CRS* with 16.0 ml of *water R*.

Blank solution. Place 20.0 ml of *water R* in a 25 ml volumetric flask.

Place the flasks in iced water, protected from light, for 5 min. Add 1.0 ml of *hydrochloric acid R* to each flask, mix and allow to stand for 5 min. Add 1.0 ml of a 20 g/l solution of *sodium nitrite R* prepared immediately before use, mix and allow to stand for 5 min. Add 1.0 ml of a 120 g/l solution of *ammonium sulphamate R*, swirl gently until gas liberation has ceased, and allow to stand for 5 min. *(CAUTION: considerable pressure is produced).* Add 1.0 ml of a freshly prepared 1 g/l solution of *naphthylethylenediamine dihydrochloride R* and mix. Remove the flasks from the iced water and allow to stand for 10 min. Dilute to 25.0 ml with *water R* and mix. Measure immediately the absorbance (*2.2.25*) at 500 nm of the solutions obtained from the test solution and the reference solution using, as the compensation liquid, the solution obtained from the blank solution.

The absorbance of the test solution is not greater than that of the reference solution.

Free iodine: maximum 10 ppm.

Dissolve 2.0 g in 25 ml of *water R* in a ground-glass stoppered centrifuge tube. Add 5 ml of *toluene R* and 5 ml of *diluted sulphuric acid R*. Shake and centrifuge. Any red colour of the upper layer is not more intense than that of the upper phase obtained in the same way from 22 ml of *water R*, 2 ml of *iodide standard solution (10 ppm I) R*, 5 ml of *dilute sulphuric acid R*, 1 ml of *concentrated hydrogen peroxide solution R* and 5 ml of *toluene R*.

Iodide: maximum 10 ppm.

Dissolve 6.000 g in *water R* and dilute to 20 ml with the same solvent. Add 2.0 ml of *0.001 M potassium iodide*. Carry out a potentiometric titration (*2.2.20*) with *0.001 M silver nitrate* using a silver indicator electrode and an appropriate reference electrode. Subtract the volume of titrant corresponding to the 2.0 ml of *0.001 M potassium iodide*, determined by titrating a blank to which is added 2.0 ml of *0.001 M potassium iodide* and use the residual value to calculate the iodide content.

1 ml of *0.001 M silver nitrate* is equivalent to 126.9 µg of iodide.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

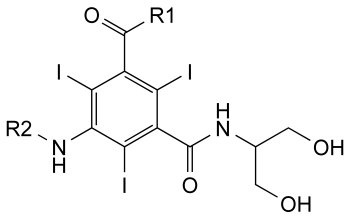
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

Bacterial endotoxins (*2.6.14*): less than 1.4 IU/g, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

To 0.300 g in a 250 ml round-bottomed flask add 5 ml of *strong sodium hydroxide solution R*, 20 ml of *water R*, 1 g of *zinc powder R* and a few glass beads. Boil under a reflux condenser for 30 min. Allow to cool and rinse the condenser with 20 ml of *water R*, adding the rinsings to the flask. Filter through a sintered-glass filter (*2.1.2*) and wash the filter with several quantities of *water R*. Collect the filtrate and washings. Add 5 ml of *glacial acetic acid R* and titrate immediately with *0.1 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*) using a suitable electrode system such as silver-silver chloride.



1 ml of *0.1 M silver nitrate* is equivalent to 25.90 mg of $C_{17}H_{22}I_3N_3O_8$.

STORAGE

Protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

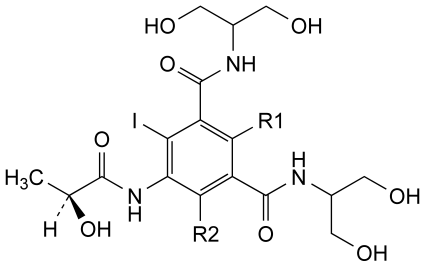
IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J, K.

A. R1 = NH-CH(CH_2OH)$_2$, R2 = H: 5-amino-*N*,*N*'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-2,4,6-triiodobenzene-1,3-dicarboxamide,

B. R1 = NH-CH(CH_2OH)$_2$, R2 = CO-CH_2OH: 5-[(hydroxyacetyl)amino]-*N*,*N*'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-2,4,6-triiodobenzene-1,3-dicarboxamide,

C. R1 = NH-CH(CH_2OH)$_2$, R2 = CO-CH_3: 5-(acetylamino)-*N*,*N*'-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-2,4,6-triiodobenzene-1,3-dicarboxamide,



D. R1 = OH, R2 = CO-CHOH-CH_3: 3-[[2-hydroxy-1-(hydroxymethyl)ethyl]carbamoyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,4,6-triiodobenzoic acid,

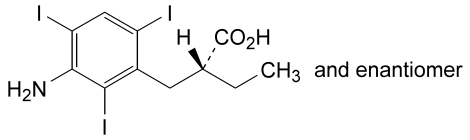
E. R1 = NH-CH(CH_2OH)$_2$, R2 = CO-CH(CH_3)-O-CO-CH_3: (1*S*)-2-[[3,5-bis[[2-hydroxy-1-(hydroxymethyl)ethyl]carbamoyl]-2,4,6-triiodophenyl]amino]-1-methyl-2-oxoethyl acetate,

F. R1 = N(CH_3)$_2$, R2 = CO-CHOH-CH_3: *N*'-[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,4,6-triiodo-*N*,*N*-dimethylbenzene-1,3-dicarboxamide,

G. R1 = NH-CH_2-CHOH-CH_2OH, R2 = CO-CHOH-CH_3: *N*-(2,3-dihydroxypropyl)-*N*'-[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,4,6-triiodobenzene-1,3-dicarboxamide,

J. R1 = NH-CH_2-CH_2OH, R2 = CO-CHOH-CH_3: *N*-(2-hydroxyethyl)-*N*'-[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,4,6-triiodobenzene-1,3-dicarboxamide,

H. R1 = I, R2 = Cl: 4-chloro-*N,N'*-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,6-diiodobenzene-1,3-dicarboxamide,



I. R1 = Cl, R2 = I: 2-chloro-*N,N'*-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-4,6-diiodobenzene-1,3-dicarboxamide,

K. R1 = I, R2 = H: *N,N'*-bis[2-hydroxy-1-(hydroxymethyl)ethyl]-5-[[(2*S*)-2-hydroxypropanoyl]amino]-2,4-diiodobenzene-1,3-dicarboxamide.

IOPANOIC ACID

Acidum iopanoicum

$C_{11}H_{12}I_3NO_2$ M_r 571
[96-83-3]

DEFINITION

Iopanoic acid contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*RS*)-2-(3-amino-2,4,6-tri-iodobenzyl)butanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white powder, practically insoluble in water, soluble in ethanol and in methanol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): about 155 °C, with decomposition.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *iopanoic acid CRS*.

C. Examine the chromatograms obtained in the test for related substances (see Tests). Spray the plate with a 1 g/l solution of *4-dimethylaminocinnamaldehyde R* in a mixture of 1 volume of *hydrochloric acid R* and 99 volumes of *alcohol R*. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Heat 50 mg carefully in a small porcelain dish over a flame. Violet vapour is evolved.

TESTS

Appearance of solution. Dissolve 1.0 g in *1 M sodium hydroxide* and dilute to 20 ml with the same solvent. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_3 (*2.2.2, Method II*).

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution (a). Dissolve 1.0 g of the substance to be examined in a mixture of 3 volumes of *ammonia R* and 97 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 3 volumes of *ammonia R* and 97 volumes of *methanol R*.

Reference solution (a). Dissolve 50 mg of *iopanoic acid CRS* in a mixture of 3 volumes of *ammonia R* and 97 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (b). Dilute 1 ml of test solution (b) to 50 ml with a mixture of 3 volumes of *ammonia R* and 97 volumes of *methanol R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *concentrated ammonia R*, 20 volumes of *methanol R*, 20 volumes of *toluene R* and 50 volumes of *dioxan R*. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Halides. To 0.46 g add 10 ml of *nitric acid R* and 15 ml of *water R*. Shake for 5 min and filter. 15 ml of the filtrate complies with the limit test for chlorides (*2.4.4*) (180 ppm, expressed as chloride).

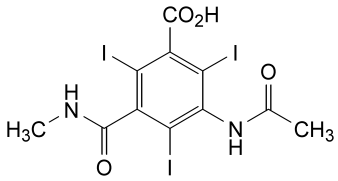
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 1 h.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

To 0.150 g in a 250 ml round-bottomed flask add 5 ml of *strong sodium hydroxide solution R*, 20 ml of *water R*, 1 g of *zinc powder R* and a few glass beads. Boil under a reflux condenser for 60 min. Allow to cool and rinse the condenser with 20 ml of *water R*, adding the rinsings to the flask. Filter through a sintered-glass filter (*2.1.2*) and wash the filter with several quantities of *water R*. Collect the filtrate and washings. Add 40 ml of *dilute sulphuric acid R* and titrate immediately with *0.1 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*), using a suitable electrode system such as silver-mercurous sulphate.

1 ml of *0.1 M silver nitrate* is equivalent to 19.03 mg of $C_{11}H_{12}I_3NO_2$.



STORAGE

Store protected from light.

corrected 6.0

IOTALAMIC ACID

Acidum iotalamicum

$C_{11}H_9I_3N_2O_4$ M_r 614
[2276-90-6]

DEFINITION

Iotalamic acid contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 3-(acetylamino)-2,4,6-tri-iodo-5-(methylcarbamoyl)benzoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, slightly soluble in water and in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *iotalamic acid CRS*.

B. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel GF_{254} plate R*.

Test solution. Dissolve 50 mg of the substance to be examined in *methanol R* containing 3 per cent *V/V* of *ammonia R* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 50 mg of *iotalamic acid CRS* in *methanol R* containing 3 per cent *V/V* of *ammonia R* and dilute to 5 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *anhydrous formic acid R*, 25 volumes of *methyl ethyl ketone R* and 60 volumes of *toluene R*. Allow the plate to dry until the solvents have evaporated and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. Heat 50 mg gently in a small porcelain dish over a flame. Violet vapour is evolved.

TESTS

Appearance of solution. Dissolve 1.0 g in *1 M sodium hydroxide* and dilute to 20 ml with the same solvent. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Related substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel GF_{254} plate R*.

Test solution. Dissolve 1.0 g of the substance to be examined in *methanol R* containing 3 per cent *V/V* of *ammonia R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 50 ml with *water R*. Dilute 1 ml of the solution to 10 ml with *water R*.

Reference solution (b). Dissolve 1 mg of *iotalamic acid impurity A CRS* in 5 ml of reference solution (a).

Apply to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 1 volume of *glacial acetic acid R*, 1 volume of *anhydrous formic acid R*, 1 volume of *methanol R*, 5 volumes of *ether R* and 10 volumes of *methylene chloride R*. Allow the plate to dry until the solvents have evaporated. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

Halides. Dissolve 0.55 g in a mixture of 4 ml of *dilute sodium hydroxide solution R* and 15 ml of *water R*. Add 6 ml of *dilute nitric acid R* and filter. 15 ml of the filtrate complies with the limit test for chlorides (*2.4.4*) (150 ppm, expressed as chloride).

Impurity A. Not more than 0.05 per cent *m/m* determined by absorption spectrophotometry (*2.2.25*).

Test solution. Transfer 0.500 g of the substance to be examined to a 50 ml volumetric flask, add 14 ml of *water R*, shake and add 1 ml of *dilute sodium hydroxide solution R*.

Reference solution. Prepare the reference solution by mixing 10.0 ml of a 8.5 g/l solution of *sodium hydroxide R* containing 25 µg/ml of *iotalamic acid impurity A CRS* with 5 ml of *water R* in a 50 ml volumetric flask.

Blank solution. Transfer 14 ml of *water R* and 1 ml of *dilute sodium hydroxide solution R* to a 50 ml volumetric flask.

In conducting the following steps, keep the flasks in iced water and protected as far as possible from light until all of the reagents have been added.

Place all three of the flasks containing the test solution, the reference solution and the blank solution in iced water, protected from light. Add 5 ml of a 5 g/l solution of *sodium nitrite R* and 12 ml of *dilute hydrochloric acid R*. Shake gently and allow to stand for exactly 2 min after adding the hydrochloric acid. Add 10 ml of a 20 g/l solution of *ammonium sulphamate R*. Allow to stand for 5 min shaking frequently (*CAUTION: considerable pressure is produced*), and add 0.15 ml of a 100 g/l solution of *α-naphthol R* in *alcohol R*. Shake and allow to stand for 5 min. Add 3.5 ml of *buffer solution pH 10.9 R*, mix and dilute to 50.0 ml with *water R*. Concomitantly and within 20 min determine the absorbance at 485 nm of the solutions obtained from the test solution and the reference solution in 5 cm cells, using the blank as the compensation liquid.

Calculate the content of impurity A.

Iodide. Not more than 20 ppm, determined by potentiometric titration (*2.2.20*). Dissolve 6.000 g in 20 ml of *1 M sodium hydroxide*, add 10 ml of *water R* and adjust to pH 4.5 to 5.5 with *acetic acid R*. Add 2.0 ml of *0.001 M potassium iodide*. Titrate with *0.001 M silver nitrate* using a silver indicator electrode and an appropriate reference electrode. Subtract the volume of titrant corresponding to the 2.0 ml of *0.001 M potassium iodide*, determined by titrating a blank to which is added 2.0 ml of *0.001 M potassium iodide* and use the residual value to calculate the iodide content.

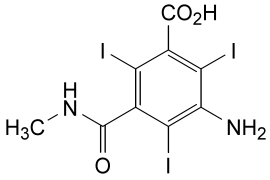
1 ml of *0.001 M silver nitrate* is equivalent to 126.9 µg of iodide.

Heavy metals (*2.4.8*). Dissolve 2.0 g in 4 ml of *dilute sodium hydroxide solution R* and dilute to 20 ml with *water R*. 12 ml of this solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 0.300 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



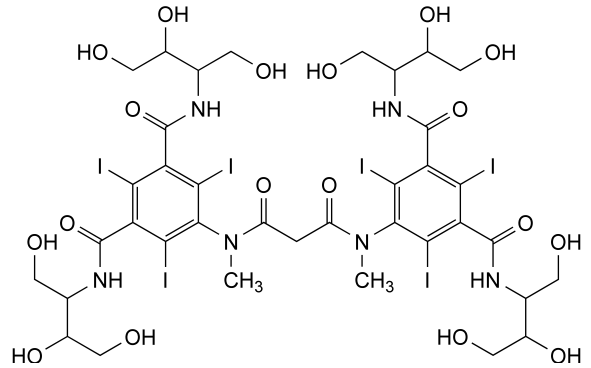
To 0.150 g in a 250 ml round-bottomed flask add 5 ml of *strong sodium hydroxide solution R*, 20 ml of *water R*, 1 g of *zinc powder R* and a few glass beads. Boil under a reflux condenser for 30 min. Allow to cool and rinse the condenser with 20 ml of *water R*, adding the rinsings to the flask. Filter through a sintered-glass filter (*2.1.2*) and wash the filter with several quantities of *water R*. Collect the filtrate and washings. Add 40 ml of *dilute sulphuric acid R* and titrate immediately with *0.1 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*), using a suitable electrode system such as silver-mercurous sulphate.

1 ml of *0.1 M silver nitrate* is equivalent to 20.47 mg of $C_{11}H_9I_3N_2O_4$.

STORAGE

Store protected from light.

IMPURITIES



A. 3-amino-2,4,6-triiodo-5-(methylcarbamoyl)benzoic acid.

01/2008:1754

IOTROLAN

Iotrolanum

$C_{37}H_{48}I_6N_6O_{18}$ M_r 1626

[79770-24-4]

DEFINITION

Mixture of stereoisomers of 5,5′-[propanedioylbis(methylimino)]bis[*N*,*N*′-bis[2,3-dihydroxy-1-(hydroxymethyl)propyl]-2,4,6-triiodobenzene-1,3-dicarboxamide].

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or yellowish-white powder, hygroscopic.

Solubility: very soluble in water, freely soluble in dimethyl sulphoxide, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *iotrolan CRS*.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Dissolve 18.0 g in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent.

Conductivity (*2.2.28*): maximum 25 μS·cm^{-1}.

Dissolve 1.000 g in *water R* and dilute to 50.0 ml with the same solvent.

Primary aromatic amines. *Protect the solutions from light throughout the test. All given times are critical for the test results. The test solution, the reference solution and the blank solution must be processed in parallel.*

Test solution. Dissolve 0.500 g of the substance to be examined in 20.0 ml of *water R* in a 25 ml volumetric flask.

Reference solution. Dissolve 5.0 mg of *iopamidol impurity A CRS* in *water R* and dilute to 20.0 ml with the same solvent. Transfer 1.0 ml of this solution to a 25 ml volumetric flask and add 19.0 ml of *water R*.

Blank solution. Place 20.0 ml of *water R* in a 25 ml volumetric flask.

Procedure. Cool the test solution, reference solution and blank solution in a bath of iced water for 5 min. Add 1.0 ml of *hydrochloric acid R1* to each solution and cool again for 5 min in a bath of iced water. Add 1.0 ml of a 20 g/l solution of *sodium nitrite R*, shake vigorously and cool for another 5 min in a bath of iced water. To each solution add 0.50 ml of an 80 g/l solution of *sulphamic acid R*. Over the next 5 min, shake vigorously several times, raising the stoppers to vent the gas that evolves. Afterwards add to each solution 1.0 ml of a 1 g/l solution of *naphthylethylenediamine dihydrochloride R* in a mixture of 300 volumes of *water R* and 700 volumes of *propylene glycol R*, shake, allow to cool to room temperature for 10 min and dilute to 25.0 ml with *water R*. Degas the solutions in an ultrasonic bath for 1 min and measure the absorbance (*2.2.25*) of the test solution and the reference solution at 495 nm against the blank, within 5 min.

System suitability:

– *absorbance of the reference solution*: minimum 0.40.

Limit:

– *absorbance of the test solution*: not more than the absorbance of the reference solution (0.05 per cent).

Related substances. Thin-layer chromatography (*2.2.27*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 1.0 g of the substance to be examined in a mixture of equal volumes of *methanol R* and *water R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with a mixture of equal volumes of *methanol R* and *water R*.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 10.0 ml with a mixture of equal volumes of *methanol R* and *water R*.

Reference solution (c). Dissolve the contents of a vial of *iotrolan for system suitability CRS* (containing about 0.05 per cent of each of impurities A and B) in 50 μl of a mixture of equal volumes of *methanol R* and *water R*.

Plate: *TLC silica gel F_{254} plate R*.

Pretreatment: over 3/4 of the plate with *methylene chloride R*.

Mobile phase: *concentrated ammonia R, water R, dioxan R* (4:20:80 *V/V/V*).

Application: 2 µl.

Development: over 3/4 of the plate.

Drying: in a current of air until the solvents have evaporated.

Detection: examine in ultraviolet light at 254 nm. Expose the plate to the ultraviolet light for 2-5 min until the principal spots appear clearly as yellow spots. Spray with *ferric chloride-ferricyanide-arsenite reagent R* and examine in daylight.

R_F *values*: iotrolan = about 0.25; impurity A = about 0.4; impurity B = about 0.5.

System suitability: reference solution (c):

– the chromatogram shows 3 clearly separated spots.

Limits:

– *impurities A, B*: any spot due to impurity A or B is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (0.5 per cent);

– *unspecified impurities*: any other spot is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.10 per cent).

Isomer distribution. Liquid chromatography (*2.2.29*) as described under Assay. Use the normalisation procedure.

Identification of peaks: use the chromatogram supplied with *iotrolan CRS* and the chromatogram obtained with the reference solution to identify the peaks due to the 3 isomer groups.

Calculate the percentage content of each of the isomer groups G1, G2 and G3, with reference to the total area of all of the peaks due to the 3 isomer groups, using the chromatogram obtained with the test solution.

Limits:

– *isomer group G1*: 53.0 per cent to 70.0 per cent;

– *isomer group G2*: 3.0 per cent to 11.0 per cent;

– *isomer group G3*: 25.0 per cent to 39.0 per cent.

Free iodine. Dissolve 0.20 g in 1 ml of *water R* in a glass-stoppered test tube. Add 4 ml of a 370 g/l solution of *sulphuric acid R* and 5 ml of *toluene R*, close and shake vigorously. The upper layer remains colourless (*2.2.2, Method II*).

Iodide: maximum 20 ppm.

Dissolve 10.0 g in 50 ml of *carbon dioxide-free water R*. Adjust to pH 3-4 adding about 0.15 ml of *dilute sulphuric acid R*. Titrate with *0.001 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*). Not more than 1.5 ml of *0.001 M silver nitrate* is required to reach the end-point.

Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): maximum 3.5 per cent, determined on 0.250 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

Bacterial endotoxins (*2.6.14*): less than 0.7 IU/g.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Dissolve 40.0 mg of the substance to be examined in *water R* and dilute to 25.0 ml with the same solvent.

Reference solution. Dissolve 40.0 mg of *iotrolan CRS* in *water R* and dilute to 25.0 ml with the same solvent.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm);

– *temperature*: 40 °C.

Mobile phase: *methanol R, water for chromatography R* (10:90 *V/V*).

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 10 µl.

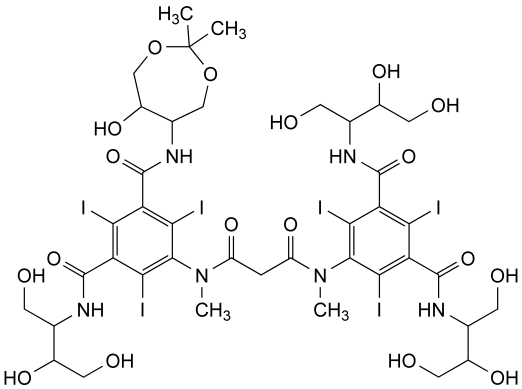
Run time: 40 min.

Retention time: isomer group G1 = about 8 min to 12 min; isomer group G2 = about 15 min to 22 min; isomer group G3 = about 22 min to 32 min.

System suitability: reference solution:

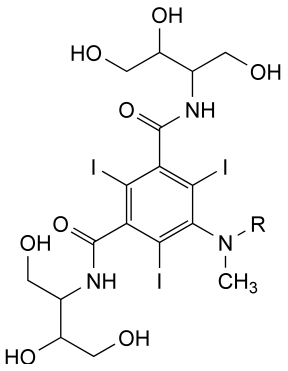
– the chromatogram obtained is similar to the chromatogram supplied with *iotrolan CRS*.

Calculate the percentage content of iotrolan from the total area of all of the peaks of the 3 isomer groups G1, G2 and G3 and the declared content of *iotrolan CRS*.



STORAGE

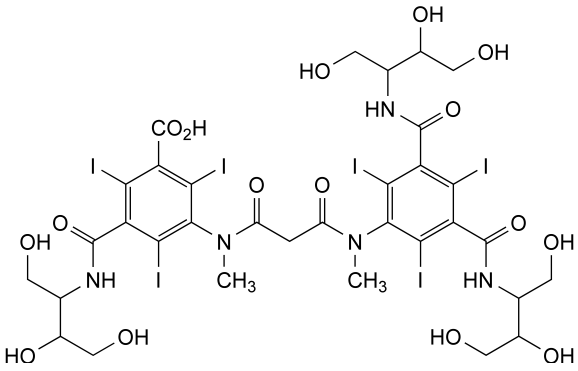
In an airtight container, protected from light.



IMPURITIES

Specified impurities: A, B.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, D, E, F, G, H, I, J.*



A. *N,N'*-bis[2,3-dihydroxy-1-(hydroxymethyl)propyl]-5-[[3-[[3-[[2,3-dihydroxy-1-(hydroxymethyl)propyl]carbamoyl]-5-[(6-hydroxy-2,2-dimethyl-1,3-dioxepan-5-yl)carbamoyl]-2,4,6-triiodophenyl]methylamino]-3-oxopropanoyl]methylamino]-2,4,6-triiodobenzene-1,3-dicarboxamide,

IOXAGLIC ACID

Acidum ioxaglicum

$C_{24}H_{21}I_6N_5O_8$ M_r 1269
[59017-64-0]

DEFINITION

3-[[[[3-(Acetylmethylamino)-2,4,6-triiodo-5-(methylcarbamoyl)benzoyl]amino]acetyl]amino]-5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoic acid.

Content: 98.5 per cent to 101.5 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: very slightly soluble in water, slightly soluble in alcohol, very slightly soluble in methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *ioxaglic acid CRS*.

TESTS

Appearance of solution. The solution is clear (*2.2.1*).

Dissolve 1.0 g in a 40 g/l solution of *sodium hydroxide R* and dilute to 20 ml with the same solution.

Absorbance (*2.2.25*): maximum 0.18, calculated for a solution containing 40 per cent of anhydrous ioxaglic acid.

Dissolve 10.0 g in about 8 ml of a 40 g/l solution of *sodium hydroxide R*. Adjust to pH 7.2-7.6 with a 40 g/l solution of *sodium hydroxide R* or *1 M hydrochloric acid*. Dilute to 25 ml with *water R*. Filter using a filter of 0.45 µm pore size. Measure the absorbance at 450 nm using *water R* as the compensation liquid.

Related substances. Liquid chromatography (*2.2.29*): use the normalisation procedure.

Test solution. Dissolve 0.10 g of the substance to be examined in about 40 ml of a mixture of 5 volumes of *acetonitrile R* and 95 volumes of *water R*. Add 0.5 ml ± 0.1 ml of a 4 g/l solution of *sodium hydroxide R* and dilute to 50.0 ml with a mixture of 5 volumes of *acetonitrile R* and 95 volumes of *water R*. Shake until dissolution is complete (using ultrasound, if necessary).

Reference solution (a). Dissolve 0.10 g of *ioxaglic acid CRS* in about 40 ml of a mixture of 5 volumes of *acetonitrile R* and 95 volumes of *water R*. Add 0.5 ml ± 0.1 ml of a 4 g/l solution of *sodium hydroxide R* and dilute to 50.0 ml with a mixture of 5 volumes of *acetonitrile R* and 95 volumes of *water R*. Shake until dissolution is complete (using ultrasound, if necessary).

Reference solution (b). Dissolve 5 mg of *ioxaglic acid impurity A CRS* in a mixture of 5 volumes of *acetonitrile R* and 95 volumes of *water R* and dilute to 50.0 ml with the same mixture of solvents. Dilute 1.0 ml of the solution to 50.0 ml with a mixture of 5 volumes of *acetonitrile R* and 95 volumes of *water R*.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: spherical end-capped *octylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of not less than 335 m^2/g, a pore size of 10 nm and a carbon loading of not less than 12 per cent,
- *temperature*: 25 °C.

Mobile phase:

- *mobile phase A*: 136 mg/l solution of *potassium dihydrogen phosphate R* adjusted to pH 3.0 with *phosphoric acid R*,
- *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	95 → 90	5 → 10
5 - 40	90	10
40 - 85	90 → 70	10 → 30
85 - 115	70	30
115 - 120	70 → 50	30 → 50
120 - 125	50	50
125 - 130	50 → 95	50 → 5
130 - 140	95	5

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 242 nm.

Injection: 10 µl.

System suitability:

- *retention time*: ioxaglic acid = about 65 min (reference solution (a)), impurity A = about 22 min (reference solution (b)),
- the chromatogram obtained with reference solution (a) is similar to the chromatogram provided with *ioxaglic acid CRS*,
- *peak-to-valley ratio*: minimum 1.3, where H_p = height above the baseline of the peak due to impurity C and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to ioxaglic acid in the chromatogram obtained with reference solution (a).

Limit: locate the impurities by comparison with the chromatogram provided with *ioxaglic acid CRS*.

- *impurity A*: not more than 0.1 per cent,
- *impurity B*: not more than 0.3 per cent,
- *impurity C*: not more than 0.3 per cent,
- *impurity E*: not more than 0.7 per cent,
- *impurity F*: not more than 0.4 per cent,
- *impurity D (sum of the peaks D1, D2, D3 and D4)*: not more than 0.7 per cent,
- *any other impurity*: not more than 0.2 per cent,
- *total*: not more than 2 per cent,
- *disregard limit*: 0.05 per cent; disregard any peak appearing at a retention time greater than 125 min.

Iodides: maximum 50 ppm.

Disperse 10.0 g in 50 ml of *water R*. Add 8 ml of *1 M sodium hydroxide*. After dissolution and homogenisation, add 1.0 ml of *glacial acetic acid R*. Immediately titrate with *0.001 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*), using a silver indicator electrode and a suitable reference electrode.

1 ml of *0.001 M silver nitrate* is equivalent to 0.1269 mg of iodides.

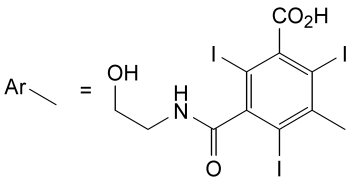
Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 2.0 g in 4 ml of a 40 g/l solution of *sodium hydroxide R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 5.0 per cent, determined on 0.100 g.

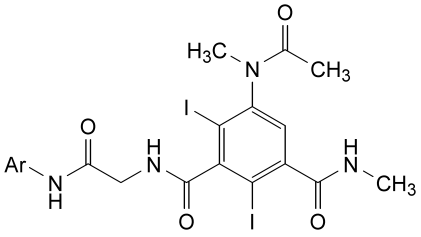
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



In a round-bottomed flask, place 0.100 g of the substance to be examined, add 5 ml of *strong sodium hydroxide solution R*, 20 ml of *water R*, 1 g of *zinc powder R* and a few glass beads. Fit the flask with a reflux condenser and boil for 30 min. Cool and rinse the condenser with 20 ml of *water R*. Add the rinsing liquid to the contents of the flask. Filter, wash the filter 3 times with 15 ml of *water R* and add the washings to the filtrate. Add 40 ml of *dilute sulphuric acid R* and titrate immediately with *0.05 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*), using a suitable electrode combination such as the silver/mercurous sulphate system.

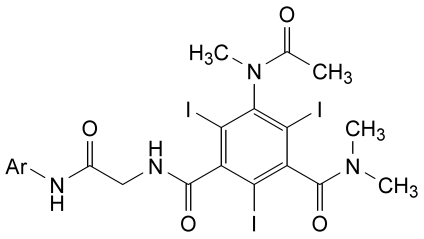
1 ml of *0.05 M silver nitrate* is equivalent to 10.58 mg of $C_{24}H_{21}I_6N_5O_8$.



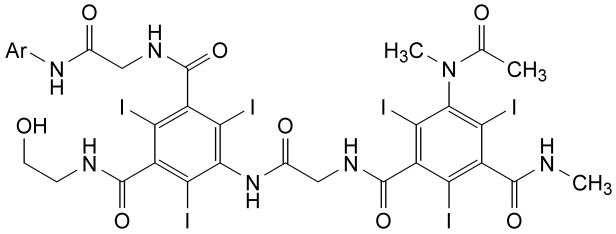
STORAGE

In an airtight container, protected from light.

IMPURITIES

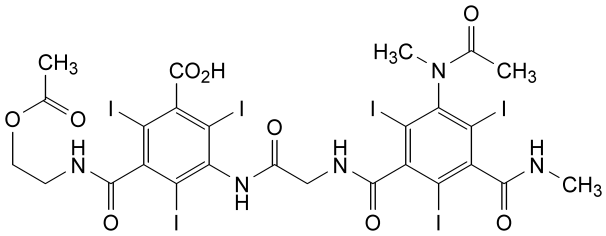


A. Ar-NH_2: 3-amino-5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoic acid,

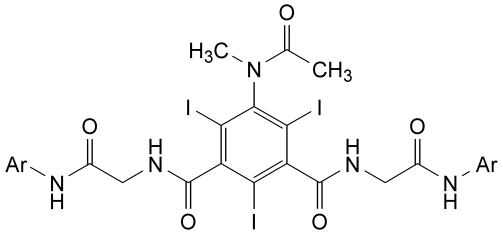


B. 3-[[[[3-(acetylmethylamino)-2,6-diiodo-5-(methylcarbamoyl)benzoyl]amino]acetyl]amino]-5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoic acid,

C. specified impurity whose structure is unknown,



D. D1, D2, D3 and D4: 3-[[[[3-(acetylmethylamino)-5-(dimethylcarbamoyl)-2,4,6-triiodobenzoyl]amino]acetyl]amino]-5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoic acid,



E. 3-[[[[3-[[[[3-(acetylmethylamino)-2,4,6-triiodo-5-(methylcarbamoyl)benzoyl]amino]acetyl]amino]-5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoyl]amino]acetyl]amino]-5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoic acid,

F. specified impurity whose structure is unknown,

G. 3-[[[[3-(acetylmethylamino)-2,4,6-triiodo-5-(methylcarbamoyl)benzoyl]amino]acetyl]amino]-5-[[2-(acetyloxy)ethyl]carbamoyl]-2,4,6-triiodobenzoic acid,

H. 3,3′-[[5-(acetylmethylamino)-2,4,6-triiodo-1,3-phenylene]bis(carbonyliminomethylenecarbonylimino)]bis[5-[(2-hydroxyethyl)carbamoyl]-2,4,6-triiodobenzoic] acid.

01/2008:1875

IPECACUANHA LIQUID EXTRACT, STANDARDISED

Ipecacuanhae extractum fluidum normatum

DEFINITION

Standardised liquid extract produced from *Ipecacuanha root (0094)*.

Content: 1.80 per cent to 2.20 per cent of total alkaloids, calculated as emetine ($C_{29}H_{40}N_2O_4$; M_r 480.7).

PRODUCTION

The extract is produced from the herbal drug and ethanol (60 to 80 per cent *V/V*) by an appropriate procedure.

CHARACTERS

Appearance: dark brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. Dilute 5.0 ml of the extract to be examined to 50 ml with *ethanol (70 per cent V/V) R*. To 2.0 ml of this solution add 2 ml of *water R* and 0.1 ml of *concentrated ammonia R*. Add 10 ml of *ether R* and shake. Separate the upper layer, dry it over about 2 g of *anhydrous sodium sulphate R* and filter.

Reference solution. Dissolve 2.5 mg of *emetine hydrochloride CRS* and 3 mg of *cephaeline hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *concentrated ammonia R, methanol R, ethyl acetate R, toluene R* (2:15:18:65 *V/V/V/V*).

Application: 10 µl as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection A: spray with a 5 g/l solution of *iodine R* in *ethanol (96 per cent) R*. Heat at 60 °C for 10 min and allow to cool for 30 min. Examine in daylight.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
_____	_____
_____	_____
Emetine: a yellow zone	A yellow zone (emetine)
Cephaeline: a light brown zone	A light brown zone (cephaeline)
Reference solution	**Test solution**

Detection B: examine the plate in ultraviolet light at 365 nm.

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones are present in the chromatogram obtained with the test solution.

Top of the plate	
_____	_____
_____	_____
Emetine: an intense yellow fluorescent zone	An intense yellow fluorescent zone (emetine) A light blue fluorescent zone (cephaeline)
Reference solution	**Test solution**

With a liquid extract from *Cephaelis acuminata* root, the zones of emetine and cephaeline in the chromatogram obtained with the test solution are of similar size.

With a liquid extract from *Cephaelis ipecacuanha* root, the zone of emetine is much larger than the zone of cephaeline in the chromatogram obtained with the test solution.

TESTS

Ethanol (*2.9.10*): 95 per cent to 105 per cent of the quantity stated on the label.

ASSAY

Dilute 1.00 g of the extract to be examined to 10 ml with *ethanol (70 per cent V/V) R* and transfer to a chromatography column about 0.2 m long and about 15 mm in internal diameter, containing 8 g of *basic aluminium oxide R*, using a glass rod. After infiltration into the aluminium oxide layer, rinse the flask, glass rod and internal wall of the column with 3 quantities, each of 2 ml, of *ethanol (70 per cent V/V) R*. Elute in portions with 40 ml of *ethanol (70 per cent V/V) R*. Avoid disturbance or drying of the surface of the aluminium oxide layer. Collect the whole of the eluate. Evaporate the eluate on a water-bath to about 10 ml. Allow to cool. Add 10.0 ml of *0.02 M hydrochloric acid* and 20 ml of *carbon dioxide-free water R*. Titrate the excess acid with *0.02 M sodium hydroxide* using 0.15 ml of *methyl red mixed solution R* as indicator.

Perform a blank assay by replacing the extract to be examined with 10.0 ml of alcohol of the strength stated on the label.

1 ml of *0.02 M hydrochloric acid* is equivalent to 4.807 mg of total alkaloids, calculated as emetine.

corrected 6.0

IPECACUANHA, PREPARED

Ipecacuanhae pulvis normatus

DEFINITION

Prepared ipecacuanha is ipecacuanha root powder (180) (*2.9.12*) adjusted, if necessary, by the addition of powdered lactose or ipecacuanha root powder with a lower alkaloidal content to contain 1.9 per cent to 2.1 per cent of total alkaloids, calculated as emetine ($C_{29}H_{40}N_2O_4$; M_r 480.7) with reference to the dried drug.

CHARACTERS

Light grey to yellowish-brown powder with a slight odour.

IDENTIFICATION

A. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: parenchymatous cells, raphides of calcium oxalate up to 80 µm in length either in bundles or scattered throughout the powder; fragments of tracheids and vessels usually 10 µm to 20 µm in diameter, with bordered pits; larger vessels and sclereids from the rhizome. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple or two- to eight-compound starch granules contained in parenchymatous cells, the simple granules being up to 15 µm in diameter in *C. ipecacuanha* and up to 22 µm in diameter in *C. acuminata*. Examined in *glycerol (85 per cent) R*, it may be seen to contain lactose crystals.

B. Examine by thin-layer chromatography (*2.2.27*), using a suitable silica gel as the coating substance.

Test solution. To 0.1 g in a test-tube add 0.05 ml of *concentrated ammonia R* and 5 ml of *ether R* and stir the mixture vigorously with a glass rod. Allow to stand for 30 min and filter.

Reference solution. Dissolve 2.5 mg of *emetine hydrochloride CRS* and 3 mg of *cephaeline hydrochloride CRS* in *methanol R* and dilute to 20 ml with the same solvent.

Apply separately to the plate as bands 10 µl of each solution. Develop over a path of 10 cm using a mixture of 2 volumes of *concentrated ammonia R*, 15 volumes of *methanol R*, 18 volumes of *ethyl acetate R* and 65 volumes of *toluene R*. Allow the plate to dry in air. Spray with a 5 g/l solution of *iodine R* in *alcohol R* and heat at 60 °C for 10 min. Examine in daylight. The chromatograms obtained with the test solution and with the reference solution show in the lower part a yellow zone corresponding to emetine and below it a light brown zone corresponding to cephaeline. Examine in ultraviolet light at 365 nm. The zone corresponding to emetine shows an intense yellow fluorescence and that corresponding to cephaeline a light blue fluorescence. The chromatogram obtained with the test solution shows also faint fluorescent zones.

With *C. acuminata* the principal zones in the chromatogram obtained with the test solution are similar in position, fluorescence and size to the zones in the chromatogram obtained with the reference solution.

With *C. ipecacuanha* the only difference is that the zone corresponding to cephaeline in the chromatogram obtained with the test solution is much smaller than the corresponding zone in the chromatogram obtained with the reference solution.

TESTS

Loss on drying (*2.2.32*). Not more than 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Total ash (*2.4.16*). Not more than 5.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*). Not more than 3.0 per cent.

ASSAY

To 7.5 g in a dry flask, add 100 ml of *ether R* and shake for 5 min. Add 5 ml of *dilute ammonia R1*, shake for 1 h, add 5 ml of *water R* and shake vigorously. Decant the ether layer into a flask through a plug of cotton. Wash the residue in the flask with two quantities, each of 25 ml, of *ether R*, decanting each portion through the same plug of cotton. Combine the ether solutions and eliminate the ether by distillation. Dissolve the residue in 2 ml of *alcohol (90 per cent V/V) R*, evaporate the alcohol to dryness and heat at 100 °C for 5 min. Dissolve the residue in 5 ml of previously neutralised *alcohol (90 per cent V/V) R*, warming on a water-bath, add 15.0 ml of *0.1 M hydrochloric acid* and titrate the excess acid with *0.1 M sodium hydroxide* using 0.5 ml of *methyl red mixed solution R* as indicator.

1 ml of *0.1 M hydrochloric acid* is equivalent to 24.03 mg of total alkaloids, calculated as emetine.

STORAGE

Store in an airtight container.

01/2008:0094
corrected 6.0

IPECACUANHA ROOT

Ipecacuanhae radix

DEFINITION

Fragmented and dried underground organs of *Cephaelis ipecacuanha* (Brot.) A. Rich., known as Matto Grosso ipecacuanha, or of *Cephaelis acuminata* Karsten, known as Costa Rica ipecacuanha, or of a mixture of both species. The principal alkaloids are emetine and cephaeline.

Content: minimum 2.0 per cent of total alkaloids, expressed as emetine ($C_{29}H_{40}N_2O_4$; M_r 480.7) (dried drug).

CHARACTERS

Slight odour.

IDENTIFICATION

A. *C. ipecacuanha.* The root occurs as somewhat tortuous pieces, dark reddish-brown or very dark brown, seldom more than 15 cm long or 6 mm thick, closely annulated externally, having rounded ridges completely encircling the root; the fracture is short in the bark and splintery in the wood. The transversely cut surface shows a wide greyish bark and a small uniformly dense wood. The rhizome occurs as short lengths usually attached to roots, cylindrical, up to 2 mm in diameter, finely wrinkled longitudinally and with pith occupying approximately one-sixth of the whole diameter.

C. acuminata. The root in general resembles the root of *C. ipecacuanha*, but differs in the following particulars: it is often up to 9 mm thick; the external surface is greyish-brown or reddish-brown with transverse ridges at intervals of usually 1-3 mm, the ridges being about 0.5-1 mm wide, extending about half-way round the circumference and fading at the extremities into the general surface level.

B. Reduce to a powder (355) (*2.9.12*). The powder is light grey or yellowish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: parenchymatous cells, raphides of calcium oxalate up to 80 µm in length either in bundles or scattered throughout the powder; fragments of tracheids and vessels usually 10-20 µm in diameter, with bordered pits; larger vessels and sclereids from the rhizome. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple or two- to eight-compound starch granules contained in parenchymatous cells, the simple granules being up to 15 µm in diameter in *C. ipecacuanha* and up to 22 µm in diameter in *C. acuminata*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 0.1 g of the powdered drug (180) (*2.9.12*) in a test-tube add 0.05 ml of *concentrated ammonia R* and 5 ml of *ether R* and stir the mixture vigorously with a glass rod. Allow to stand for 30 min and filter.

Reference solution. Dissolve 2.5 mg of *emetine hydrochloride CRS* and 3 mg of *cephaeline hydrochloride CRS* in *methanol R* and dilute to 20 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *concentrated ammonia R, methanol R, ethyl acetate R, toluene R* (2:15:18:65 *V/V/V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection A: spray with a 5 g/l solution of *iodine R* in *ethanol (96 per cent) R* and heat at 60 °C for 10 min. Examine in daylight.

Results A: the chromatograms obtained with the test solution and with the reference solution show in the lower part a yellow zone due to emetine and below a light brown zone due to cephaeline.

Detection B: examine in ultraviolet light at 365 nm.

Results B: the zone due to emetine shows an intense yellow fluorescence and that due to cephaeline a light blue fluorescence. The chromatogram obtained with the test solution shows also faint fluorescent zones.

With *C. acuminata* the principal zones in the chromatogram obtained with the test solution are similar in position, fluorescence and size to the zones in the chromatogram obtained with the reference solution.

With *C. ipecacuanha* the only difference is that the zone due to cephaeline in the chromatogram obtained with the test solution is much smaller than the corresponding zone in the chromatogram obtained with the reference solution.

TESTS

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of powdered drug (180) (*2.9.12*) by drying in an oven at 105 °C.

Total ash (*2.4.16*): maximum 5.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 3.0 per cent.

ASSAY

To 7.5 g of the powdered drug (180) (*2.9.12*) in a dry flask, add 100 ml of *ether R* and shake for 5 min. Add 5 ml of *dilute ammonia R1*, shake for 1 h. Add 5 ml of *water R* and shake vigorously. Decant the ether layer into a flask through a plug of cotton. Wash the residue in the flask with 2 quantities, each of 25 ml, of *ether R*, decanting each portion through the same plug of cotton. Combine the ether solutions and eliminate the ether by distillation. Dissolve the residue in 2 ml of *ethanol (90 per cent V/V) R*, evaporate to dryness and heat at 100 °C for 5 min. Dissolve the residue in 5 ml of previously neutralised *ethanol (90 per cent V/V) R*, warming on a water-bath. Add 15.0 ml of *0.1 M hydrochloric acid* and titrate the excess acid with *0.1 M sodium hydroxide* using 0.5 ml of *methyl red mixed solution R* as indicator.

1 ml of *0.1 M hydrochloric acid* is equivalent to 24.03 mg of total alkaloids, expressed as emetine.

STORAGE

Protected from moisture.

01/2008:1530

IPECACUANHA TINCTURE, STANDARDISED

Ipecacuanhae tinctura normata

DEFINITION

Tincture produced from *Ipecacuanha root (0094)*.

Content: 0.18 per cent (*m/m*) to 0.22 per cent (*m/m*) of total alkaloids, calculated as emetine ($C_{29}H_{40}N_2O_4$; M_r 480.7).

PRODUCTION

The tincture is produced from the herbal drug and ethanol (70 per cent *V/V*) by an appropriate procedure.

CHARACTERS

Appearance: yellowish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (*2.2.27*).

Test solution. To 2.0 ml of the tincture to be examined add 2 ml of *water R* and 0.1 ml of *concentrated ammonia R*. Add 10 ml of *ether R* and shake. Separate the ether layer, dry it over about 2 g of *anhydrous sodium sulphate R* and filter.

Reference solution. Dissolve 2.5 mg of *emetine hydrochloride CRS* and 3 mg of *cephaeline hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *concentrated ammonia R, methanol R, ethyl acetate R, toluene R* (2:15:18:65 *V/V/V/V*).

Application: 10 µl as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection A: spray with a 5 g/l solution of *iodine R* in *ethanol (96 per cent) R* and heat at 60 °C for 10 min. Examine in daylight.

Results A: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
———	———
———	———
Emetine: a yellow zone	A yellow zone (emetine)
Cephaeline: a light brown zone	A light brown zone (cephaeline)
Reference solution	**Test solution**

Detection B: examine the plate in ultraviolet light at 365 nm.

Results B: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones are present in the chromatogram obtained with the test solution.

Top of the plate	
———	———
———	———
Emetine: an intense yellow fluorescent zone	An intense yellow fluorescent zone (emetine) A light blue fluorescent zone (cephaeline)
Reference solution	**Test solution**

With a tincture from *Cephaelis acuminata* root, the zones of emetine and cephaeline in the chromatogram obtained with the test solution are similar in size.

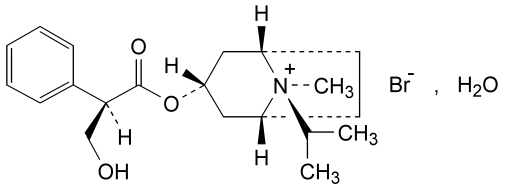
With a tincture from *Cephaelis ipecacuanha* root, the zone of emetine is much larger than the zone of cephaeline in the chromatogram obtained with the test solution.

TESTS

Ethanol (*2.9.10*): 95 per cent to 105 per cent of the quantity stated on the label.

ASSAY

Transfer 10.00 g of the tincture to be examined to a chromatography column about 0.2 m long and about 15 mm in internal diameter, filled with 8 g of *basic aluminium oxide R*. After infiltration into the aluminium oxide layer rinse the internal wall of the column with 3 quantities, each of 2 ml, of *ethanol (70 per cent V/V) R*. Elute in portions, with 40 ml of *ethanol (70 per cent V/V) R*. Avoid whirling or drying of the surface of the aluminium oxide layer. Collect the whole of the eluate. Evaporate the eluate on a water-bath to about 10 ml. Allow to cool. Add 10.0 ml of *0.02 M hydrochloric acid* and 20 ml of *carbon dioxide-free water R*. Titrate the excess acid with *0.02 M sodium hydroxide* using 0.15 ml of *methyl red mixed solution R* as indicator.



Perform a blank assay replacing the tincture to be examined with 10.0 ml of alcohol of the strength stated on the label.

1 ml of *0.02 M hydrochloric acid* is equivalent to 4.807 mg of total alkaloids, calculated as emetine.

01/2008:0919

IPRATROPIUM BROMIDE

Ipratropii bromidum

and enantiomer

$C_{20}H_{30}BrNO_3,H_2O$ M_r 430.4
[66985-17-9]

DEFINITION

(1*R*,3*r*,5*S*,8*r*)-3-[[(2*RS*)-3-Hydroxy-2-phenylpropanoyl]oxy]-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane bromide monohydrate.

Content: 99.0 per cent to 100.5 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water, freely soluble in methanol, slightly soluble in ethanol (96 per cent).

mp: about 230 °C, with decomposition.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *ipratropium bromide CRS*.

B. Examine the chromatograms obtained in the test for impurity A.
Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. To 5 ml of solution S (see Tests), add 2 ml of *dilute sodium hydroxide solution R*. No precipitate is formed.

D. To about 1 mg add 0.2 ml of *nitric acid R* and evaporate to dryness on a water-bath. Dissolve the residue in 2 ml of *acetone R* and add 0.1 ml of a 30 g/l solution of *potassium hydroxide R* in *methanol R*. A violet colour develops.

E. It gives reaction (a) of bromides (*2.3.1*).

TESTS

Solution S. Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution GY_7 (*2.2.2, Method II*).

pH (*2.2.3*): 5.0 to 7.5 for solution S.

Impurity A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 1.0 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *ipratropium bromide CRS* in *methanol R* and dilute to 1.0 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *methylatropine bromide CRS* in 1.0 ml of reference solution (a).

Reference solution (c). Dissolve 5 mg of *ipratropium impurity A CRS* in 100.0 ml of *methanol R*. Dilute 2.0 ml of the solution to 5.0 ml with *methanol R*.

Plate: *TLC silica gel plate R* (2-10 µm).

Mobile phase: *anhydrous formic acid R, water R, ethanol (96 per cent) R, methylene chloride R* (1:3:18:18 *V/V/V/V*).

Application: 1 µl.

Development: over a path of 6 cm.

Drying: at 60 °C for 15 min.

Detection: spray with *potassium iodobismuthate solution R*, allow the plate to dry in air, spray with a 50 g/l solution of *sodium nitrite R* and protect immediately with a sheet of glass.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated principal spots.

Limits:

– *impurity A*: any spot due to impurity A is not more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.1 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.200 g of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *ipratropium bromide CRS* in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *ipratropium bromide CRS* and 5 mg of *ipratropium impurity B CRS* in 1 ml of *methanol R* and dilute to 25.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 3.9 mm,
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
– *temperature*: 30 °C.

Mobile phase: dissolve 12.4 g of *sodium dihydrogen phosphate R* and 1.7 g of *tetrapropylammonium chloride R* in 870 ml of *water R*; adjust to pH 5.5 with a 180 g/l solution of *disodium hydrogen phosphate R* and add 130 ml of *methanol R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 5 µl.

Run time: 6 times the retention time of ipratropium.

Relative retention with reference to ipratropium (retention time = about 4.9 min): impurity C = about 0.7; impurity B = about 1.2; impurity D = about 1.8; impurity E = about 2.3; impurity F = about 5.1.

System suitability: reference solution (b):

– *resolution*: minimum 3.0 between the peaks due to impurity B and ipratropium,

– *symmetry factor*: maximum 2.5 for the principal peak.

Limits:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity C = 0.3; impurity D = 0.2; impurity F = 0.5;

– *impurity D*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

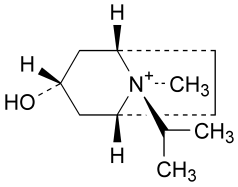
– *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent);

– *disregard limit*: one-third of the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent); disregard the peak due to the bromide ion.

Water (*2.5.12*): 3.9 per cent to 4.4 per cent, determined on 0.50 g.

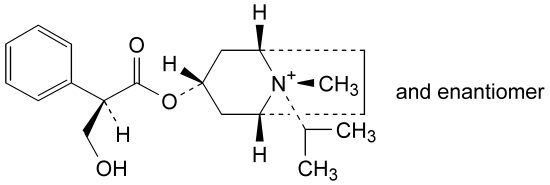
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



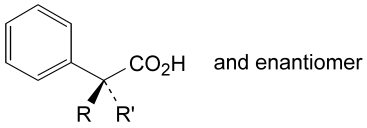
Dissolve 0.350 g in 50 ml of *water R* and add 3 ml of *dilute nitric acid R*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M silver nitrate* is equivalent to 41.24 mg of $C_{20}H_{30}BrNO_3$.



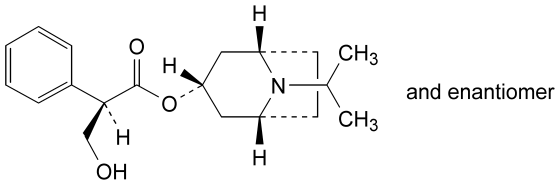
IMPURITIES

Specified impurities: *A, B, C, D.*

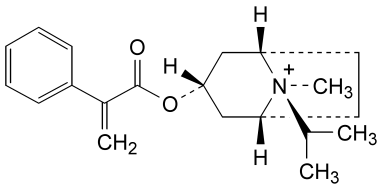


Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E, F.*

A. (1*R*,3*r*,5*S*,8*r*)-3-hydroxy-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane,



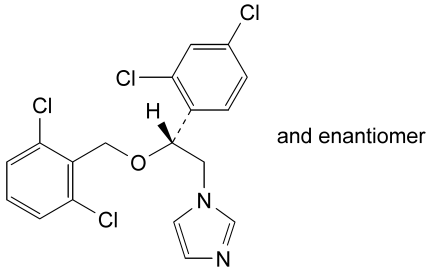
B. (1*R*,3*r*,5*S*,8*s*)-3-[[(2*RS*)-3-hydroxy-2-phenylpropanoyl]oxy]-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane,



C. R = CH_2-OH, R′ = H: (2*RS*)-3-hydroxy-2-phenylpropanoic acid (DL-tropic acid),

D. R + R′ = CH_2: 2-phenylpropenoic acid (atropic acid),

E. (1*R*,3*r*,5*S*)-8-(1-methylethyl)-8-azabicyclo[3.2.1]oct-3-yl (2*RS*)-3-hydroxy-2-phenylpropanoate,



F. (1*R*,3*r*,5*S*,8*r*)-8-methyl-8-(1-methylethyl)-3-[(2-phenylpropenoyl)oxy]-8-azoniabicyclo[3.2.1]octane.

corrected 6.0

ISOCONAZOLE

Isoconazolum

$C_{18}H_{14}Cl_4N_2O$ M_r 416.1
[27523-40-6]

DEFINITION

1-[(2*RS*)-2-[(2,6-Dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)-ethyl]-1*H*-imidazole.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, very soluble in methanol, freely soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 111 °C to 115 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *isoconazole CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 30 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 30 mg of *isoconazole CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 30 mg of *isoconazole CRS* and 30 mg of *econazole nitrate CRS* in *methanol R*, then dilute to 5 ml with the same solvent.

Plate: *TLC octadecylsilyl silica gel plate R*.

Mobile phase: *ammonium acetate solution R, dioxan R, methanol R* (20:40:40 *V/V/V*).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in a current of warm air for 15 min.

Detection: expose to iodine vapour until the spots appear and examine in daylight.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To about 30 mg in a porcelain crucible add 0.3 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 0.20 g in *methanol R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Optical rotation (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in 3.2 ml of *methanol R*. Add 3.0 ml of *acetonitrile R* and dilute to 10.0 ml with a solution of *ammonium acetate R* (6.0 g in 380 ml of *water R*).

Reference solution (a). Dissolve 2.5 mg of *isoconazole CRS* and 2.5 mg of *econazole nitrate CRS* in the mobile phase, then dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 20.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.1 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase: dissolve 6.0 g of *ammonium acetate R* in a mixture of 300 ml of *acetonitrile R*, 320 ml of *methanol R* and 380 ml of *water R*.

Flow rate: 2 ml/min.

Detection: spectrophotometer at 235 nm.

Equilibration: with the mobile phase for about 30 min.

Injection: 10 µl.

Run time: 1.5 times the retention time of isoconazole.

Retention time: econazole = about 10 min; isoconazole = about 14 min.

System suitability: reference solution (a):

– *resolution*: minimum 5.0 between the peaks due to econazole and isoconazole; if necessary, adjust the composition of the mobile phase.

Limits:

– *impurities B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

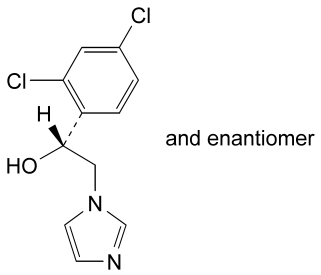
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Using 0.2 ml of *naphtholbenzein solution R* as indicator, titrate with *0.1 M perchloric acid* until the colour changes from orange-yellow to green.

1 ml of *0.1 M perchloric acid* is equivalent to 41.61 mg of $C_{18}H_{14}Cl_4N_2O$.



STORAGE

Protected from light.

ISOCONAZOLE NITRATE

Isoconazoli nitras

and enantiomer , HNO_3

$C_{18}H_{15}Cl_4N_3O_4$ M_r 479.1
[40036-10-0]

DEFINITION

1-[(2*RS*)-2-[(2,6-Dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)-ethyl]-1*H*-imidazole nitrate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: very slightly soluble in water, soluble in methanol, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 178 °C to 182 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *isoconazole nitrate CRS.*

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 30 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 30 mg of *isoconazole nitrate CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 30 mg of *isoconazole nitrate CRS* and 30 mg of *econazole nitrate CRS* in *methanol R*, then dilute to 5 ml with the same solvent.

Plate: *TLC octadecylsilyl silica gel plate R.*

Mobile phase: *ammonium acetate solution R, dioxan R, methanol R* (20:40:40 *V/V/V*).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in a current of warm air for 15 min.

Detection: expose to iodine vapour until the spots appear and examine in daylight.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. It gives the reaction of nitrates (*2.3.1*).

TESTS

Solution S. Dissolve 0.20 g in *methanol R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Optical rotation (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 2.5 mg of *isoconazole nitrate CRS* and 2.5 mg of *econazole nitrate CRS* in the mobile phase, then dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 20.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.1 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase: dissolve 6.0 g of *ammonium acetate R* in a mixture of 300 ml of *acetonitrile R*, 320 ml of *methanol R* and 380 ml of *water R*.

Flow rate: 2 ml/min.

Detection: spectrophotometer at 235 nm.

Equilibration: with the mobile phase for about 30 min.

Injection: 10 µl.

Run time: 1.5 times the retention time of isoconazole.

Retention time: econazole = about 10 min; isoconazole = about 14 min.

System suitability: reference solution (a):

– *resolution*: minimum 5.0 between the peaks due to econazole and isoconazole; if necessary, adjust the composition of the mobile phase.

Limits:

– *impurities A, B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

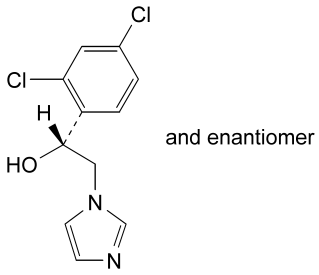
– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard the peak due to the nitrate ion.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 2 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

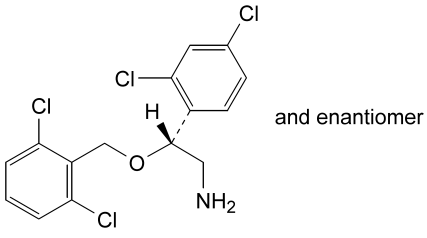
ASSAY

Dissolve 0.350 g in 75 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



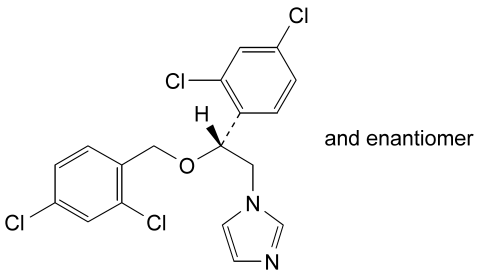
1 ml of *0.1 M perchloric acid* is equivalent to 47.91 mg of $C_{18}H_{15}Cl_4N_3O_4$.

STORAGE



Protected from light.

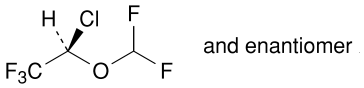
IMPURITIES



Specified impurities: *A, B, C.*

A. (1*RS*)-1-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-yl)ethanol,

B. (2*RS*)-2-[(2,6-dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethanamine,



C. 1-[(2*RS*)-2-[(2,4-dichlorobenzyl)oxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole.

ISOFLURANE

Isofluranum

$C_3H_2ClF_5O$ M_r 184.5
[26675-46-7]

DEFINITION

(2*RS*)-2-Chloro-2-(difluoromethoxy)-1,1,1-trifluoroethane.

CHARACTERS

Appearance: clear, colourless, mobile, heavy liquid.

Solubility: practically insoluble in water, miscible with ethanol and trichloroethylene.

bp: about 48 °C.

It is non-flammable.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Preparation: examine the substance in the gaseous state.

Comparison: *Ph. Eur. reference spectrum of isoflurane.*

TESTS

Acidity or alkalinity. To 20 ml add 20 ml of *carbon dioxide-free water R*, shake for 3 min and allow to stand. Collect the upper layer and add 0.2 ml of *bromocresol purple solution R*. Not more than 0.1 ml of *0.01 M sodium hydroxide* or 0.6 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator.

Related substances. Gas chromatography (*2.2.28*).

Test solution. The substance to be examined.

Reference solution. To 80 ml of *ethanol R*, add 1.0 ml of the substance to be examined and 1.0 ml of *acetone R*, avoiding loss by evaporation. Dilute to 100.0 ml with *ethanol R*. Dilute 1.0 ml of the solution to 100.0 ml with *ethanol R*.

Column:

– *material*: fused silica,

– *size*: *l* = 30 m, Ø = 0.32 mm,

– *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R.*

Flow rate: 1.0 ml/min.

Split ratio: 1:25.

Temperature:

– *column*: 35 °C,

– *injection port*: 150 °C,
– *detector*: 250 °C.

Detection: flame ionisation.

Injection: 1.0 µl of each solution and 1.0 µl of *ethanol R* as a blank.

Run time: until elution of the ethanol peak in the chromatogram obtained with the reference solution.

Relative retention with reference to isoflurane (retention time = about 3.8 min): acetone = about 0.75.

System suitability: reference solution:

– *resolution*: minimum of 5 between the peaks due to acetone and to isoflurane,
– *repeatability*: maximum relative standard deviation 15.0 per cent for the peak due to isoflurane after 3 injections.

Limits:

– *acetone*: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.01 per cent),
– *any other impurity*: not more than the area of the peak due to isoflurane in the chromatogram obtained with the reference solution (0.01 per cent),
– *total*: not more than 3 times the area of the peak due to isoflurane in the chromatogram obtained with the reference solution (0.03 per cent),
– *disregard limit*: 0.1 times the area of the peak due to isoflurane in the chromatogram obtained with the reference solution (0.001 per cent).

Chlorides (*2.4.4*): maximum 10 ppm.

To 10 ml add 10 ml of *0.01 M sodium hydroxide* and shake for 3 min. To 5 ml of the upper layer add 10 ml of *water R*. The solution complies with the limit test for chlorides.

Fluorides: maximum 10 ppm.

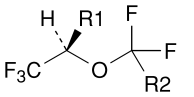
Determine by potentiometry (*2.2.36, Method I*) using a fluoride-selective indicator-electrode and a silver-silver chloride reference electrode.

Test solution. To 10.0 ml in a separating funnel, add 10 ml of a mixture of 30.0 ml of *dilute ammonia R2* and 70.0 ml of *distilled water R*. Shake for 1 min and collect the upper layer. Repeat this extraction procedure twice collecting the upper layer each time. Adjust the combined upper layers to pH 5.2 using *dilute hydrochloric acid R*. Add 5.0 ml of *fluoride standard solution (1 ppm F) R* and dilute to 50.0 ml with *distilled water R*. To 20.0 ml of the solution add 20.0 ml of *total-ionic-strength-adjustment buffer R* and dilute to 50.0 ml with *distilled water R*.

Reference solutions. To each of 5.0 ml, 4.0 ml, 3.0 ml, 2.0 ml and 1.0 ml of *fluoride standard solution (10 ppm F) R* add 20.0 ml of *total-ionic-strength-adjustment buffer R* and dilute to 50.0 ml with *distilled water R*.

Carry out the measurements on 20 ml of each solution. Calculate the concentration of fluorides using the calibration curve, taking into account the addition of fluoride to the test solution.

Non-volatile matter: maximum 200 mg/l.



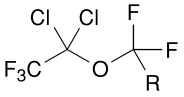
Evaporate 10.0 ml to dryness with the aid of a stream of cold air and dry the residue at 50 °C for 2 h. The residue weighs a maximum of 2.0 mg.

Water (*2.5.12*): maximum 1.0 mg/ml, determined on 10.0 ml.

STORAGE

In an airtight container, protected from light.

IMPURITIES



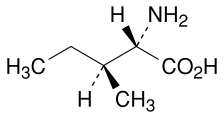
and enantiomer

A. R1 = H, R2 = Cl: 2-(chlorodifluoromethoxy)-1,1,1-trifluoroethane,

B. R1 = R2 = H: 2-(difluoromethoxy)-1,1,1-trifluoroethane,

C. R1 = R2 = Cl: (2*RS*)-2-chloro-2-(chlorodifluoromethoxy)-1,1,1-trifluoroethane,

D. R = H: 1,1-dichloro-1-(difluoromethoxy)-2,2,2-trifluoroethane,



E. R = Cl: 1,1-dichloro-1-(chlorodifluoromethoxy)-2,2,2-trifluoroethane,

F. acetone.

ISOLEUCINE

Isoleucinum

$C_6H_{13}NO_2$ M_r 131.2
[73-32-5]

DEFINITION

Isoleucine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (2*S*,3*S*)-2-amino-3-methylpentanoic acid, calculated with reference to the dried substance.

CHARACTERS

White or almost white, crystalline powder or flakes, sparingly soluble in water, slightly soluble in alcohol. It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. It complies with the test for specific optical rotation (see Tests).

B. Dissolve 0.5 g in *water R* and dilute to 25 ml with the same solvent. The solution is dextrorotatory.

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *isoleucine CRS*. Examine the substances prepared as discs.

D. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. Dissolve 0.5 g in *1 M hydrochloric acid* and dilute to 10 ml with the same acid. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*). Dissolve 1.00 g in *hydrochloric acid R1* and dilute to 25.0 ml with the same acid. The specific optical rotation is + 40.0 to + 43.0, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *0.1 M hydrochloric acid* and dilute to 10 ml with the same acid.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *isoleucine CRS* in *0.1 M hydrochloric acid* and dilute to 50 ml with the same acid.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *isoleucine CRS* and 10 mg of *valine CRS* in *0.1 M hydrochloric acid* and dilute to 25 ml with the same acid.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at 100-105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows 2 clearly separated spots.

Chlorides (*2.4.4*). Dissolve 0.25 g in *water R* and dilute to 15 ml with the same solvent. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (*2.4.13*). Dissolve 0.5 g in 3 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (*2.4.1*). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (*2.4.9*). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (*2.4.8*). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

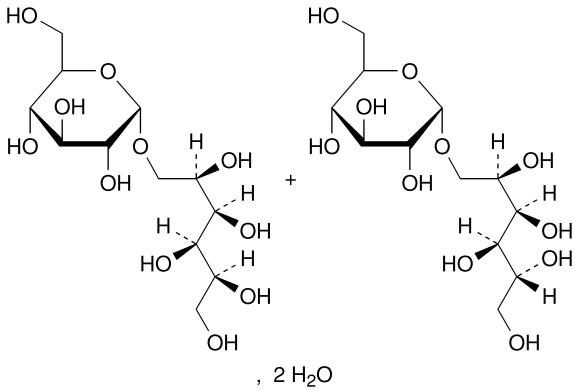
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 3 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Using 0.1 ml of *naphtholbenzein solution R* as indicator, titrate with *0.1 M perchloric acid* until the colour changes from brownish-yellow to green.

1 ml of *0.1 M perchloric acid* is equivalent to 13.12 mg of $C_6H_{13}NO_2$.



STORAGE

Store protected from light.

01/2008:1531

ISOMALT

Isomaltum

$C_{12}H_{24}O_{11}$ M_r 344.3

$C_{12}H_{24}O_{11},2H_2O$ M_r 380.3

DEFINITION

Mixture of 6-*O*-α-D-glucopyranosyl-D-glucitol (6-*O*-α-D-glucopyranosyl-D-sorbitol; 1,6-GPS) and 1-*O*-α-D-glucopyranosyl-D-mannitol (1,1-GPM).

Content: 98.0 per cent to 102.0 per cent for the mixture of 1,6-GPS and 1,1-GPM and neither of the 2 components is less than 3.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder or granules.

Solubility: freely soluble in water, practically insoluble in anhydrous ethanol.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Examine the chromatograms obtained in the assay.

Results: the 2 principal peaks in the chromatogram obtained with the test solution are similar in retention time to the 2 principal peaks in the chromatogram obtained with reference solution (a).

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 50 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 mg of *isomalt CRS* in *water R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *acetic acid R, propionic acid R, water R, ethyl acetate R, pyridine R* (5:5:10:50:50 *V/V/V/V/V*).

Application: 1 µl; thoroughly dry the starting points in warm air.

Development: over a path of 10 cm.

Drying: in a current of warm air.

Detection: dip for 3 s in a 1 g/l solution of *sodium periodate R* and dry in a current of hot air; dip for 3 s in a mixture of 1 volume of *acetic acid R*, 1 volume of *anisaldehyde R*, 5 volumes of *sulphuric acid R* and 90 volumes of *anhydrous ethanol R*; dry in a current of hot air until coloured spots become visible; the background colour may be brightened in warm steam; examine in daylight.

Results: the chromatogram obtained with the reference solution shows 2 blue-grey spots with R_F values of about 0.13 (1,6-GPS) and 0.16 (1,1-GPM). The chromatogram obtained with the test solution shows principal spots similar in position and colour to the principal spots in the chromatogram obtained with the reference solution.

C. To 3 ml of a freshly prepared 100 g/l solution of *pyrocatechol R* add 6 ml of *sulphuric acid R* while cooling in iced water. To 3 ml of the cooled mixture add 0.3 ml of a 100 g/l solution of the substance to be examined. Heat gently over a naked flame for about 30 s. A pink colour develops.

TESTS

Conductivity (*2.2.38*): maximum 20 $\mu S \cdot cm^{-1}$.

Dissolve 20.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent. Measure the conductivity of the solution while gently stirring with a magnetic stirrer.

Reducing sugars: maximum 0.3 per cent, expressed as glucose equivalent.

Dissolve 3.3 g in 10 ml of *water R* with the aid of gentle heat. Cool and add 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that the boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R*. When the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution R* as indicator, added towards the end of the titration. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Related products. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 1.00 g of the substance to be examined in 20 ml of *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 1.00 g of *isomalt CRS* in 20 ml of *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dissolve 10.0 mg of *sorbitol CRS* (impurity C) and 10.0 mg of *mannitol CRS* (impurity B) in 20 ml of *water R* and dilute to 100.0 ml with the same solvent.

Precolumn:

– *size*: *l* = 30 mm, Ø = 4.6 mm;

– *stationary phase*: *strong cation-exchange resin (calcium form) R* (9 µm);

– *temperature*: 80 ± 1 °C.

Column:

– *size*: *l* = 0.3 m, Ø = 7.8 mm;

– *stationary phase*: *strong cation-exchange resin (calcium form) R* (9 µm);

– *temperature*: 80 ± 1 °C.

Mobile phase: degassed *water R*.

Flow rate: 0.5 ml/min.

Detection: differential refractometer maintained at a constant temperature.

Injection: 20 µl of the test solution and reference solution (b).

Run time: until impurity C is completely eluted (about 25 min).

Relative retention with reference to 1,1-GPM (retention time = about 12.3 min): impurity A = about 0.8; 1,6-GPS = about 1.2; impurity B = about 1.6; impurity C = about 2.0.

Limits:

– *impurities B, C*: for each impurity, not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *any other impurity*: for each impurity, not more than the area of the peak due to impurity C in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *total*: not more than 4 times the area of the peak due to impurity C in the chromatogram obtained with reference solution (b) (2 per cent);

– *disregard limit*: 0.2 times the area of the peak due to impurity C in the chromatogram obtained with reference solution (b) (0.1 per cent).

Lead (*2.4.10*): maximum 0.5 ppm.

Nickel (*2.4.15*): maximum 1 ppm.

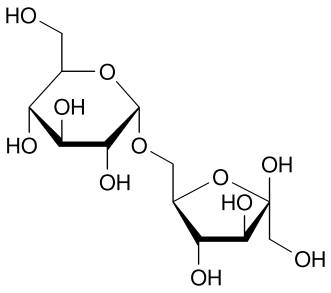
Water (*2.5.12*): maximum 7.0 per cent, determined on 0.3 g. As solvent, use a mixture of 20 ml of *anhydrous methanol R* and 20 ml of *formamide R* at 50 ± 5 °C.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related products with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of isomalt (1,1-GPM and 1,6-GPS) from the declared content of 1,1-GPM and 1,6-GPS in *isomalt CRS*.

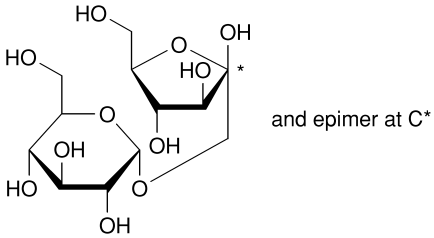


LABELLING

The label states the percentage content of 1,6-GPS and 1,1-GPM.

IMPURITIES

Specified impurities: *B, C.*

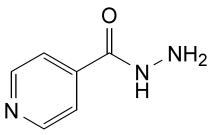


Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A, D.*

A. 6-*O*-α-D-glucopyranosyl-β-D-*arabino*-hex-2-ulofuranose (isomaltulose),

B. mannitol,

C. sorbitol,



D. 1-*O*-α-D-glucopyranosyl-D-*arabino*-hex-2-ulofuranose (trehalulose).

ISONIAZID

Isoniazidum

$C_6H_7N_3O$ M_r 137.1
[54-85-3]

DEFINITION

Isoniazid contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of pyridine-4-carbohydrazide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, freely soluble in water, sparingly soluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. Melting point (*2.2.14*): 170 °C to 174 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *isoniazid CRS*.

C. Dissolve 0.1 g in 2 ml of *water R* and add 10 ml of a warm 10 g/l solution of *vanillin R*. Allow to stand and scratch the wall of the test tube with a glass rod. A yellow precipitate is formed, which, after recrystallisation from 5 ml of *alcohol (70 per cent V/V) R* and drying at 100 °C to 105 °C, melts (*2.2.14*) at 226 °C to 231 °C.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

pH (*2.2.3*). The pH of solution S is 6.0 to 8.0.

Hydrazine and related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in a mixture of equal volumes of *acetone R* and *water R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution. Dissolve 50.0 mg of *hydrazine sulphate R* in 50 ml of *water R* and dilute to 100.0 ml with *acetone R*. To 10.0 ml of this solution add 0.2 ml of the test solution and dilute to 100.0 ml with a mixture of equal volumes of *acetone R* and *water R*.

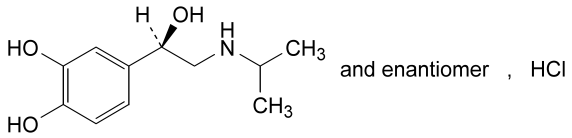
Apply separately to the plate 5 µl of each solution and develop over a path of 15 cm using a mixture of 10 volumes of *water R*, 20 volumes of *acetone R*, 20 volumes of *methanol R* and 50 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.2 per cent). Spray the plate with *dimethylaminobenzaldehyde solution R1*. Examine in daylight. An additional spot, corresponding to hydrazine, appears in the chromatogram obtained with the reference solution. Any corresponding spot in the chromatogram obtained with the test solution is not more intense than the spot corresponding to hydrazine in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (*2.4.8*). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.250 g in *water R* and dilute to 100.0 ml with the same solvent. To 20.0 ml of the solution add 100 ml of *water R*, 20 ml of *hydrochloric acid R*, 0.2 g of *potassium bromide R* and 0.05 ml of *methyl red solution R*. Titrate dropwise with *0.0167 M potassium bromate*, shaking continuously, until the red colour disappears.

1 ml of *0.0167 M potassium bromate* is equivalent to 3.429 mg of $C_6H_7N_3O$.

01/2008:1332

ISOPRENALINE HYDROCHLORIDE

Isoprenalini hydrochloridum

$C_{11}H_{18}ClNO_3$ M_r 247.7
[51-30-9]

DEFINITION

(1*RS*)-1-(3,4-Dihydroxyphenyl)-2-[(1-methylethyl)amino]-ethanol hydrochloride.

Content: 98.0 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, sparingly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, C, E.

Second identification: A, C, D, E.

A. Melting point (*2.2.14*): 165 °C to 170 °C, with decomposition.

B. Infrared absorption spectrophotometry (*2.2.24*).
Preparation: discs.
Comparison: *isoprenaline hydrochloride CRS*.

C. Optical rotation (see Tests).

D. To 0.1 ml of solution S (see Tests) add 0.05 ml of *ferric chloride solution R1* and 0.9 ml of *water R*. A green colour is produced. Add dropwise *sodium hydrogen carbonate solution R*. The colour becomes blue then red.

E. To 0.5 ml of solution S add 1.5 ml of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Prepare the solutions immediately before use.

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution B_7 or BY_7 (*2.2.2, Method II*).

pH (*2.2.3*): 4.3 to 5.5.

Mix 5 ml of solution S and 5 ml of *carbon dioxide-free water R*.

Optical rotation (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Test solution (b). Dilute 0.5 ml of test solution (a) to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 2.5 mg of *isoprenaline hydrochloride CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 2.5 mg of *orciprenaline sulphate CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (c). To 1.0 ml of test solution (b) add 1.0 ml of reference solution (b) and dilute to 20.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.125 m, Ø = 4.0 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *methanol R*, 11.5 g/l solution of *phosphoric acid R* (5:95 *V/V*).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl of test solution (a) and reference solutions (a) and (c).

Run time: 7 times the retention time of isoprenaline.

Retention time: isoprenaline = about 3 min; if necessary, adjust the concentration of methanol in the mobile phase.

System suitability: reference solution (c):

– *resolution*: minimum 3 between the peaks due to isoprenaline and orciprenaline;
– *signal-to-noise ratio*: minimum 3 for the peak due to isoprenaline.

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent);
– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.025 per cent).

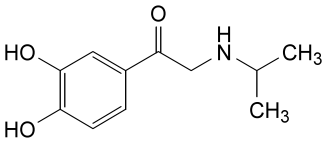
Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying *in vacuo* at 15-25 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.150 g in 10 ml of *anhydrous formic acid R* and add 50 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).



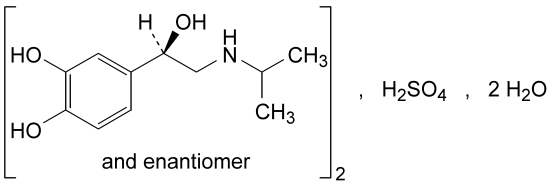
1 ml of *0.1 M perchloric acid* is equivalent to 24.77 mg of $C_{11}H_{18}ClNO_3$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A.



A. 1-(3,4-dihydroxyphenyl)-2-[(1-methylethyl)amino]-ethanone.

01/2008:0502

ISOPRENALINE SULPHATE

Isoprenalini sulfas

$C_{22}H_{36}N_2O_{10}S,2H_2O$ M_r 556.6
[6700-39-6]

DEFINITION

Bis[(1*RS*)-1-(3,4-dihydroxyphenyl)-2-[(1-methylethyl)-amino]ethanol] sulphate dihydrate.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, very slightly soluble in ethanol (96 per cent).

mp: about 128 °C, with decomposition.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Dissolve 0.5 g in 1.5 ml of *water R* and add 3.5 ml of *2-propanol R*. Scratch the wall of the tube with a glass rod to initiate crystallisation. Collect the crystals and dry *in vacuo* at 60 °C over *diphosphorus pentoxide R*.

Comparison: repeat the operations using 0.5 g of *isoprenaline sulphate CRS*.

B. To 0.1 ml of solution S (see Tests) add 0.9 ml of *water R* and 0.05 ml of *ferric chloride solution R1*. A green colour is produced. Add dropwise *sodium hydrogen carbonate solution R*. The colour becomes blue and then red.

C. Dilute 1 ml of solution S to 10 ml with *water R* and add 0.25 ml of *silver nitrate solution R1*. A shining, grey, fine precipitate is formed within 10 min and the solution becomes pink.

D. Solution S gives reaction (a) of sulphates (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent. Use within 2 h of preparation.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

pH (*2.2.3*): 4.3 to 5.5.

Dilute 5 ml of solution S to 10 ml with *carbon dioxide-free water R*.

Isoprenalone: the absorbance (*2.2.25*) is not greater than 0.20 at 310 nm.

Dissolve 0.20 g in *0.005 M sulphuric acid* and dilute to 100.0 ml with the same acid.

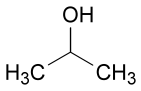
Water (*2.5.12*): 5.0 per cent to 7.5 per cent, determined on 0.200 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 20 ml of *anhydrous acetic acid R*, warming gently if necessary and add 20 ml of *methyl isobutyl ketone R*. Titrate with *0.1 M perchloric acid* determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 52.06 mg of $C_{22}H_{36}N_2O_{10}S$.



STORAGE

In an airtight container, protected from light.

01/2008:0970

ISOPROPYL ALCOHOL

Alcohol isopropylicus

C_3H_8O M_r 60.1
[67-63-0]

DEFINITION

Propan-2-ol.

CHARACTERS

Appearance: clear, colourless liquid.

Solubility: miscible with water and with alcohol.

IDENTIFICATION

A. Relative density (*2.2.5*): 0.785 to 0.789.

B. Refractive index (*2.2.6*): 1.376 to 1.379.

C. To 1 ml add 2 ml of *potassium dichromate solution R* and 1 ml of *dilute sulphuric acid R*. Boil. Vapour is produced which changes the colour of a piece of filter paper impregnated with *nitrobenzaldehyde solution R* to green. Moisten the filter paper with *dilute hydrochloric acid R*. The colour changes to blue.

TESTS

Appearance. The substance to be examined is clear (*2.2.1*) and colourless (*2.2.2, Method II*). Dilute 1 ml to 20 ml with *water R*. After 5 min, the solution is clear (*2.2.1*).

Acidity or alkalinity. Gently boil 25 ml for 5 min. Add 25 ml of *carbon dioxide-free water R* and allow to cool protected from carbon dioxide in the air. Add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.6 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pale pink.

Absorbance (*2.2.25*): maximum 0.30 at 230 nm, 0.10 at 250 nm, 0.03 at 270 nm, 0.02 at 290 nm and 0.01 at 310 nm.

The absorbance is measured between 230 nm and 310 nm using *water R* as the compensation liquid. The absorption curve is smooth.

Benzene and related substances. Gas chromatography (*2.2.28*).

Test solution (a). The substance to be examined.

Test solution (b). Dilute 1.0 ml of *2-butanol R1* to 50.0 ml with test solution (a). Dilute 5.0 ml of the solution to 100.0 ml with test solution (a).

Reference solution (a). Dilute 0.5 ml of *2-butanol R1* and 0.5 ml of *propanol R* to 50.0 ml with test solution (a). Dilute 5.0 ml of the solution to 50.0 ml with test solution (a).

Reference solution (b). Dilute 100 µl of *benzene R* to 100.0 ml with test solution (a). Dilute 0.20 ml of the solution to 100.0 ml with test solution (a).

Column:

– *material*: fused silica,

– *size*: *l* = 30 m, Ø = 0.32 mm,

– *stationary phase*: *poly[(cyanopropyl)(phenyl)][dimethyl]siloxane R* (film thickness 1.8 µm).

Carrier gas: *helium for chromatography R.*

Auxiliary gas: *nitrogen for chromatography R* or *helium for chromatography R.*

Linear velocity: 35 cm/s.

Split ratio: 1:5.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 12	40
	12 - 32	40 → 240
	32 - 42	240
Injection port		280
Detector		280

Detection: flame ionisation.

Injection: 1 µl.

Retention time: benzene = about 10 min.

System suitability: reference solution (a):

– *resolution*: minimum of 10 between the first peak (propanol) and the second peak (2-butanol).

Limits:

– *benzene* (test solution (a)): not more than half of the area of the corresponding peak in the chromatogram obtained with reference solution (b) (2 ppm), after the sensitivity has been adjusted so that the height of the peak due to benzene in the chromatogram obtained with reference solution (b) represents at least 10 per cent of the full scale of the recorder.

– *total of impurities apart from 2-butanol* (test solution (b)): not more than 3 times the area of the peak due to 2-butanol in the chromatogram obtained with test solution (b) (0.3 per cent), after the sensitivity has been adjusted so that the height of the 2 peaks following the principal peak in the chromatogram obtained with reference solution (a) represents at least 50 per cent of the full scale of the recorder.

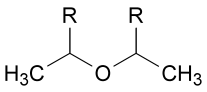
Peroxides. In a 12 ml test-tube with a ground-glass stopper and a diameter of about 15 mm, introduce 8 ml of *potassium iodide and starch solution R*. Fill completely with the substance to be examined. Shake vigorously and allow to stand protected from light for 30 min. No colour develops.

Non-volatile substances: maximum 20 ppm.

Evaporate 100 g to dryness on a water-bath *after having verified that it complies with the test for peroxides* and dry in an oven at 100-105 °C. The residue weighs a maximum of 2 mg.

Water (*2.5.12*): maximum 0.5 per cent, determined on 5.0 g.

STORAGE



Protected from light.

IMPURITIES

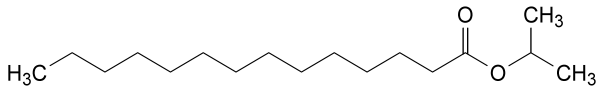
A. acetone,

B. benzene,

C. R = CH_3: 2-(1-methylethoxy)propane (diisopropyl ether),

D. R = H: ethoxyethane (diethyl ether),

E. CH_3-OH: methanol,



F. propan-1-ol (*n*-propanol).

01/2008:0725

ISOPROPYL MYRISTATE

Isopropylis myristas

$C_{17}H_{34}O_2$ M_r 270.5

DEFINITION

1-Methylethyl tetradecanoate together with variable amounts of other fatty acid isopropyl esters.

Content: minimum 90.0 per cent of $C_{17}H_{34}O_2$.

CHARACTERS

Appearance: clear, colourless, oily liquid.

Solubility: immiscible with water, miscible with ethanol (96 per cent), with methylene chloride, with fatty oils and with liquid paraffin.

Relative density: about 0.853.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. It complies with the test for saponification value (see Tests).

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

C. Superpose 2 ml of a 1 g/l solution in *ethanol (96 per cent) R* on a freshly prepared solution of 20 mg of *dimethylaminobenzaldehyde R* in 2 ml of *sulphuric acid R*. After 2 min, a yellowish-red colour appears at the junction of the 2 liquids and gradually becomes red.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Dissolve 2.0 g in *methanol R* and dilute to 20 ml with the same solvent.

Refractive index (*2.2.6*): 1.434 to 1.437.

Viscosity (*2.2.9*): 5 mPa·s to 6 mPa·s.

Acid value (*2.5.1*): maximum 1.0.

Iodine value (*2.5.4*): maximum 1.0.

Saponification value (*2.5.6*): 202 to 212.

Water (*2.5.12*): maximum 0.1 per cent, determined on 5.0 g.

Total ash (*2.4.16*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 50.0 mg of *tricosane R* in *heptane R* and dilute to 250.0 ml with the same solvent.

Test solution. Dissolve 20.0 mg of the substance to be examined in the internal standard solution and dilute to 100.0 ml with the same solution.

Reference solution. Dissolve 20.0 mg of *isopropyl tetradecanoate CRS* in the internal standard solution and dilute to 100.0 ml with the same solution.

Column:

- *material*: fused silica,
- *size*: *l* = 50 m, Ø = 0.2 mm,
- *stationary phase*: *poly(cyanopropyl)siloxane R* (film thickness 0.2 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1 ml/min.

Split ratio: 1:40.

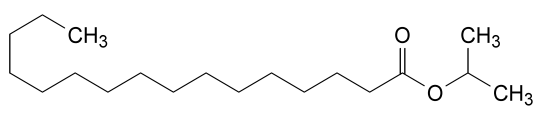
Temperature:

	Time (min)	Temperature (°C)
Column	0 - 6	125 → 185
	6 - 16	185
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 2 µl.

Calculate the percentage content of $C_{17}H_{34}O_2$ in the substance to be examined.



STORAGE

Protected from light.

01/2008:0839

ISOPROPYL PALMITATE

Isopropylis palmitas

$C_{19}H_{38}O_2$ M_r 298.5

DEFINITION

1-Methylethyl hexadecanoate together with varying amounts of other fatty acid isopropyl esters.

Content: minimum 90.0 per cent of $C_{19}H_{38}O_2$.

CHARACTERS

Appearance: clear, colourless, oily liquid.

Solubility: immiscible with water, miscible with ethanol (96 per cent), with methylene chloride, with fatty oils and with liquid paraffin.

Relative density: about 0.854.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. It complies with the test for saponification value (see Tests).

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

C. Superpose 2 ml of a 1 g/l solution in *ethanol (96 per cent) R* on a freshly prepared solution of 20 mg of *dimethylaminobenzaldehyde R* in 2 ml of *sulphuric acid R*. After 2 min, a yellowish-red colour appears at the junction of the 2 liquids which gradually becomes red.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Dissolve 2.0 g in *methanol R* and dilute to 20 ml with the same solvent.

Refractive index (*2.2.6*): 1.436 to 1.440.

Viscosity (*2.2.9*): 5 mPa·s to 10 mPa·s.

Acid value (*2.5.1*): maximum 1.0.

Iodine value (*2.5.4*): maximum 1.0.

Saponification value (*2.5.6*): 183 to 193.

Water (*2.5.12*): maximum 0.1 per cent, determined on 5.0 g.

Total ash (*2.4.16*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 50.0 mg of *tricosane R* in *heptane R* and dilute to 250.0 ml with the same solvent.

Test solution. Dissolve 20.0 mg of the substance to be examined in the internal standard solution and dilute to 100.0 ml with the same solution.

Reference solution. Dissolve 20.0 mg of *isopropyl hexadecanoate CRS* in the internal standard solution and dilute to 100.0 ml with the same solution.

Column:

- *material*: fused silica,
- *size*: *l* = 50 m, Ø = 0.2 mm,
- *stationary phase*: *poly(cyanopropyl)siloxane R* (film thickness 0.2 µm).

Carrier gas: *helium for chromatography R*.

corrected 6.0

ISOSORBIDE DINITRATE, DILUTED

Isosorbidi dinitras dilutus

$C_6H_8N_2O_8$ M_r 236.1

DEFINITION

Dry mixture of isosorbide dinitrate and *Lactose monohydrate (0187)* or *Mannitol (0559)*.

Content: 95.0 per cent *m/m* to 105.0 per cent *m/m* of the content of 1,4:3,6-dianhydro-D-glucitol 2,5-dinitrate stated on the label.

CAUTION: undiluted isosorbide dinitrate may explode if subjected to percussion or excessive heat. Appropriate precautions must be taken and only very small quantities handled.

CHARACTERS

Appearance: undiluted isosorbide dinitrate is a fine, white or almost white, crystalline powder.

Solubility: undiluted isosorbide dinitrate is very slightly soluble in water, very soluble in acetone, sparingly soluble in ethanol (96 per cent).

The solubility of the diluted product depends on the diluent and its concentration.

IDENTIFICATION

First identification: A, C, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs prepared with the residue obtained in identification test D.

Comparison: *isosorbide dinitrate CRS*.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Shake a quantity of the substance to be examined corresponding to 10 mg of isosorbide dinitrate with 10 ml of *ethanol (96 per cent) R* for 5 min and filter.

Reference solution. Shake a quantity of *isosorbide dinitrate CRS* corresponding to 10 mg of isosorbide dinitrate with 10 ml of *ethanol (96 per cent) R* for 5 min and filter.

Plate: *TLC silica gel G plate R*.

Mobile phase: *methanol R, methylene chloride R* (5:95 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in a current of air.

Detection: spray with freshly prepared *potassium iodide and starch solution R*; expose to ultraviolet light at 254 nm for 15 min and examine in daylight.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Shake a quantity of the substance to be examined corresponding to 0.10 g of lactose or mannitol with 10 ml of *water R*. Filter if necessary.

Reference solution (a). Dissolve 0.10 g of *lactose R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 0.10 g of *mannitol R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (c). Mix equal volumes of reference solutions (a) and (b).

Plate: *TLC silica gel G plate R*.

Mobile phase: *water R, methanol R, anhydrous acetic acid R, ethylene chloride R* (10:15:25:50 *V/V/V/V*); measure the volumes accurately since a slight excess of water produces cloudiness.

Application: 1 µl; thoroughly dry the starting points.

Development A: over a path of 15 cm.

Drying A: in a current of warm air.

Development B: immediately, over a path of 15 cm, after renewing the mobile phase.

Drying B: in a current of warm air.

Detection: spray with *4-aminobenzoic acid solution R*, dry in a current of cold air until the acetone is removed, then heat at 100 °C for 15 min; allow to cool, spray with a 2 g/l solution of *sodium periodate R*, dry in a current of cold air, and heat at 100 °C for 15 min.

System suitability: reference solution (c):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a) for lactose or to the principal spot in the chromatogram obtained with reference solution (b) for mannitol.

D. Shake a quantity of the substance to be examined corresponding to 25 mg of isosorbide dinitrate with 10 ml of *acetone R* for 5 min. Filter, evaporate to dryness at a temperature below 40 °C and dry the residue over *diphosphorus pentoxide R* at a pressure of 0.7 kPa for 16 h. The melting point (*2.2.14*) of the residue is 69 °C to 72 °C.

TESTS

Impurity A. Thin-layer chromatography (*2.2.27*).

Test solution. Shake a quantity of the substance to be examined corresponding to 0.10 g of isosorbide dinitrate with 5 ml of *ethanol (96 per cent) R* and filter.

Reference solution. Dissolve 10 mg of *potassium nitrate R* in 1 ml of *water R* and dilute to 100 ml with *ethanol (96 per cent) R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *glacial acetic acid R, acetone R, toluene R* (15:30:60 *V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in a current of air until the acetic acid is completely removed.

Detection: spray copiously with freshly prepared *potassium iodide and starch solution R*; expose to ultraviolet light at 254 nm for 15 min and examine in daylight.

Limit:

– *impurity A*: any spot due to impurity A is not more intense than the principal spot in the chromatogram obtained with the reference solution (0.5 per cent, calculated as potassium nitrate).

Impurities B and C. Liquid chromatography (*2.2.29*).

Test solution (a). Sonicate a quantity of the substance to be examined corresponding to 25.0 mg of isosorbide dinitrate with 20 ml of the mobile phase for 15 min and dilute to 25.0 ml with the mobile phase. Filter the solution through a suitable membrane filter.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the mobile phase.

Reference solution (a). Sonicate a quantity of *isosorbide dinitrate CRS* corresponding to 25.0 mg of isosorbide dinitrate with 20 ml of the mobile phase for 15 min and dilute to 25.0 ml with the mobile phase. Filter the solution through a suitable membrane filter.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 10.0 mg of *isosorbide 2-nitrate CRS* (impurity B) in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 0.1 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (d). Dissolve 10.0 mg of *isosorbide mononitrate CRS* (impurity C) in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 0.1 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (e). Dissolve 5 mg of *isosorbide 2-nitrate CRS* (impurity B) in the mobile phase and dilute to 10 ml with the mobile phase. To 1 ml of this solution add 0.5 ml of reference solution (a) and dilute to 10 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *aminopropylmethylsilyl silica gel for chromatography R* (10 µm).

Mobile phase: *anhydrous ethanol R, trimethylpentane R* (15:85 *V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 210-215 nm.

Injection: 10 µl of test solution (a) and reference solutions (c), (d) and (e).

Retention time: isosorbide dinitrate = about 5 min; impurity B = about 8 min; impurity C = about 11 min.

System suitability: reference solution (e):

– *resolution*: minimum 6.0 between the peaks due to isosorbide dinitrate and impurity B.

Limits:

– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent);

– *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent).

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for impurities B and C with the following modifications.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl of test solution (b) and reference solution (b).

If the areas of the peaks from 2 successive injections of reference solution (b) do not agree to within 1.0 per cent, then inject a further 4 times and calculate, for the 6 injections, the relative standard deviation.

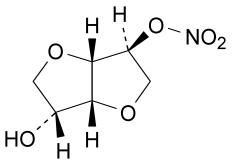
System suitability: reference solution (b):

– *repeatability*: maximum relative standard deviation of 2.0 per cent after 6 injections.

Calculate the content of isosorbide dinitrate as a percentage of the declared content.

STORAGE

Protected from light.



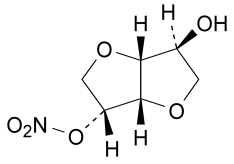
LABELLING

The label states the percentage content of isosorbide dinitrate.

IMPURITIES

Specified impurities: A, B, C.

A. inorganic nitrates,



B. isosorbide 2-nitrate,

C. isosorbide mononitrate (isosorbide 5-nitrate).

01/2008:1118
corrected 6.0

ISOSORBIDE MONONITRATE, DILUTED

Isosorbidi mononitras dilutus

$C_6H_9NO_6$ M_r 191.1

DEFINITION

Dry mixture of isosorbide mononitrate and *Lactose monohydrate (0187)* or *Mannitol (0559)*.

Content: 95.0 per cent *m/m* to 105.0 per cent *m/m* of the content of 1,4:3,6-dianhydro-D-glucitol 5-nitrate stated on the label.

CHARACTERS

Appearance: undiluted isosorbide mononitrate is a white or almost white, crystalline powder.

Solubility: undiluted isosorbide mononitrate is freely soluble in water, in acetone, in ethanol (96 per cent) and in methylene chloride.

The solubility of the diluted product depends on the diluent and its concentration.

IDENTIFICATION

First identification: A, C, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs prepared with the residue obtained in identification test D.

Comparison: *isosorbide mononitrate CRS*.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Shake a quantity of the substance to be examined corresponding to 10 mg of isosorbide mononitrate with 10 ml of *ethanol (96 per cent) R* for 5 min and filter.

Reference solution. Dissolve 10 mg of *isosorbide mononitrate CRS* in *ethanol (96 per cent) R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R*.

Mobile phase: *methanol R, methylene chloride R* (5:95 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in a current of air.

Detection: spray with freshly prepared *potassium iodide and starch solution R*. Expose to ultraviolet light at 254 nm for 15 min and examine in daylight.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Shake a quantity of the substance to be examined corresponding to 0.10 g of lactose or mannitol with 10 ml of *water R*; filter if necessary.

Reference solution (a). Dissolve 0.10 g of *lactose R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 0.10 g of *mannitol R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (c). Mix equal volumes of reference solutions (a) and (b).

Plate: *TLC silica gel G plate R*.

Mobile phase: *water R, methanol R, anhydrous acetic acid R, ethylene chloride R* (10:15:25:50 *V/V/V/V*); measure the volumes accurately since a slight excess of water produces cloudiness.

Application: 1 µl; thoroughly dry the starting points.

Development A: over a path of 15 cm.

Drying A: in a current of warm air.

Development B: immediately, over a path of 15 cm, after renewing the mobile phase.

Drying B: in a current of warm air.

Detection: spray with *4-aminobenzoic acid solution R* and dry in a current of cold air until the acetone is removed; heat at 100 °C for 15 min and allow to cool; spray with a 2 g/l solution of *sodium periodate R* and dry in a current of cold air; heat at 100 °C for 15 min.

System suitability: reference solution (c):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a) for lactose or to the principal spot in the chromatogram obtained with reference solution (b) for mannitol.

D. Shake a quantity of the substance to be examined corresponding to 25 mg of isosorbide mononitrate with 10 ml of *acetone R* for 5 min. Filter, evaporate to dryness at a temperature below 40 °C and dry the residue over *diphosphorus pentoxide R* at a pressure of 0.7 kPa for 16 h. The melting point (*2.2.14*) of the residue is 89 °C to 91 °C.

TESTS

Impurity A. Thin-layer chromatography (*2.2.27*).

Test solution. Shake a quantity of the substance to be examined corresponding to 0.10 g of isosorbide mononitrate with 5 ml of *ethanol (96 per cent) R* and filter.

Reference solution. Dissolve 10 mg of *potassium nitrate R* in 1 ml of *water R* and dilute to 100 ml with *ethanol (96 per cent) R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *glacial acetic acid R, acetone R, toluene R* (15:30:60 *V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in a current of air until the acetic acid is completely removed.

Detection: spray copiously with freshly prepared *potassium iodide and starch solution R*; expose to ultraviolet light at 254 nm for 15 min and examine in daylight.

Limit:

– *impurity A*: any spot due to impurity A is not more intense than the principal spot in the chromatogram obtained with the reference solution (0.5 per cent, calculated as potassium nitrate).

Impurities B and C. Liquid chromatography (*2.2.29*).

Test solution (a). Sonicate a quantity of the substance to be examined corresponding to 25.0 mg of isosorbide mononitrate with 20 ml of the mobile phase for 15 min and dilute to 25.0 ml with the mobile phase. Filter the solution through a suitable membrane filter.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *isosorbide mononitrate CRS* in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *isosorbide-2-nitrate CRS* (impurity C) in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 0.1 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (c). Sonicate a quantity of *isosorbide dinitrate CRS* (impurity B) corresponding to 10.0 mg of isosorbide dinitrate in 15 ml of the mobile phase for 15 min

and dilute to 20.0 ml with the mobile phase. Filter the solution through a suitable membrane filter. Dilute 0.1 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (d). Dissolve 5 mg of *isosorbide mononitrate CRS* and 5 mg of *isosorbide-2-nitrate CRS* (impurity C) in the mobile phase and dilute to 10 ml with the mobile phase. Dilute 1 ml of this solution to 10 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *aminopropylmethylsilyl silica gel for chromatography R* (10 µm).

Mobile phase: *anhydrous ethanol R, trimethylpentane R* (15:85 *V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 210-215 nm.

Injection: 10 µl of test solution (a) and reference solutions (b), (c) and (d).

Retention time: impurity B = about 5 min; impurity C = about 8 min; isosorbide 5-nitrate = about 11 min.

System suitability: reference solution (d):

– *resolution*: minimum 4.0 between the peaks due to impurity C and isosorbide 5-nitrate.

Limits:

– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent);
– *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for impurities B and C with the following modifications.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl of test solution (b) and reference solution (a).

If the areas of the peaks from 2 successive injections of reference solution (a) do not agree to within 1.0 per cent, then inject a further 4 times and calculate, for the 6 injections, the relative standard deviation.

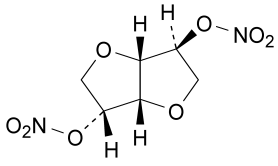
System suitability: reference solution (a):

– *repeatability*: maximum relative standard deviation of 2.0 per cent after 6 injections.

Calculate the content of isosorbide mononitrate as a percentage of the declared content.

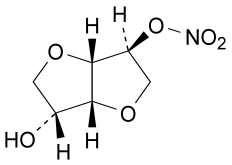
STORAGE

Protected from light.



LABELLING

The label states the percentage content of isosorbide mononitrate.



IMPURITIES

ISOTRETINOIN

Isotretinoinum

$C_{20}H_{28}O_2$ M_r 300.4

[4759-48-2]

DEFINITION

Isotretinoin contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (2*Z*,4*E*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid, calculated with reference to the dried substance.

CHARACTERS

A yellow or light-orange, crystalline powder, practically insoluble in water, soluble in methylene chloride, slightly soluble in alcohol. It is sensitive to air, heat and light, especially in solution.

Carry out all operations as rapidly as possible and avoid exposure to actinic light; use freshly prepared solutions.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Dissolve 75.0 mg in 5 ml of *methylene chloride R* and dilute immediately to 100.0 ml with acidified 2-propanol (prepared by diluting 1 ml of *0.01 M hydrochloric acid* to 1000 ml with *2-propanol R*). Dilute 5.0 ml of this solution to 100.0 ml with the acidified 2-propanol (solution A). Dilute 5.0 ml of solution A to 50.0 ml with the acidified 2-propanol. Examined between 300 nm and 400 nm (*2.2.25*), the solution shows an absorption maximum at 354 nm. The specific absorbance at the maximum is 1290 to 1420.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *isotretinoin CRS*. Examine the substances prepared as discs.

C. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel GF_{254} plate R*.

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *isotretinoin CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *isotretinoin CRS* and 10 mg of *tretinoin CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of *glacial acetic acid R*, 4 volumes of *acetone R*, 40 volumes of *peroxide-free ether R* and 54 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

D. Dissolve about 5 mg in 2 ml of *antimony trichloride solution R*. An intense red colour develops and later becomes violet.

TESTS

Related substances. Examine by liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of *tretinoin CRS* in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 25.0 ml with *methanol R*.

Reference solution (c). Mix 1.0 ml of reference solution (a) with 0.5 ml of the test solution and dilute to 25.0 ml with *methanol R*.

Reference solution (d). Dilute 0.5 ml of the test solution to 100.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),

– as mobile phase at a flow rate of 1.0 ml/min a mixture of 5 volumes of *glacial acetic acid R*, 225 volumes of *water R* and 770 volumes of *methanol R*.

– as detector a spectrophotometer set at 355 nm.

Inject separately 10 µl of each of reference solutions (b), (c) and (d) and of the test solution. Adjust the sensitivity of the detector so that the height of the principal peak in the chromatogram obtained with reference solution (b) is not less than 70 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks due to isotretinoin and tretinoin in the chromatogram obtained with reference solution (c) is at least 2.0. In the chromatogram obtained with the test solution: the area of any peak due to tretinoin is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent); the sum of the areas of any peaks, apart from the principal peak and any peak due to tretinoin, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent).

Heavy metals (*2.4.8*). 0.5 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

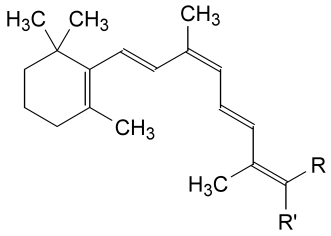
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* for 16 h.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 70 ml of *acetone R*. Titrate with *0.1 M tetrabutylammonium hydroxide* determining the end-point potentiometrically (*2.2.20*).

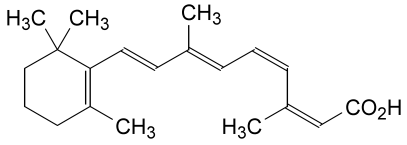
1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 30.04 mg of $C_{20}H_{28}O_2$.



STORAGE

Store in an airtight container, protected from light, at a temperature not exceeding 25 °C.

It is recommended that the contents of an opened container be used as soon as possible and any unused part be protected by an atmosphere of an inert gas.

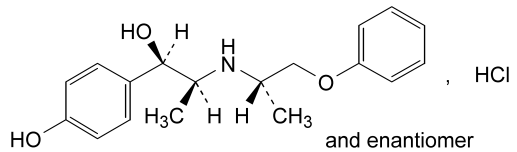


IMPURITIES

A. tretinoin,

B. R = CO_2H, R′ = H: (2*Z*,4*E*,6*Z*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid (9,13-di-*cis*-retinoic acid),

D. R = H, R′ = CO_2H: (2*E*,4*E*,6*Z*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid (9-*cis*-retinoic acid),



C. (2*Z*,4*Z*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid (11,13-di-*cis*-retinoic acid),

E. oxidation products of isotretinoin.

corrected 6.0

ISOXSUPRINE HYDROCHLORIDE

Isoxsuprini hydrochloridum

$C_{18}H_{24}ClNO_3$ M_r 337.8
[579-56-6]

DEFINITION

(1*RS*,2*SR*)-1-(4-Hydroxyphenyl)-2-[[(1*SR*)-1-methyl-2-phenoxyethyl]amino]propan-1-ol hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: sparingly soluble in water and in ethanol (96 per cent), practically insoluble in methylene chloride.

mp: about 205 °C, with decomposition.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50.0 mg in *0.1 M hydrochloric acid* and dilute to 50.0 ml with the same acid. Dilute 10.0 ml of this solution to 100.0 ml with *0.1 M hydrochloric acid.*

Spectral range: 230-350 nm.

Absorption maxima: at 269 nm and 275 nm.

Resolution (*2.2.25*): minimum 1.7 for the absorbance ratio.

Specific absorbance at the absorption maxima:

– at 269 nm: 71 to 74;
– at 275 nm: 70 to 73.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *isoxsuprine hydrochloride CRS.*

If the spectra obtained show differences, dissolve 50 mg of the substance to be examined and of the reference substance separately in 2 ml of *methanol R*, add 15 ml of *methylene chloride R*, evaporate to dryness and record new spectra using the residues.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20 mg of *isoxsuprine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: *concentrated ammonia R, methanol R, methylene chloride R* (0.25:15:85 *V/V/V*).

Application: 10 µl.

Development: over a path of 12 cm.

Drying: in a current of warm air.

Detection: spray with a 10 g/l solution of *potassium permanganate R.*

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. To 1 ml of solution S (see Tests) add 0.05 ml of *copper sulphate solution R* and 0.5 ml of *strong sodium hydroxide solution R*. The solution becomes blue. Add 1 ml of *ether R* and shake. Allow to separate. The upper layer remains colourless.

E. 2 ml of solution S gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 0.50 g, with gentle heating if necessary, in *carbon dioxide-free water R*, cool and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 4.5 to 6.0 for solution S.

Optical rotation (*2.2.7*): – 0.05° to + 0.05°, determined on solution S.

Phenones: maximum 1.0 per cent, calculated as impurity B.

Dissolve 10.0 mg in *water R* and dilute to 100.0 ml with the same solvent. The absorbance (*2.2.25*) of the solution measured at the absorption maximum at 310 nm is not greater than 0.10.

Related substances. Gas chromatography (*2.2.28*). *Prepare the solutions immediately before use.*

Internal standard solution (a). Dissolve 0.1 g of *hexacosane R* in *trimethylpentane R* and dilute to 20 ml with the same solvent.

Internal standard solution (b). Dilute 1 ml of internal standard solution (a) to 50 ml with *trimethylpentane R.*

Test solution. To 10.0 mg of the substance to be examined, add 0.5 ml of *N-trimethylsilylimidazole R*. Heat to 65 °C for 10 min. Allow to cool, then add 2.0 ml of the internal standard solution (b) and 2.0 ml of *water R*. Shake. Use the upper layer.

Reference solution (a). To 10.0 mg of the substance to be examined, add 0.5 ml of *N-trimethylsilylimidazole R*. Heat to 65 °C for 10 min. Allow to cool, then add 2.0 ml of the internal standard solution (a) and 2.0 ml of *water R*. Shake. Dilute 1.0 ml of the upper layer to 50.0 ml with *trimethylpentane R*.

Reference solution (b). To 10.0 mg of the substance to be examined, add 0.5 ml of *N-trimethylsilylimidazole R*. Heat to 65 °C for 10 min. Allow to cool, then add 2.0 ml of *trimethylpentane R* and 2.0 ml of *water R*. Shake. Use the upper layer.

Column:

– *material*: glass;
– *size*: *l* = 1.5 m, Ø = 4 mm;
– *stationary phase*: *silanised diatomaceous earth for gas chromatography R* (125-135 µm) impregnated with 3 per cent *m/m* of *poly(dimethyl)siloxane R.*

Carrier gas: *nitrogen for chromatography R.*

Flow rate: 30 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 25	195
	25 - 29	195 → 215
	29 - 39	215
Injection port		225
Detector		225

Detection: flame ionisation.

Injection: 1 µl.

Elution order: isoxsuprine, hexacosane.

System suitability:

– *resolution*: minimum 5.0 between the peaks due to isoxsurpine and hexacosane in the chromatogram obtained with reference solution (a);
– in the chromatogram obtained with reference solution (b), there is no peak with the same retention time as the internal standard.

Limit:

– *total*: calculate the ratio (*R*) of the area of the peak due to the trimethylsilyl derivative of isoxsuprine to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (a); from the chromatogram obtained with the test solution, calculate the ratio of the sum of the areas of any peaks, apart from the principal peak and the peak due to the

internal standard, to the area of the peak due to the internal standard: this ratio is not greater than *R* (2.0 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

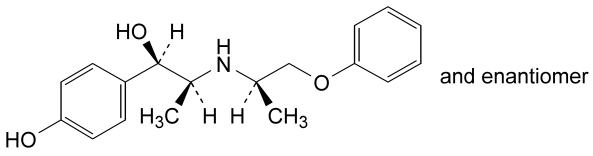
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

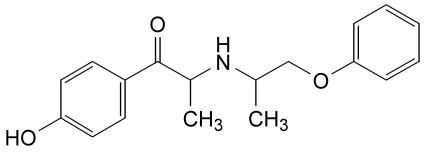
Dissolve 0.250 g in 80 ml of *ethanol (96 per cent) R* and add 1.0 ml of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 33.78 mg of $C_{18}H_{24}ClNO_3$.



STORAGE

Protected from light.



IMPURITIES

Specified impurities: *B*.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *A*.

A. (1*RS*,2*SR*)-1-(4-hydroxyphenyl)-2-[[(1*RS*)-1-methyl-2-phenoxyethyl]amino]propan-1-ol,

B. 1-(4-hydroxyphenyl)-2-[(1-methyl-2-phenoxyethyl)amino]-propan-1-one.

ISPAGHULA HUSK

Plantaginis ovatae seminis tegumentum

DEFINITION

Episperm and collapsed adjacent layers removed from the seeds of *Plantago ovata* Forssk. (*P. ispaghula* Roxb.).

IDENTIFICATION

A. The husk consists of pinkish-beige fragments or flakes up to about 2 mm long and 1 mm wide, some showing a light brown spot corresponding to the location of the embryo before it was removed from the seed.

B. Reduce to a powder (355) (*2.9.12*). The powder is pale yellow. Examine under a microscope using *lactic reagent R*. The powder shows the following diagnostic characters: mainly fragments of the episperm with polygonal cells filled with mucilage; fragments of the inner layers of the testa with brownish thin-walled cells often associated with the outer layers of the endosperm. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows occasional starch granules, single or in groups of 2-4, measuring 3-25 µm in diameter.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 10 mg of the powdered drug (355) (*2.9.12*) in a thick-walled centrifuge tube, add 2 ml of a 230 g/l solution of *trifluoroacetic acid R* and shake vigorously. Stopper the test tube and heat at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant liquid into a 50 ml flask, add 10 ml of *water R* and evaporate to dryness under reduced pressure. Take up the residue in 10 ml of *water R* and evaporate again to dryness under reduced pressure. Take up the residue with 2 ml of *methanol R*.

Reference solution (a). Dissolve 10 mg of *arabinose R* in a small quantity of *water R* and dilute to 10 ml with *methanol R*.

Reference solution (b). Dissolve 10 mg of *xylose R* in a small quantity of *water R* and dilute to 10 ml with *methanol R*.

Reference solution (c). Dissolve 10 mg of *galactose R* in a small quantity of *water R* and dilute to 10 ml with *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *water R, acetonitrile R* (15:85 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Detection: spray with *aminohippuric acid reagent R* and heat at 120 °C for 5 min; examine in daylight.

Results: the chromatogram obtained with the test solution shows 2 orange-pink zones (arabinose and xylose) and a yellow zone (galactose) similar in position and colour to the zones in the chromatograms obtained with the reference solutions.

TESTS

Foreign matter (*2.8.2*). Carry out the determination using 5.0 g.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 4.0 per cent.

Swelling index (*2.8.4*): minimum 40, determined on 0.1 g of the powdered drug (355) (*2.9.12*).

01/2008:1333 corrected 6.0

ISPAGHULA SEED

Plantaginis ovatae semen

DEFINITION

Dried ripe seeds of *Plantago ovata* Forssk. (*P. ispaghula* Roxb.).

IDENTIFICATION

A. Ispaghula seed is pinkish-beige, smooth, boat-shaped and curved. It is 1.5 mm to 3.5 mm long, 1.5 mm to 2 mm wide and 1 mm to 1.5 mm thick. The concave surface shows in the centre a light coloured spot corresponding to the hilum. The convex surface shows a light brown spot corresponding to the location of the embryo and takes up about one quarter of the length of the seed.

B. Reduce to a powder (355) (*2.9.12*). The powder is pale brown. Examine under a microscope using *lactic reagent R*. The powder shows mainly fragments of the episperm with polygonal cells filled with mucilage; fragments of the inner layers of the testa with brownish thin-walled cells often associated with the outer layers of the endosperm; fragments of the endosperm with cells with thick cellulose walls containing aleurone grains and oil droplets; a few fragments of embryo with thin-walled cells. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows starch granules, single or in groups of 2 to 4 and measuring 3 µm to 25 µm in diameter.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 50 mg of the powdered drug (355) (*2.9.12*) in a thick-walled centrifuge tube add 2 ml of a 230 g/l solution of *trifluoroacetic acid R*, and shake vigorously. Stopper the test tube and heat the mixture at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant liquid into a 50 ml flask, add 10 ml of *water R* and evaporate the solution to dryness under reduced pressure. Take up the residue in 10 ml of *water R* and evaporate again to dryness under reduced pressure. Take up the residue in 2 ml of *methanol R*.

Reference solution (a). Dissolve 10 mg of *arabinose R* in a small quantity of *water R* and dilute to 10 ml with *methanol R*.

Reference solution (b). Dissolve 10 mg of *xylose R* in a small quantity of *water R* and dilute to 10 ml with *methanol R*.

Reference solution (c). Dissolve 10 mg of *galactose R* in a small quantity of *water R* and dilute to 10 ml with *methanol R*.

Plate: *TLC silica gel plate R*

Mobile phase: *water R, acetonitrile R* (15:85 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Detection: Spray with *aminohippuric acid reagent R* and heat at 120 °C for 5 min. Examine in daylight.

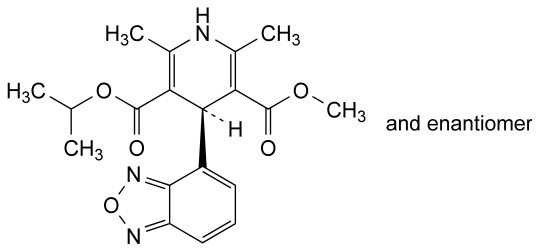
Results: see below the sequence of the zones present in the chromatograms obtained with the reference and the test solutions.

Top of the plate	
Xylose: an orange-pink zone	An orange-pink zone (xylose)
Arabinose: an orange-pink zone	An orange-pink zone (arabinose)
Galactose: a yellow zone	A yellow zone (galactose)
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*). Carry out the determination using 10.0 g.

Swelling index (*2.8.4*): minimum 9.



Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 4.0 per cent.

01/2008:2110 corrected 6.0

ISRADIPINE

Isradipinum

and enantiomer

$C_{19}H_{21}N_3O_5$ M_r 371.4
[75695-93-1]

DEFINITION

Methyl 1-methylethyl (4*RS*)-4-(2,1,3-benzoxadiazol-4-yl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate.

Content: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: yellow, crystalline powder.

Solubility: practically insoluble in water, freely soluble in acetone, soluble in methanol.

mp: about 168 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: isradipine CRS.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in 1 ml of *methanol R*, using an ultrasonic bath if necessary, and dilute to 25.0 ml with the mobile phase.

Test solution (b). Dissolve 50.0 mg of the substance to be examined in 2 ml of *methanol R* and dilute to 250.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 2 mg of the substance to be examined and 2 mg of *isradipine impurity D CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 50.0 mg of *isradipine CRS* in 2 ml of *methanol R* and dilute to 250.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *acetonitrile R, tetrahydrofuran R, water R* (125:270:625 *V/V/V*).

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl of test solution (a) and reference solutions (a) and (b).

Run time: 5 times the retention time of isradipine.

Identification of impurities: use the chromatogram supplied with *isradipine CRS* to identify the peaks due to impurities A and B.

Relative retention with reference to isradipine (retention time = about 7 min): impurity A = about 0.8; impurity D = about 0.9; impurity B = about 1.8.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to isradipine and impurity D.

Limits:

– *correction factor*: for the calculation of content, multiply the peak area of impurity D by 1.4,

– *impurity A*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),

– *impurity B*: not more than 8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent),

– *impurity D*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.2 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

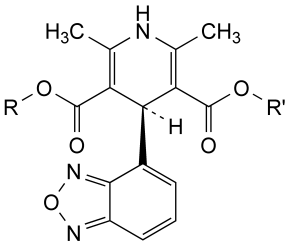
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Detection: spectrophotometer at 326 nm.

Injection: test solution (b) and reference solution (c).

Run time: twice the retention time of isradipine.

Calculate the percentage content of isradipine from the areas of the peaks and the declared content of *isradipine CRS*.



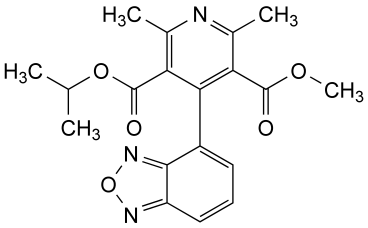
STORAGE

Protected from light.

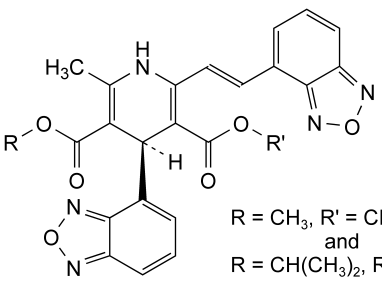
IMPURITIES

Specified impurities: *A, B, D.*

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, E.*



and enantiomer



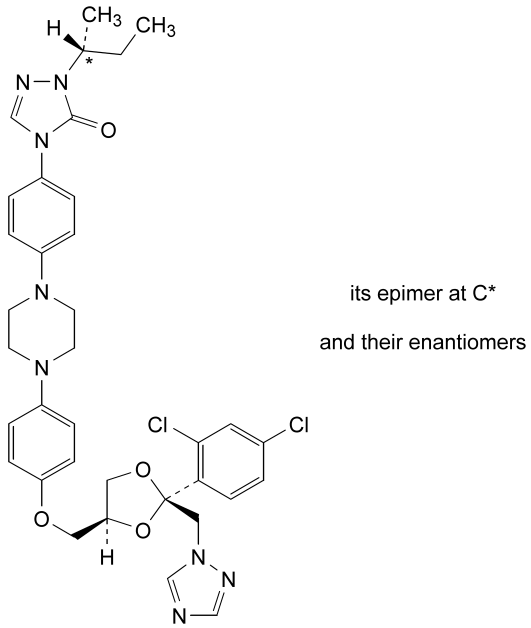
A. R = C_2H_5, R' = CH_3: ethyl methyl (4*RS*)-4-(2,1,3-benzoxadiazol-4-yl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate,

B. R = R' = $CH(CH_3)_2$: bis(1-methylethyl) (4*RS*)-4-(2,1,3-benzoxadiazol-4-yl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate,

C. R = R' = CH_3: dimethyl (4*RS*)-4-(2,1,3-benzoxadiazol-4-yl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate,

D. methyl 1-methylethyl 4-(2,1,3-benzoxadiazol-4-yl)-2,6-dimethylpyridine-3,5-dicarboxylate,

its (*Z*) isomer and their enantiomers



R = CH_3, R' = $CH(CH_3)_2$
and
R = $CH(CH_3)_2$, R' = CH_3

E. methyl 1-methylethyl (4*RS*)-4-(2,1,3-benzoxadiazol-4-yl)-2-[(*EZ*)-2-(2,1,3-benzoxadiazol-4-yl)ethenyl]-6-methyl-1,4-dihydropyridine-3,5-dicarboxylate.

corrected 6.0

ITRACONAZOLE

Itraconazolum

$C_{35}H_{38}Cl_2N_8O_4$ M_r 706
[84625-61-6]

DEFINITION

Itraconazole contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 4-[4-[4-[4-[[*cis*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-[(1*RS*)-1-methylpropyl]-2,4-dihydro-3*H*-1,2,4-triazol-3-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in tetrahydrofuran, very slightly soluble in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 166 °C to 170 °C.

B. Examine by infrared spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *itraconazole CRS*. Examine the substance prepared as discs.

C. Examine by thin-layer chromatography (*2.2.27*), using a suitable octadecylsilyl silica gel as the coating substance.

Test solution. Dissolve 30 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (a). Dissolve 30 mg of *itraconazole CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (b). Dissolve 30 mg of *itraconazole CRS* and 30 mg of *ketoconazole CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Apply to the plate 5 µl of each solution. Develop in an unsaturated tank over a path of 10 cm using a mixture of 20 volumes of *ammonium acetate solution R*, 40 volumes of *dioxan R* and 40 volumes of *methanol R*. Dry the plate in a current of warm air for 15 min and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

D. To 30 mg in a porcelain crucible add 0.3 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 2.0 g in *methylene chloride R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Optical rotation (*2.2.7*). The angle of optical rotation is – 0.10° to + 0.10°, determined on solution S.

Related substances. Examine by liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in a mixture of equal volumes of *methanol R* and *tetrahydrofuran R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 5.0 mg of *itraconazole CRS* and 5.0 mg of *miconazole CRS* in a mixture of equal volumes of *methanol R* and *tetrahydrofuran R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of equal volumes of *methanol R* and *tetrahydrofuran R*. Dilute to 5.0 ml of this solution to 10.0 ml with the same mixture of solvents.

The chromatographic procedure may be carried out using:

– a stainless steel column 0.1 m long and 4.0 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm),

– as mobile phase at a flow rate of 1.5 ml/min a gradient programme using the following conditions:

Mobile phase A. A 27.2 g/l solution of *tetrabutylammonium hydrogen sulphate R*,

Mobile phase B. Acetonitrile R,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)	Comment
0 - 20	80 → 50	20 → 50	linear gradient
20 - 25	50	50	isocratic elution
25 - 30	80	20	switch to initial eluent composition
30 = 0	80	20	restart gradient

– as detector a spectrophotometer set at 225 nm.

Equilibrate the column for at least 30 min with *acetonitrile R* at a flow rate of 1.5 ml/min and then equilibrate at the initial eluent composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

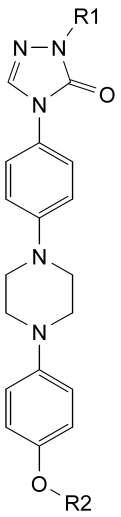
Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: miconazole about 10.5 min and itraconazole about 11 min. The test is not valid unless the resolution between the peaks corresponding to miconazole and itraconazole is at least 2.0. If necessary, adjust the concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient elution.

Inject separately 10 µl of the mixture of equal volumes of *methanol R* and *tetrahydrofuran R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than that of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.25 per cent). Disregard any peak obtained with the blank run and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

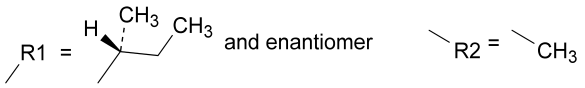
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

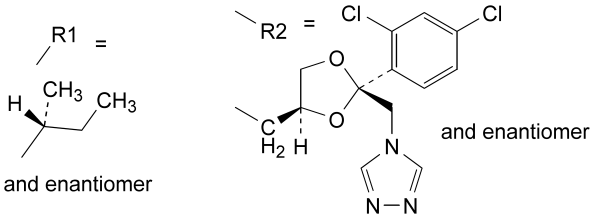


Dissolve 0.300 g in 70 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically at the second point of inflexion (*2.2.20*).



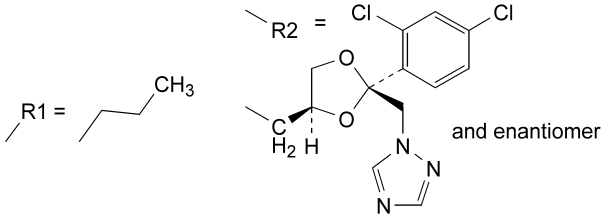
1 ml of *0.1 M perchloric acid* is equivalent to 35.3 mg of $C_{35}H_{38}Cl_2N_8O_4$.

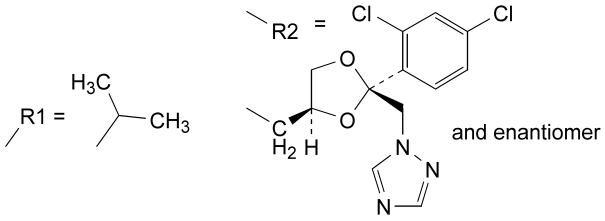
STORAGE



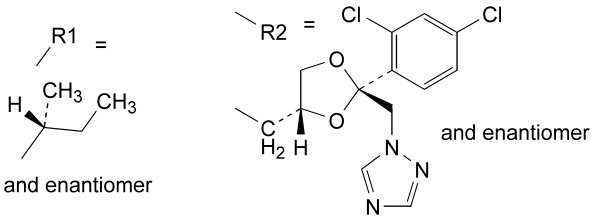
Store protected from light.

IMPURITIES

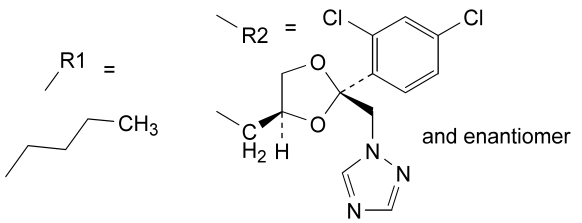




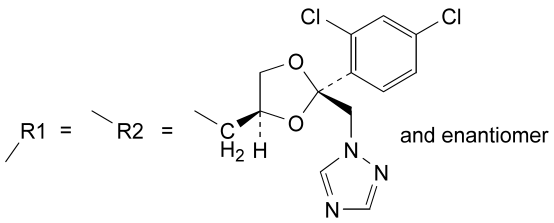
A. 4-[4-[4-(4-methoxyphenyl)piperazin-1-yl]phenyl]-2-[(1*RS*)-1-methylpropyl]-2,4-dihydro-3*H*-1,2,4-triazol-3-one,



B. 4-[4-[4-[4-[[*cis*-2-(2,4-dichlorophenyl)-2-(4*H*-1,2,4-triazol-4-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-[(1*RS*)-1-methylpropyl]-2,4-dihydro-3*H*-1,2,4-triazol-3-one,



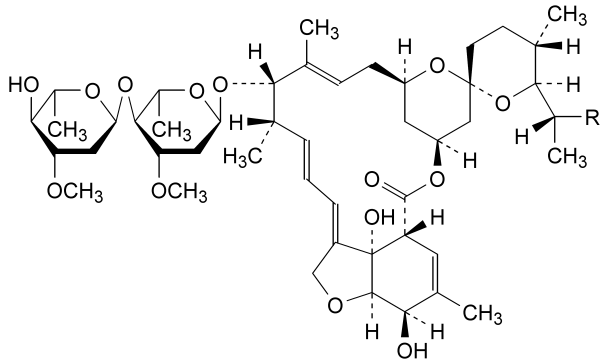
C. 4-[4-[4-[4-[[*cis*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-propyl-2,4-dihydro-3*H*-1,2,4-triazol-3-one,



D. 4-[4-[4-[4-[[*cis*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-(1-methylethyl)-2,4-dihydro-3*H*-1,2,4-triazol-3-one,

E. 4-[4-[4-[4-[[*trans*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-[(1*RS*)-1-methylpropyl]-2,4-dihydro-3*H*-1,2,4-triazol- 3-one,

F. 2-butyl-4-[4-[4-[4-[[*cis*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2,4-dihydro-3*H*-1,2,4-triazol-3-one,



G. 4-[4-[4-[4-[[*cis*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazin-1-yl]phenyl]-2-[[*cis*-2-(2,4-dichlorophenyl)-2-(1*H*-1,2,4-triazol-1-ylmethyl)-1,3-dioxolan-4-yl]methyl]-2,4-dihydro-3*H*-1,2,4-triazol-3-one.

IVERMECTIN

Ivermectinum

Component	R	Molecular formula	M_r
H_2B_{1a}	CH_2-CH_3	$C_{48}H_{74}O_{14}$	875
H_2B_{1b}	CH_3	$C_{47}H_{72}O_{14}$	861

Ivermectin B1a: [70161-11-4]
Ivermectin B1b: [70288-86-7]

DEFINITION

Mixture of (2a*E*,4*E*,5′*S*,6*S*,6′*R*,7*S*,8*E*,11*R*,13*R*,15*S*,17a*R*,20*R*,20a*R*,20b*S*)-7-[[2,6-dideoxy-4-*O*-(2,6-dideoxy-3-*O*-methyl-α-L-*arabino*-hexopyranosyl)-3-*O*-methyl-α-L-*arabino*-hexopyranosyl]oxy]-20,20b-dihydroxy-5′,6,8,19-tetramethyl-6′-[(1*S*)-1-methylpropyl]-3′,4′,5′,6,6′,7,10,11,14,15,17a,20,20a,20b-tetradecahydrospiro[11,15-methano-2*H*,13*H*,17*H*-furo[4,3,2-*pq*][2,6]benzodioxacyclooctadecene-13,2′-[2*H*]pyran]-17-one (or 5-*O*-demethyl-22,23-dihydroavermectin A_{1a}) (component H_2B_{1a}) and (2a*E*,4*E*,5′*S*,6*S*,6′*R*,7*S*,8*E*,11*R*,13*R*,15*S*,17a*R*,20*R*,20a*R*,20b*S*)-7-[[2,6-dideoxy-4-*O*-(2,6-dideoxy-3-*O*-methyl-α-L-*arabino*-hexopyranosyl)-3-*O*-methyl-α-L-*arabino*-hexopyranosyl]oxy]-20,20b-dihydroxy-5′,6,8,19-tetramethyl-6′-(1-methylethyl)-3′,4′,5′,6,6′,7,10,11,14,15,17a,20,20a,20b-tetradecahydrospiro[11,15-methano-2*H*,13*H*,17*H*-furo[4,3,2-*pq*][2,6]benzodioxacyclooctadecene-13,2′-[2*H*]pyran]-17-one (or 5-*O*-demethyl-25-de(1-methylpropyl)-25-(1-methylethyl)-22,23-dihydroavermectin A_{1a}) (component H_2B_{1b}).

Semi-synthetic product derived from a fermentation product.

Content:

– ivermectin (H_2B_{1a} + H_2B_{1b}): 95.0 per cent to 102.0 per cent (anhydrous substance),

– ratio $H_2B_{1a}/(H_2B_{1a} + H_2B_{1b})$ (areas by liquid chromatography): minimum 90.0 per cent.

CHARACTERS

Appearance: white or yellowish-white, crystalline powder, slightly hygroscopic.

Solubility: practically insoluble in water, freely soluble in methylene chloride, soluble in alcohol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *ivermectin CRS*.

B. Examine the chromatograms obtained in the assay.
Results: the retention times and sizes of the 2 principal peaks in the chromatogram obtained with the test solution are similar to those of the 2 principal peaks in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

Dissolve 1.0 g in 50 ml of *toluene R*.

Specific optical rotation (*2.2.7*): – 17 to – 20 (anhydrous substance).

Dissolve 0.250 g in *methanol R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 40.0 mg of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 40.0 mg of *ivermectin CRS* in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol R*.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 100.0 ml with *methanol R*.

Column:

– size: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 μm).

Mobile phase: *water R, methanol R, acetonitrile R* (15:34:51 *V/V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μl.

System suitability:

– *resolution*: minimum of 3.0 between the first peak (component H_2B_{1b}) and the second peak (component H_2B_{1a}) in the chromatogram obtained with reference solution (a),

– *signal-to-noise ratio*: minimum of 10 for the principal peak in the chromatogram obtained with reference solution (c),

– *symmetry factor*: maximum of 2.5 for the principal peak in the chromatogram obtained with reference solution (a).

Limits:

– *impurity with a relative retention of 1.3 to 1.5* with reference to the principal peak: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent),

– *any other impurity* (apart from the 2 principal peaks): not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent),

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (5 per cent),

– *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Ethanol and formamide. Gas chromatography (*2.2.28*).

Internal standard solution. Dilute 0.5 ml of *propanol R* to 100 ml with *water R*.

Test solution. In a centrifuge tube, dissolve 0.120 g of the substance to be examined in 2.0 ml of *m-xylene R* (if necessary heat in a water-bath at 40-50 °C). Add 2.0 ml of *water R*, mix thoroughly and centrifuge. Remove the upper layer and extract it with 2.0 ml of *water R*. Discard the upper layer and combine the aqueous layers. Add 1.0 ml of the internal standard solution. Centrifuge and discard any remaining *m*-xylene.

Reference solution (a). Dilute 3.0 g of *ethanol R* to 100.0 ml with *water R*.

Reference solution (b). Dilute 1.0 g of *formamide R* to 100.0 ml with *water R*.

Reference solution (c). Dilute 5.0 ml of reference solution (a) and 5.0 ml of reference solution (b) to 50.0 ml with *water R*. Introduce 2.0 ml of this solution into a centrifuge tube, add 2.0 ml of *m-xylene R*, mix thoroughly and centrifuge. Remove the upper layer and extract it with 2.0 ml of *water R*. Discard the upper layer and combine the aqueous layers. Add 1.0 ml of the internal standard solution. Centrifuge and discard any remaining *m*-xylene.

Reference solution (d). Dilute 10.0 ml of reference solution (a) and 10.0 ml of reference solution (b) to 50.0 ml with *water R*. Treat as prescribed for reference solution (c) (from "Introduce 2.0 ml of this solution...").

Column:

– *material*: fused silica,

– *size*: *l* = 30 m, Ø = 0.53 mm,

– *stationary phase*: *macrogol 20 000 R* (film thickness 1 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 7.5 ml/min.

Split ratio: 1:10.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	50 → 80
	2 - 8	80 → 240
Injection port		220
Detector		280

Detection: flame ionisation.

Injection: 1 µl; inject the test solution and reference solutions (c) and (d).

Limits:

– *ethanol*: maximum 5.0 per cent,

– *formamide*: maximum 3.0 per cent.

Heavy metals (*2.4.8*): maximum 20 ppm.

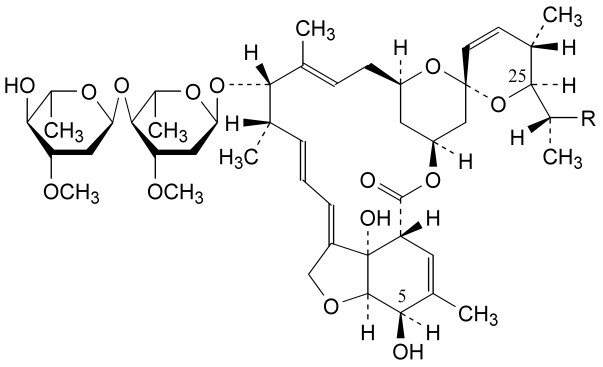
1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 1.0 per cent, determined on 0.50 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

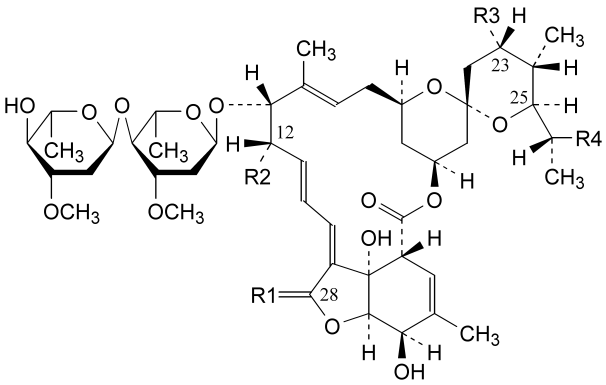
Liquid chromatography (*2.2.29*) as described in the test for related substances.



Injection: 20 µl; inject the test solution and reference solution (a).

Calculate the percentage contents of ivermectin (H_2B_{1a} + H_2B_{1b}) and the ratio $H_2B_{1a}/(H_2B_{1a} + H_2B_{1b})$ using the declared contents of *ivermectin CRS*.

STORAGE



In an airtight container.

IMPURITIES

A. R = C_2H_5: 5-*O*-demethylavermectin A_{1a} (avermectin B_{1a}),

IVY LEAF

Hederae folium

DEFINITION

Whole or cut, dried leaves of *Hedera helix* L., collected in spring.

Content: minimum 3.0 per cent of hederacoside C ($C_{59}H_{96}O_{26}$; M_r 1221) (dried drug).

IDENTIFICATION

A. Whole leaves are coriaceous, 4-10 cm in length and width, cordate at the base. The lamina is palmately 3-5 lobed, the lobes more or less triangular with entire margins. The upper surface is dark green with a paler, radiate venation, the lower surface more greyish-green and the venation is distinctly raised. The petioles are long, cylindrical, about 2 mm in diameter and grooved longitudinally. Scattered white hairs occur on the petioles and on the surfaces of younger leaves, the older leaves are glabrous. Occasional entire, ovate-rhombic to lanceolate leaves 3-8 cm long from the flowering stems may be present.

B. Reduce to a powder (355) (*2.9.12*). The powder is green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the lamina in surface view showing the cells of both the upper and lower epidermises with thickened, sinuous to wavy anticlinal walls and a thick cuticle; numerous stomata occur in the lower epidermis only, they are mostly anomocytic but occasionally anisocytic (*2.8.3*) and some of the surrounding cells may show faint cuticular striations; scattered stellate covering trichomes may be present, composed of 4-8 unicellular branches joined at the base; fragments in sectional view show 1-3 (usually 2) layers of palisade cells and a very porous spongy mesophyll containing occasional large mucilage cells; cluster crystals of calcium oxalate, about 40 µm in diameter, occur throughout the mesophyll; groups of lignified fibro-vascular tissue from the veins.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Extract 0.50 g of the powdered drug (355) (*2.9.12*) under a reflux condenser in a water bath at 60 °C with 5 ml of *methanol R* for 30 min. Cool and filter.

Reference solution. Dissolve 1.0 mg of *hederacoside C R* and 1.0 mg of *α-hederin R* in 1.0 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, methanol R, acetone R, ethyl acetate R* (4:20:20:30 *V/V/V/V*).

Application: 20 µl, as bands of 15 mm.

Development: over a path of 12 cm.

Drying: at 100-105 °C.

Detection: spray with *alcoholic solution of sulphuric acid R*. Heat at 110 °C for 10 min. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A green zone
———	———
α-Hederin: a purple zone	A very faint purple zone (α-hederin)
	A broad yellow zone
	2-3 purple or green zones
———	———
Hederacoside C: a purple zone	A purple zone (hederacoside C)
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 10 per cent of discoloured matter, maximum 10 per cent of stems, and maximum 2 per cent other foreign matter.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 10.0 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. To 1.00 g of the powdered drug (355) (*2.9.12*) in a 250 ml round bottomed flask add 50 ml of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R*. Heat under a reflux condenser in a water-bath at 80 °C for 1 h. Cool and filter through cotton into a 100 ml volumetric flask. The cotton together with the residue is again extracted with 30 ml of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R* under reflux for 30 min. Filter and combine the filtrates. Rinse the round bottomed flask and the cotton with a mixture of 20 volumes of *water R* and 80 volumes of *methanol R* and use this mixture of solvents to dilute the contents of the volumetric flask to exactly 100.0 ml. Filter through a suitable membrane before use.

Reference solution. Dissolve an amount of *ivy leaf standardised tincture CRS* corresponding to 3.0 mg of hederacoside C in *methanol R* and dilute to 5.0 ml with the same solvent.

Column:

– *size*: *l* = 0.125 m, Ø = 4 mm;
– *stationary phase*: suitable *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: mix 140 volumes of *acetonitrile R* and 880 volumes of *water R* and adjust to pH 2.0 with *phosphoric acid R*;
– *mobile phase B*: *phosphoric acid R, acetonitrile R* (2:998 *V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	100	0
5 - 6	100 → 94	0 → 6
6 - 40	94 → 60	6 → 40
40 - 41	60 → 0	40 → 100
41 - 55	0	100
55 - 56	0 → 94	100 → 6
56 - 70	94	6

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 20 µl.

System suitability: reference solution:

– *retention time*: hederacoside C = about 20 min.

If necessary, adjust the time intervals of the gradient.

Calculate the percentage content of hederacoside C with reference to the dried drug using the following expression:

$$\frac{F_1 \times m_2 \times 400}{F_2 \times m_1 \times (100 - d)}$$

F_1 = area of the peak due to hederacoside C in the chromatogram obtained with the test solution;

F_2 = area of the peak due to hederacoside C in the chromatogram obtained with the reference solution;

d = loss on drying, in per cent;

m_1 = mass of drug, in grams;

m_2 = mass of hederacoside C in the reference solution, in grams.

JAVA TEA

Orthosiphonis folium

DEFINITION

Fragmented, dried leaves and tops of stems of *Orthosiphon stamineus* Benth. (*O. aristatus* Miq.; *O. spicatus* Bak.).

Content: minimum 0.05 per cent of sinensetin ($C_{20}H_{20}O_7$; M_r 372.4) (dried drug).

IDENTIFICATION

A. The leaves are friable, up to 7.5 cm in length and 2.5 cm in width. The petiole is short. The lamina is oval to lanceolate, the apex acuminate and the base cuneate. The abaxial surface of the leaves is light greyish-green and the adaxial surface is dark green to brownish-green. The venation is pinnate with few secondary veins. Examined under a lens (× 10), the secondary veins, after running parallel to the midrib, diverge at an acute angle. The margin is irregularly and roughly dentate, sometimes crenate and the abaxial surface is slightly curved. The petioles are thin, quadrangular, 4 mm to 8 mm long and, like the primary venation, usually violet-coloured. Occasionally, inflorescences in clusters of bluish-white to violet flowers, not yet opened, are found.

B. Reduce to a powder (355) (*2.9.12*). The powder is dark green. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of epidermis, with cells with sinuous outlines bearing unicellular or bicellular conical covering trichomes and articulated uniseriate trichomes up to 450 µm long, consisting of 3 to 8 cells with thick pitted walls; capitate trichomes with unicellular or bicellular heads; secretory trichomes with unicellular stalks and usually tetracellular heads; diacytic stomata (*2.8.3*), which are more numerous on the lower epidermis.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Shake 1 g of the powdered drug (710) (*2.9.12*) for 5 min with 10 ml of *methanol R* in a water-bath at 60 °C and filter the cooled solution.

Reference solution. Dissolve 1 mg of *sinensetin R* in *methanol R* and dilute to 20 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *methanol R, ethyl acetate R, toluene R* (5:40:55 *V/V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatogram obtained with the reference solution and the test solution. Furthermore, red fluorescent zones are present in the lower third and near the solvent front of the chromatogram obtained with the test solution.

Top of the plate	
	1 or 2 more or less intense blue to violet-blue fluorescent zones
———	———
Sinensetin: an intense light blue fluorescent zone	A major blue fluorescent zone (sinensetin)
———	———
	2 bluish fluorescent zones
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 5 per cent of stems with a diameter greater than 1 mm; maximum 2 per cent of other foreign matter.

Loss on drying (*2.2.32*): maximum 11.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 12.5 per cent.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Heat 2.5 g of the powdered drug (355) (*2.9.12*) and 100 ml of *methylene chloride R* on a water-bath for 30 min with stirring. Filter. Collect the filtrate and repeat the operation twice, in the same manner, on the filtration residue. Combine the filtrates. Evaporate the solvent under reduced pressure. Dissolve the residue in 25.0 ml of the mobile phase, using an ultrasonic bath if necessary. Filter the solution through a nitrocellulose filter with a pore size of 0.45 µm.

Reference solution. Dissolve 5 mg (m_2) of *sinensetin R* in 80 ml of the mobile phase using an ultrasonic bath if necessary and dilute to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *tetrahydrofuran R, acetic acid R, water R, methanol R* (5:8:42:45 *V/V/V/V*).

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 258 nm.

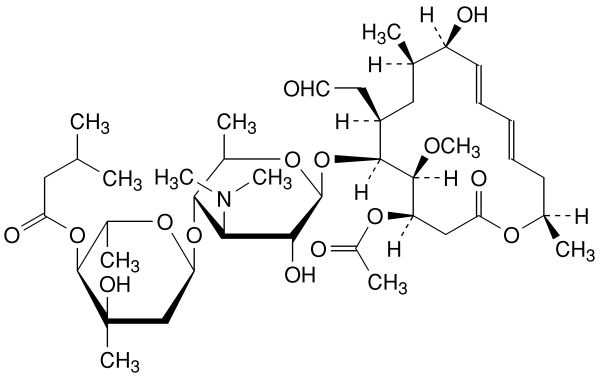
Injection: 20 µl.

Calculate the percentage content of sinensetin from the expression:

$$\frac{m_2 \times F_1 \times 25}{m_1 \times F_2}$$

F_1 = area of the peak corresponding to sinensetin in the chromatogram obtained with the test solution;

F_2 = area of the peak corresponding to sinensetin in the chromatogram obtained with the reference solution;



m_1 = mass of the drug to be examined, in grams;

m_2 = mass of sinensetin in the reference solution, in grams.

01/2008:1983

JOSAMYCIN

Josamycinum

$C_{42}H_{69}NO_{15}$ M_r 828

DEFINITION

Josamycin is a macrolide antibiotic produced by certain strains of *Streptomyces narbonensis* var. *josamyceticus* var. *nova*, or obtained by any other means. The main component is (4*R*,5*S*,6*S*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-4-(acetyloxy)-6-[[3,6-dideoxy-4-*O*-[2,6-dideoxy-3-*C*-methyl-4-*O*-(3-methylbutanoyl)-α-L-*ribo*-hexopyranosyl]-3-(dimethylamino)-β-D-glucopyranosyl]oxy]-10-hydroxy-5-methoxy-9,16-dimethyl-7-(2-oxoethyl)oxacyclohexadeca-11,13-dien-2-one.

Content: minimum 900 Ph. Eur. U./mg (dried substance).

CHARACTERS

Appearance: white or slightly yellowish powder, slightly hygroscopic.

Solubility: very slightly soluble in water, freely soluble in methanol and in methylene chloride, soluble in acetone.

IDENTIFICATION

First identification: A, B.

Second identification: B, C.

A. Dissolve 0.10 g in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 50.0 ml with *methanol R*. Examined between 220 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 232 nm. The specific absorbance at the maximum is 330 to 370.

B. Examine the chromatograms obtained in the test for related substances.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a) and its position is different from that of the principal spot in the chromatograms obtained with reference solutions (d) and (e).

C. Dissolve about 10 mg in 5 ml of *hydrochloric acid R1* and allow to stand for 10-20 min. A pink colour develops, turning brown.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_4 (*2.2.2, Method II*).

Dissolve 1.0 g in *methanol R* and dilute to 10 ml with the same solvent.

Specific optical rotation (*2.2.7*): – 65 to – 75 (dried substance).

Dissolve 1.000 g in *methanol R* and dilute to 100.0 ml with the same solvent. Allow to stand for 30 min before measuring the angle of rotation.

Related substances. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 0.10 g of *josamycin CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of reference solution (a) to 10 ml with *methanol R*.

Reference solution (c). Dilute 1 ml of reference solution (a) to 20 ml with *methanol R*.

Reference solution (d). Dissolve 0.10 g of *josamycin propionate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (e). Dissolve 0.10 g of *spiramycin CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (f). Dissolve 10 mg of *josamycin CRS* and 10 mg of *josamycin propionate CRS* in 1 ml of *methanol R*.

Plate: *TLC silica gel G plate R.*

Mobile phase: *methanol R, acetone R, ethyl acetate R, toluene R, hexane R* (8:10:20:25:30 *V/V/V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: at 100 °C for 10 min.

Detection: spray with *dilute sulphuric acid R* and heat at 100 °C for 10 min.

System suitability: the chromatogram obtained with reference solution (f) shows 2 clearly separated principal spots.

Limits:

– *any impurity*: any spot, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (10 per cent) and not more than 1 such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (5 per cent).

Heavy metals (*2.4.8*): maximum 30 ppm.

1.0 g complies with limit test C. Prepare the standard using 3 ml of *lead standard solution (10 ppm Pb) R*.

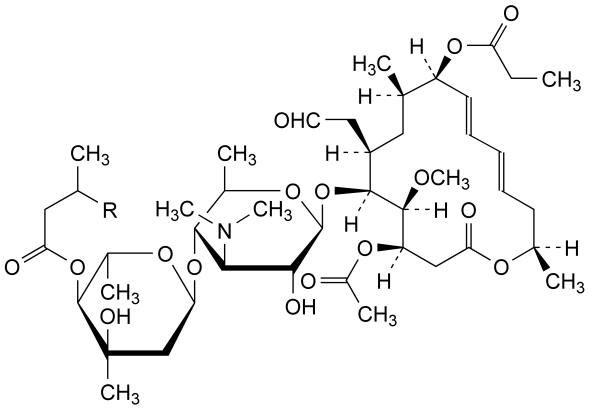
Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven *in vacuo* at 60 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 30.0 mg in 5 ml of *methanol R* and dilute to 100.0 ml with *water R*.

Carry out the microbiological assay of antibiotics (*2.7.2*).



STORAGE

In an airtight container.

corrected 6.0

JOSAMYCIN PROPIONATE

Josamycini propionas

Leucomycin propionate	R	Mol. Formula	*Mr*
A3	CH_3	$C_{45}H_{73}NO_{16}$	884
A4	H	$C_{44}H_{71}NO_{16}$	870

DEFINITION

Propionyl ester of a macrolide antibiotic produced by certain strains of *Streptomyces narbonensis* var. *josamyceticus* var. *nova*, or obtained by any other means. The main component is (4*R*,5*S*,6*S*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-4-(acetyloxy)-6-[[3,6-dideoxy-4-*O*-[2,6-dideoxy-3-*C*-methyl-4-*O*-(3-methylbutanoyl)-α-L-*ribo*-hexopyranosyl]-3-(dimethylamino)-β-D-glucopyranosyl]oxy]-5-methoxy-9,16-dimethyl-7-(2-oxoethyl)-10-(propanoyloxy)oxacyclohexadeca-11,13-dien-2-one propionate (leucomycin A3 propionate).

Semi-synthetic product derived from a fermentation product.

Content:

– minimum 843 Ph. Eur. U./mg (dried substance).

CHARACTERS

Appearance: white or slightly yellowish, crystalline, slightly hygroscopic powder.

Solubility: practically insoluble in water, freely soluble in methanol and in methylene chloride, soluble in acetone.

IDENTIFICATION

First identification: A, B.

Second identification: B, C.

Prepare solutions in methanol immediately before use.

A. Dissolve 0.10 g in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 50.0 ml with *methanol R*. Examined between 220 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 231 nm. The specific absorbance at the absorption maximum is 310 to 350.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 1 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *josamycin propionate CRS* in *methanol R* and dilute to 1 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *josamycin CRS* in *methanol R* and dilute to 1 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of *spiramycin CRS* in *methylene chloride R* and dilute to 1 ml with the same solvent.

Reference solution (d). Mix 0.5 ml of reference solution (a) with 0.5 ml of reference solution (b).

Plate: *TLC silica gel G plate R.*

Mobile phase: *methanol R, acetone R, ethyl acetate R, toluene R, hexane R* (8:10:20:25:30 *V/V/V/V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: at 100 °C for 10 min.

Detection: spray with *dilute sulphuric acid R* and heat at 100 °C for 10 min.

System suitability: the chromatogram obtained with reference solution (d) shows 2 clearly separated principal spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a) and its position is different from that of the principal spot in the chromatograms obtained with reference solutions (b) and (c).

C. Dissolve about 10 mg in 5 ml of *hydrochloric acid R1* and allow to stand for 10-20 min. A pink colour develops, turning brown.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_4 (*2.2.2, Method II*).

Dissolve 1 g in *methanol R* and dilute to 10 ml with the same solvent.

Specific optical rotation (*2.2.7*): – 65 to – 75 (dried substance).

Dissolve 1.000 g in *methanol R* and dilute to 100.0 ml with the same solvent. Allow to stand for 30 min before measuring the angle of rotation.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in *acetonitrile for chromatography R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 50.0 mg of *josamycin propionate CRS* in *acetonitrile for chromatography R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of the substance to be examined in 10 ml of *methanol R* and add 40 µl of *dilute phosphoric acid R*. Mix, allow to stand for 5 min and inject.

Reference solution (c). Dilute 2.0 ml of reference solution (a) to 100.0 ml with *acetonitrile for chromatography R*.

Column:

– *size*: *l* = 0.15 m, Ø = 3.9 mm,

– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm),

– *temperature*: 30 °C.

Mobile phase: *acetonitrile R*, a 15.4 g/l solution of *ammonium acetate R* previously adjusted to pH 6.0 with *dilute phosphoric acid R* (60:40 *V/V*).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 232 nm.

Injection: 20 µl of the test solution and reference solutions (b) and (c).

Run time: 3 times the retention time of leucomycin A3 propionate.

Relative retention with reference to leucomycin A3 propionate (retention time = about 18 min): impurity E = about 0.2; impurity A = about 0.3; impurity B = about 0.5; leucomycin A4 propionate = about 0.7; impurity C = about 1.4; impurity D = about 2.0.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the 2 peaks eluting with a relative retention with reference to leucomycin A3 propionate of about 0.5 and 0.7 respectively.

Limits:

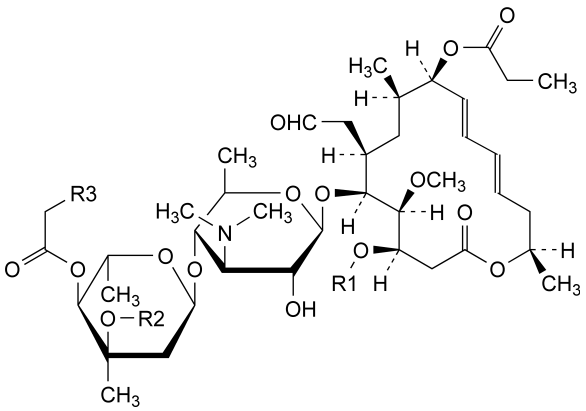
– *impurity D*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (c),
– *impurities A, B, C, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c),
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c),
– *total*: not more than 7 times the area of the principal peak in the chromatogram obtained with reference solution (c),
– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c).

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven *in vacuo* at 60 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 40.0 mg in 20 ml of *methanol R* and dilute to 100.0 ml with *phosphate buffer solution pH 5.6 R*.



Carry out the microbiological assay of antibiotics (*2.7.2*).

STORAGE

In an airtight container.

IMPURITIES

Specified impurities: A, B, C, D, E.

A. R1 = CO-CH_3, R2 = R3 = H: leucomycin A8 9-propionate,

B. R1 = R2 = H, R3 = C_2H_5: leucomycin A5 9-propionate,

C. R1 = CO-C_2H_5, R2 = H, R3 = $CH(CH_3)_2$: platenomycin A1 9-propionate,

D. R1 = CO-CH_3, R2 = CO-C_2H_5, R3 = $CH(CH_3)_2$: leucomycin A3 3″,9-dipropionate,

E. josamycin.

01/2008:1532

JUNIPER

Iuniperi pseudo-fructus

DEFINITION

Dried ripe cone berry of *Juniperus communis* L.

Content: minimum 10 ml/kg of essential oil (anhydrous drug).

CHARACTERS

Strongly aromatic odour, especially if crushed.

IDENTIFICATION

A. The berry-shaped cone is globular, up to 10 mm in diameter, and violet-brown or blackish-brown, frequently with a bluish bloom. It consists of 3 fleshy scales. The apex has a three-rayed closed cleft and 3 not very clearly defined projections. A remnant of peduncle is frequently attached at the base. The fleshy part is crumbly and brownish. It contains 3 or, more rarely, 2 small, elongated, extremely hard seeds that have 3 sharp edges and are slightly rounded at the back, acuminate at the apex. The seeds are fused with the fleshy part of the cone berry in the lower part on the outside of their bases. Very large, oval oil glands containing sticky resin lie at the outer surface of the seeds.

B. Reduce to a powder (355) (*2.9.12*). The powder is brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of epidermis of the cone berry wall containing cells with thick, pitted, colourless walls and brown glandular content, occasionnally with anomocytic stomata (*2.8.3*); fragments of the three-rayed apical cleft of the cone berry with spaces and epidermal cells interlocked by papillous outgrowths; fragments of the hypodermis with collenchymatous thickened cells; fragments of the mesocarp consisting of large thin-walled parenchymatous cells, usually rounded, with large intercellular spaces and irregular, large, usually scarcely pitted, yellow idioblasts (barrel cells); fragments of schizogenous oil cells; fragments of the testa with thick-walled, pitted, colourless sclereids containing one or several prism crystals of calcium oxalate; fragments of the endosperm and embryonic tissue with thin-walled cells containing fatty oil and aleurone grains.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dilute the oil-xylene mixture obtained in the assay to 5.0 ml with *hexane R*.

Reference solution. Dissolve 4.0 mg of *guaiazulene R* and 50 µl of *cineole R* in 10 ml of *hexane R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 20 µl of the test solution and 10 µl of the reference solution, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray the plate with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min and examine in daylight.

Results: the chromatogram obtained with the reference solution shows a red zone (guaiazulene) in the upper half and a brownish-violet or greyish-violet zone (cineole) in the lower half. The chromatogram obtained with the test solution shows a strong violet zone (mono- and sesquiterpenes) similar in position to the zone due to guaiazulene in the chromatogram obtained with the

reference solution, a reddish-violet zone a little above the zone due to cineole in the chromatogram obtained with the reference solution, a greyish-violet zone (terpinen-4-ol) a little below the zone due to cineole in the chromatogram obtained with the reference solution, and just below that a blue zone. A faint violet zone may be present in a similar position to the zone due to cineole. Further zones are present.

TESTS

Foreign matter (*2.8.2*): maximum 5 per cent of unripe or discoloured cone berries and maximum 2 per cent of other foreign matter.

Water (*2.2.13*): maximum 120 ml/kg, determined on 20.0 g of the crushed drug.

Total ash (*2.4.16*): maximum 4.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs (*2.8.12*). Use 20.0 g of drug crushed immediately before the assay, a 500 ml round-bottomed flask, 200 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 3-4 ml/min for 90 min.

01/2008:1832

JUNIPER OIL

Iuniperi aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the ripe, non-fermented berry cones of *Juniperus communis* L. A suitable antioxidant may be added.

CHARACTERS

Appearance: mobile, colourless to yellowish liquid, with a characteristic odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.2 ml of the substance to be examined in 5 ml of *heptane R.*

Reference solution. Dissolve 20 mg of *α-terpineol R* and 20 µl of *terpinen-4-ol R* in 25 ml of *heptane R.*

Plate: *TLC silica gel plate R.*

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 20 µl, as bands.

Development: over a path of 12 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C until the zones appear. Examine immediately in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
	An intense brownish-violet zone
	A brown zone
	A violet-pink zone
Terpinen-4-ol: a brownish-violet zone	A brownish-violet zone (terpinen-4-ol)
	A violet zone
α-Terpineol: a violet or brownish-violet zone	A violet or brownish-violet zone (α-terpineol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*): 0.857 to 0.876.

Refractive index (*2.2.6*): 1.471 to 1.483.

Optical rotation (*2.2.7*): – 15° to – 0.5°.

Peroxide value (*2.5.5*): maximum 20.

Fatty oils and resinified essential oils (*2.8.7*). It complies with the test for fatty oils and resinified essential oils.

Chromatographic profile. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Dissolve 60 mg of the substance to be examined in *trimethylpentane R* and dilute to 5.0 ml with the same solvent.

Reference solution. Mix 25 µl each of *α-pinene R, sabinene R, β-pinene R, β-myrcene R, α-phellandrene R, limonene R, terpinen-4-ol R, bornyl acetate R* and *β-caryophyllene R* and dilute to 25.0 ml with *trimethylpentane R.*

Column:

– *material*: fused silica,

– *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm,

– *stationary phase*: *poly(dimethyl)(diphenyl)siloxane R.*

Carrier gas: *helium for chromatography R.*

Flow rate: 2.0 ml/min.

Split ratio: 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	60
	1 - 58	60→230
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 0.5 µl.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

– *resolution*: minimum 1.5 between the peaks due to sabinene and β-pinene.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of the components. Disregard the peak due to trimethylpentane and peaks comprising less than 0.01 per cent of the total surface area. The percentages are within the following ranges:

- *α-pinene*: 20 per cent to 50 per cent,
- *sabinene*: less than 20 per cent,
- *β-pinene*: 1.0 per cent to 12 per cent
- *β-myrcene*: 1.0 per cent to 35 per cent,
- *α-phellandrene*: less than 1.0 per cent,
- *limonene*: 2.0 per cent to 12 per cent,
- *terpinen-4-ol*: 0.5 per cent to 10 per cent,
- *bornyl acetate*: less than 2.0 per cent,
- *β-caryophyllene*: less than 7.0 per cent.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

KANAMYCIN ACID SULPHATE

Kanamycini sulfas acidus

DEFINITION

Kanamycin acid sulphate is a form of kanamycin sulphate prepared by adding sulphuric acid to a solution of kanamycin monosulphate and drying by a suitable method. The potency is not less than 670 IU/mg, calculated with reference to the dried substance.

Fermentation product.

PRODUCTION

It is produced by methods of manufacture designed to eliminate or minimise substances lowering blood pressure.

The method of manufacture is validated to demonstrate that the product if tested would comply with the following test.

Abnormal toxicity (*2.6.9*). Inject into each mouse 0.5 ml of a solution containing 2 mg per millilitre of the substance to be examined.

CHARACTERS

A white or almost white powder, hygroscopic, soluble in about 1 part of water, practically insoluble in acetone and in alcohol.

IDENTIFICATION

A. Examine by thin-layer chromatography (*2.2.27*), using a plate coated with a 0.75 mm layer of the following mixture: mix 0.3 g of *carbomer R* with 240 ml of *water R* and allow to stand, with moderate shaking, for 1 h; adjust to pH 7 by the gradual addition, with continuous shaking, of *dilute sodium hydroxide solution R* and add 30 g of *silica gel H R*.

   Heat the plate at 110 °C for 1 h, allow to cool and use immediately.

   Test solution. Dissolve 10 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

   Reference solution (a). Dissolve 10 mg of *kanamycin monosulphate CRS* in *water R* and dilute to 10 ml with the same solvent.

   Reference solution (b). Dissolve 10 mg of *kanamycin monosulphate CRS*, 10 mg of *neomycin sulphate CRS* and 10 mg of *streptomycin sulphate CRS* in *water R* and dilute to 10 ml with the same solvent.

   Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm using a 70 g/l solution of *potassium dihydrogen phosphate R*. Dry the plate in a current of warm air and spray with a mixture of equal volumes of a 2 g/l solution of *dihydroxynaphthalene R* in *alcohol R* and a 460 g/l solution of *sulphuric acid R*. Heat at 150 °C for 5 min to 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 3 clearly separated spots.

B. Dissolve 0.5 g in 10 ml of *water R*. Add 10 ml of *picric acid solution R*. Initiate crystallisation if necessary by scratching the wall of the tube with a glass rod and allow to stand. Collect the crystals, wash with 20 ml of *water R* and filter. Dry at 100 °C. The crystals melt (*2.2.14*) at about 235 °C, with decomposition.

C. Dissolve about 50 mg in 2 ml of *water R*. Add 1 ml of a 10 g/l solution of *ninhydrin R* and heat for a few minutes on a water-bath. A violet colour develops.

D. It gives the reactions of sulphates (*2.3.1*).

TESTS

Solution S. Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent.

pH (*2.2.3*). The pH of solution S is 5.5 to 7.5.

Specific optical rotation (*2.2.7*). +103 to +115, determined on solution S and calculated with reference to the dried substance.

Kanamycin B. Examine by thin-layer chromatography (*2.2.27*), using a plate prepared as prescribed under identification test A.

Heat the plate at 110 °C for 1 h, allow to cool and use immediately.

Test solution. Dissolve 0.11 g of the substance to be examined in *water R* and dilute to 20 ml with the same solvent.

Reference solution. Dissolve 4 mg of *kanamycin B sulphate CRS* in *water R* and dilute to 20 ml with the same solvent.

Apply separately to the plate 4 µl of each solution. Develop over a path of 12 cm using a 70 g/l solution of *potassium dihydrogen phosphate R*. Dry the plate in a current of warm air and spray with *ninhydrin and stannous chloride reagent R*. Heat the plate at 110 °C for 15 min. Any spot corresponding to kanamycin B in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (4.0 per cent).

Loss on drying (*2.2.32*). Not more than 5.0 per cent, determined on 1.00 g by drying at 60 °C at a pressure not exceeding 670 Pa for 3 h.

Sulphated ash (*2.4.14*). Not more than 0.5 per cent, determined on 1.0 g.

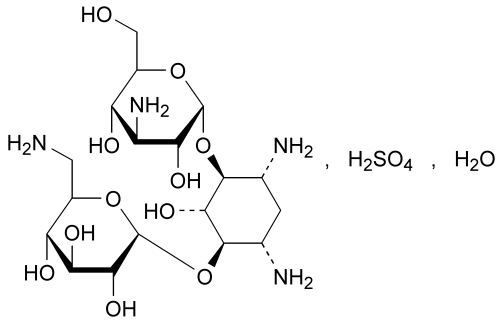
Sulphate. 23.0 per cent to 26.0 per cent of sulphate (SO_4), calculated with reference to the dried substance. Dissolve 0.175 g in 100 ml of *water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 ml of *0.1 M barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with *0.1 M sodium edetate* adding 50 ml of *alcohol R* when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears.

1 ml of *0.1 M barium chloride* is equivalent to 9.606 mg of sulphate (SO_4).

Pyrogens (*2.6.8*). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1 ml of a solution in *water for injections R* containing 10 mg per millilitre of the substance to be examined.

ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*). Use *kanamycin monosulphate CRS* as the reference substance.



STORAGE

If the substance is sterile, store in a sterile, tamper-proof container.

01/2008:0032

KANAMYCIN MONOSULPHATE

Kanamycini monosulfas

$C_{18}H_{38}N_4O_{15}S,H_2O$ M_r 601

DEFINITION

Kanamycin monosulphate is 6-*O*-(3-amino-3-deoxy-α-D-glucopyranosyl)-4-*O*-(6-amino-6-deoxy-α-D-glucopyranosyl)-2-deoxy-D-streptamine sulphate, an antimicrobial substance produced by the growth of certain strains of *Streptomyces kanamyceticus*. The potency is not less than 750 IU/mg, calculated with reference to the dried substance.

PRODUCTION

It is produced by methods of manufacture designed to eliminate or minimise substances lowering blood pressure.

The method of manufacture is validated to demonstrate that the product if tested would comply with the following test:

Abnormal toxicity (*2.6.9*). Inject into each mouse 0.5 ml of a solution containing 2 mg per millilitre of the substance to be examined.

CHARACTERS

A white or almost white, crystalline powder, soluble in about 8 parts of water, practically insoluble in acetone and in alcohol.

IDENTIFICATION

A. Examine by thin-layer chromatography (*2.2.27*), using a plate coated with a 0.75 mm layer of the following mixture: mix 0.3 g of *carbomer R* with 240 ml of *water R* and allow to stand, with moderate shaking, for 1 h; adjust to pH 7 by the gradual addition, with continuous shaking, of *dilute sodium hydroxide solution R* and add 30 g of *silica gel H R*.

Heat the plate at 110 °C for 1 h, allow to cool and use immediately.

Test solution. Dissolve 10 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *kanamycin monosulphate CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *kanamycin monosulphate CRS*, 10 mg of *neomycin sulphate CRS* and 10 mg of *streptomycin sulphate CRS* in *water R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm using a 70 g/l solution of *potassium dihydrogen phosphate R*. Dry the plate in a current of warm air and spray with a mixture of equal volumes of a 2 g/l solution of *dihydroxynaphthalene R* in *alcohol R* and a 460 g/l solution of *sulphuric acid R*. Heat at 150 °C for 5 min to 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. Dissolve 0.5 g in 10 ml of *water R*. Add 10 ml of *picric acid solution R*. Initiate crystallisation if necessary by scratching the wall of the tube with a glass rod and allow to stand. Collect the crystals, wash with 20 ml of *water R* and filter. Dry at 100 °C. The crystals melt (*2.2.14*) at about 235 °C, with decomposition.

C. Dissolve about 50 mg in 2 ml of *water R*. Add 1 ml of a 10 g/l solution of *ninhydrin R* and heat for a few minutes on a water-bath. A violet colour develops.

D. It gives the reactions of sulphates (*2.3.1*).

TESTS

Solution S. Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent.

pH (*2.2.3*). The pH of solution S is 6.5 to 8.5.

Specific optical rotation (*2.2.7*). +112 to +123, determined on solution S and calculated with reference to the dried substance.

Kanamycin B. Examine by thin-layer chromatography (*2.2.27*), using a plate prepared as prescribed under identification test A. Heat the plate at 110 °C for 1 h, allow to cool and use immediately.

Test solution. Dissolve 0.1 g of the substance to be examined in *water R* and dilute to 20 ml with the same solvent.

Reference solution. Dissolve 4 mg of *kanamycin B sulphate CRS* in *water R* and dilute to 20 ml with the same solvent.

Apply separately to the plate 4 µl of each solution. Develop over a path of 12 cm using a 70 g/l solution of *potassium dihydrogen phosphate R*. Dry the plate in a current of warm air and spray with *ninhydrin and stannous chloride reagent R*. Heat the plate at 110 °C for 15 min. Any spot corresponding to kanamycin B in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Loss on drying (*2.2.32*). Not more than 1.5 per cent, determined on 1.00 g by drying at 60 °C at a pressure not exceeding 670 Pa for 3 h.

Sulphated ash (*2.4.14*). Not more than 0.5 per cent, determined on 1.0 g.

Sulphate. 15.0 per cent to 17.0 per cent of sulphate (SO_4), calculated with reference to the dried substance. Dissolve 0.250 g in 100 ml of *water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 ml of *0.1 M barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with *0.1 M sodium edetate* adding 50 ml of *alcohol R* when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears.

1 ml of *0.1 M barium chloride* is equivalent to 9.606 mg of sulphate (SO_4).

Pyrogens (*2.6.8*). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1 ml of a solution in *water for injections R* containing 10 mg per millilitre of the substance to be examined.

ASSAY

Carry out the microbiological assay of antibiotics (*2.7.2*).

STORAGE

If the substance is sterile, store in a sterile, tamper-proof container.

01/2008:0503

KAOLIN, HEAVY

Kaolinum ponderosum

DEFINITION

Purified, natural, hydrated aluminium silicate of variable composition.

CHARACTERS

Appearance: fine, white or greyish-white, unctuous powder.

Solubility: practically insoluble in water and in organic solvents.

IDENTIFICATION

A. To 0.5 g in a metal crucible add 1 g of *potassium nitrate R* and 3 g of *sodium carbonate R* and heat until the mixture melts. Allow to cool. To the residue add 20 ml of boiling *water R*, mix and filter. Wash the residue with 50 ml of *water R*. To the residue add 1 ml of *hydrochloric acid R* and 5 ml of *water R*. Filter. To the filtrate add 1 ml of *strong sodium hydroxide solution R* and filter. To the filtrate add 3 ml of *ammonium chloride solution R*. A gelatinous white precipitate is formed.

B. Add 2.0 g in 20 portions to 100 ml of a 10 g/l solution of *sodium laurilsulfate R* in a 100 ml graduated cylinder about 30 mm in diameter. Allow 2 min between additions for each portion to settle. Allow to stand for 2 h. The apparent volume of the sediment is not greater than 5 ml.

C. 0.25 g gives the reaction of silicates (*2.3.1*).

TESTS

Solution S. To 4 g add a mixture of 6 ml of *acetic acid R* and 34 ml of *distilled water R*, shake for 1 min and filter.

Acidity or alkalinity. To 1.0 g add 20 ml of *carbon dioxide-free water R*, shake for 2 min and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.25 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink.

Organic impurities. Heat 0.3 g to redness in a calcination tube. The residue is only slightly more coloured than the original substance.

Adsorption power. To 1.0 g in a ground-glass-stoppered test-tube add 10.0 ml of a 3.7 g/l solution of *methylene blue R* and shake for 2 min. Allow to settle. Centrifuge and dilute the solution 1 to 100 with *water R*. The solution is not more intensely coloured than a 0.03 g/l solution of *methylene blue R*.

Swelling power. Triturate 2 g with 2 ml of *water R*. The mixture does not flow.

Substances soluble in mineral acids: maximum 1 per cent.

To 5.0 g add 7.5 ml of *dilute hydrochloric acid R* and 27.5 ml of *water R* and boil for 5 min. Filter, wash the residue on the filter with *water R* and dilute the combined filtrate and washings to 50.0 ml with *water R*. To 10.0 ml of the solution add 1.5 ml of *dilute sulphuric acid R*, evaporate to dryness on a water-bath and ignite. The residue weighs a maximum of 10 mg.

Chlorides (*2.4.4*): maximum 250 ppm.

Dilute 2 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 0.1 per cent.

Dilute 1.5 ml of solution S to 15 ml with *distilled water R*.

Calcium (*2.4.3*): maximum 250 ppm.

Dilute 4 ml of solution S to 15 ml with *distilled water R*.

Heavy metals (*2.4.8*): maximum 50 ppm.

To 5 ml of the solution prepared for the test for substances soluble in mineral acids add 5 ml of *water R*, 10 ml of *hydrochloric acid R* and 25 ml of *methyl isobutyl ketone R*. Shake for 2 min. Separate the layers. Evaporate the aqueous layer to dryness on a water-bath. Dissolve the residue in 1 ml of *acetic acid R* and dilute to 25 ml with *water R*. Filter. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

If intended for internal use, the above test is replaced by the following test for heavy metals (*2.4.8*): maximum 25 ppm.

To 10 ml of the solution prepared for the test for substances soluble in mineral acids add 10 ml of *water R*, 20 ml of *hydrochloric acid R* and 25 ml of *methyl isobutyl ketone R*. Shake for 2 min. Separate the layers. Evaporate the aqueous layer to dryness on a water-bath. Dissolve the residue in 1 ml of *acetic acid R* and dilute to 25 ml with *water R*. Filter. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 micro-organisms per gram, determined by plate-count.

LABELLING

The label states, where applicable, that the substance is suitable for internal use.

01/2008:1426
corrected 6.0

KELP

Fucus vel Ascophyllum

DEFINITION

Fragmented dried thallus of *Fucus vesiculosus* L. or *F. serratus* L. or *Ascophyllum nodosum* Le Jolis.

Content: minimum 0.03 per cent and maximum 0.2 per cent of total iodine (A_r 126.9) (dried drug).

CHARACTERS

Salty and mucilaginous taste.

Unpleasant marine odour.

IDENTIFICATION

A. The drug consists of fragments with a corneous consistency, blackish-brown to greenish-brown, sometimes covered with whitish efflorescence. The thallus consists of a ribbon-like blade, branching dichotomously with prominent central ribs (pseudoveins). *F. vesiculosus* typically shows a foliose blade with smooth edges and bears occasional ovoid, single or paired, air vesicles. The ends of certain branches are of ovoid shape and a little widened. They bear numerous reproductive organs (conceptacles). *F. serratus* has a foliose blade with

a serrate margin and no vesicles, the branches bearing conceptacles are less swollen. The thallus of *A. nodosum* is irregularly branched, without pseudo-midrib. It shows single ovoid air vesicles; the falciform conceptacles are located at the end of small branches.

B. Reduce to a powder (355) (*2.9.12*). The powder is greenish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of surface tissue with regular isodiametric cells with brown contents, and fragments of deep tissue with colourless, elongated cells arranged in long filaments with large mucilaginous spaces between them. Thick-walled cells in files and in closely packed groups, from the pseudovein, are sometimes visible.

C. To 1 g of the powdered drug (355) (*2.9.12*) add 20 ml of a 2 per cent *V/V* solution of *hydrochloric acid R*. Shake vigorously and filter. Wash the residue with 10 ml of *water R* and filter. To the residue add 10 ml of a 200 g/l solution of *sodium carbonate R*. Shake and centrifuge. Collect the supernatant liquid. Adjust to pH 1.5 using *sulphuric acid R*. A white, flocculent precipitate is slowly formed.

TESTS

Arsenic (*2.4.27*) : maximum 90 ppm.

Cadmium (*2.4.27*) : maximum 4 ppm.

Lead (*2.4.27*) : maximum 5 ppm.

Mercury (*2.4.27*) : maximum 0.1 ppm.

Swelling index (*2.8.4*): minimum 6.

Loss on drying (*2.2.32*): maximum 15.0 per cent, determined on 1.000 g by drying in an oven at 105 °C, for 2 h.

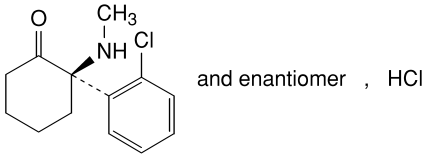
Total ash (*2.4.16*): maximum 24 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 3.0 per cent.

ASSAY

TOTAL IODINE. To 1.000 g of the powdered drug, in a tall silica crucible, add 5 ml of *water R* and 5 g of *potassium hydroxide R*. Stir with a magnesium rod. Heat on a water bath. Add 1 g of *potassium carbonate R*. Mix, add the tip of the magnesium rod with the residues of the drug and dry, first on a water-bath then over an open flame. Incinerate raising the temperature progressively to not more than 600 °C. Allow to cool. Add 20 ml of *water R* and heat gently to boiling, stirring with a glass rod. Filter the hot mixture through an unpleated filter, into a conical flask. Rinse the residue with 4 quantities, each of 20 ml, of hot *water R*. Rinse the filter and the crucible with 50 ml of hot *water R*. Combine the solutions. Allow to cool. Neutralise with *dilute sulphuric acid R* in the presence of *methyl orange solution R*. Add 3 ml of *dilute sulphuric acid R* and 1 ml of *bromine water R*. The solution is yellow. After 5 min add 0.6 ml of a 50 g/l solution of *phenol R*. The solution is clear. Acidify with 5 ml of *phosphoric acid R* and add 0.2 g of *potassium iodide R*. Allow to stand for 5 min protected from light. Add 1 ml of *starch solution R* and titrate with *0.01 M sodium thiosulphate*.

1 ml of *0.01 M sodium thiosulphate* is equivalent to 0.2115 mg of iodine.



LABELLING

The label states the species of kelp present.

01/2008:1020

KETAMINE HYDROCHLORIDE

Ketamini hydrochloridum

$C_{13}H_{17}Cl_2NO$ M_r 274.2
[1867-66-9]

DEFINITION

(*RS*)-2-(2-Chlorophenyl)-2-(methylamino)cyclohexanone hydrochloride.

Content: 99.0 per cent to 101.0 per cent.

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water and in methanol, soluble in ethanol (96 per cent).

mp: about 260 °C, with decomposition.

IDENTIFICATION

A. Optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *ketamine hydrochloride CRS*.

C. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 3.5 to 4.1

Dilute 10 ml of solution S to 20 ml with *carbon dioxide-free water R*.

Optical rotation (*2.2.7*): – 0.2° to + 0.2°.

Dilute 2.5 ml of solution S to 25.0 ml with *water R*.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *ketamine impurity A CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase (using ultrasound if necessary). To 1.0 ml of the solution, add 0.5 ml of the test solution and dilute to 100.0 ml with the mobile phase. Prepare immediately before use.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Precolumn:
- *size*: *l* = 4 mm, Ø = 4.0 mm,
- *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm).

Column:
- *size*: *l* = 0.125 m, Ø = 4.0 mm,
- *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dissolve 0.95 g of *sodium hexanesulphonate R* in 1 litre of a mixture of 25 volumes of *acetonitrile R* and 75 volumes of *water R* and add 4 ml of *acetic acid R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 20 µl.

Run time: 10 times the retention time of ketamine.

System suitability: reference solution (a):

– *retention time*: ketamine = 3 min to 4.5 min,

– *resolution*: minimum 1.5 between the peaks due to impurity A and ketamine.

Limits:

– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

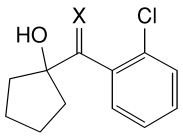
– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

Dilute 10 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

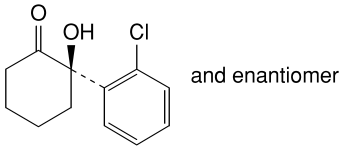
ASSAY



Dissolve 0.200 g in 50 ml of *methanol R* and add 1.0 ml of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 27.42 mg of $C_{13}H_{17}Cl_2NO$.

STORAGE

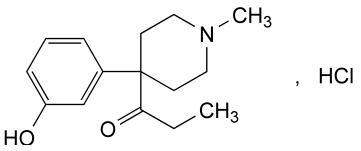


Protected from light.

IMPURITIES

A. X = N-CH_3: 1-[(2-chlorophenyl)(methylimino)methyl]cyclopentanol,

C. X = O: (2-chlorophenyl)(1-hydroxycyclopentyl)methanone,



B. (2*RS*)-2-(2-chlorophenyl)-2-hydroxycyclohexanone.

01/2008:1746

KETOBEMIDONE HYDROCHLORIDE

Cetobemidoni hydrochloridum

$C_{15}H_{22}ClNO_2$ M_r 283.8
[469-79-4]

DEFINITION

1-[4-(3-Hydroxyphenyl)-1-methylpiperidin-4-yl]propan-1-one hydrochloride.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, soluble in alcohol, very slightly soluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *Ph. Eur. reference spectrum of ketobemidone hydrochloride*.

B. Solution S (see Tests) gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 0.250 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution B_8 (*2.2.2, Method II*).

pH (*2.2.3*): 4.5 to 5.5 for solution S.

Related substances. Liquid chromatography (*2.2.29*).

Solution A: 1.54 g/l solution of *ammonium acetate R* adjusted to pH 8.0 with *dilute ammonia R1*.

Test solution. Dissolve 50.0 mg of the substance to be examined in solution A and dilute to 25.0 ml with the same solution.

Reference solution (a). Dissolve 1 mg of *ketobemidone impurity B CRS* and 1 mg of *ketobemidone impurity C CRS* in solution A and dilute to 25 ml with the same solution.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with solution A. Dilute 20.0 ml of this solution to 100.0 ml with solution A.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *phenylhexylsilyl silica gel for chromatography R* (5 µm),

– *temperature*: 40 °C.

Mobile phase: *acetonitrile R*, solution A (20:80 *V/V*).

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 278 nm.

Injection: 20 µl.

Run time: 4.5 times the retention time of ketobemidone.

Relative retention with reference to ketobemidone (retention time = about 10 min): impurity A = about 0.4; impurity B = about 0.6; impurity C = about 0.7; impurity D = about 3.5; impurity E = about 4.2.

System suitability: reference solution (a):

– *resolution*: minimum 4.0 between the peaks due to impurity B and impurity C.

Limits:

– *impurities A, B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),

– *any other impurity*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

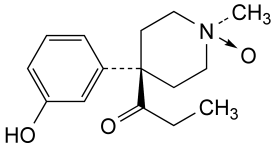
– *total*: not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.7 per cent),

– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (*2.5.12*): maximum 1.0 per cent, determined on 0.50 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

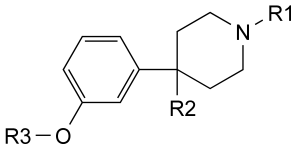
ASSAY



Dissolve 0.200 g in a mixture of 5.0 ml of *0.01 M hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (*2.2.20*) using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 28.38 mg of $C_{15}H_{22}ClNO_2$.

IMPURITIES



Specified impurities: *A, B, C, D.*

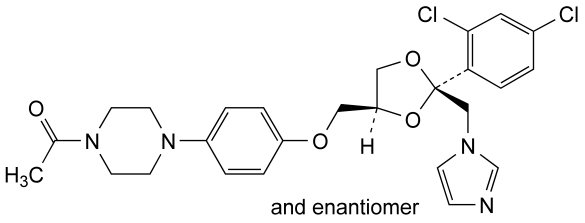
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E.*

and *trans* isomer

A. 1-[4-(3-hydroxyphenyl)-1-methyl-1-oxidopiperidin-4-yl]propan-1-one (*cis* and *trans* isomers),

B. R1 = CH_3, R2 = CO-CH_3, R3 = H: 1-[4-(3-hydroxyphenyl)-1-methylpiperidin-4-yl]ethanone,

C. R1 = R3 = H, R2 = CO-CH_2-CH_3: 1-[4-(3-hydroxyphenyl)piperidin-4-yl]propan-1-one,



D. R1 = R3 = CH_3, R2 = CO-CH_2-CH_3: 1-[4-(3-methoxyphenyl)-1-methylpiperidin-4-yl]propan-1-one,

E. R1 = CH_3, R2 = CN, R3 = H: 4-(3-hydroxyphenyl)-1-methylpiperidin-4-carbonitrile.

KETOCONAZOLE

Ketoconazolum

and enantiomer

$C_{26}H_{28}Cl_2N_4O_4$ M_r 531.4
[65277-42-1]

DEFINITION

1-Acetyl-4-[4-[[(2*RS*,4*SR*)-2-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)1,3-dioxolan-4-yl]methoxy]phenyl]-piperazine.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, soluble in methanol, sparingly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 148 °C to 152 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *ketoconazole CRS*.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 30 mg of the substance to be examined in the mobile phase and dilute to 5 ml with the mobile phase.

Reference solution (a). Dissolve 30 mg of *ketoconazole CRS* in the mobile phase and dilute to 5 ml with the mobile phase.

Reference solution (b). Dissolve 30 mg of *ketoconazole CRS* and 30 mg of *econazole nitrate CRS* in the mobile phase, then dilute to 5 ml with the mobile phase.

Plate: *TLC octadecylsilyl silica gel plate R.*

Mobile phase: *ammonium acetate solution R, dioxan R, methanol R* (20:40:40 *V/V/V*).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in a current of warm air for 15 min.

Detection: expose to iodine vapour until the spots appear and examine in daylight.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To about 30 mg in a porcelain crucible add 0.3 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 1.0 g in *methylene chloride R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_4 (*2.2.2, Method II*).

Optical rotation (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2.5 mg of *ketoconazole CRS* and 2.5 mg of *loperamide hydrochloride CRS* in *methanol R*, then dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:

– *mobile phase A*: *acetonitrile R1*, 3.4 g/l solution of *tetrabutylammonium hydrogen sulphate R* (5:95 *V/V*);

– *mobile phase B*: *acetonitrile R1*, 3.4 g/l solution of *tetrabutylammonium hydrogen sulphate R* (50:50 *V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 10	100 → 0	0 → 100
10 - 15	0	100

Flow rate: 2 ml/min.

Detection: spectrophotometer at 220 nm.

Equilibration: with *acetonitrile R* for at least 30 min and then with mobile phase A for at least 5 min.

Injection: 10 µl; inject *methanol R* as a blank.

Retention time: ketoconazole = about 6 min; loperamide = about 8 min.

System suitability: reference solution (a):

– *resolution*: minimum 15 between the peaks due to ketoconazole and loperamide; if necessary, adjust the final concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient elution.

Limits:

– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

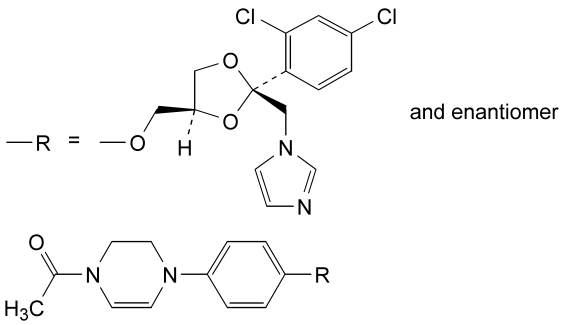
Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test D. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

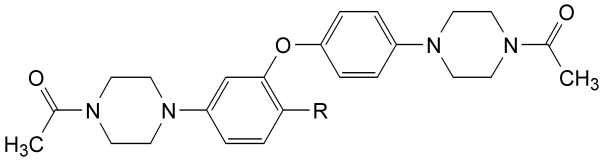
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



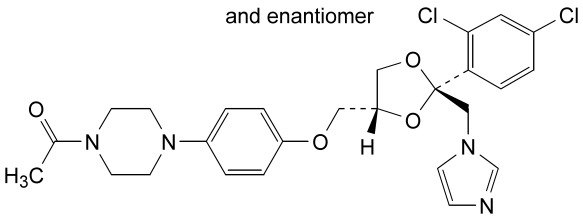
Dissolve 0.200 g in 70 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 26.57 mg of $C_{26}H_{28}Cl_2N_4O_4$.

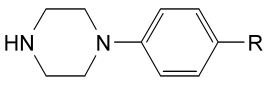


STORAGE

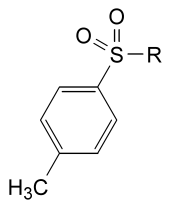
Protected from light.



IMPURITIES



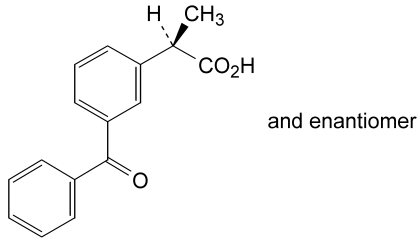
A. 1-acetyl-4-[4-[[(2*RS*,4*SR*)-2-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]1,2,3,4-tetrahydropyrazine,



B. 1-acetyl-4-[4-[[(2*RS*,4*SR*)-2-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]-3-[4-(4-acetylpiperazin-1-yl)phenoxy]phenyl]piperazine,

C. 1-acetyl-4-[4-[[(2*RS*,4*RS*)-2-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazine,

D. 1-[4-[[(2*RS*,4*SR*)-2-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]piperazine,



E. [(2*RS*,4*SR*)-2-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methyl 4-methylbenzenesulphonate.

01/2008:0922

KETOPROFEN

Ketoprofenum

$C_{16}H_{14}O_3$ M_r 254.3
[22071-15-4]

DEFINITION

(2*RS*)-2-(3-Benzoylphenyl)propanoic acid.

Content: 99.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in acetone, in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Melting point (*2.2.14*): 94 °C to 97 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50.0 mg in *ethanol (96 per cent) R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 50.0 ml with *ethanol (96 per cent) R*.

Spectral range: 230-350 nm.

Absorption maximum: at 255 nm.

Specific absorbance at the absorption maximum: 615 to 680.

C. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *ketoprofen CRS*.

D. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *ketoprofen CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *indometacin CRS* in *acetone R* and dilute to 10 ml with the same solvent. To 1 ml of this solution add 1 ml of reference solution (a).

Plate: *TLC silica gel GF_{254} plate R.*

Mobile phase: *glacial acetic acid R, methylene chloride R, acetone R* (1:49:50 *V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in obtained with reference solution (a).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Dissolve 1.0 g in *acetone R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *ketoprofen impurity A CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 5.0 mg of *ketoprofen impurity C CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. To 1.0 ml of this solution add 1.0 ml of reference solution (b).

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 350 m^2/g and a pore size of 10 nm.

Mobile phase: mix 2 volumes of freshly prepared *phosphate buffer solution pH 3.5 R*, 43 volumes of *acetonitrile R* and 55 volumes of *water R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 233 nm.

Injection: 20 µl.

Run time: 7 times the retention time of ketoprofen.

Relative retention with reference to ketoprofen (retention time = about 7 min): impurity C = about 0.34; impurity H = about 0.39; impurity G = about 0.46; impurity E = about 0.69; impurity B = about 0.73; impurity D = about 1.35; impurity I = about 1.43;

impurity A = about 1.50; impurity J = about 1.86;
impurity F = about 1.95; impurity K = about 2.27;
impurity L = about 2.49.

System suitability: reference solution (d):

– *resolution*: minimum 7.0 between the peaks due to ketoprofen and impurity A.

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatograms obtained with reference solution (b) (0.2 per cent);

– *impurity C*: not more than the area of the principal peak in the chromatograms obtained with reference solution (c) (0.2 per cent);

– *impurities B, D, E, F*: for each impurity, not more than the area of the principal peak in the chromatograms obtained with reference solution (a) (0.2 per cent);

– *sum of impurities other than A and C*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

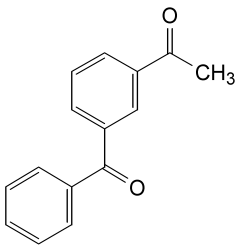
Heavy metals (*2.4.8*: maximum 10 ppm.

2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g at 60 °C at a pressure not exceeding 670 Pa.

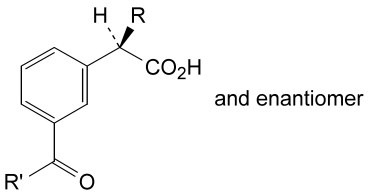
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.200 g in 25 ml of *ethanol (96 per cent) R*. Add 25 ml of *water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M sodium hydroxide* is equivalent to 25.43 mg of $C_{16}H_{14}O_3$.



IMPURITIES

Specified impurities: A, B, C, D, E, F.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. KETOROLAC TROMETAMOL

Ketorolacum trometamolum

and enantiomer

$C_{19}H_{24}N_2O_6$ M_r 376.4
[74103-07-4]

DEFINITION

2-Amino-2-(hydroxymethyl)propane-1,3-diol (1*RS*)-5-benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylate.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water and in methanol, slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *ketorolac trometamol CRS*.

TESTS

Solution S. Dissolve 0.75 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*).

pH (*2.2.3*): 5.7 to 6.7.

Dilute 5 ml of solution S to 15 ml with *carbon dioxide-free water R*.

Absorbance (*2.2.25*): maximum 0.10, determined at 430 nm for solution S.

Related substances. Liquid chromatography (*2.2.29*). *Protect the solutions from bright light.*

Solvent mixture: *tetrahydrofuran R, water R* (30:70 *V/V*).

Test solution. Dissolve 20 mg of the substance to be examined in the solvent mixture and dilute to 50 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dissolve 2 mg of *ketorolac trometamol for peak identification CRS* (containing impurities A, B, C and D) in 5 ml of the solvent mixture.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm);
- *temperature*: 40 °C.

Mobile phase: mix 30 volumes of *tetrahydrofuran R* with 70 volumes of a solution prepared as follows: dissolve 5.75 g of *ammonium dihydrogen phosphate R* in 900 ml of *water R*, adjust to pH 3.0 with *phosphoric acid R* and dilute to 1000 ml with *water R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 313 nm.

Injection: 10 µl.

Run time: 3 times the retention time of ketorolac.

Identification of impurities: use the chromatogram supplied with *ketorolac trometamol for peak identification CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A, B, C and D.

Relative retention with reference to ketorolac (retention time = about 10 min): impurity C = about 0.5; impurity A = about 0.6; impurity D = about 0.7; impurity B = about 0.9.

System suitability: reference solution (b):

- *resolution*: minimum 1.5 between the peaks due to impurity B and ketorolac.

Limits:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.67; impurity B = 0.52; impurity C = 2.2;
- *impurities A, B, C, D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test F. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

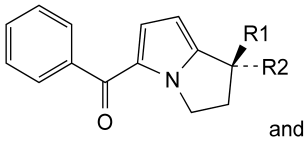
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 60 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 37.64 mg of $C_{19}H_{24}N_2O_6$.



STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

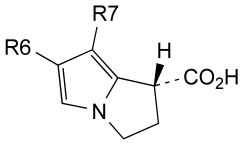
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E, F, G, H, I, J.*

and enantiomer

A. R1 = H, R2 = OH: (1*RS*)-5-benzoyl-2,3-dihydro-1*H*-pyrrolizin-1-ol,

B. R1 + R2 = O: 5-benzoyl-2,3-dihydro-1*H*-pyrrolizin-1-one,

D. R1 = CO_2H, R2 = OCH_3: (1*RS*)-5-benzoyl-1-methoxy-2,3-dihydro-1*H*-pyrrolizine-1-carboxylic acid,



E. R1 = H, R2 = CO-NH-$C(CH_2OH)_3$: (1*RS*)-5-benzoyl-*N*-[2-hydroxy-1,1-bis(hydroxymethyl)ethyl]-2,3-dihydro-1*H*-pyrrolizine-1-carboxamide,

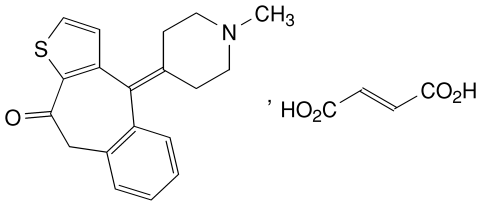
G. R1 = CO_2CH_3, R2 = OH: methyl (1*RS*)-5-benzoyl-1-hydroxy-2,3-dihydro-1*H*-pyrrolizine-1-carboxylate,

H. R1 = H, R2 = CO_2CH_3: methyl (1*RS*)-5-benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylate,

I. R1 = R2 = H: phenyl(2,3-dihydro-1*H*-pyrrolizin-5-yl)methanone,

J. R1 = H, R2 = $CO_2C_2H_5$: ethyl (1*RS*)-5-benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylate,

and enantiomer



C. R6 = CO-C_6H_5, R7 = H: (1*RS*)-6-benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylic acid,

F. R6 = H, R7 = CO-C_6H_5: (1*RS*)-7-benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylic acid.

KETOTIFEN HYDROGEN FUMARATE

Ketotifeni hydrogenofumaras

$C_{23}H_{23}NO_5S$ M_r 425.5
[34580-14-8]

DEFINITION

4-(1-Methylpiperidin-4-ylidene)-4,9-dihydro-10*H*-benzo[4,5]cyclohepta[1,2-*b*]thiophen-10-one hydrogen (*E*)-butenedioate.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white to brownish-yellow, fine, crystalline powder.

Solubility: sparingly soluble in water, slightly soluble in methanol, very slightly soluble in acetonitrile.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of ketotifen hydrogen fumarate.*

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 40 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 11 mg of *fumaric acid CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *cellulose for chromatography F_{254} R* as the coating substance.

Mobile phase: *water R, anhydrous formic acid R, di-isopropyl ether R* (3:7:90 *V/V/V*).

Application: 5 µl.

Development: over a path of 17 cm.

Drying: in a current of warm air.

Detection: examine in ultraviolet light at 254 nm. Spray lightly with a 5 g/l solution of *potassium permanganate R* in a 1.4 per cent *V/V* solution of *sulphuric acid R*. Examine in daylight by transparency.

Results: the spot due to fumaric acid in the chromatogram obtained with the test solution is similar in position, colour and intensity to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_4, BY_4 or B_4 (*2.2.2, Method II*).

Dissolve 0.2 g in *methanol R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 30.0 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with a mixture of equal volumes of *methanol R* and *water R*. Dilute 1.0 ml to 10.0 ml with a mixture of equal volumes of *methanol R* and *water R*.

Reference solution (b). Dissolve 3.0 mg of *ketotifen impurity G CRS* in 10 ml of *methanol R* and dilute to 20.0 ml with *water R. Protect the solution from light.*

Reference solution (c). To 1.5 ml of reference solution (b) add 1.0 ml of the test solution and dilute to 10.0 ml with a mixture of equal volumes of *methanol R* and *water R. Protect the solution from light.*

Reference solution (d). Dilute 0.5 ml of reference solution (b) to 50.0 ml with a mixture of equal volumes of *methanol R* and *water R. Protect the solution from light.*

Column:

– *size*: *l* = 0.15 m, Ø = 4.0 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm),

– *temperature*: 40 °C.

Mobile phase:

– *mobile phase A*: mix 175 µl of *triethylamine R* and 500 ml of *water R*,

– *mobile phase B*: mix 175 µl of *triethylamine R* and 500 ml of *methanol R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 12	40	60
12 - 20	40 → 10	60 → 90
20 - 25	10	90
25 - 26	10 → 40	90 → 60
26 - 31	40	60

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 297 nm.

Injection: 20 µl; inject the test solution and reference solutions (a), (c) and (d).

Relative retentions with reference to ketotifen: impurity D = about 0.31; impurity C = about 0.61; impurity G = about 0.86; impurity E = about 1.18; impurity F = about 1.36; impurity B = about 1.72; impurity A = about 2.15.

System suitability:

– *resolution*: minimum of 1.5 between the peaks due to ketotifen and to impurity G in the chromatogram obtained with reference solution (c),

– *signal-to-noise ratio*: minimum of 70 for the principal peak in the chromatogram obtained with reference solution (d).

Limits:

– *correction factor*: for the calculation of contents, multiply the area of the corresponding peak by the following correction factor: impurity G = 1.36,

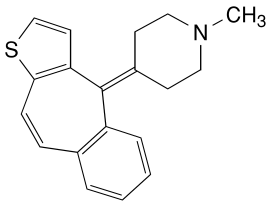
– *impurity G*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),

– *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),

– *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),

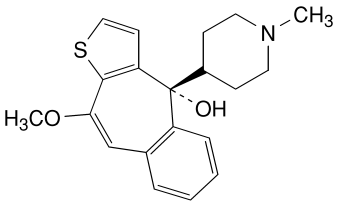
– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.



Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

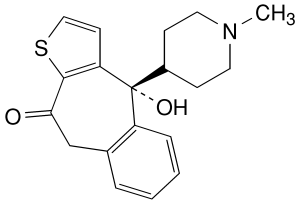
ASSAY



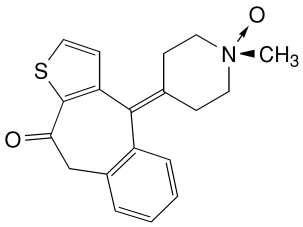
Dissolve 0.350 g in a mixture of 30 ml of *anhydrous acetic acid R* and 30 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 42.55 mg of $C_{23}H_{23}NO_5S$.

IMPURITIES

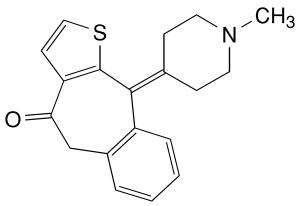


A. 4-(4*H*-benzo[4,5]cyclohepta[1,2-*b*]thiophen-4-ylidene)-1-methylpiperidine,



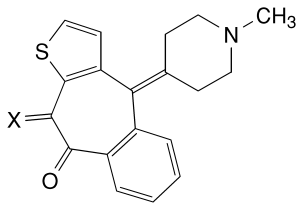
and enantiomer

B. (4*RS*)-10-methoxy-4-(1-methylpiperidin-4-yl)-4*H*-benzo[4,5]cyclohepta[1,2-*b*]thiophen-4-ol,



and enantiomer

C. (4*RS*)-4-hydroxy-4-(1-methylpiperidin-4-yl)-4,9-dihydro-10*H*-benzo[4,5]cyclohepta[1,2-*b*]thiophen-10-one,



and enantiomer

D. 4-[(*aRaS*)-1-methylpiperidin-4-ylidene]-4,9-dihydro-10*H*-benzo[4,5]cyclohepta[1,2-*b*]thiophen-10-one *N*-oxide (ketotifen *N*-oxide),

E. 10-(1-methylpiperidin-4-ylidene)-5,10-dihydro-4*H*-benzo[5,6]cyclohepta[1,2-*b*]thiophen-4-one,

F. X = H_2: 4-(1-methylpiperidin-4-ylidene)-4,10-dihydro-9*H*-benzo[4,5]cyclohepta[1,2-*b*]thiophen-9-one,

G. X = O: 4-(1-methylpiperidin-4-ylidene)-4*H*-benzo[4,5]cyclohepta[1,2-*b*]thiophen-9,10-dione.

01/2008:1885
corrected 6.0

KNOTGRASS

Polygoni avicularis herba

DEFINITION

Whole or cut dried flowering aerial parts of *Polygonum aviculare* L. *s.l.*

Content: minimum 0.30 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

IDENTIFICATION

A. The stem is 0.5 mm to 2 mm thick, branched, with nodes, cylindrical or slightly angular and longitudinally striated. It bears sessile or shortly petiolate, glabrous entire leaves, which differ widely in shape and size. The sheath-like stipules (ochrea) are lacerate and silvery. The small axillary flowers have 5 greenish-white perianth segments, the tips of which are often coloured red. The fruits are 2 mm to 4 mm, brown to black triangular nuts, usually punctate or striate.

B. Reduce to a powder (355) (*2.9.12*). The powder is greenish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the leaf epidermis with polygonal to sinuous cell walls and numerous anisocytic stomata (*2.8.3*), with a striated cuticle; fragments of leaves and stems containing numerous calcium oxalate clusters, some of them very large; groups of thick-walled fibres from the hypodermis of the stem; globular pollen grains with smooth exine and 3 germinal pores; occasional brown fragments of the exocarp composed of cells with thick sinuous walls. Examine under a microscope using a 675 g/l solution of *potassium hydroxide R*. Heat gently. The epidermis of the leaves and a few cells of the mesophyll stain red to reddish-violet. Examine under a microscope using a 0.1 g/l solution of *ferric chloride R*. Leaf fragments are stained almost black.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methanol R*. Heat the mixture under a reflux condenser, in a water-bath for 10 min. Cool and filter.

Reference solution. Dissolve 1 mg of *caffeic acid R*, 2.5 mg of *hyperoside R* and 1 mg of *chlorogenic acid R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R* (7:7:14:72 *V/V/V/V*).

Application: 20 µl, as bands.

Development: over a path of 10 cm.

Drying: at 100-105 °C.

Detection: spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for about 30 min. Examine in ultraviolet light at 365 nm.

Results: see below the sequence of the fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a light blue fluorescent zone	1 or 2 blue fluorescent zones (caffeic acid)
———	———
	1 or 2 yellowish-green fluorescent zones
	A yellow fluorescent zone
Hyperoside: a yellowish-brown fluorescent zone	
	A yellowish-brown fluorescent zone
Chlorogenic acid: a light blue fluorescent zone	A light blue fluorescent zone (chlorogenic acid)
———	———
	A yellowish-brown fluorescent zone
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 2 per cent of roots and maximum 2 per cent of other foreign matter.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of powdered drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 10.0 per cent.

ASSAY

Stock solution. In a 100 ml round-bottomed flask, place 0.800 g of the powdered drug (355) (*2.9.12*), add 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 ml, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool, filter each extract through the plug of absorbent cotton into the flask. Filter the combined acetone extracts through a filter paper into a volumetric flask, dilute to 100.0 ml with *acetone R* rinsing the flask and the filter paper. Introduce 20.0 ml of the solution into a separating funnel, add 20 ml of *water R* and shake the mixture with 1 quantity of 15 ml and then 3 quantities, each of 10 ml of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel and wash with 2 quantities, each of 50 ml, of *water R*. Filter the extracts over 10 g of *anhydrous sodium sulphate R* into a 50 ml volume tric flask and dilute to volume with *ethyl acetate R*.

Test solution. To 10.0 ml of the stock solution add 1 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Compensation liquid. Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance (*2.2.25*) of the test solution after 30 min by comparison with the compensation liquid at 425 nm. Calculate the percentage content of flavonoids, calculated as hyperoside, from the expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

A = absorbance at 425 nm,

m = mass of the drug to be examined, in grams.

LABETALOL HYDROCHLORIDE

Labetaloli hydrochloridum

$C_{19}H_{25}ClN_2O_3$ M_r 364.9
[32780-64-6]

DEFINITION

2-Hydroxy-5-[1-hydroxy-2-[(1-methyl-3-phenylpropyl)amino]-ethyl]benzamide hydrochloride.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: sparingly soluble in water and in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, C, E.

Second identification: A, B, D, E.

A. Optical rotation (*2.2.7*): – 0.05° to + 0.05°, determined on solution S (see Tests).

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 25.0 mg in *0.1 M hydrochloric acid* and dilute to 250.0 ml with the same acid.

Spectral range: 230-350 nm.

Absorption maximum: at 302 nm.

Specific absorbance at the absorption maximum: 83 to 88.

C. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *labetalol hydrochloride CRS.*

D. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in 1 ml of *ethanol (96 per cent) R.*

Reference solution (a). Dissolve 10 mg of *labetalol hydrochloride CRS* in 1 ml of *ethanol (96 per cent) R.*

Reference solution (b). Dissolve 10 mg of *labetalol hydrochloride CRS* and 10 mg of *propranolol hydrochloride CRS* in *ethanol (96 per cent) R* and dilute to 5 ml with the same solvent.

Plate: *TLC octadecylsilyl silica gel F_{254} plate R.*

Mobile phase: *perchloric acid R, water R, methanol R* (0.5:50:80 *V/V/V*).

Application: 2 µl.

Development: place the plate in a chromatographic tank immediately after the addition of the mobile phase, close the tank and develop over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

E. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent. *Solution S must be freshly prepared.*

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

pH (*2.2.3*): 4.0 to 5.0 for solution S.

Diastereoisomer ratio. Gas chromatography (*2.2.28*).

Test solution. Dissolve 2.0 mg of the substance to be examined in 1.0 ml of a 12.0 g/l solution of *butylboronic acid R* in *anhydrous pyridine R* and allow to stand for 20 min.

Column:

– *material*: glass;

– *size*: *l* = 1.5 m, Ø = 4 mm;

– *stationary phase*: *silanised diatomaceous earth for gas chromatography R* (125-150 µm) impregnated with 3 per cent *m/m* of *polymethylphenylsiloxane R.*

Carrier gas: *nitrogen for chromatography R.*

Flow rate: 40 ml/min.

Temperature:

– *column, injection port and detector*: 300 °C.

Detection: flame ionisation.

Injection: 2 µl.

System suitability:

– the height of the trough separating the 2 peaks due to the pairs of diastereoisomers is less than 5 per cent of the full scale of the recorder.

Limit:

– *each pair of diastereoisomers*: for the area of each peak, 45 per cent to 55 per cent of the total area of the 2 peaks.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution. Dilute 0.5 ml of the test solution to 100.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 150 ml of *tetrahydrofuran R*, 300 ml of *methanol R*, 550 ml of *water R*, 0.82 g of *tetrabutylammonium hydrogen sulphate R*, 1 g of *sodium octyl sulphate R* and 10 ml of a 10 per cent *V/V* solution of *sulphuric acid R.*

Flow rate: 1 ml/min.

Detection: spectrophotometer at 229 nm.

Equilibration: with the mobile phase for about 30 min.

Injection: 20 µl.

Run time: 3 times the retention time of labelatol.

Retention time: labelatol = 10 min to 15 min; if necessary, adjust the water content of the mobile phase ensuring that the 2:1 ratio of methanol to tetrahydrofuran is maintained.

Limits:

- *impurities A, B*: for each impurity, not more than 0.6 times the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent);
- *total*: not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent);
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

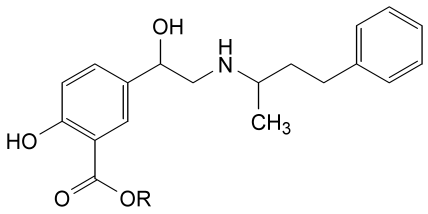
Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C at a pressure not exceeding 0.7 kPa.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



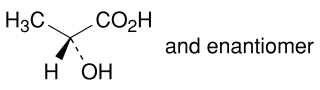
In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.200 g in a mixture of 10 ml of *anhydrous formic acid R* and 40 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 36.49 mg of $C_{19}H_{25}ClN_2O_3$.

IMPURITIES

Specified impurities: *A, B.*



A. R = H: 2-hydroxy-5-[1-hydroxy-2-[(1-methyl-3-phenylpropyl)-amino]ethyl]benzoic acid,

B. R = CH_3: methyl 2-hydroxy-5-[1-hydroxy-2-[(1-methyl-3-phenylpropyl)amino]ethyl]benzoate.

01/2008:0458

LACTIC ACID

Acidum lacticum

$C_3H_6O_3$ M_r 90.1

DEFINITION

Mixture of 2-hydroxypropanoic acid, its condensation products, such as lactoyl-lactic acid and polylactic acids, and water. The equilibrium between lactic acid and polylactic acids depends on the concentration and temperature. It is usually the racemate ((*RS*)-lactic acid).

Content: 88.0 per cent *m/m* to 92.0 per cent *m/m* of $C_3H_6O_3$.

CHARACTERS

Appearance: colourless or slightly yellow, syrupy liquid.

Solubility: miscible with water and with ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 1 g in 10 ml of *water R*. The solution is strongly acidic (*2.2.4*).

B. Relative density (*2.2.5*): 1.20 to 1.21.

C. It gives the reaction of lactates (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in 42 ml of *1 M sodium hydroxide* and dilute to 50 ml with *distilled water R*.

Appearance. The substance to be examined is not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Ether-insoluble substances. Dissolve 1.0 g in 25 ml of *ether R*. The solution is not more opalescent than the solvent used for the test.

Sugars and other reducing substances. To 1 ml of solution S add 1 ml of *1 M hydrochloric acid*, heat to boiling, allow to cool and add 1.5 ml of *1 M sodium hydroxide* and 2 ml of *cupri-tartaric solution R*. Heat to boiling. No red or greenish precipitate is formed.

Methanol (*2.4.24*): maximum 50 ppm, if intended for use in the manufacture of parenteral dosage forms.

Citric, oxalic and phosphoric acids. To 5 ml of solution S add *dilute ammonia R1* until slightly alkaline (*2.2.4*). Add 1 ml of *calcium chloride solution R*. Heat on a water-bath for 5 min. Both before and after heating, any opalescence in the solution is not more intense than that in a mixture of 1 ml of *water R* and 5 ml of solution S.

Sulphates (*2.4.13*): maximum 200 ppm.

Dilute 7.5 ml of solution S to 15 ml with *distilled water R*.

Calcium (*2.4.3*): maximum 200 ppm.

Dilute 5 ml of solution S to 15 ml with *distilled water R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

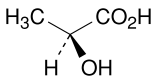
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

Bacterial endotoxins (*2.6.14*): less than 5 IU/g, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins. Before use, neutralise the test solution to pH 7.0-7.5 with *strong sodium hydroxide solution R* and shake vigorously.

ASSAY

Place 1.000 g in a ground-glass-stoppered flask and add 10 ml of *water R* and 20.0 ml of *1 M sodium hydroxide*. Close the flask and allow to stand for 30 min. Using 0.5 ml of *phenolphthalein solution R* as indicator, titrate with *1 M hydrochloric acid* until the pink colour is discharged.

1 ml of *1 M sodium hydroxide* is equivalent to 90.1 mg of $C_3H_6O_3$.



LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

01/2008:1771

(*S*)-LACTIC ACID

Acidum (*S*)-lacticum

$C_3H_6O_3$ M_r 90.1

DEFINITION

Mixture of (*S*)-2-hydroxypropanoic acid, its condensation products, such as lactoyl-lactic acid and polylactic acids, and water. The equilibrium between lactic acid and polylactic acids depends on the concentration and temperature.

Content: 88.0 per cent *m/m* to 92.0 per cent *m/m* of $C_3H_6O_3$, not less than 95.0 per cent of which is the (*S*)-enantiomer.

CHARACTERS

Appearance: colourless or slightly yellow, syrupy liquid.

Solubility: miscible with water and with ethanol (96 per cent).

IDENTIFICATION

A. Dissolve 1 g in 10 ml of *water R*. The solution is strongly acidic (*2.2.4*).

B. Relative density (*2.2.5*): 1.20 to 1.21.

C. It gives the reaction of lactates (*2.3.1*).

D. It complies with the limits of the assay.

TESTS

Solution S. Dissolve 5.0 g in 42 ml of *1 M sodium hydroxide* and dilute to 50 ml with *distilled water R*.

Appearance. The substance to be examined is not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Ether-insoluble substances. Dissolve 1.0 g in 25 ml of *ether R*. The solution is not more opalescent than the solvent used for the test.

Sugars and other reducing substances. To 1 ml of solution S add 1 ml of *1 M hydrochloric acid*, heat to boiling, allow to cool and add 1.5 ml of *1 M sodium hydroxide* and 2 ml of *cupri-tartaric solution R*. Heat to boiling. No red or greenish precipitate is formed.

Methanol (*2.4.24*): maximum 50 ppm, if intended for use in the manufacture of parenteral dosage forms.

Citric, oxalic and phosphoric acids. To 5 ml of solution S add *dilute ammonia R1* until slightly alkaline (*2.2.4*). Add 1 ml of *calcium chloride solution R*. Heat on a water-bath for 5 min. Both before and after heating, any opalescence in the solution is not more intense than that in a mixture of 1 ml of *water R* and 5 ml of solution S.

Sulphates (*2.4.13*): maximum 200 ppm.

Dilute 7.5 ml of solution S to 15 ml with *distilled water R*.

Calcium (*2.4.3*): maximum 200 ppm.

Dilute 5 ml of solution S to 15 ml with *distilled water R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

Bacterial endotoxins (*2.6.14*): less than 5 IU/g if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins. Before use, neutralise the test solution to pH 7.0-7.5 with *strong sodium hydroxide solution R* and shake vigorously.

ASSAY

Place 1.000 g in a ground-glass-stoppered flask and add 10 ml of *water R* and 20.0 ml of *1 M sodium hydroxide*. Close the flask and allow to stand for 30 min. Using 0.5 ml of *phenolphthalein solution R* as indicator, titrate with *1 M hydrochloric acid* until the pink colour is discharged.

1 ml of *1 M sodium hydroxide* is equivalent to 90.1 mg of $C_3H_6O_3$.

(*S*)-enantiomer

Transfer an amount of the substance to be examined equivalent to 2.00 g of lactic acid into a round-bottomed flask, add 25 ml of *1 M sodium hydroxide* and boil gently for 15 min. Cool down and adjust to pH 7.0 using *1 M hydrochloric acid*. Add 5.0 g of *ammonium molybdate R*, dissolve and dilute to 50.0 ml with *water R*. Filter and measure the angle of optical rotation (*2.2.7*). Calculate the percentage content of (*S*)-enantiomer using the expression:

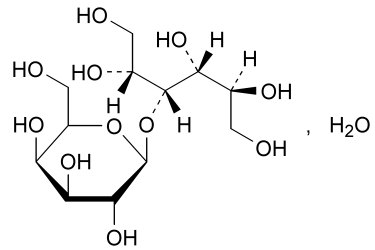
$$50 + \left(24.18 \times \alpha \times \frac{2.222}{m} \times \frac{90}{c}\right)$$

α = angle of optical rotation (absolute value),

m = mass of the substance to be examined, in grams,

c = percentage content of $C_3H_6O_3$ in the substance to be examined.

The complex of (*S*)-lactic acid formed under these test conditions is laevorotatory.



LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

corrected 6.0

LACTITOL MONOHYDRATE

Lactitolum monohydricum

$C_{12}H_{24}O_{11},H_2O$ M_r 362.3
[81025-04-9]

DEFINITION

4-*O*-(β-D-galactopyranosyl)-D-glucitol.

Content: 96.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very soluble in water, slightly soluble in alcohol, practically insoluble in methylene chloride

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *lactitol monohydrate CRS.*

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 50 mg of the substance to be examined in *methanol R* and dilute to 20 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *lactitol monohydrate CRS* in *methanol R* and dilute to 2 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *sorbitol CRS* in 2 ml of reference solution (a) and dilute to 20 ml with *methanol R.*

Plate: *TLC silica gel G plate R.*

Mobile phase: *water R, acetonitrile R* (25:75 *V/V*).

Application: 2 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with *4-aminobenzoic acid solution R.* Dry the plate in a current of cold air until the solvent is removed. Heat at 100 °C for 15 min. Allow to cool and spray with a 2 g/l solution of *sodium periodate R.* Dry the plate in a current of cold air. Heat at 100 °C for 15 min.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dissolve 5.000 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 10 ml of *carbon dioxide-free water R.* To 10 ml of this solution add 0.05 ml of *phenolphthalein solution R.* Not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink. To a further 10 ml of the solution add 0.05 ml of *methyl red solution R.* Not more than 0.3 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator to red.

Specific optical rotation(*2.2.7*): + 13.5 to + 15.5 (anhydrous substance), determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dilute 2.0 ml of test solution (a) to 50.0 ml with *water R.*

Reference solution (a). Dissolve 5.0 mg of *lactitol monohydrate CRS* and 5 mg of *glycerol R* in *water R* and dilute to 25.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with *water R.* Dilute 5.0 ml of this solution to 100.0 ml with *water R.*

Reference solution (c). Dilute 2.5 ml of reference solution (a) to 10.0 ml with *water R.*

Column:

– *size*: *l* = 0.30 m, Ø = 7.8 mm,
– *stationary phase*: *strong cation exchange resin (calcium form) R,*
– *temperature*: 60 °C.

Mobile phase: *water R.*

Flow rate: 0.6 ml/min.

Detection: refractive index detector maintained at a constant temperature.

Injection: 100 µl; inject test solution (a) and reference solutions (b) and (c).

Run time: 2.5 times the retention time of lactitol.

Relative retention with reference to lactitol (retention time = about 13 min): impurity A = about 0.7; impurity B = about 0.8; glycerol = about 1.3; impurity C = about 1.5; impurity D = about 1.8; impurity E = about 1.9.

System suitability: reference solution (c):

– *resolution*: minimum 5 between the peaks due to lactitol and glycerol.

Limits:

– *impurity B*: not more than the area of the peak due to lactitol in the chromatogram obtained with reference solution (c) (1.0 per cent),
– *total of other impurities*: not more than the area of the peak due to lactitol in the chromatogram obtained with reference solution (c) (1.0 per cent),
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard any peak due to the solvent.

Reducing sugars: maximum 0.2 per cent.

Dissolve 5.0 g in 3 ml of *water R* with gentle heating. Cool and add 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of *0.025 M iodine.* With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R.* When the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution R* added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Lead (*2.4.10*): maximum 0.5 ppm.

Nickel (*2.4.15*): maximum 1 ppm.

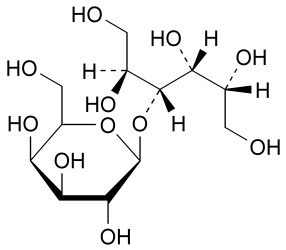
Water (*2.5.12*): 4.5 per cent to 5.5 per cent, determined on 0.30 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 micro-organisms per gram. It complies with the tests for *Escherichia coli*, *Salmonella* and *Pseudomonas aeruginosa* (*2.6.13*).

ASSAY

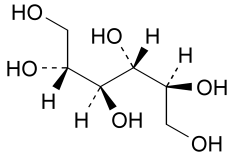
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.



Injection: test solution (b) and reference solution (a).

Calculate the percentage content of $C_{12}H_{24}O_{11}$ using the chromatograms obtained with test solution (b) and reference solution (a) and the declared content of *lactitol monohydrate CRS.*

IMPURITIES

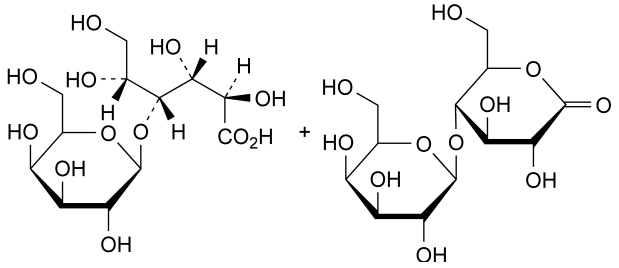


Specified impurities: A, B, C, D, E.

A. lactose,

B. lactulitol,

C. mannitol,



D. dulcitol (galactitol),

E. sorbitol.

01/2008:1647

LACTOBIONIC ACID

Acidum lactobionicum

$C_{12}H_{22}O_{12}$ (acid form) M_r 358.3
[96-82-2]

$C_{12}H_{20}O_{11}$ (δ-lactone) M_r 340.3
[5965-65-1]

DEFINITION

Mixture in variable proportions of 4-*O*-β-D-galactopyranosyl-D-gluconic acid and 4-*O*-β-D-galactopyranosyl-D-glucono-1,5-lactone.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, slightly soluble in glacial acetic acid, in anhydrous ethanol and in methanol.

mp: about 125 °C with decomposition.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *lactobionic acid CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *water R*, dry at 105 °C and record new spectra using the residues.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of the substance to be examined in *water R* and dilute to 1 ml with the same solvent.

Reference solution. Dissolve 10 mg of *lactobionic acid CRS* in *water R* and dilute to 1 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *concentrated ammonia R1, ethyl acetate R, water R, methanol R* (2:2:2:4 *V/V/V/V*).

Application: 5 µl.

Development: over 3/4 of the plate.

Detection: spray 3 times with *ammonium molybdate solution R6* and heat in an oven at 110 °C for 15 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and colour to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution Y_5 (*2.2.2, Method II*).

Dissolve 3.0 g in 25 ml of *water R*.

Specific optical rotation (*2.2.7*): + 23.0 to + 29.0 (anhydrous substance).

Dissolve 1.0 g in 80 ml of *water R* and dilute to 100.0 ml with the same solvent. Allow to stand for 24 h.

Reducing sugars: maximum 0.2 per cent, calculated as glucose.

Dissolve 5.0 g in 25 ml of *water R* with the aid of gentle heat. Cool and add 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R* and, when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with limit test E. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 5.0 per cent, determined on 0.50 g.

Use a mixture of 1 volume of *formamide R* and 2 volumes of *methanol R* as solvent.

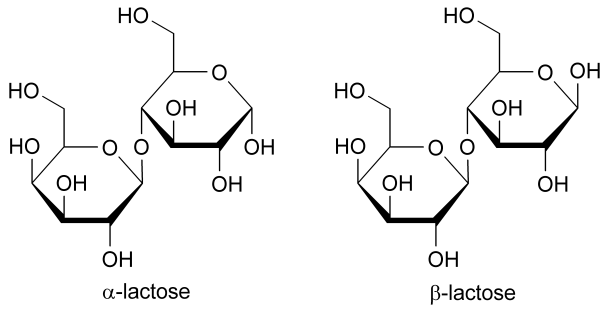
Total ash (*2.4.16*): maximum 0.2 per cent.

ASSAY

Dissolve 0.350 g in 50 ml of *carbon dioxide-free water R*, previously heated to 30 °C. Immediately titrate with *0.1 M sodium hydroxide* and determine the 2 equivalence points potentiometrically (*2.2.20*).

The first equivalence point (V_1) corresponds to the acid form of lactobionic acid and the second equivalence point ($V_2 - V_1$) corresponds to the δ-lactone form.

1 ml of *0.1 M sodium hydroxide* is equivalent to 35.83 mg of $C_{12}H_{22}O_{12}$.



1 ml of *0.1 M sodium hydroxide* is equivalent to 34.03 mg of $C_{12}H_{20}O_{11}$.

The sum of the 2 results is expressed as a percentage content of lactobionic acid.

01/2008:1061
corrected 6.0

LACTOSE, ANHYDROUS

Lactosum anhydricum

$C_{12}H_{22}O_{11}$ M_r 342.3

DEFINITION

O-β-D-Galactopyranosyl-(1→4)-β-D-glucopyranose or mixture of *O*-β-D-galactopyranosyl-(1→4)-α-D-glucopyranose and *O*-β-D-galactopyranosyl-(1→4)-β-D-glucopyranose.

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely but slowly soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *anhydrous lactose CRS.*

B. Thin-layer chromatography (*2.2.27*).

Solvent mixture: *water R, methanol R* (2:3 *V/V*).

Test solution. Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (a). Dissolve 10 mg of *anhydrous lactose CRS* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (b). Dissolve 10 mg of *anhydrous lactose CRS*, 10 mg of *fructose CRS*, 10 mg of *glucose CRS* and 10 mg of *sucrose CRS* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Plate: *TLC silica gel G plate R.*

Mobile phase: *water R, methanol R, glacial acetic acid R, ethylene chloride R* (10:15:25:50 *V/V/V/V*); measure the volumes accurately, as a slight excess of water produces cloudiness.

Application: 2 µl; thoroughly dry the starting points.

Development A: over a path of 15 cm.

Drying A: in a current of warm air.

Development B: immediately, over a path of 15 cm, after renewing the mobile phase.

Drying B: in a current of warm air.

Detection: spray with a solution of 0.5 g of *thymol R* in a mixture of 5 ml of *sulphuric acid R* and 95 ml of *ethanol (96 per cent) R*; heat at 130 °C for 10 min.

System suitability: reference solution (b):

– the chromatogram shows 4 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.25 g in 5 ml of *water R*. Add 5 ml of *ammonia R* and heat in a water-bath at 80 °C for 10 min. A red colour develops.

D. Water (see Tests).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

Dissolve 1.0 g in boiling *water R* and dilute to 10 ml with the same solvent.

Acidity or alkalinity. Dissolve 6.0 g by heating in 25 ml of *carbon dioxide-free water R*, cool and add 0.3 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.4 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to pink.

Specific optical rotation (*2.2.7*): + 54.4 to + 55.9 (anhydrous substance).

Dissolve 10.0 g in 80 ml of *water R*, heating to 50 °C. Allow to cool and add 0.2 ml of *dilute ammonia R1*. Allow to stand for 30 min and dilute to 100.0 ml with *water R*.

Absorbance (*2.2.25*).

Test solution (a). Dissolve 1.0 g in boiling *water R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *water R*.

Spectral range: 400 nm for test solution (a) and 210-300 nm for test solution (b).

Results:

– at 400 nm: maximum 0.04 for test solution (a);

– from 210 nm to 220 nm: maximum 0.25 for test solution (b);

– from 270 nm to 300 nm: maximum 0.07 for test solution (b).

Heavy metals (*2.4.8*): maximum 5 ppm.

2.0 g complies with test C. Prepare the reference solution using 1.0 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 1.0 per cent, determined on 0.50 g, using a mixture of 1 volume of *formamide R* and 2 volumes of *methanol R* as the solvent.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^2 micro-organisms per gram, determined by plate-count. It complies with the test for *Escherichia coli* (*2.6.13*)

FUNCTIONALITY-RELATED CHARACTERISTICS

This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient. This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. Control of these characteristics can however contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.

The following characteristics may be relevant for anhydrous lactose used as a filler/diluent in solid dosage forms (compressed and powder).

Particle size distribution (*2.9.31* or *2.9.38*).

Bulk and tapped density (*2.9.15*). Determine the bulk density and the tapped density. Calculate the Hausner index using the following expression:

$$\frac{V_0}{V_f}$$

V_0 = volume of bulk substance;

V_f = volume of tapped substance.

α-Lactose and β-lactose. Gas chromatography (*2.2.28*).

Silylation reagent. Mix 28 volumes of *N-trimethylsilylimidazole R* and 72 volumes of *pyridine R*.

Test solution. Dissolve about 1 mg of the substance to be examined in 0.45 ml of *dimethyl sulphoxide R*. Add 1.8 ml of the silylation reagent. Mix gently and allow to stand for 20 min.

Reference solution. Prepare a mixture of *α-lactose monohydrate R* and *β-lactose R* having an anomeric ratio of about 1:1 based on the labelled anomeric contents of the α-lactose monohydrate and β-lactose. Dissolve about 1 mg of this mixture in 0.45 ml of *dimethyl sulphoxide R*. Add 1.8 ml of the silylation reagent. Mix gently and allow to stand for 20 min.

Column:

– *material*: glass;
– *size*: *l* = 0.9 m, Ø = 4 mm;
– *stationary phase*: *silanised diatomaceous earth for gas chromatography R* impregnated with 3 per cent *m/m* of *poly[(cyanopropyl)(methyl)][(phenyl)(methyl)] siloxane R*.

Carrier gas: *helium for chromatography R*.

Flow rate: 40 ml/min.

Temperature:

– *column*: 215 °C;
– *injection port and detector*: 275 °C.

Detection: flame ionisation.

Injection: 2 µl.

System suitability: reference solution:

– *relative retention* with reference to β-lactose: α-lactose = about 0.7;
– *resolution*: minimum 3.0 between the peaks due to α-lactose and β-lactose.

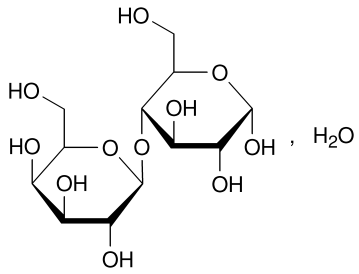
Calculate the percentage content of α-lactose from the following expression:

$$\frac{100S_a}{S_a + S_b}$$

Calculate the percentage content of β-lactose from the following expression:

$$\frac{100S_b}{S_a + S_b}$$

S_a = area of the peak due to α-lactose,



S_b = area of the peak due to β-lactose.

Loss on drying (*2.2.32*). Determine on 1.000 g by drying in an oven at 80 °C for 2 h.

01/2008:0187
corrected 6.0

LACTOSE MONOHYDRATE

Lactosum monohydricum

$C_{12}H_{22}O_{11},H_2O$ M_r 360.3

DEFINITION

O-β-D-Galactopyranosyl-(1→4)-α-D-glucopyranose monohydrate.

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely but slowly soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *lactose CRS*.

B. Thin-layer chromatography (*2.2.27*).

Solvent mixture: *water R, methanol R* (2:3 *V/V*).

Test solution. Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (a). Dissolve 10 mg of *lactose CRS* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (b). Dissolve 10 mg of *fructose CRS*, 10 mg of *glucose CRS*, 10 mg of *lactose CRS* and 10 mg of *sucrose CRS* in the solvent mixture and dilute to 20 ml with the solvent mixture.

Plate: *TLC silica gel G plate R*.

Mobile phase: *water R, methanol R, glacial acetic acid R, ethylene chloride R* (10:15:25:50 *V/V/V/V*); measure the volumes accurately, as a slight excess of water produces cloudiness.

Application: 2 µl; thoroughly dry the starting points.

Development A: over a path of 15 cm.

Drying A: in a current of warm air.

Development B: immediately, over a path of 15 cm, after renewing the mobile phase.

Drying B: in a current of warm air.

Detection: spray with a solution of 0.5 g of *thymol R* in a mixture of 5 ml of *sulphuric acid R* and 95 ml of *ethanol (96 per cent) R*; heat at 130 °C for 10 min.

System suitability: reference solution (b):

– the chromatogram shows 4 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.25 g in 5 ml of *water R*. Add 5 ml of *ammonia R* and heat in a water-bath at 80 °C for 10 min. A red colour develops.

D. Water (see Tests).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_7 (*2.2.2, Method II*).

Dissolve 1.0 g in boiling *water R* and dilute to 10 ml with the same solvent.

Acidity or alkalinity. Dissolve 6.0 g by heating in 25 ml of *carbon dioxide-free water R*, cool and add 0.3 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.4 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to pink.

Specific optical rotation (*2.2.7*): + 54.4 to + 55.9 (anhydrous substance).

Dissolve 10.0 g in 80 ml of *water R*, heating to 50 °C. Allow to cool and add 0.2 ml of *dilute ammonia R1*. Allow to stand for 30 min and dilute to 100.0 ml with *water R*.

Absorbance (*2.2.25*).

Test solution (a). Dissolve 1.0 g in boiling *water R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *water R*.

Spectral range: 400 nm for test solution (a) and 210-300 nm for test solution (b).

Results:

– at 400 nm: maximum 0.04 for test solution (a);

– from 210 nm to 220 nm: maximum 0.25 for test solution (b);

– from 270 nm to 300 nm: maximum 0.07 for test solution (b).

Heavy metals (*2.4.8*): maximum 5 ppm.

Dissolve 4.0 g in *water R* with warming, add 1 ml of *0.1 M hydrochloric acid* and dilute to 20 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): 4.5 per cent to 5.5 per cent, determined on 0.50 g, using a mixture of 1 volume of *formamide R* and 2 volumes of *methanol R* as the solvent.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^2 micro-organisms per gram, determined by plate-count. It complies with the test for *Escherichia coli* (*2.6.13*).

STORAGE

In an airtight container.

FUNCTIONALITY-RELATED CHARACTERISTICS

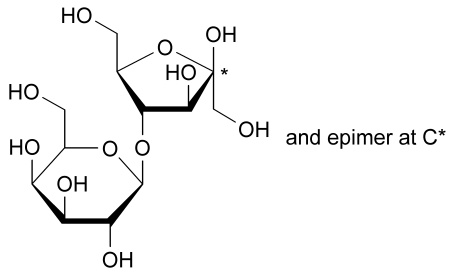
This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient. This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. Control of these characteristics can however contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.

The following characteristics may be relevant for lactose monohydrate used as a filler/diluent in solid dosage forms (compressed and powder).

Particle size distribution (*2.9.31* or *2.9.38*).

Bulk and tapped density (*2.9.15*). Determine the bulk density and the tapped density. Calculate the Hausner Index using the following expression:

$$\frac{V_0}{V_f}$$



V_0 = volume of bulk substance;

V_f = volume of tapped substance.

01/2008:1230

LACTULOSE

Lactulosum

$C_{12}H_{22}O_{11}$ M_r 342.3

[4618-18-2]

DEFINITION

4-*O*-(β-D-Galactopyranosyl)-D-*arabino*-hex-2-ulofuranose.

Content: 95.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, sparingly soluble in methanol, practically insoluble in toluene.

mp: about 168 °C.

IDENTIFICATION

First identification: B, C, D, E.

Second identification: A, C, D, E.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dissolve 50.0 mg of *lactulose CRS* in *water R* and dilute to 10.0 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: *glacial acetic acid R,* 50 g/l solution of *boric acid R, methanol R, ethyl acetate R* (10:15:20:55 *V/V/V/V*).

Application: 2 µl.

Development: over a path of 15 cm.

Drying: at 100-105 °C for 5 min and allow to cool.

Detection: spray with a 1.0 g/l solution of *1,3-dihydroxynaphthalene R* in a mixture of 10 volumes of *sulphuric acid R* and 90 volumes of *methanol R*. Heat at 110 °C for 5 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (b).

C. Dissolve 50 mg in 10 ml of *water R*. Add 3 ml of *cupri-tartaric solution R* and heat. A red precipitate is formed.

D. Dissolve 0.125 g in 5 ml of *water R*. Add 5 ml of *ammonia R*. Heat on a water-bath at 80 °C for 10 min. A red colour develops.

E. Specific optical rotation (see Tests).

TESTS

Solution S. Dissolve 3.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

pH (*2.2.3*): 3.0 to 7.0.

To 10 ml of solution S add 0.1 ml of a saturated solution of *potassium chloride R*.

Specific optical rotation (*2.2.7*): – 46.0 to – 50.0 (anhydrous substance).

Dissolve 1.25 g in *water R,* add 0.2 ml of *concentrated ammonia R* and dilute to 25.0 ml with *water R*.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 1.00 g of the substance to be examined in 10 ml of *water R*. Add 12.5 ml of *acetonitrile R* with gentle heating and dilute to 25.0 ml with *water R*.

Reference solution (a). To 3 ml of the test solution add 47.5 ml of *acetonitrile R* with gentle heating and dilute to 100.0 ml with *water R*.

Reference solution (b). Dissolve 1.00 g of *lactulose CRS* in 10 ml of *water R*. Add 12.5 ml of *acetonitrile R* with gentle heating and dilute to 25.0 ml with *water R*.

Reference solution (c). Dissolve the contents of a vial of *lactulose for system suitability CRS* in 1 ml of a mixture of equal volumes of *acetonitrile R* and *water R*.

Precolumn:

– *size*: *l* = 0.05 m, Ø = 4.6 mm;
– *stationary phase*: *aminopropylsilyl silica gel for chromatography R* (3 µm);
– *temperature*: 38 ± 1 °C.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *aminopropylsilyl silica gel for chromatography R* (3 µm);
– *temperature*: 38 ± 1 °C.

Mobile phase: dissolve 0.253 g of *sodium dihydrogen phosphate R* in 220 ml of *water R* and add 780 ml of *acetonitrile R*.

Flow rate: 1.0 ml/min.

Detection: refractometer maintained at a constant temperature.

Injection: 20 µl of the test solution and reference solutions (a) and (c).

Run time: 2.5 times the retention time of lactulose.

Relative retention with reference to lactulose (retention time = about 18.3 min): impurity E = about 0.38; impurity D = about 0.42; impurity B = about 0.57; impurity A = about 0.90; impurity C = about 1.17.

System suitability: reference solution (c):

– *resolution*: minimum 1.3 between the peaks due to lactulose and impurity A; if necessary, adjust the concentration of acetonitrile in the mobile phase to between 75.0 per cent *V/V* and 82.0 per cent *V/V*;
– the chromatogram obtained is similar to the chromatogram supplied with *lactulose for system suitability CRS*.

Limit:

– *sum of impurities A, B, C, D, E*: not more than the area of the peak due to lactulose in the chromatogram obtained with reference solution (a) (3 per cent).

Methanol. Head-space gas chromatography (*2.2.28*).

Internal standard solution. Mix 0.5 ml of *propanol R* with 100.0 ml of *water R*. Dilute 1.0 ml of this solution to 100.0 ml with *water R*. Dilute 5.0 ml of the solution to 50.0 ml with *water R*.

Test solution. To 79 mg of the substance to be examined in a 20 ml vial add 1.0 ml of the internal standard solution and 5 µl of a 0.1 per cent *V/V* solution of *methanol R*.

Reference solution. To 1.0 ml of the internal standard solution in a 20 ml vial add 5 µl of a 0.1 per cent *V/V* solution of *methanol R*.

Column:

– *size*: *l* = 2 m, Ø = 2 mm;
– *stationary phase*: *ethylvinylbenzene-divinylbenzene copolymer R* (180 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 30 ml/min.

Static head-space conditions which may be used:

– *equilibration temperature*: 60 °C;
– *equilibration time*: 1 h;
– *pressurisation time*: 1 min.

Temperature:

– *column*: 140 °C;
– *injection port*: 200 °C;
– *detector*: 220 °C.

Detection: flame ionisation.

Injection: 1 ml of the gaseous phase.

Calculate the content of methanol taking its density (*2.2.5*) at 20 °C to be 0.79 g/ml.

Limit:

– *methanol*: calculate the ratio (*R*) of the area of the peak due to methanol to the area of the peak due to the internal standard in the chromatogram obtained with the reference solution; calculate the ratio of the area of the peak due to methanol to the area of the peak due to the internal standard in the chromatogram obtained with the test solution: this ratio is not greater than 2 *R* (50 ppm).

Boron: maximum 9 ppm.

Avoid where possible the use of glassware.

Reference solution. Dissolve 50.0 mg of *boric acid R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *water R*. *Keep in a well-closed polyethylene container.*

In 4 polyethylene 25 ml flasks, place separately:

– 0.50 g of the substance to be examined dissolved in 2.0 ml of *water R* (solution A);
– 0.50 g of the substance to be examined dissolved in 1.0 ml of the reference solution and 1.0 ml of *water R* (solution B);
– 1.0 ml of the reference solution and 1.0 ml of *water R* (solution C);
– 2.0 ml of *water R* (solution D).

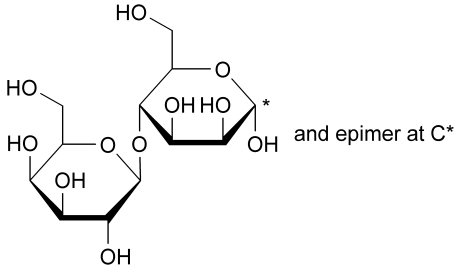
To each flask, add 4.0 ml of *acetate-edetate buffer solution pH 5.5 R*. Mix and add 4.0 ml of freshly prepared *azomethine H solution R*. Mix and allow to stand for 1 h. Measure the absorbance (*2.2.25*) of solutions A, B and C at 420 nm, using solution D as the compensation liquid. The test is not valid unless the absorbance of solution C is at least 0.25. The absorbance of solution B is not less than twice that of solution A.

Lead (*2.4.10*): maximum 0.5 ppm.

Water (*2.5.12*): maximum 2.5 per cent, determined on 0.500 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^2 micro-organisms per gram, determined by plate count. It complies with the test for *Escherichia coli* (*2.6.13*).



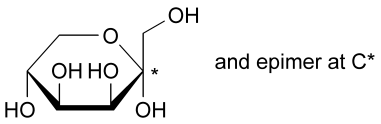
ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: the test solution and reference solution (b).

Calculate the percentage content of $C_{12}H_{22}O_{11}$ from the declared content of *lactulose CRS*.

IMPURITIES



A. 4-*O*-(β-D-galactopyranosyl)-D-mannopyranose (epilactose),

B. galactose,

C. lactose,

D. fructose,

E. D-*lyxo*-hex-2-ulopyranose (tagatose).

01/2008:0924

LACTULOSE, LIQUID

Lactulosum liquidum

DEFINITION

Aqueous solution of 4-*O*-(β-D-galactopyranosyl)-D-*arabino*-hex-2-ulofuranose normally prepared by alkaline isomerisation of lactose. It may contain lesser amounts of other sugars including lactose, epilactose, galactose, tagatose and fructose.

Content: minimum 620 g/l of lactulose ($C_{12}H_{22}O_{11}$; M_r 342.3) and 95.0 per cent to 105.0 per cent of the content of lactulose stated on the label.

It may contain a suitable antimicrobial preservative.

CHARACTERS

Appearance: clear, viscous liquid, colourless or pale brownish-yellow.

Solubility: miscible with water. It may be a supersaturated solution or may contain crystals which disappear on heating.

A 10 per cent *V/V* solution is laevorotatory.

IDENTIFICATION

First identification: B, C, D.

Second identification: A, C, D.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dilute 0.50 g of the substance to be examined to 50 ml with *water R*.

Reference solution. Dissolve 60 mg of *lactulose CRS* in *water R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: *glacial acetic acid R*, 50 g/l solution of *boric acid R*, *methanol R*, *ethyl acetate R* (10:15:20:55 *V/V/V/V*).

Application: 2 µl.

Development: over a path of 15 cm.

Drying: at 100-105 °C for 5 min and allow to cool.

Detection: spray with a 1.0 g/l solution of *1,3-dihydroxynaphthalene R* in a mixture of 10 volumes of *sulphuric acid R* and 90 volumes of *methanol R*. Heat at 110 °C for 5 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (b).

C. To 0.1 g add 10 ml of *water R* and 3 ml of *cupri-tartaric solution R* and heat. A red precipitate is formed.

D. To 0.25 g add 5 ml of *water R* and 5 ml of *ammonia R*. Heat in a water-bath at 80 °C for 10 min. A red colour develops.

TESTS

Solution S. Mix 10 g with *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

pH (*2.2.3*): 3.0 to 7.0.

To 10 ml of solution S, add 0.1 ml of a saturated solution of *potassium chloride R*.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Mix 4.00 g of the substance to be examined with 20 ml of *water R*. Add 25.0 ml of *acetonitrile R* with gentle heating and dilute to 50.0 ml with *water R*.

Reference solution (a). To 5 ml of the test solution, add 47.5 ml of *acetonitrile R* with gentle heating and dilute to 100.0 ml with *water R*.

Reference solution (b). Dissolve 2.00 g of *lactulose CRS* in 20 ml of *water R*. Add 25.0 ml of *acetonitrile R* with gentle heating and dilute to 50.0 ml with *water R*.

Reference solution (c). Dissolve the contents of a vial of *lactulose for system suitability CRS* in 1 ml of a mixture of equal volumes of *acetonitrile R* and *water R*.

Precolumn:

– *size*: *l* = 0.05 m, Ø = 4.6 mm;
– *stationary phase*: *aminopropylsilyl silica gel for chromatography R* (3 µm);
– *temperature*: 38 ± 1 °C.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *aminopropylsilyl silica gel for chromatography R* (3 µm);
– *temperature*: 38 ± 1 °C.

Mobile phase: dissolve 0.253 g of *sodium dihydrogen phosphate R* in 220 ml of *water R* and add 780 ml of *acetonitrile R*.

Flow rate: 1.0 ml/min.

Detection: refractometer maintained at a constant temperature.

Injection: 20 µl of the test solution and reference solutions (a) and (c).

Run time: 2.5 times the retention time of lactulose.

Relative retention with reference to lactulose (retention time = about 18 min): impurity E = about 0.38; impurity D = about 0.42; impurity B = about 0.57; impurity A = about 0.90; impurity C = about 1.17.

System suitability: reference solution (c):

– *resolution*: minimum 1.3 between the peaks due to lactulose and impurity A; if necessary, adjust the concentration of acetonitrile in the mobile phase to between 75.0 per cent *V/V* and 82.0 per cent *V/V*;
– the chromatogram obtained is similar to the chromatogram supplied with *lactulose for system suitability CRS*.

Limits:

– *impurities A, C*: for each impurity, not more than twice the area of the peak due to lactulose in the chromatogram obtained with reference solution (a) (10 per cent);
– *impurity B*: not more than 3 times the area of the peak due to lactulose in the chromatogram obtained with reference solution (a) (15 per cent);
– *impurity D*: not more than 0.2 times the area of the peak due to lactulose in the chromatogram obtained with reference solution (a) (1 per cent);
– *impurity E*: not more than 0.8 times the area of the peak due to lactulose in the chromatogram obtained with reference solution (a) (4 per cent).

Methanol. Head-space gas chromatography (*2.2.28*).

Internal standard solution. Mix 0.5 ml of *propanol R* with 100.0 ml of *water R*. Dilute 1.0 ml of this solution to 100.0 ml with *water R*. Dilute 5.0 ml of the solution to 50.0 ml with *water R*.

Test solution. To 0.13 g of the substance to be examined in a 20 ml vial add 1.0 ml of the internal standard solution and 5 µl of a 0.1 per cent *V/V* solution of *methanol R*.

Reference solution. To 1.0 ml of the internal standard solution in a 20 ml vial add 5 µl of a 0.1 per cent *V/V* solution of *methanol R*.

Column:

– *size*: *l* = 2 m, Ø = 2 mm;
– *stationary phase*: *ethylvinylbenzene-divinylbenzene copolymer R* (180 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 30 ml/min.

Static head-space conditions which may be used:

– *equilibration temperature*: 60 °C;
– *equilibration time*: 1 h;
– *pressurisation time*: 1 min.

Temperature:

– *column*: 140 °C;
– *injection port*: 200 °C;
– *detector*: 220 °C.

Detection: flame ionisation.

Injection: 1 ml of the gaseous phase.

Calculate the content of methanol taking its density (*2.2.5*) at 20 °C to be 0.79 g/ml.

Limit:

– *methanol*: calculate the ratio (*R*) of the area of the peak due to methanol to the area of the peak due to the internal standard in the chromatogram obtained with the reference solution; calculate the ratio of the area of the peak due to methanol to the area of the peak due to the internal standard in the chromatogram obtained with the test solution: this ratio is not greater than 2 *R* (30 ppm).

Sulphites: maximum 30 ppm.

Mix 5.0 g with 40 ml of *water R*, add 2.0 ml of *0.1 M sodium hydroxide* and dilute to 100 ml with *water R*. To 10.0 ml of this solution, add 1.0 ml of *hydrochloric acid R1*, 2.0 ml of *decolorised fuchsin solution R1* and 2.0 ml of a 0.5 per cent *V/V* solution of *formaldehyde R*. Allow to stand for 30 min and measure the absorbance (*2.2.25*) at 583 nm using as the compensation liquid a solution prepared at the same time and in the same manner with 10.0 ml of *water R* instead of the solution of the substance to be examined. The absorbance is not greater than that of a reference solution prepared at the same time and in the same manner using 10.0 ml of *sulphite standard solution (1.5 ppm SO_2) R* instead of the solution of the substance to be examined.

Boron: maximum 5 ppm.

Avoid where possible the use of glassware.

Reference solution. Dissolve 56.0 mg of *boric acid R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *water R*. *Keep in a well-closed polyethylene container.*

In 4 polyethylene 25 ml flasks, place separately:

– 1.00 g of the substance to be examined and 1 ml of *water R* (solution A);

– 1.00 g of the substance to be examined and 1 ml of the reference solution (solution B);

– 1 ml of the reference solution and 1 ml of *water R* (solution C);

– 2 ml of *water R* (solution D).

To each flask, add 4.0 ml of *acetate-edetate buffer solution pH 5.5 R*. Mix and add 4.0 ml of freshly prepared *azomethine H solution R*. Mix and allow to stand for 1 h. Measure the absorbance (*2.2.25*) of solutions A, B and C at 420 nm, using solution D as the compensation liquid. The test is not valid unless the absorbance of solution C is at least 0.25. The absorbance of solution B is not less than twice that of solution A.

Lead (*2.4.10*): maximum 0.5 ppm, calculated with reference to the declared content of lactulose.

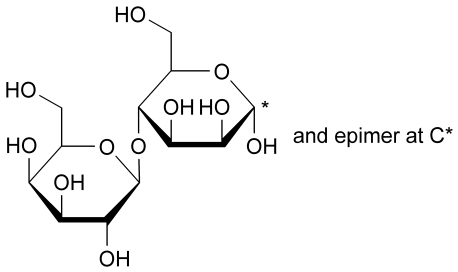
Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.5 g and calculated with reference to the declared content of lactulose.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^2 micro-organisms per gram, determined by plate count. It complies with the test for *Escherichia coli* (*2.6.13*).

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: the test solution and reference solution (b).



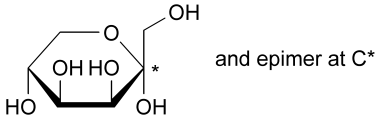
Calculate the percentage content of $C_{12}H_{22}O_{11}$ from the declared content of *lactulose CRS*.

LABELLING

The label states the declared content of lactulose.

IMPURITIES

Specified impurities: *A, B, C, D, E.*

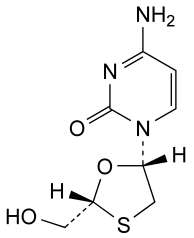


A. 4-*O*-(β-D-galactopyranosyl)-D-mannopyranose (epilactose),

B. galactose,

C. lactose,

D. fructose,



E. D-*lyxo*-hex-2-ulopyranose (tagatose).

01/2008:2217

LAMIVUDINE

Lamivudinum

$C_8H_{11}N_3O_3S$ M_r 229.3
[134678-17-4]

DEFINITION

4-Amino-1-[(2*R*,5*S*)-2-(hydroxymethyl)-1,3-oxathiolan-5-yl]pyrimidin-2(1*H*)-one.

Content: 97.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: soluble in water, sparingly soluble in methanol, slightly soluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

First identification: *B, C.*

Second identification: *A, B.*

A. Specific optical rotation (*2.2.7*): – 97 to – 99 (dried substance).

Dissolve 0.250 g in *water R* and dilute to 50.0 ml with the same solvent.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *lamivudine CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

C. Enantiomeric purity (see Tests).

TESTS

Absorbance (*2.2.25*): maximum 0.3 at 440 nm, using a path length of 4 cm.

Dissolve 1.00 g in *water R*, using sonication if necessary, and dilute to 20.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *salicylic acid R* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 50.0 mg of *lamivudine CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (d). Dissolve 5 mg of *cytosine R* and 5 mg of *uracil R* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (e). Dissolve 5 mg of *lamivudine for system suitability 1 CRS* (containing impurities A and B) in 2 ml of mobile phase. Add 1.0 ml of reference solution (d) and dilute to 10.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (5 µm),
– *temperature*: 35 °C.

Mobile phase: mix 5 volumes of *methanol R* and 95 volumes of a 1.9 g/l solution of *ammonium acetate R*, previously adjusted to pH 3.8 with *glacial acetic acid R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 277 nm.

Injection: 10 µl.

Run time: 3 times the retention time of lamivudine.

Identification of impurities: use the chromatograms obtained with reference solutions (e) and (b) to identify the peaks due to impurities A, B, E, F and C.

Relative retention with reference to lamivudine (retention time = about 9 min): impurity E = about 0.28; impurity F = about 0.32; impurity A = about 0.36; impurity B = about 0.91; impurity J = about 1.45; impurity C = about 2.32.

System suitability: reference solution (e):

– *resolution*: minimum 1.5 between the peaks due to impurity F and impurity A; minimum 1.5 between the peaks due to impurity B and lamivudine.

Limits:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity E = 0.6; impurity F = 2.2; impurity J = 2.2;
– *impurity A*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
– *impurity B*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
– *total*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.6 per cent);
– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Enantiomeric purity. Liquid chromatography (*2.2.29*): use the normalisation procedure.

Test solution. Dissolve 25.0 mg of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution. Dissolve the contents of a vial of *lamivudine for system suitability 2 CRS* (containing impurity D) in 1.0 ml of *water R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,
– *stationary phase*: *silica gel BC for chiral chromatography R*,
– *temperature*: maintain at constant temperature between 15 °C and 30 °C; the temperature may be adjusted to optimise the resolution between lamivudine and impurity D; a lower temperature favours improved resolution.

Mobile phase: mix 5 volumes of *methanol R* and 95 volumes of a 7.7 g/l solution of *ammonium acetate R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 270 nm.

Injection: 10 µl.

Run time: twice the retention time of lamivudine.

Relative retention with reference to lamivudine (retention time = about 8 min): impurity D = about 1.2; impurity B and enantiomer = about 1.3 and 1.5.

System suitability: reference solution:

– *peak-to-valley-ratio*: minimum 15, where H_p = height above the baseline of the peak due to impurity D and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to lamivudine.

Calculate the sum of the percentage contents of all impurity peaks with a relative retention from 1.2 to 1.5. Subtract the percentage content of impurity B as obtained in the test for related substances.

Limit:

– *impurity D*: maximum 0.3 per cent.

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test F. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

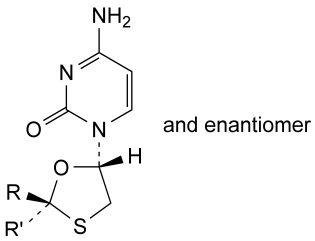
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (c).

Calculate the percentage content of $C_8H_{11}N_3O_3S$ using the chromatograms obtained with the test solution and reference solution (c) and the declared content of $C_8H_{11}N_3O_3S$ in *lamivudine CRS*.



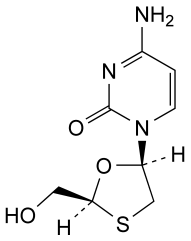
STORAGE

Protected from light.

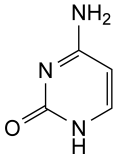
IMPURITIES

Specified impurities: *A, B, C, D.*

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E, F, G, H, I, J.*

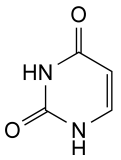


and enantiomer

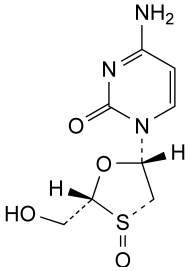


A. R = H, R′ = CO_2H: (2*RS*,5*SR*)-5-(4-amino-2-oxopyrimidin-1(2*H*)-yl)-1,3-oxathiolane-2-carboxylic acid,

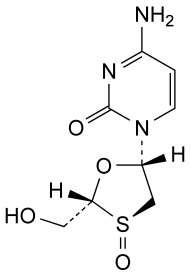
B. R = CH_2OH, R′ = H: 4-amino-1-[(2*RS*,5*RS*)-2-(hydroxymethyl)-1,3-oxathiolan-5-yl]pyrimidin-2(1*H*)-one ((±)-*trans*-lamivudine),



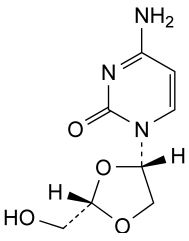
C. salicylic acid,



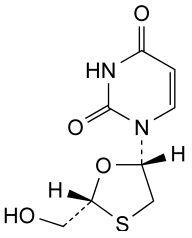
D. 4-amino-1-[(2*S*,5*R*)-2-(hydroxymethyl)-1,3-oxathiolan-5-yl]pyrimidin-2(1*H*)-one,



E. 4-aminopyrimidin-2(1*H*)-one (cytosine),



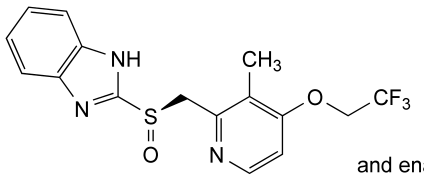
F. pyrimidine-2,4(1*H*,3*H*)-dione (uracil),



G. 4-amino-1-[(2*R*,3*S*,5*S*)-2-(hydroxymethyl)-1,3-oxathiolan-5-yl]pyrimidin-2(1*H*)-one *S*-oxide,

H. 4-amino-1-[(2*R*,3*R*,5*S*)-2-(hydroxymethyl)-1,3-oxathiolan-5-yl]pyrimidin-2(1*H*)-one *S*-oxide,

I. 4-amino-1-[(2*S*,4*S*)-2-(hydroxymethyl)-1,3-dioxolan-4-yl]pyrimidin-2(1*H*)-one,



J. 1-[(2*R*,5*S*)-2-(hydroxymethyl)-1,3-oxathiolan-5-yl]pyrimidine-2,4(1*H*,3*H*)-dione.

01/2008:2219

LANSOPRAZOLE

Lansoprazolum

and enantiomer

$C_{16}H_{14}F_3N_3O_2S$ M_r 369.4
[103577-45-3]

DEFINITION

2-[(*RS*)-[[3-Methyl-4-(2,2,2-trifluoroethoxy)pyridin-2-yl]methyl]sulphinyl]-1*H*-benzimidazole.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or brownish powder.

Solubility: practically insoluble in water, soluble in anhydrous ethanol, very slightly soluble in acetonitrile.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *lansoprazole CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *anhydrous ethanol R*, evaporate to dryness and record new spectra using the residues.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution B_2 or BY_2 (*2.2.2, Method II*).

Dissolve 1.0 g in *dimethylformamide R* and dilute to 20 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use and protect them from light.*

Solvent mixture: mix 1 volume of *triethylamine R* with 60 volumes of *water R*; adjust the pH to 10.5 using *phosphoric acid R*; mix the solution obtained with 40 volumes of *acetonitrile R1*.

Test solution. Dissolve 10 mg of the substance to be examined in the solvent mixture and dilute to 10 ml with the solvent mixture.

Reference solution (a). Dissolve the contents of a vial of *lansoprazole for peak identification CRS* (containing impurities A and B) in 1.0 ml of the solvent mixture.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Reference solution (c). Dissolve 5 mg of *2-mercaptobenzimidazole R* (impurity E) and 5 mg of *2-hydroxybenzimidazole R* (impurity D) in the solvent mixture and dilute to 100 ml with the solvent mixture. Dilute 1 ml of this solution to 10 ml with the solvent mixture.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *amidohexadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 1 volume of *triethylamine R* with 60 volumes of *water R*; adjust the pH to 6.2 using *phosphoric acid R*; mix the solution obtained with 40 volumes of *acetonitrile R1*.

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 285 nm.

Injection: 10 µl.

Run time: 3 times the retention time of lansoprazole.

Identification of impurities: use the chromatogram supplied with *lansoprazole for peak identification CRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to impurities A and B; use the chromatogram obtained with reference solution (c) to identify the peaks due to impurities D and E.

Relative retention with reference to lansoprazole (retention time = about 7 min): impurity D = about 0.4; impurity A = about 0.5; impurity E = about 0.6; impurity B = about 1.2.

System suitability: reference solution (a):

– *resolution*: minimum 3.0 between the peaks due to lansoprazole and impurity B.

Limits:

– *correction factor*: for the calculation of content, multiply the peak area of impurity E by 0.4;
– *impurity B*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent);
– *impurities A, D, E*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
– *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent);
– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

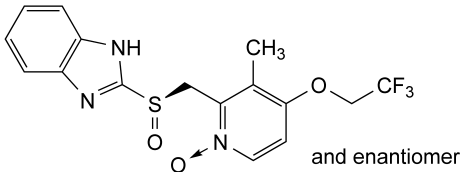
Water (*2.5.32*): maximum 0.1 per cent, determined on 1.000 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

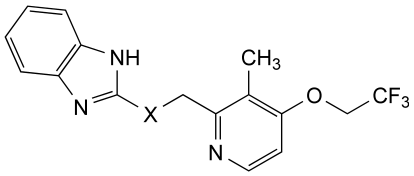
Dissolve 0.300 g in 40 ml of *ethanol (96 per cent) R* and dilute to 50 ml with *water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M sodium hydroxide* is equivalent to 36.94 mg of $C_{16}H_{14}F_3N_3O_2S$.



STORAGE

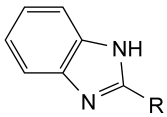
In an airtight container, protected from light.



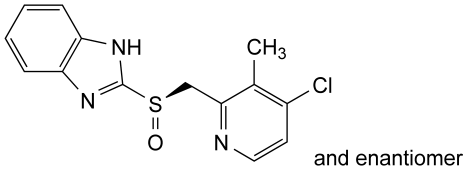
IMPURITIES

Specified impurities: A, B, D, E.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, F.*



A. 2-[(*RS*)-[[3-methyl-1-oxido-4-(2,2,2-trifluoroethoxy)pyridin-2-yl]methyl]sulphinyl]-1*H*-benzimidazole,



B. X = SO_2: 2-[[[3-methyl-4-(2,2,2-trifluoroethoxy)pyridin-2-yl]methyl]sulphonyl]-1*H*-benzimidazole,

C. X = S: 2-[[[3-methyl-4-(2,2,2-trifluoroethoxy)pyridin-2-yl]methyl]sulphanyl]-1*H*-benzimidazole,

D. R = OH: 1*H*-benzimidazol-2-ol,

E. R = SH: 1*H*-benzimidazole-2-thiol,

F. 2-[(*RS*)-[(4-chloro-3-methylpyridin-2-yl)methyl]sulphinyl]-1*H*-benzimidazole.

01/2008:1231

LAUROYL MACROGOLGLYCERIDES

Macrogolglyceridorum laurates

DEFINITION

Mixtures of monoesters, diesters and triesters of glycerol and monoesters and diesters of macrogols with a mean relative molecular mass between 300 and 1500.

They are obtained by partial alcoholysis of saturated oils mainly containing triglycerides of lauric (dodecanoic) acid, using macrogol, or by esterification of glycerol and macrogol with saturated fatty acids, or by mixing glycerol esters and condensates of ethylene oxide with the fatty acids of these hydrogenated oils.

CHARACTERS

Appearance: pale yellow waxy solid.

Solubility: dispersible in hot water, freely soluble in methylene chloride.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 20 ml with the same solvent.

Plate: *TLC silica gel plate R.*

Mobile phase: *hexane R, ether R* (30:70 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 0.1 g/l solution of *rhodamine B R* in *ethanol (96 per cent) R* and examine in ultraviolet light at 365 nm.

Results: the chromatogram shows a spot due to triglycerides with an R_F value of about 0.9 (R_{st} 1) and spots due to 1,3-diglycerides (R_{st} 0.7), to 1,2-diglycerides (R_{st} 0.6), to monoglycerides (R_{st} 0.1) and to esters of macrogol (R_{st} 0).

B. Hydroxyl value (see Tests).

C. Saponification value (see Tests).

D. Fatty acid composition (see Tests).

TESTS

Drop point (*2.2.17*). Introduce into the cup the substance to be examined, which has been melted by heating for 1 h in an oven at 100 ± 2 °C, and allow to stand for 5 h at about 5 °C.

Ethylene oxide units per molecule (nominal value)	Type of macrogol	Drop point
6	300	33 - 38
8	400	36 - 41
12	600	38 - 43
32	1500	42.5 - 47.5

Acid value (*2.5.1*): maximum 2.0, determined on 2.0 g.

Hydroxyl value (*2.5.3, Method A*). Use 1.0 g.

Ethylene oxide units per molecule (nominal value)	Type of macrogol	Hydroxyl value
6	300	65 - 85
8	400	60 - 80
12	600	50 - 70
32	1500	36 - 56

Peroxide value (*2.5.5, Method A*): maximum 6.0, determined on 2.0 g.

Saponification value (*2.5.6*). Use 2.0 g.

Ethylene oxide units per molecule (nominal value)	Type of macrogol	Saponification value
6	300	190 - 204
8	400	170 - 190
12	600	150 - 170
32	1500	79 - 93

Alkaline impurities. Introduce 5.0 g into a test tube and carefully add a mixture, neutralised if necessary with *0.01 M hydrochloric acid* or with *0.01 M sodium hydroxide*, of 0.05 ml of a 0.4 g/l solution of *bromophenol blue R* in *ethanol (96 per cent) R*, 0.3 ml of *water R* and 10 ml of *ethanol (96 per cent) R*. Shake and allow to stand. Not more than 1.0 ml of *0.01 M hydrochloric acid* is required to change the colour of the upper layer to yellow.

Free glycerol: maximum 3.0 per cent.

Dissolve 1.20 g in 25.0 ml of *methylene chloride R*. Heat if necessary. After cooling, add 100 ml of *water R*. Shake and add 25.0 ml of *periodic acetic acid solution R*. Shake and allow to stand for 30 min. Add 40 ml of a 75 g/l solution of *potassium iodide R*. Allow to stand for 1 min. Add 1 ml of *starch solution R*. Titrate the iodine with *0.1 M sodium thiosulphate*. Carry out a blank titration.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 2.3 mg of glycerol.

Composition of fatty acids (*2.4.22, Method A*).

Composition of the fatty-acid fraction of the substance:

- *caprylic acid*: maximum 15.0 per cent;
- *capric acid*: maximum 12.0 per cent;
- *lauric acid*: 30.0 per cent to 50.0 per cent;
- *myristic acid*: 5.0 per cent to 25.0 per cent;
- *palmitic acid*: 4.0 per cent to 25.0 per cent;
- *stearic acid*: 5.0 per cent to 35.0 per cent.

Ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.0 g. Use a mixture of 30 volumes of *anhydrous methanol R* and 70 volumes of *methylene chloride R* as solvent.

Total ash (*2.4.16*): maximum 0.1 per cent.

LABELLING

The label states the type of macrogol used (mean relative molecular mass) or the number of units of ethylene oxide per molecule (nominal value).

01/2008:1534

LAVENDER FLOWER

Lavandulae flos

DEFINITION

Dried flower of *Lavandula angustifolia* P. Mill. (*L. officinalis* Chaix).

Content: minimum 13 ml/kg of essential oil (anhydrous drug).

CHARACTERS

Strongly aromatic odour.

IDENTIFICATION

First identification: A, B, D.

Second identification: A, B, C.

A. The flower has a short peduncle and consists of a bluish-grey tubular calyx divided distally into 4 very short teeth and a small rounded lobe, a blue bilabial corolla with the upper lip bifid and the lower lip trilobate and 4 didynamous stamens with ovoid anthers.

B. Reduce to a powder (355) (*2.9.12*). The powder is bluish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: covering trichomes bifurcating at one or more levels; secretory trichomes with short stalks and eight-celled heads of the *Labiatae* type; secretory trichomes with unicellular or multicellular stalks and unicellular heads; secretory trichomes with long uneven stalks and unicellular heads, separated from the peduncle by an intermediary cell with a smooth cuticle; certain such trichomes show a crown of small spheroid cells just below the insertion point of the intermediary cell on the peduncle; fragments of warty epidermis from the inner surface of the petals; fragments of calyx epidermis with sinuous-walled cells and containing prismatic crystals of calcium oxalate; spherical pollen grains which have a diameter of about 45 µm and an exine with 6 slit-like germinal pores and 6 ribbon-like groins radiating from the poles.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 0.5 g of the powdered drug (355) (*2.9.12*) add 5 ml of *hexane R*, shake for 5 min and filter.

Reference solution. Dissolve 10 µl of *linalol R* and 10 µl of *linalyl acetate R* in 5 ml of *hexane R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min and examine in daylight.

Results: the chromatogram obtained with the reference solution shows in the lower third a greyish-blue zone (linalol) and in the middle third a greyish-blue zone (linalyl acetate). The chromatogram obtained with the test solution shows the zones due to linalol and linalyl acetate and in the middle, between these zones, a redish-violet zone (epoxydihydrocaryophyllene). Further zones are also present.

D. Examine the chromatograms obtained in the test for other species and varieties of lavender.

Results: the 5 principal peaks in the chromatogram obtained with the reference solution are similar in retention time to peaks in the chromatogram obtained with the test solution. Among them are mainly linalol and linalyl acetate peaks.

TESTS

Foreign matter (*2.8.2*): maximum 3 per cent of stems and maximum 2 per cent of other foreign matter.

Other species and varieties of lavender. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Dilute 0.2 ml of the essential oil-xylene mixture obtained in the assay to 5 ml with *hexane R*, add 1 g of *anhydrous sodium sulphate R*, shake and use the supernatant liquid.

Reference solution. Dissolve 0.1 g of *limonene R*, 0.2 g of *cineole R*, 0.05 g of *camphor R*, 0.4 g of *linalol R*, 0.6 g of *linalyl acetate R* and 0.2 g of *α-terpineol R* in 100 ml of *hexane R*.

Column:

– *material*: fused silica;
– *size*: *l* = 60 m, Ø = 0.25 mm;
– *stationary phase*: *macrogol 20 000 R*.

Carrier gas: *helium for chromatography R*.

Flow rate: 1.5 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15	70
	15 - 70	70 → 180
Injection port		220
Detector		220

Detection: flame ionisation.

Injection: the same volume of each solution.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

– *resolution*: minimum 1.5 between the peaks due to limonene and cineol;
– *number of theoretical plates*: minimum 30 000, calculated for the peak due to limonene at 110 °C.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the 6 components of the reference solution in the chromatogram obtained with the test solution. Disregard the peaks due to hexane and xylene.

Limit:

– *camphor*: maximum 1 per cent.

Water (*2.2.13*): maximum 100 ml/kg, determined on 20.0 g.

Total ash (*2.4.16*): maximum 9.0 per cent.

ASSAY

Carry out the determination of essential oils in herbal drugs (*2.8.12*). Use 20.0 g of drug, a 1000 ml round-bottomed flask, 500 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

01/2008:1338

LAVENDER OIL

Lavandulae aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the flowering tops of *Lavandula angustifolia* Miller (*Lavandula officinalis* Chaix).

CHARACTERS

Appearance: colourless or pale yellow, clear liquid.

It has a characteristic odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 20 µl of the substance to be examined in 1 ml of *toluene R.*

Reference solution. Dissolve 10 µl of *linalol R* and 10 µl of *linalyl acetate R* in 1 ml of *toluene R.*

Plate: *TLC silica gel plate R.*

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 10 µl as bands.

Development: twice, 5 min apart, over a path of 10 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min. Examine immediately in daylight.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet-red or greenish-brown zones are present in the chromatogram obtained with the test solution above the zone of linalyl acetate up to the solvent front.

Top of the plate	
	Several violet-red or greenish-brown zones
———	———
Linalyl acetate: a violet to brown zone	
	A violet to brown zone (linalyl acetate)
	A violet-red zone
	Possibly a weak violet-brown zone (cineole)
———	———
Linalol: a violet to brown zone	A violet to brown zone (linalol)
	A weak brownish-green zone
	Several unresolved zones
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

TESTS

Relative density (*2.2.5*): 0.878 to 0.892.

Refractive index (*2.2.6*): 1.455 to 1.466.

Optical rotation (*2.2.7*): – 12.5° to – 7.0°.

Acid value (*2.5.1*): maximum 1.0, determined on 5.0 g of the substance to be examined dissolved in 50 ml of the prescribed mixture of solvents.

Chromatographic profile. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. The substance to be examined.

Reference solution (a). Dissolve 0.1 g of *limonene R*, 0.2 g of *cineole R*, 0.2 g of *3-octanone R*, 0.05 g of *camphor R*, 0.4 g of *linalol R*, 0.6 g of *linalyl acetate R*, 0.2 g of *terpinen-4-ol R*, 0.1 g of *lavandulyl acetate R*, 0.2 g of *lavandulol R* and 0.2 g of *α-terpineol R* in 5 ml of *hexane R.*

Reference solution (b). Dissolve 5 mg of *3-octanone R* in *hexane R* and dilute to 10 ml with the same solvent.

Column:

- *material*: fused silica,
- *size*: *l* = 60 m , Ø = 0.25 mm,
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R.*

Flow rate: 1.5 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15	70
	15 - 70	70 → 180
Injection port		220
Detector		220

Detection: flame ionisation.

Injection: 0.2 µl.

Elution order: order indicated in the composition of reference solution (a). Record the retention times of these substances.

System suitability: reference solution (a):

- *resolution*: minimum 1.4 between the peaks due to terpinen-4-ol and lavandulyl acetate.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

- *limonene*: less than 1.0 per cent,
- *cineole*: less than 2.5 per cent,
- *3-octanone*: 0.1 per cent to 2.5 per cent,
- *camphor*: less than 1.2 per cent,
- *linalol*: 20.0 per cent to 45.0 per cent,
- *linalyl acetate*: 25.0 per cent to 46.0 per cent,
- *terpinen-4-ol*: 0.1 per cent to 6.0 per cent,
- *lavandulyl acetate*: more than 0.2 per cent,
- *lavandulol*: more than 0.1 per cent,
- *α-terpineol*: less than 2.0 per cent.
- *disregard limit*: area of the peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chiral purity. Gas chromatography (*2.2.28*).

Test solution. Dissolve 0.02 g of the substance to be examined in *pentane R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 µl of *linalol R*, add 10 µl of *linalyl acetate R* and 5 mg of *borneol R* in *pentane R* and dilute to 10 ml with the same solvent.

Column:

– *material*: fused silica,
– *size*: *l* = 25 m, Ø = 0.25 mm,
– *stationary phase*: *modified β-cyclodextrin for chiral chromatography R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.3 ml/min.

Split ratio: 1:30.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 65	50 → 180
Injection port		230
Detector		230

Detection: flame ionisation.

Injection: 1 µl.

System suitability: reference solution:

– *resolution*: minimum 5.5 between the peaks due to (*R*)-linalol (1st peak) and (*S*)-linalol (2nd peak), minimum 2.9 between the peaks due to (*S*)-linalol and borneol (3rd peak) and minimum 2.7 between the peaks due to (*R*)-linalyl acetate (4th peak) and (*S*)-linalyl acetate (5th peak).

Calculate the percentage content of the specified (*S*)-enantiomers from the following expression:

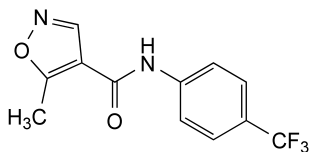
$$\frac{A_S}{A_S + A_R} \times 100$$

A_S = area of the peak due to the corresponding (*S*)-enantiomer,

A_R = area of the peak due to the corresponding (*R*)-enantiomer.

Limits:

– *(S)-linalol*: maximum 12 per cent,
– *(S)-linalyl acetate*: maximum 1 per cent.



STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

01/2008:2330

LEFLUNOMIDE

Leflunomidum

$C_{12}H_9F_3N_2O_2$ M_r 270.2

DEFINITION

5-Methyl-*N*-[4-(trifluoromethyl)phenyl]isoxazole-4-carboxamide.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in methanol, sparingly soluble in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Preparation: heat the substance to be examined and the reference substance at 130 °C for 10 min.

Comparison: *leflunomide CRS*.

TESTS

Related substances. Liquid chromatography (*2.2.29*). *Store all solutions protected from light.*

Test solution (a). Dissolve 25.0 mg of the substance to be examined in 5 ml of *acetonitrile for chromatography R* and dilute to 50.0 ml with the mobile phase.

Test solution (b). Dissolve 0.125 g of the substance to be examined in 5 ml of *acetonitrile for chromatography R* and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 5.0 ml of test solution (a) to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 12.5 mg of *leflunomide impurity A CRS* in 5 ml of *acetonitrile for chromatography R* and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 25.0 mg of *leflunomide CRS* in 5 ml of *acetonitrile for chromatography R* and dilute to 50.0 ml with the mobile phase.

Reference solution (d). Dissolve the contents of 1 vial of *leflunomide for peak identification CRS* (containing impurities B and C) in 2.0 ml of the mobile phase and sonicate for 10 min.

Column:

– *size*: *l* = 0.125 m, Ø = 4.0 mm;
– *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 5 volumes of *triethylamine R* with 650 volumes of *water for chromatography R*, adjust to pH 3.4 ± 0.1 with *phosphoric acid R* and add 350 volumes of *acetonitrile for chromatography R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl of test solutions (a) and (b) and reference solutions (a), (b) and (d).

Run time: twice the retention time of leflunomide.

Identification of impurities: use the chromatogram supplied with *leflunomide for peak identification CRS* and the chromatogram obtained with reference solution (d) to identify the peaks due to impurities B and C.

Relative retention with reference to leflunomide (retention time = about 25 min): impurity B = about 0.2; impurity A = about 0.4; impurity C = about 0.9.

System suitability: reference solution (d):

– *peak-to-valley ratio*: minimum 3, where H_p = height above the baseline of the peak due to impurity C and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to leflunomide.

Limits: test solution (a):

– *impurity B*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);

– *sum of impurities C and E*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);

– *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *sum of impurities other than B*: not more twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Limit: test solution (b):

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test F. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.3 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 4 h.

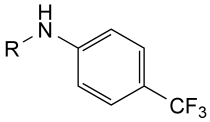
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution (a) and reference solution (c).

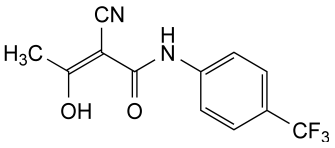
Calculate the percentage content of $C_{12}H_9F_3N_2O_2$ from the declared content of *leflunomide CRS*.



STORAGE

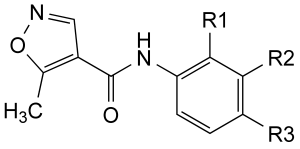
Protected from light.

IMPURITIES



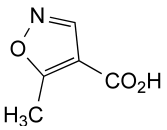
Specified impurities: A, B.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C, D, E, F, G, H.*

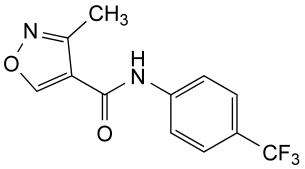


A. R = H: 4-(trifluoromethyl)aniline,

H. R = CO-CH_2-CN: 2-cyano-*N*-[4-(trifluoromethyl)phenyl]-acetamide,



B. (2*Z*)-2-cyano-3-hydroxy-*N*-[4-(trifluoromethyl)phenyl]but-2-enamide (teriflunomide),



C. R1 = R3 = H, R2 = CF_3: 5-methyl-*N*-[3-(trifluoromethyl)phenyl]isoxazole-4-carboxamide,

F. R1 = CF_3, R2 = R3 = H: 5-methyl-*N*-[2-(trifluoromethyl)phenyl]isoxazole-4-carboxamide,

G. R1 = R2 = H, R3 = CH_3: 5-methyl-*N*-(4-methylphenyl)isoxazole-4-carboxamide,

D. 5-methylisoxazole-4-carboxylic acid,

E. 3-methyl-*N*-[4-(trifluoromethyl)phenyl]isoxazole-4-carboxamide.

01/2008:0620

LEMON OIL

Limonis aetheroleum

DEFINITION

Essential oil obtained by suitable mechanical means, without the aid of heat, from the fresh peel of *Citrus limon* (L.) Burman fil.

CHARACTERS

Appearance: clear, mobile, pale yellow to greenish-yellow liquid with a characteristic odour. It may become cloudy at low temperatures.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Mix 1 ml of the substance to be examined in 1 ml of *toluene R*.

Reference solution. Dissolve 10 mg of *citropten R* and 50 µl of *citral R* in *toluene R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel GF_{254} plate R*.

Mobile phase: *ethyl acetate R, toluene R* (15:85 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
	A quenching zone (bergamotin)
Citral: a quenching zone	A quenching zone (citral)
	A dark blue zone (5-geranyloxy-7-methoxycoumarin)
Citropten: a light blue fluorescent zone	A light blue fluorescent zone (citropten)
	A quenching zone (psoralen derivative)
	A quenching zone (biakangelicin)
Reference solution	**Test solution**

Detection B: examine in ultraviolet light at 365 nm.

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
	A yellow fluorescent zone (bergamotin)
Citral: a quenching zone	A quenching zone (citral)
	A bright blue fluorescent zone (5-geranyloxy-7-methoxycoumarin)
Citropten: a bright blue fluorescent zone	A bright violet-blue fluorescent zone (citropten)
	A yellow fluorescent zone (psoralen derivative)
	An orange zone (biakangelicin)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*): 0.850 to 0.858.

Refractive index (*2.2.6*): 1.473 to 1.476.

Optical rotation (*2.2.7*): + 57° to + 70°.

Absorbance (*2.2.25*). Dissolve 0.250 g of the substance to be examined in *alcohol R*, mix and dilute to 100.0 ml with the same solvent. Measure the absorbance over the range 260 nm to 400 nm. If a manual instrument is used, measure the absorbance at 5 nm intervals from 260 nm to about 12 nm before the expected absorption maximum, then at 3 nm intervals for 3 readings and at 1 nm intervals to about 5 nm beyond the maximum and finally at 10 nm intervals to 400 nm. Plot a curve representing the absorption spectrum with the absorbances as ordinates and the wavelengths as abscissae. Draw as a baseline the tangent between *A* and *B* (Figure 0620.-1). The absorption maximum *C* is situated at 315 ± 3 nm. From *C* draw a line perpendicular to the axis of abscissae and intersecting *AB* at *D*. Deduct the absorbance corresponding to point *D* from that corresponding to point *C*. The value *C* – *D* is 0.20 to 0.96 and for Italian-type lemon oil it is not less than 0.45.

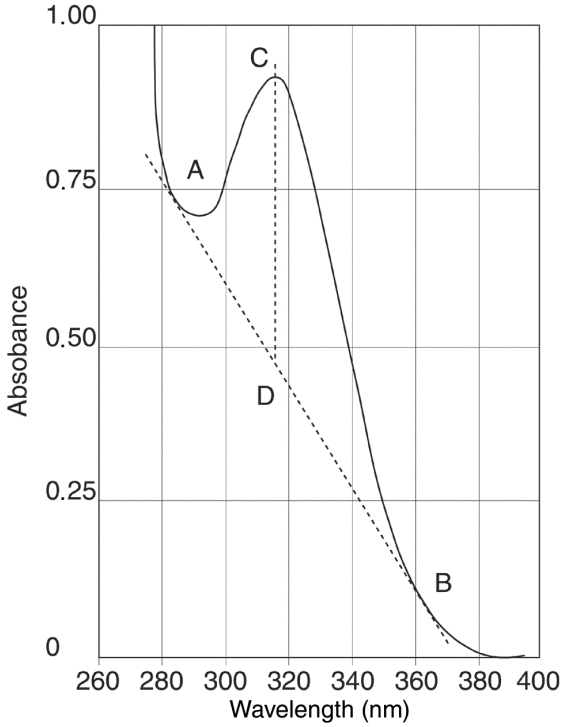


Figure 0620.-1. – *Typical spectrum of lemon oil for the test for absorbance*

Fatty oils and resinified essential oils (*2.8.7*). It complies with the test for fatty oils and resinified essential oils.

Chromatographic profile. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. The substance to be examined.

Reference solution. Dissolve 20 µl of *β-pinene R*, 10 µl of *sabinene R*, 100 µl of *limonene R*, 10 µl of *γ-terpinene R*, 5 µl of *β-caryophyllene R*, 20 µl of *citral R*, 5 µl of *α-terpineol R*, 5 µl of *neryl acetate R* and 5 µl of *geranyl acetate R* in 1 ml of *acetone R*.

Column:

– *material*: fused silica,
– *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm,
– *stationary phase*: *macrogol 20 000 R*.

Carrier gas: *helium for chromatography R*.

Flow rate: 1.0 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 6	45
	6 - 21	45 → 90
	21 - 39	90 → 180
	39 - 55	180
Injection port		220
Detector		220

Detection: flame ionisation.

Injection: 0.5 µl of the reference solution and 0.2 µl of the test solution.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

– *resolution*: minimum 1.5 between the peaks due to β-pinene and sabinene and minimum 1.5 between the peaks due to geranial and geranyl acetate.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components. The percentages are within the following ranges:

– *β-pinene*: 7.0 per cent to 17.0 per cent,
– *sabinene*: 1.0 per cent to 3.0 per cent,
– *limonene*: 56.0 per cent to 78.0 per cent,
– *γ-terpinene*: 6.0 per cent to 12.0 per cent,
– *β-caryophyllene*: maximum 0.5 per cent,
– *neral*: 0.3 per cent to 1.5 per cent,
– *α-terpineol*: maximum 0.6 per cent,
– *neryl acetate*: 0.2 per cent to 0.9 per cent,
– *geranial*: 0.5 per cent to 2.3 per cent,
– *geranyl acetate*: 0.1 per cent to 0.8 per cent.

Residue on evaporation (*2.8.9*): 1.8 per cent to 3.6 per cent after heating on the water-bath for 4 h.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

LABELLING

The label states, where applicable, that the contents are Italian-type lemon oil.

01/2008:1834
corrected 6.0

LEMON VERBENA LEAF

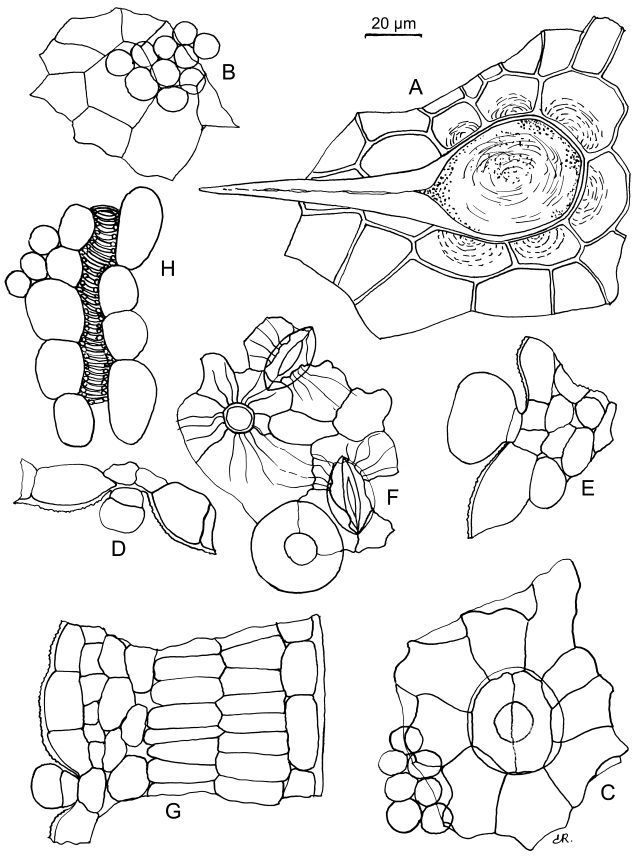
Verbenae citriodoratae folium

DEFINITION

Whole or fragmented, dried leaves of *Aloysia citriodora* Palau (syn. *Aloysia triphylla* (L'Hér.) Kuntze; *Verbena triphylla* L'Hér.; *Lippia citriodora* Kunth.).

Content:

– *acteoside* ($C_{29}H_{36}O_{15}$; M_r 625): minimum 2.5 per cent, expressed as ferulic acid (dried drug);
– *essential oil*: minimum 3.0 ml/kg for the whole drug and minimum 2.0 ml/kg for the fragmented drug (dried drug).



CHARACTERS

After grinding, it has a characteristic odour reminiscent of lemon.

IDENTIFICATION

A. The leaves are simple with short petioles. They are narrow, lanceolate, and about 4 times longer than they are wide. The entire, slightly undulating margins are curled towards the upper surface. The upper surface is dark green and rough to the touch; the lower surface is paler green and shows a prominent midrib with secondary veins running to the margins.

B. Reduce to a powder (355) (*2.9.12*). The powder is light green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the lamina in surface view, those of the upper epidermis being composed of polygonal cells with numerous short, unicellular, thick-walled cystolithic trichomes, each arising from a rosette of cells at the base, stomata are absent; the cells of the lower epidermis are more irregular and somewhat sinuous in outline and anomocytic stomata (*2.8.3*) are abundant, also present are numerous subsessile glandular trichomes with a globular head; fragments of parenchyma of the mesophyll and groups of lignified tissue from the veins.

A. Upper epidermis with cystolithic trichome, with subsidiary cells containing calcium concretons
B-C. Surface view of upper epidermis, with palisade parenchyma and glandular trichome (C)
D-E. Transverse section of glandular trichomes
F. Surface view of lower epidermis with striated cuticule, anomocytic stomata and glandular trichome
G. Transverse section of the lamina
H. Parenchyma of the mesophyll with a lignified vein

Figure 1834.-1. – *Illustration of powdered herbal drug of lemon verbena leaf (see Identification B)*

C. Examine the chromatograms obtained in the test for *Verbena officinalis*.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution. Zones may be present in the chromatogram obtained with the test solution below the zone due to rutin in the chromatogram obtained with the reference solution.

Top of the plate	
———	———
	An intense greyish-green zone
Arbutin: a blue or brown zone	
Rutin: a dark brownish-yellow zone	A blue or violet zone
———	———
Reference solution	**Test solution**

TESTS

Verbena officinalis. Thin-layer chromatography (*2.2.27*).

Test solution. To 0.50 g of the powdered drug (710) (*2.9.12*) add 5 ml of *methanol R*. Heat in a water-bath at 60 °C for 10 min. Cool and filter.

Reference solution. Dissolve 10 mg of *arbutin R* and 10 mg of *rutin R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase: *anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R* (11:11:27:100 *V/V/V/V*).

Application: 20 µl [or 5 µl], as bands.

Development: over a path of about 12 cm [or 6 cm].

Drying: in air.

Detection: spray with *anisaldehyde solution R* and dry at 100-105 °C for about 10 min; examine in daylight.

Results: the chromatogram obtained with the test solution shows no brownish-grey zone at a position between that of arbutin and rutin in the chromatogram obtained with the reference solution.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 13.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 3.5 per cent.

ASSAY

Acteoside. Liquid chromatography (*2.2.29*).

Test solution. To 1.00 g of the powdered drug (710) (*2.9.12*) add 50.0 ml of the reference solution and stir for 2 h with a magnetic stirrer. Centrifuge for 15 min and pass the supernatant through a membrane filter (pore size 0.45 µm).

Reference solution. Dissolve 10.0 mg of *ferulic acid CRS* in *ethanol (60 per cent V/V) R* and dilute to 100.0 ml with the same solvent.

Precolumn:

– *size*: *l* = 0.01 m, Ø = 4.0 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Column:

– *size*: *l* = 0.25 m, Ø = 4.0 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm);
– *temperature*: 20 °C.

Mobile phase:

– *mobile phase A*: 0.3 per cent *V/V* solution of *phosphoric acid R*;
– *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 20	93 → 83	7 → 17
20 - 30	83	17
30 - 35	83 → 75	17 → 25
35 - 40	75 → 20	25 → 80
40 - 45	20 → 93	80 → 7

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 330 nm.

Injection: 20 µl.

System suitability: test solution:

– *resolution*: minimum 3.5 between the peaks due to ferulic acid and acteoside.

Calculate the percentage content of acteoside, expressed as ferulic acid, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 5 \times 3.1}{A_2 \times m_1}$$

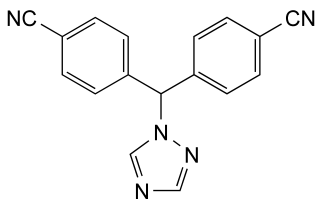
A_1 = area of the peak due to acteoside in the chromatogram obtained with the test solution;

A_2 = area of the peak due to ferulic acid in the chromatogram obtained with the reference solution;

m_1 = mass of the drug in the test solution, in grams;

m_2 = mass of *ferulic acid CRS* in the reference solution, in grams;

p = percentage content of ferulic acid in *ferulic acid CRS*;



3.1 = correlation factor between acteoside and ferulic acid.

Essential oil (*2.8.12*). Introduce 25.0 g of the freshly crushed drug into a 1000 ml flask and add 500 ml of a 10 g/l solution of *sodium chloride R* as the distillation liquid. Use 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 3.0-3.5 ml/min for 3 h.

01/2008:2334

LETROZOLE

Letrozolum

$C_{17}H_{11}N_5$ M_r 285.3
[112809-51-5]

DEFINITION

4,4′-(1*H*-1,2,4-Triazol-1-ylmethylene)dibenzonitrile.

Content: 97.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or yellowish, crystalline powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in methanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *letrozole CRS*.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 25.0 mg of the substance to be examined in 15 ml of *acetonitrile R1* and dilute to 50.0 ml with *water R*.

Test solution (b). To 2.0 ml of test solution (a) add 30 ml of *acetonitrile R1* and dilute to 100.0 ml with *water R*.

Reference solution (a). Dissolve 5.0 mg of *letrozole CRS* (containing impurities A and B) in 3 ml of *acetonitrile R1* and dilute to 10.0 ml with *water R*.

Reference solution (b). To 2.0 ml of test solution (a) add 30 ml of *acetonitrile R1* and dilute to 100.0 ml with *water R*. To 1.0 ml of this solution add 6 ml of *acetonitrile R1* and dilute to 20.0 ml with *water R*.

Reference solution (c). Dissolve 25.0 mg of *letrozole CRS* in 15 ml of *acetonitrile R1* and dilute to 50.0 ml with *water R*. To 2.0 ml of this solution add 30 ml of *acetonitrile R1* and dilute to 100.0 ml with *water R*.

Column:

- *size*: *l* = 0.125 m, Ø = 4.6 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

- *mobile phase A*: *water R*;
- *mobile phase B*: *acetonitrile R1*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 4	70	30
4 - 29	70 → 30	30 → 70
29 - 30	30 → 70	70 → 30

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl of test solution (a) and reference solutions (a) and (b).

Relative retention with reference to letrozole (retention time = about 13 min): impurity A = about 0.6; impurity B = about 1.9.

System suitability: reference solution (a):

- *resolution*: minimum 5 between the peaks due to impurity A and letrozole;
- the chromatogram obtained is similar to the chromatogram supplied with *letrozole CRS*.

Limits:

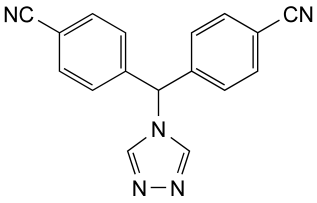
- *impurity A*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *impurity B*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (*2.5.12*): maximum 0.3 per cent, determined on 1.000 g. Use a validated pyridine-free iodosulphurous reagent.

ASSAY

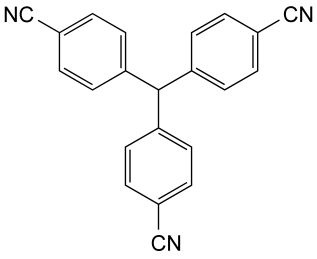
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Injection: test solution (b) and reference solution (c).



System suitability: reference solution (c):

- *symmetry factor*: maximum 1.7 for the peak due to letrozole.

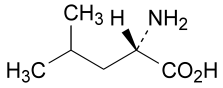


Calculate the percentage content of $C_{17}H_{11}N_5$ from the declared content of *letrozole CRS*.

IMPURITIES

Specified impurities: A, B.

A. 4,4′-(4*H*-1,2,4-triazol-4-ylmethylene)dibenzonitrile,



B. 4,4′,4″-methanetriyltribenzonitrile.

01/2008:0771
corrected 6.0

LEUCINE

Leucinum

$C_6H_{13}NO_2$ M_r 131.2
[61-90-5]

DEFINITION

Leucine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*S*)-2-amino-4-methylpentanoic acid, calculated with reference to the dried substance.

CHARACTERS

White or almost white crystalline powder or shiny flakes, sparingly soluble in water, practically insoluble in alcohol. It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. It complies with the test for specific optical rotation (see Tests).

B. Dissolve 0.50 g in *water R* and dilute to 25 ml with the same solvent. The solution is laevorotatory.

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *leucine CRS*. Examine the substances prepared as discs.

D. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. Dissolve 0.5 g in *1 M hydrochloric acid* and dilute to 10 ml with the same acid. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*). Dissolve 1.00 g in *hydrochloric acid R1* and dilute to 25.0 ml with the same acid. The specific optical rotation is + 14.5 to + 16.5, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *0.1 M hydrochloric acid* and dilute to 10 ml with the same acid.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *leucine CRS* in *0.1 M hydrochloric acid* and dilute to 50 ml with the same acid.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *leucine CRS* and 10 mg of *valine CRS* in *0.1 M hydrochloric acid* and dilute to 25 ml with the same acid.

Apply separately to the plate 5 µl of each solution. Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (*2.4.4*). Dissolve 0.25 g in *water R* and dilute to 15 ml with the same solvent. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (*2.4.13*). Dissolve 0.5 g in 3 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (*2.4.1*). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (*2.4.9*). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (*2.4.8*). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

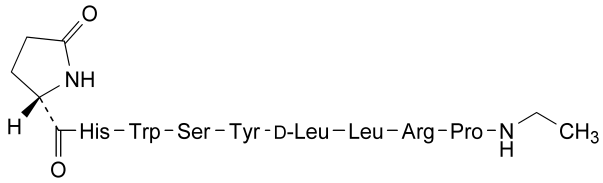
Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 3 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid* using 0.1 ml of *naphtholbenzein solution R* as indicator, until the colour changes from brownish-yellow to green.

1 ml of *0.1 M perchloric acid* is equivalent to 13.12 mg of $C_6H_{13}NO_2$.



STORAGE

Store protected from light.

01/2008:1442

LEUPRORELIN

Leuprorelinum

$C_{59}H_{84}N_{16}O_{12}$ M_r 1209
[53714-56-0]

DEFINITION

5-Oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-D-leucyl-L-leucyl-L-arginyl-*N*-ethyl-L-prolinamide.

Synthetic nonapeptide analogue of the hypothalamic peptide, gonadorelin. It is obtained by chemical synthesis and is available as an acetate.

Content: 97.0 per cent to 103.0 per cent (anhydrous and acetic acid-free substance).

CHARACTERS

Appearance: hygroscopic, white or almost white powder.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs of *potassium bromide R*.

Comparison: *Ph. Eur. reference spectrum of leuprorelin*.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with test solution (b) is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (b).

C. Amino acid analysis (*2.2.56*). For hydrolysis use Method 1 and for analysis use Method 1.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids taking one seventh of the sum of the number of moles of histidine, glutamic acid, leucine, proline, tyrosine and arginine as equal to 1. The values fall within the following limits: serine present; glutamic acid = 0.85 to 1.1; proline = 0.85 to 1.1; leucine = 1.8 to 2.2; tyrosine = 0.85 to 1.1; histidine = 0.85 to 1.1 and arginine = 0.85 to 1.1. Not more than traces of other amino acids are present, with the exception of tryptophan.

TESTS

Specific optical rotation (*2.2.7*): – 38.0 to – 42.0 (anhydrous and acetic acid-free substance).

Dissolve the substance to be examined in a 1 per cent *V/V* solution of *glacial acetic acid R* to obtain a concentration of 10.0 mg/ml.

Related substances. Liquid chromatography (*2.2.29*): use the normalisation procedure.

Test solution (a). Dissolve the substance to be examined in the mobile phase to obtain a concentration of 1.0 mg/ml.

Test solution (b). Dilute 0.5 ml of test solution (a) to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve *leuprorelin CRS* in the mobile phase to obtain a concentration of 1.0 mg/ml.

Reference solution (b). Dilute 0.5 ml of reference solution (a) to 10.0 ml with the mobile phase.

Resolution solution. Dilute 5.0 ml of reference solution (a) to 50.0 ml with *water R*. To 5 ml of the solution add 100 µl of *1 M sodium hydroxide* and shake vigorously. Heat in an oven at 100 °C for 60 min, cool immediately and add 50 µl of *dilute phosphoric acid R*. Shake vigorously.

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase: dissolve about 15.2 g of *triethylamine R* in 800 ml of *water R*, adjust to pH 3.0 with *phosphoric acid R* and dilute to 1000 ml with *water R*. Add 850 ml of this solution to 150 ml of a mixture of 2 volumes of *propanol R* and 3 volumes of *acetonitrile R*.

Flow rate: 1.0-1.5 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl of test solution (a) and the resolution solution.

Run time: 90 min.

Relative retention with reference to leuprorelin (retention time = 41-49 min): impurity E = about 0.7; impurity F = about 0.7; impurity H = about 0.78; impurity A = about 0.8; impurity B = about 0.9; impurity I = about 0.94; impurity J = about 1.09; impurity C = about 1.2; impurity G = about 1.3; impurity K = about 1.31; impurity D = about 1.5.

System suitability: resolution solution:

– *resolution*: minimum 1.5 between the peaks due to impurity B and leuprorelin.

Limits:

– *impurity D*: maximum 1.0 per cent;

– *impurities A, B, C*: for each impurity, maximum 0.5 per cent;

– *unspecified impurities*: for each impurity, maximum 0.5 per cent;

– *total*: maximum 2.5 per cent;

– *disregard limit*: 0.1 per cent.

Acetic acid (*2.5.34*): 4.7 per cent to 9.0 per cent.

Test solution. Dissolve 10.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of mobile phases.

Water (*2.5.32*): maximum 5.0 per cent.

Sulphated ash (*2.4.14*): maximum 0.3 per cent.

Bacterial endotoxins (*2.6.14, Method D*): less than 16.7 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Run time: 60 min.

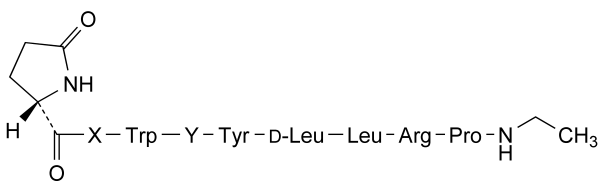
Injection: 20 µl of test solution (b) and reference solution (b).

Calculate the content of leuprorelin ($C_{59}H_{84}N_{16}O_{12}$) using the areas of the peaks and the declared content of $C_{59}H_{84}N_{16}O_{12}$ in *leuprorelin CRS*.

STORAGE

In an airtight container, protected from light, at a temperature not exceeding 30 °C.

If the substance is sterile, store in a sterile, airtight, tamper-proof container.

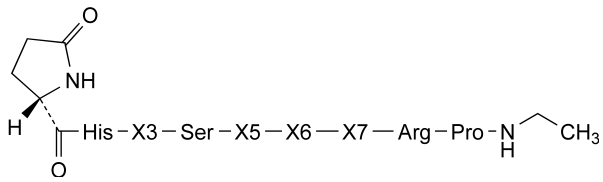


LABELLING

The label states the mass of peptide in the container.

IMPURITIES

Specified impurities: A, B, C, D.

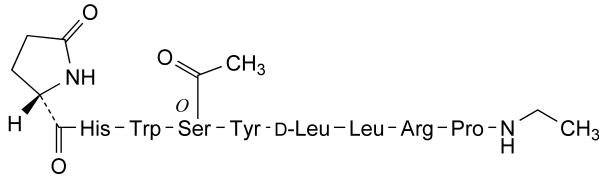


Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *E, F, G, H, I, J, K.*

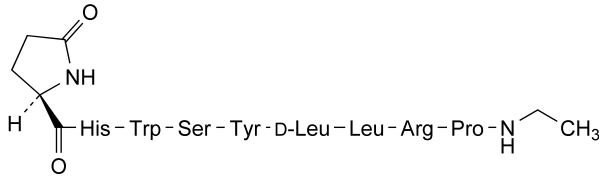
A. X = L-His, Y = D-Ser: [4-D-serine]leuprorelin,

B. X = D-His, Y = L-Ser: [2-D-histidine]leuprorelin,

F. X = D-His, Y = D-Ser: [2-D-histidine,4-D-serine]leuprorelin,

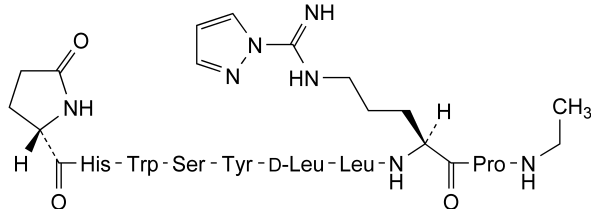


C. X3 = L-Trp, X5 = L-Tyr, X6 = X7 = L-Leu:
[6-L-leucine]leuprorelin,

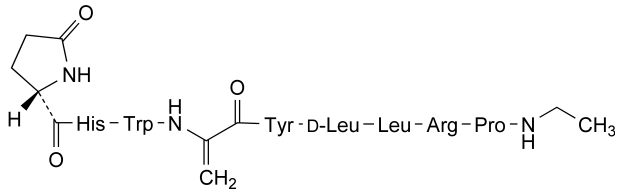


E. X3 = D-Trp, X5 = L-Tyr, X6 = D-Leu, X7 = L-Leu:
[3-D-tryptophane]leuprorelin,

G. X3 = L-Trp, X5 = D-Tyr, X6 = D-Leu, X7 = L-Leu:
[5-D-tyrosine]leuprorelin,



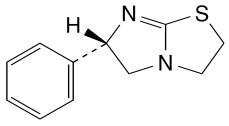
H. X3 = L-Trp, X5 = L-Tyr, X6 = X7 = D-Leu:
[7-D-leucine]leuprorelin,



D. [4-(*O*-acetyl-L-serine)]leuprorelin,

I. [1-(5-oxo-D-proline)]leuprorelin,

J. [8-[5-*N*-[imino(1*H*-pyrazol-1-yl)methyl]-L-ornithine]]leuprorelin,



K. [4-dehydroalanine]leuprorelin.

LEVAMISOLE FOR VETERINARY USE

Levamisolum ad usum veterinarium

$C_{11}H_{12}N_2S$ M_r 204.3
[14769-73-4]

DEFINITION

(6*S*)-6-Phenyl-2,3,5,6-tetrahydroimidazo[2,1-*b*]thiazole.

Content: 98.5 per cent to 101.5 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: slightly soluble in water, freely soluble in alcohol and in methanol.

It shows polymorphism (*5.9*).

IDENTIFICATION

A. It complies with the test for specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of levamisole.*

If the spectra show differences, dissolve the substance to be examined in *methylene chloride R*, evaporate to dryness and record a new spectrum using the residue.

TESTS

Solution S. Dissolve 2.50 g in *ethanol R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*): – 85 to – 89 (anhydrous substance), determined on solution S.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use, protect from light and keep below 25 °C.*

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of *levamisole hydrochloride for system suitability CRS* in *methanol R*, add 0.5 ml of *concentrated ammonia R* and dilute to 5.0 ml with *methanol R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of the solution to 25.0 ml with *methanol R*.

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm,
– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:

– *mobile phase A*: dissolve 0.5 g of *ammonium dihydrogen phosphate R* in 90 ml of *water R*; adjust to pH 6.5 with a 40 g/l solution of *sodium hydroxide R* and dilute to 100 ml with *water R*,
– *mobile phase B*: *acetonitrile R*.

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 8	90 → 30	10 → 70
8 - 10	30	70
10 - 11	30 → 90	70 → 10

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 215 nm.

Equilibration: at least 4 min with the mobile phase at the initial composition.

Injection: 10 µl.

Relative retention with reference to levamisole (retention time = about 3 min): impurity A = about 0.9; impurity B = about 1.4; impurity C = about 1.5; impurity D = about 1.6; impurity E = about 2.0.

System suitability: reference solution (a):

– the chromatogram obtained is similar to the chromatogram supplied with *levamisole hydrochloride for system suitability CRS*.

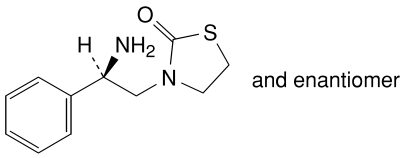
Limits:

– *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 2.0; impurity B = 1.7; impurity C = 2.9; impurity D = 1.3; impurity E = 2.7;
– *impurities A, B, C, D, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
– *any other impurity*: not more than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
– *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (*2.5.12*): maximum 0.5 per cent, determined on 1.00 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

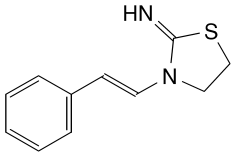
ASSAY



Dissolve 0.150 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid*, using 0.2 ml of *naphtholbenzein solution R* as indicator.

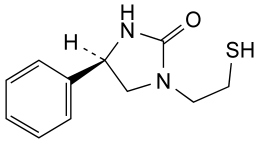
1 ml of *0.1 M perchloric acid* is equivalent to 20.43 mg of $C_{11}H_{12}N_2S$.

STORAGE



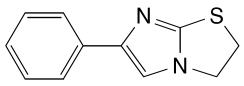
In an airtight container, protected from light.

IMPURITIES

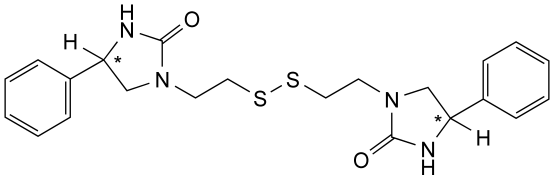


and enantiomer

A. 3-[(2*RS*)-2-amino-2-phenylethyl]thiazolidin-2-one,



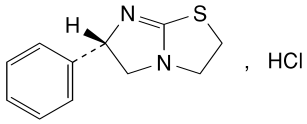
B. 3-[(*E*)-2-phenylethenyl]thiazolidin-2-imine,



and enantiomer

C. (4*RS*)-4-phenyl-1-(2-sulphanylethyl)imidazolidin-2-one,

D. 6-phenyl-2,3-dihydroimidazo[2,1-*b*]thiazole,



E. 1,1′-[(disulphane-1,2-diyl)bis(ethylene)]bis[(4*RS*)-4-phenylimidazolidin-2-one].

LEVAMISOLE HYDROCHLORIDE

Levamisoli hydrochloridum

$C_{11}H_{13}ClN_2S$ M_r 240.8
[16595-80-5]

DEFINITION

(6*S*)-6-Phenyl-2,3,5,6-tetrahydroimidazo[2,1-*b*]thiazole hydrochloride.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white crystalline powder.

Solubility: freely soluble in water, soluble in alcohol, slightly soluble in methylene chloride.

IDENTIFICATION

A. It complies with the test for specific optical rotation (see Tests).
B. Infrared absorption spectrophotometry (*2.2.24*).
Preparation: discs.
Comparison: *levamisole hydrochloride CRS*.
C. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

pH (*2.2.3*): 3.0 to 4.5 for solution S.

Specific optical rotation (*2.2.7*): – 121 to – 128(dried substance), determined on solution S.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use, protect from light and keep below 25 °C.*

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R*, add 1.0 ml of *concentrated ammonia R* and dilute to 10.0 ml with *methanol R*.

Reference solution (a). Dissolve 50 mg of *levamisole hydrochloride for system suitability CRS* in *methanol R*, add 0.5 ml of *concentrated ammonia R* and dilute to 5.0 ml with *methanol R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of the solution to 25.0 ml with *methanol R*.

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm,

– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm).

Mobile phase:

– *mobile phase A*: dissolve 0.5 g of *ammonium dihydrogen phosphate R* in 90 ml of *water R*; adjust to pH 6.5 with a 40 g/l solution of *sodium hydroxide R* and dilute to 100 ml with *water R*,

– *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 8	90 → 30	10 → 70
8 - 10	30	70
10 - 11	30 → 90	70 → 10

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 215 nm.

Equilibration: at least 4 min with the mobile phase at the initial composition.

Injection: 10 µl.

Relative retention with reference to levamisole (retention time = about 3 min): impurity A = about 0.9; impurity B = about 1.4; impurity C = about 1.5; impurity D = about 1.6; impurity E = about 2.0.

System suitability: reference solution (a):

– the chromatogram obtained is similar to the chromatogram supplied with *levamisole hydrochloride for system suitability CRS*.

Limits:

– *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 2.0; impurity B = 1.7; impurity C = 2.9; impurity D = 1.3; impurity E = 2.7;

– *impurities A, B, C, D, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);

– *any other impurity*: not more than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);

– *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);

– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

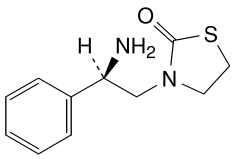
Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

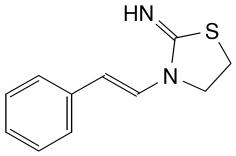
ASSAY



Dissolve 0.200 g in 30 ml of *alcohol R* and add 5.0 ml of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

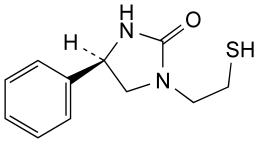
1 ml of *0.1 M sodium hydroxide* is equivalent to 24.08 mg of $C_{11}H_{13}ClN_2S$.

STORAGE



Protected from light.

IMPURITIES



and enantiomer

A. 3-[(2*RS*)-2-amino-2-phenylethyl]thiazolidin-2-one,

LEVOCABASTINE HYDROCHLORIDE

Levocabastini hydrochloridum

$C_{26}H_{30}ClFN_2O_2$ M_r 457.0
[79547-78-7]

DEFINITION

(3*S*,4*R*)-1-[*cis*-4-Cyano-4-(4-fluorophenyl)cyclohexyl]-3-methyl-4-phenylpiperidine-4-carboxylic acid monohydrochloride.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, sparingly soluble in methanol, slightly soluble in ethanol (96 per cent) and in a 2 g/l solution of sodium hydroxide.

IDENTIFICATION

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *levocabastine hydrochloride CRS*.

B. Dissolve 50 mg in a mixture of 0.4 ml of *ammonia R* and 2 ml of *water R*. Mix, allow to stand for 5 min and filter. Acidify the filtrate with *dilute nitric acid R*. It gives reaction (a) of chlorides (*2.3.1*).

C. Specific optical rotation (see Tests).

TESTS

Solution S. Dissolve 0.250 g in *methanol R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*): – 102 to – 106 (dried substance), determined on solution S.

Related substances. Capillary electrophoresis (*2.2.47*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 25.0 mg of the substance to be examined in a 2 g/l solution of *sodium hydroxide R* and dilute to 10.0 ml with the same solution.

Reference solution (a). Dissolve 2.5 mg of *levocabastine hydrochloride CRS* and 2.5 mg of *levocabastine impurity D CRS* in a 2 g/l solution of *sodium hydroxide R* and dilute to 200.0 ml with the same solution.

Reference solution (b). Dilute 5.0 ml of this test solution to 100.0 ml with a 2 g/l solution of *sodium hydroxide R*. Dilute 1.0 ml of this solution to 10.0 ml with a 2 g/l solution of *sodium hydroxide R*.

Blank solution. A 2 g/l solution of *sodium hydroxide R*.

Capillary:

– *material*: uncoated fused silica;

– *size*: effective length = 0.5 m, Ø = 75 µm.

Temperature: 50 °C.

Electrolyte solution: dissolve 1.08 g of *sodium dodecyl sulphate R* and 0.650 g of *hydroxypropyl-β-cyclodextrin R* in 5 ml of *2-propanol R* and dilute to 50.0 ml with buffer solution pH 9.0 prepared as follows: dissolve 1.39 g of *boric acid R* in *water R* and adjust to pH 9.0 with *1 M sodium hydroxide* (about 9 ml). Dilute to 100.0 ml with *water R*.

Detection: spectrophotometer at 214 nm.

Preconditioning of the capillary: rinse the capillary for 2 min with a 2 g/l solution of *sodium hydroxide R* and for at least 5 min with the electrolyte solution.

Injection: under pressure (3,45 kPa) for 5 s.

Migration:

Time (min)	Current (µA)
0 - 0.17	0 → 75
0.17 - 15	75 → 130
15 - 40	130
40 - 60	130 → 200

Migration times: levocabastine = about 28 min; impurity D = about 30 min.

System suitability: reference solution (a):

– *resolution*: minimum 4 between the peaks due to levocabastine and impurity D; if necessary adjust the current gradient.

Limits:

– *impurities A, B, C, D, E*: for each impurity, not more than the area of the principal peak in the electropherogram obtained with reference solution (b) (0.5 per cent);

– *total*: not more than twice the area of the principal peak in the electropherogram obtained with reference solution (b) (1.0 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the electropherogram obtained with reference solution (b) (0.05 per cent); disregard any peak due to the blank.

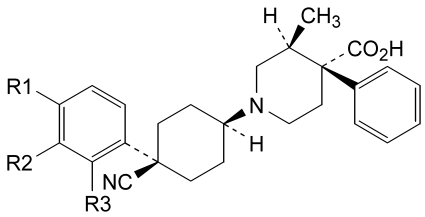
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.175 g in 50 ml of *ethanol (96 per cent) R* and add 5.0 ml of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 1st and 3rd point of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 22.85 mg of $C_{26}H_{30}ClFN_2O_2$.

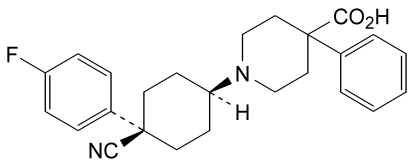


STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.



Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *F, G, H, I.*

corrected 6.0

LEVOCARNITINE

Levocarnitinum

$C_7H_{15}NO_3$ M_r 161.2
[541-15-1]

DEFINITION

(3*R*)-3-Hydroxy-4-(trimethylammonio)butanoate.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals, hygroscopic.

Solubility: freely soluble in water, soluble in warm ethanol (96 per cent), practically insoluble in acetone.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs, prepared using substance previously dried *in vacuo* at 50 °C for 5 h.

Comparison: *levocarnitine CRS.*

C. To 1 ml of solution S (see Tests) add 9 ml of *water R*, 10 ml of *dilute sulphuric acid R* and 30 ml of *ammonium reineckate solution R*. A pink precipitate is formed. Allow to stand for 30 min. Filter and wash with *water R*, with *ethanol (96 per cent) R* and then with *acetone R* and dry at 80 °C. The precipitate melts (*2.2.14*) at 147 °C to 150 °C.

TESTS

Solution S. Dissolve 5.00 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 6.5 to 8.5.

Dilute 10 ml of solution S to 20 ml with *carbon dioxide-free water R*.

Specific optical rotation (*2.2.7*): – 29.0 to – 32.0 (anhydrous substance), determined on solution S at 25 °C.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.10 g of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 12.5 mg of *levocarnitine impurity A CRS* in *water R* and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (c). Dissolve 10.0 mg of *levocarnitine impurity A CRS* in *water R* and dilute to 10.0 ml with the same solvent. Dilute 2.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (d). Dissolve 0.100 g of *levocarnitine CRS* in reference solution (c) and dilute to 10.0 ml with the same solution.

Column:

– *size*: *l* = 0.30 m, Ø = 3.9 mm;
– *stationary phase*: *aminopropylmethylsilyl silica gel for chromatography R* (10 µm);
– *temperature*: 30 °C.

Mobile phase: mix 35 volumes of a 6.81 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 4.7 with *dilute sodium hydroxide solution R*, and 65 volumes of *acetonitrile R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 25 µl of the test solution and reference solutions (a), (b) and (d).

Retention time: levocarnitine = about 9.6 min; impurity A = about 10.6 min.

System suitability: reference solution (d):

– *resolution*: minimum 0.9 between the peaks due to levocarnitine and impurity A when the chromatogram is recorded over 15 min.

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
– *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Chlorides (*2.4.4*): maximum 200 ppm.

Dilute 2.5 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 300 ppm.

Dilute 5 ml of solution S to 15 ml with *distilled water R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

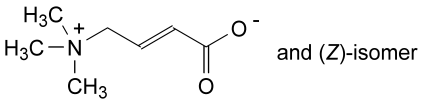
12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): maximum 1.0 per cent, determined on 2.00 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

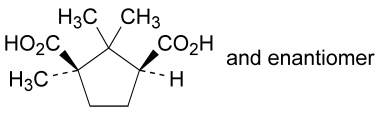
ASSAY

Dissolve 0.125 g in a mixture of 3 volumes of *anhydrous formic acid R* and 50 volumes of *anhydrous acetic acid R*. Add 0.2 ml of *crystal violet solution R*. Titrate with *0.1 M perchloric acid* until the colour changes from violet to green. 1 ml of *0.1 M perchloric acid* is equivalent to 16.12 mg of $C_7H_{15}NO_3$.



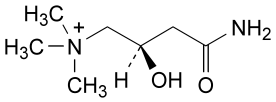
STORAGE

In an airtight container.

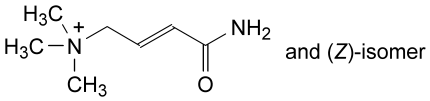


IMPURITIES

Specified impurities: *A*.



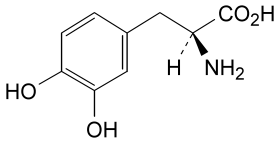
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D*.



A. (*E*)- or (*Z*)-4-(trimethylammonio)but-2-enoate,

B. (1*RS*,3*SR*)-1,2,2-trimethylcyclopentane-1,3-dicarboxylic acid (camphoric acid),

C. (2*R*)-4-amino-2-hydroxy-*N,N,N*-trimethyl-4-oxobutan-1-aminium (carnitinamide),



D. (*E*)- or (*Z*)-4-amino-*N,N,N*-trimethyl-4-oxobut-2-en-1-aminium.

LEVODOPA

Levodopum

$C_9H_{11}NO_4$ M_r 197.2
[59-92-7]

DEFINITION

(2*S*)-2-Amino-3-(3,4-dihydroxyphenyl)propanoic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: slightly soluble in water, practically insoluble in ethanol (96 per cent). It is freely soluble in *1 M hydrochloric acid* and sparingly soluble in *0.1 M hydrochloric acid*.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *levodopa CRS*.

TESTS

Appearance of solution. The solution is not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Dissolve 1.0 g in a 103 g/l solution of *hydrochloric acid R* and dilute to 25 ml with the same solution.

pH (*2.2.3*): 4.5 to 7.0.

Shake 0.10 g with 10 ml of *carbon dioxide-free water R* for 15 min.

Related substances

Liquid chromatography (*2.2.29*). *Use freshly prepared solutions.*

Solution A. 10.3 g/l solution of *hydrochloric acid R*.

Test solution. Dissolve 0.100 g of the substance to be examined in solution A and dilute to 25 ml with solution A.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with solution A. Dilute 5.0 ml of this solution to 100.0 ml with solution A.

Reference solution (b). Dissolve 8 mg of *tyrosine R* (impurity B) and 4 mg of *3-methoxy-L-tyrosine R* (L-isomer of impurity C) in 2 ml of the test solution and dilute to 50 ml with solution A. Dilute 5 ml of this solution to 100 ml with solution A.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: spherical *di-isobutyloctadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 8 nm.

Mobile phase:

– *mobile phase A*: *0.1 M phosphate buffer solution pH 3.0*;
– *mobile phase B*: *methanol R, 0.1 M phosphate buffer solution pH 3.0* (18:85 *V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 18	90	10
18 - 22	90 → 0	10 → 100
22 - 35	0	100
35 - 36	0 → 90	100 → 10
36 - 49	90	10

Flow rate: 1 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl.

Relative retention with reference to levodopa (retention time = about 6 min): impurity A = about 0.7; impurity B = about 2; impurity C = about 3.5.

System suitability: reference solution (b):

– *resolution*: minimum 10 between the peaks due to levodopa and impurity B.

Limits:

– *correction factor*: for the calculation of content, multiply the peak area of impurity B by 2.2;
– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
– *impurity B*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
– *impurity C*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
– *unspecified impurities*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent);
– *total*: not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent);
– *disregard limit*: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 per cent).

Enantiomeric purity. Liquid chromatography (*2.2.29*). *Use freshly prepared solutions.*

Test solution. Dissolve 25 mg of the substance to be examined in the mobile phase and dilute to 25 ml with the mobile phase.

Reference solution (a). Dilute 5.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *D-dopa R* (impurity D) in 10 ml of the test solution. Dilute 1 ml of this solution to 100 ml with the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 3.9 mm;
– *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 350 m^2/g and a pore size of 10 nm.

Mobile phase: dissolve separately 200 mg of *copper acetate R* and 387 mg of *N,N-dimethyl-L-phenylalanine R* in *water R*; mix the 2 solutions and adjust immediately to pH 4.0 with *acetic acid R*; add 50 ml of *methanol R* and dilute to 1000 ml with *water R*; mix and filter.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl.

Run time: twice the retention time of levodopa.

Relative retention with reference to levodopa (retention time = about 7 min): impurity D = about 0.4.

System suitability: reference solution (b):

– *resolution*: minimum 5 between the peaks due to impurity D and levodopa.

Limit:

– *impurity D*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).

Heavy metals (*2.4.8*): maximum 10 ppm.

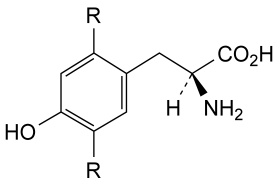
2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 0.500 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

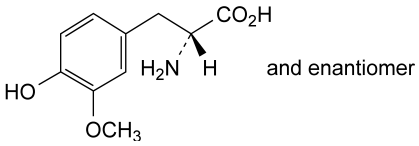
Dissolve 0.180 g, heating if necessary, in 5 ml of *anhydrous formic acid R*. Add 25 ml of *anhydrous acetic acid R*. Add 25 ml of *dioxan R* and 0.1 ml of *crystal violet solution R*. Titrate with *0.1 M perchloric acid*, until a green colour is obtained.



1 ml of *0.1 M perchloric acid* is equivalent to 19.72 mg of $C_9H_{11}NO_4$.

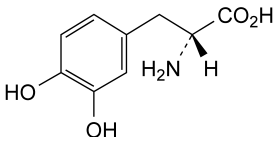
STORAGE

Protected from light.



IMPURITIES

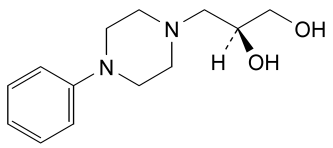
Specified impurities: A, B, C, D.



A. R = OH: (2*S*)-2-amino-3-(2,4,5-trihydroxyphenyl)propanoic acid,

B. R = H: (2*S*)-2-amino-3-(4-hydroxyphenyl)propanoic acid (tyrosine),

C. (2*RS*)-2-amino-3-(4-hydroxy-3-methoxyphenyl)propanoic acid (3-methoxy-DL-tyrosine),



D. (2*R*)-2-amino-3-(3,4-dihydroxyphenyl)propanoic acid (D-dopa).

01/2008:1535

LEVODROPROPIZINE

Levodropropizinum

$C_{13}H_{20}N_2O_2$ M_r 236.3
[99291-25-5]

DEFINITION

(2*S*)-3-(4-Phenylpiperazin-1-yl)propane-1,2-diol.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: slightly soluble in water, freely soluble in dilute acetic acid and in methanol, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

A. Specific optical rotation (*2.2.7*): – 30.0 to – 33.5 (dried substance).

Dissolve 1.50 g in a 21 g/l solution of *hydrochloric acid R* and dilute to 50.0 ml with the same acid.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *levodropropizine CRS*.

TESTS

pH (*2.2.3*): 9.2 to 10.2.

Suspend 2.5 g in *carbon dioxide-free water R*, heat to dissolve, cool to room temperature and dilute to 100 ml with the same solvent.

Impurity B and related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 24.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 12.0 mg of *1-phenylpiperazine R* (impurity B) in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Mix 2 ml of the test solution with 2 ml of reference solution (a) and dilute to 10 ml with the mobile phase.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;

– *stationary phase*: *base-deactivated octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix 12 volumes of *methanol R* and 88 volumes of a 6.81 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 3.0 with *phosphoric acid R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

System suitability: reference solution (b):

– *resolution*: minimum 2.0 between the peaks due to levodropropizine and impurity B.

Limits:

– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 per cent);

– *unspecified impurities*: for each impurity, not more than 0.2 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (a) (0.10 per cent);

– *disregard limit*: 0.02 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (a) (0.01 per cent).

Impurity C. Gas chromatography (*2.2.28*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 0.50 g of the substance to be examined in *methylene chloride R* and dilute to 2.5 ml with the same solvent.

Reference solution (a). Dissolve 0.20 g of *glycidol R* (impurity C) in *methylene chloride R* and dilute to 100.0 ml with the same solvent. Dilute 0.5 ml of this solution to 100.0 ml with *methylene chloride R*.

Reference solution (b). Dissolve 0.50 g of the substance to be examined in *methylene chloride R*, add 0.5 ml of reference solution (a) and dilute to 2.5 ml with *methylene chloride R*.

Column:

– *material*: fused silica;
– *size*: *l* = 30 m, Ø = 0.53 mm;
– *stationary phase*: *poly[(cyanopropyl)(phenyl)][dimethyl]siloxane R* (film thickness 3 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 2.5 ml/min.

Split ratio: 1:8.

Temperature:

– *column*: 140 °C;
– *injection port*: 170 °C;
– *detector*: 250 °C.

Detection: flame ionisation.

Injection: 1 µl of the test solution and reference solution (b).

Use a split-liner consisting of a column about 1 cm long packed with glass wool.

At the end of a series of tests, heat the column at 250 °C for 4-6 h.

Limit:

– *impurity C*: not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (10 ppm).

Enantiomeric purity. Liquid chromatography (*2.2.29*).

Solvent mixture: *anhydrous ethanol R, hexane R* (40:60 *V/V*).

Test solution. Dissolve 10.0 mg of the substance to be examined in 10.0 ml of the solvent mixture. Dilute 1.0 ml of this solution to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 10.0 mg of *levodropropizine CRS* in 10.0 ml of the solvent mixture. Dilute 1.0 ml of this solution to 50.0 ml with the solvent mixture.

Reference solution (b). Dissolve 10.0 mg of *levodropropizine impurity A CRS* in 10.0 ml of the solvent mixture. Dilute 1.0 ml of this solution to 50.0 ml with the solvent mixture.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 50.0 ml with the solvent mixture.

Reference solution (d). Dilute 0.5 ml of reference solution (b) to 25 ml with reference solution (a).

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *silica gel OD for chiral separations R*.

Mobile phase: *diethylamine R, anhydrous ethanol R, hexane R* (0.2:5:95 *V/V/V*).

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl of the test solution and reference solutions (a), (c) and (d).

Elution order: impurity A, levodropropizine.

System suitability:

– *retention times*: the retention times of the principal peaks in the chromatograms obtained with the test solution and reference solution (a) are similar;
– *resolution*: minimum 1.3 between the peaks due to impurity A and levodropropizine in the chromatogram obtained with reference solution (d).

Limit:

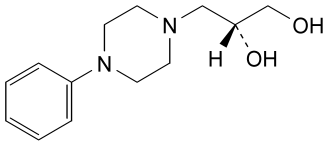
– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (2 per cent).

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 0.500 g by drying *in vacuo* at 60 °C over *diphosphorus pentoxide R* at a pressure of 0.15-0.25 kPa for 4 h.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

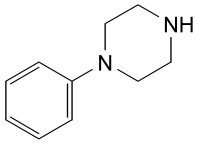
ASSAY

Dissolve 0.100 g in 50 ml of *anhydrous acetic acid R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M perchloric acid*. Read the volume added at the 2nd point of inflexion.



1 ml of *0.1 M perchloric acid* is equivalent to 11.82 mg of $C_{13}H_{20}N_2O_2$.

STORAGE



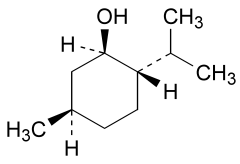
Protected from light.

IMPURITIES

Specified impurities: *A, B, C.*

A. (2*R*)-3-(4-phenylpiperazin-1-yl)propane-1,2-diol (dextrodropropizine),

B. 1-phenylpiperazine,



C. [(2*RS*)-oxiran-2-yl]methanol (glycidol).

01/2008:0619

LEVOMENTHOL

Levomentholum

$C_{10}H_{20}O$ M_r 156.3
[2216-51-5]

DEFINITION

(1*R*,2*S*,5*R*)-5-Methyl-2-(1-methylethyl)cyclohexanol.

CHARACTERS

Appearance: prismatic or acicular, colourless, shiny crystals.

Solubility: practically insoluble in water, very soluble in ethanol (96 per cent) and in light petroleum, freely soluble in fatty oils and in liquid paraffin, very slightly soluble in glycerol.

mp: about 43 °C.

IDENTIFICATION

First identification: A, C.

Second identification: B, D.

A. Specific optical rotation (see Tests).

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 25 mg of *menthol CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 2 µl.

Development: over a path of 15 cm.

Drying: in air, until the solvents have evaporated.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. Examine the chromatograms obtained in the test for related substances.

Results: the principal peak in the chromatogram obtained with test solution (b) is similar in position and approximate dimensions to the principal peak in the chromatogram obtained with reference solution (c).

D. Dissolve 0.20 g in 0.5 ml of *anhydrous pyridine R*. Add 3 ml of a 150 g/l solution of *dinitrobenzoyl chloride R* in *anhydrous pyridine R*. Heat on a water-bath for 10 min. Add 7.0 ml of *water R* in small quantities with stirring and allow to stand in iced water for 30 min. A precipitate is formed. Allow to stand and decant the supernatant liquid. Wash the precipitate with 2 quantities, each of 5 ml, of iced *water R*, recrystallise from 10 ml of *acetone R*, wash with iced *acetone R* and dry at 75 °C at a pressure not exceeding 2.7 kPa for 30 min. The crystals melt (*2.2.14*) at 154 °C to 157 °C.

TESTS

Solution S. Dissolve 2.50 g in 10 ml of *ethanol (96 per cent) R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. Dissolve 1.0 g in *ethanol (96 per cent) R* and dilute to 10 ml with the same solvent. Add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.5 ml of *0.01 M sodium hydroxide* is required to change the colour of the indicator to pink.

Specific optical rotation (*2.2.7*): – 48 to – 51, determined on solution S.

Related substances. Gas chromatography (*2.2.28*).

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methylene chloride R* and dilute to 50.0 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methylene chloride R*.

Reference solution (a). Dissolve 40.0 mg of the substance to be examined and 40.0 mg of *isomenthol R* in *methylene chloride R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 0.10 ml of test solution (a) to 100.0 ml with *methylene chloride R*.

Reference solution (c). Dissolve 40.0 mg of *menthol CRS* in *methylene chloride R* and dilute to 100.0 ml with the same solvent.

Column:

– *material*: glass;
– *size*: *l* = 2.0 m, Ø = 2 mm;
– *stationary phase*: *diatomaceous earth for gas chromatography R* impregnated with 15 per cent *m/m* of *macrogol 1500 R*.

Carrier gas: *nitrogen for chromatography R.*

Flow rate: 30 ml/min.

Temperature:

– *column*: 120 °C;
– *injection port*: 150 °C;
– *detector*: 200 °C.

Detection: flame ionisation.

Injection: 1 µl.

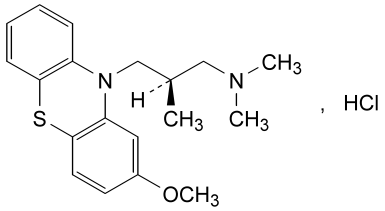
Run time: twice the retention time of menthol.

System suitability:

– *resolution*: minimum 1.4 between the peaks due to menthol and isomenthol in the chromatogram obtained with reference solution (a);
– *signal-to-noise ratio*: minimum 5 for the principal peak in the chromatogram obtained with reference solution (b).

Limits: test solution (a):

– *total*: not more than 1 per cent of the area of the principal peak;
– *disregard limit*: 0.05 per cent of the area of the principal peak.



Residue on evaporation: maximum 0.05 per cent.

Evaporate 2.00 g on a water-bath and heat in an oven at 100-105 °C for 1 h. The residue weighs not more than 1.0 mg.

01/2008:0505
corrected 6.0

LEVOMEPROMAZINE HYDROCHLORIDE

Levomepromazini hydrochloridum

$C_{19}H_{25}ClN_2OS$ M_r 364.9
[1236-99-3]

DEFINITION

Levomepromazine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (2*R*)-3-(2-methoxy-10*H*-phenothiazin-10-yl)-*N*,*N*,2-trimethylpropan-1-amine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or very slightly yellow, crystalline powder, slightly hygroscopic, freely soluble in water and in alcohol. It deteriorates when exposed to air and light. It exists in two forms, one melting at about 142 °C and the other at about 162 °C.

IDENTIFICATION

A. *Prepare the solution protected from bright light and carry out the measurements immediately.* Dissolve 50.0 mg in *water R* and dilute to 500.0 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with *water R*. Examined between 230 nm and 340 nm (*2.2.25*), the solution shows two absorption maxima, at 250 nm and 302 nm. The specific absorbance at the maximum at 250 nm is 640 to 700.

B. It complies with the identification test for phenothiazines by thin-layer chromatography (*2.3.3*): use *levomepromazine hydrochloride CRS* to prepare the reference solution.

C. Introduce 0.2 g into a 100 ml separating funnel. Add 5 ml of *water R* and 0.5 ml of *strong sodium hydroxide solution R*. Shake vigorously with two quantities, each of 10 ml, of *ether R*. Combine the ether layers, dry over *anhydrous sodium sulphate R* and evaporate to dryness. Keep the residue at 100 °C to 105 °C for 15 min and allow to crystallise in iced water. Initiate crystallisation if necessary by scratching the wall of the flask with a glass rod. Dry the crystals at 60 °C for 2 h. The crystals melt (*2.2.14*) at 122 °C to 128 °C.

D. It gives reaction (b) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *bromocresol green solution R*. Not more than 0.5 ml of *0.01 M sodium hydroxide* or 1.0 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator.

Specific optical rotation (*2.2.7*): + 9.5 to + 11.5, determined on solution S and calculated with reference to the dried substance.

Related substances. *Carry out the test protected from bright light.* Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents. Prepare immediately before use.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *acetone R*, 10 volumes of *diethylamine R* and 80 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

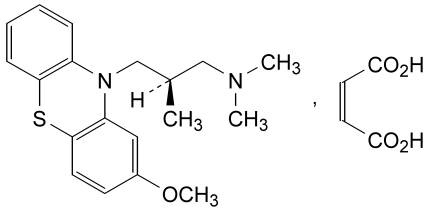
Loss on drying (*2.2.32*). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 5 ml of *water R* and add 50 ml of *2-propanol R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M sodium hydroxide* is equivalent to 36.49 mg of $C_{19}H_{25}ClN_2OS$.



STORAGE

Store in an airtight container, protected from light.

corrected 6.0

LEVOMEPROMAZINE MALEATE

Levomepromazini maleas

$C_{23}H_{28}N_2O_5S$ M_r 444.6
[7104-38-3]

DEFINITION

Levomepromazine maleate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (2*R*)-3-(2-methoxy-10*H*-phenothiazin-10-yl)-*N*,*N*,2-trimethylpropan-1-amine (*Z*)-butenedioate, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, slightly soluble in water, sparingly soluble in methylene chloride, slightly soluble in alcohol. It deteriorates when exposed to air and light.

It melts at about 186 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *levomepromazine maleate CRS*. Examine the substances prepared as discs.

C. It complies with the identification test for phenothiazines by thin-layer chromatography (*2.3.3*): use *levomepromazine maleate CRS* to prepare the reference solution.

D. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution. Dissolve 0.20 g of the substance to be examined in a mixture of 10 volumes of *water R* and 90 volumes of *acetone R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 50 mg of *maleic acid CRS* in a mixture of 10 volumes of *water R* and 90 volumes of *acetone R* and dilute to 10 ml with the same mixture of solvents.

Apply separately to the plate as bands 10 mm by 2 mm 5 µl of each solution. Develop over a path of 12 cm using a mixture of 3 volumes of *water R*, 7 volumes of *anhydrous formic acid R* and 90 volumes of *di-isopropyl ether R*. Dry the plate at 120 °C for 10 min and examine in ultraviolet light at 254 nm. The chromatogram obtained with the test solution shows a band at the starting-point and another band similar in position and size to the principal band in the chromatogram obtained with the reference solution.

TESTS

pH (*2.2.3*). *Carry out the test protected from bright light.* Introduce 0.50 g into a conical flask and add 25.0 ml of *carbon dioxide-free water R*. Shake and allow the solids to settle. The pH of the supernatant solution is 3.5 to 5.5.

Specific optical rotation (*2.2.7*). Dissolve 1.25 g in *dimethylformamide R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is – 7.0 to – 8.5, calculated with reference to the dried substance.

Related substances. *Carry out the test protected from bright light and prepare the solutions immediately before use.* Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution. Dissolve 0.20 g of the substance to be examined in a mixture of 10 volumes of *water R* and 90 volumes of *acetone R* and dilute to 10 ml with the same mixture of solvents.

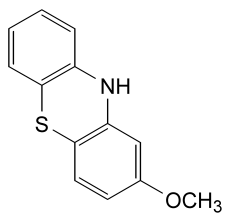
Reference solution. Dilute 0.5 ml of the test solution to 100 ml with a mixture of 10 volumes of *water R* and 90 volumes of *acetone R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *acetone R*, 10 volumes of *diethylamine R* and 80 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 3 h.

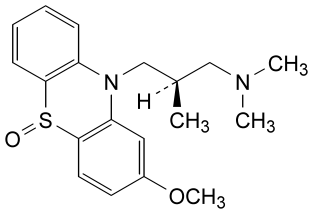
Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.350 g in 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 44.46 mg of $C_{23}H_{28}N_2O_5S$.

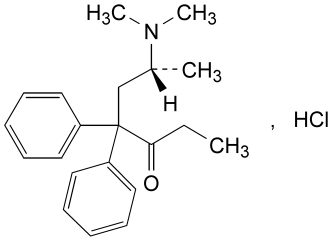


STORAGE

Store protected from light.

IMPURITIES

A. 2-methoxyphenothiazine,



B. 10-[(2*R*)-3-(dimethylamino)-2-methylpropyl]-2-methoxy-10*H*-phenothiazine 5-oxide.

01/2008:1787
corrected 6.0

LEVOMETHADONE HYDROCHLORIDE

Levomethadoni hydrochloridum

$C_{21}H_{28}ClNO$ M_r 345.9
[125-58-6]

DEFINITION

(6*R*)-6-(Dimethylamino)-4,4-diphenylheptan-3-one hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water, freely soluble in alcohol.

IDENTIFICATION

First identification: A, C, D.

Second identification: A, B, D.

A. Specific optical rotation (see Tests).

B. Melting point (*2.2.14*): 239 °C to 242 °C.

C. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *Ph. Eur. reference spectrum of methadone hydrochloride.*

D. Dilute 1 ml of solution S (see Tests) to 5 ml with *water R* and add 1 ml of *dilute ammonia R1*. Mix, allow to stand for 5 min and filter. The filtrate gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. Dilute 10 ml of solution S to 25 ml with *carbon dioxide-free water R*. To 10 ml of the solution add 0.2 ml of *methyl red solution R* and 0.2 ml of *0.01 M sodium hydroxide*. The solution is yellow. Add 0.4 ml of *0.01 M hydrochloric acid*. The solution is red.

Specific optical rotation (*2.2.7*): – 125 to – 135 (dried substance), determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 12.0 mg of *imipramine hydrochloride CRS* in the mobile phase and dilute to 10 ml with the mobile phase. To 1 ml of the solution add 5 ml of the test solution and dilute to 10 ml with the mobile phase.

Column:

– *size*: *l* = 0.125 m, Ø = 4.6 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),

– *temperature*: 25 °C.

Mobile phase: mix 35 volumes of *acetonitrile R* and 65 volumes of an 11.5 g/l solution of *phosphoric acid R* adjusted to pH 3.6 with *tetraethylammonium hydroxide solution R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 210 nm.

Equilibration: about 30 min.

Injection: 10 µl.

Run time: 7 times the retention time of levomethadone.

Retention time: levomethadone = about 5 min.

System suitability: reference solution (b):

– *resolution*: minimum 2.5 between the peaks due to imipramine and levomethadone.

Limits:

– *any impurity*: not more than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),

– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Dextromethadone. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 40.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *2-hydroxypropylbetadex for chromatography R* (5 µm),

– *temperature*: 10 °C.

Mobile phase: mix 1 volume of *triethylamine R* adjusted to pH 4.0 with *phosphoric acid R*, 15 volumes of *acetonitrile R* and 85 volumes of a 13.6 g/l solution of *potassium dihydrogen phosphate R*.

Flow rate: 0.7 ml/min.

Detection: spectrophotometer at 210 nm.

Equilibration: about 30 min.

Injection: 10 µl.

Relative retention with reference to levomethadone: dextromethadone = about 1.4.

System suitability: test solution:

– *number of theoretical plates*: minimum 2000, calculated for the peak due to levomethadone,

– *tailing factor*: maximum 3 for the peak due to levomethadone.

Limit:

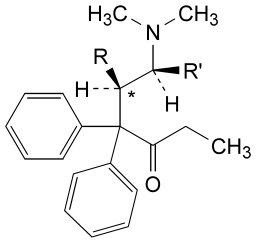
– *dextromethadone*: not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 40 ml of *water R* and 5 ml of *acetic acid R*. Titrate with *0.1 M silver nitrate*. Determine the end-point potentiometrically (*2.2.20*), using a silver electrode.

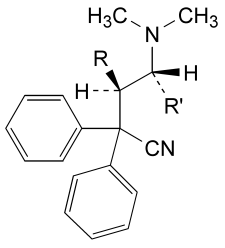


1 ml of *0.1 M silver nitrate* is equivalent to 34.59 mg of $C_{21}H_{28}ClNO$.

STORAGE

Protected from light.

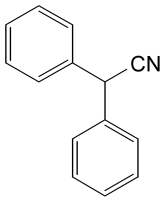
IMPURITIES



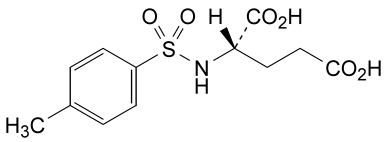
Specified impurities: A, B, C, D, E, F.

and epimer at C*

A. R = H, R′ = CH_3: (6*S*)-6-(dimethylamino)-4,4-diphenylheptan-3-one,



D. R = CH_3, R′ = H: (5*RS*)-6-(dimethylamino)-5-methyl-4,4-diphenylhexan-3-one,

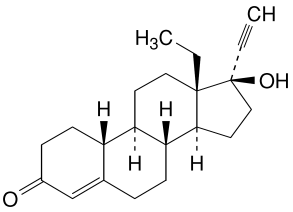


and enantiomer

B. R = H, R′ = CH_3: (4*RS*)-4-(dimethylamino)-2,2-diphenylpentanenitrile,

C. R = CH_3,R′ = H: (3*RS*)-4-(dimethylamino)-3-methyl-2,2-diphenylbutanenitrile,

E. diphenylacetonitrile,



F. (2*S*)-2-[[(4-methylphenyl)sulphonyl]amino]pentanedioic acid (*N-p*-tosyl-L-glutamic acid).

01/2008:0926
corrected 6.0

LEVONORGESTREL

Levonorgestrelum

$C_{21}H_{28}O_2$ M_r 312.5
[797-63-7]

DEFINITION

Levonorgestrel contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 13β-ethyl-17β-hydroxy-18,19-dinor-17α-pregn-4-en-20-yn-3-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in methylene chloride, slightly soluble in alcohol.

IDENTIFICATION

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *levonorgestrel CRS*.

TESTS

Specific optical rotation (*2.2.7*). Dissolve 0.200 g in *chloroform R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is - 30 to - 35.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in *chloroform R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 10 ml with *methylene chloride R*. Dilute 1 ml of this solution to 20 ml with *methylene chloride R*.

Reference solution (b). Dilute 4 ml of reference solution (a) to 10 ml with *methylene chloride R*.

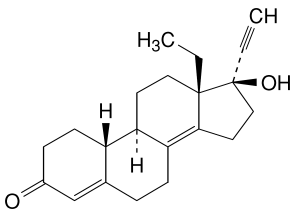
Reference solution (c) Dissolve 5 mg of *levonorgestrel CRS* and 5 mg of *ethinylestradiol CRS* in *methylene chloride R* and dilute to 50 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *ethyl acetate R* and 80 volumes of *methylene chloride R*. Allow the plate to dry in air, spray with a 100 g/l solution of *phosphomolybdic acid R* in *alcohol R*, heat at 100 °C to 105 °C for 15 min and examine immediately. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (0.5 per cent) and at most two such spots are more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

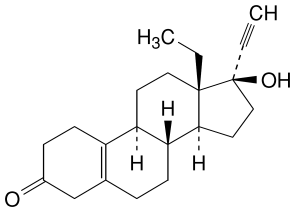
Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY



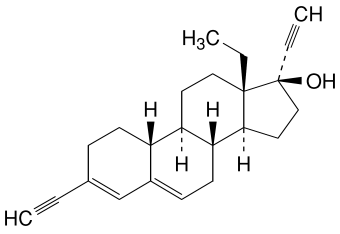
Dissolve 0.200 g in 45 ml of *tetrahydrofuran R*. Add 10 ml of a 100 g/l solution of *silver nitrate R*. After 1 min, titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 31.25 mg $C_{21}H_{28}O_2$.

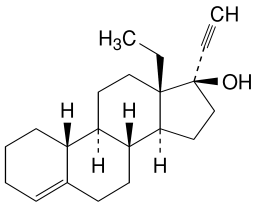


STORAGE

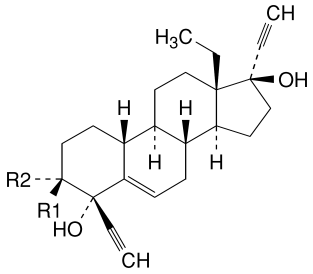
Store protected from light.



IMPURITIES



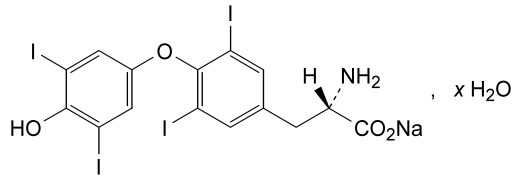
A. 13-ethyl-17-hydroxy-18,19-dinor-17α-pregna-4,8(14)-dien-20-yn-3-one,



B. 13-ethyl-17-hydroxy-18,19-dinor-17α-pregn-5(10)-en-20-yn-3-one,

C. 13-ethyl-3-ethynyl-18,19-dinor-17α-pregna-3,5-dien-20-yn-17-ol,

D. 13-ethyl-18,19-dinor-17α-pregn-4-en-20-yn-17-ol,



E. R1 = OH, R2 = C≡CH: 13-ethyl-3,4-diethynyl-18,19-dinor-17α-pregn-5-en-20-yn-3β,4α,17-triol,

F. R1 = C≡CH, R2 = OH: 13-ethyl-3,4-diethynyl-18,19-dinor-17α-pregn-5-en-20-yn-3α,4α,17-triol.

LEVOTHYROXINE SODIUM

Levothyroxinum natricum

$C_{15}H_{10}I_4NNaO_4,xH_2O$ M_r 799 (anhydrous substance)
[55-03-8]

DEFINITION

Levothyroxine sodium contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of sodium (2*S*)-2-amino-3-[4-(4-hydroxy-3,5-diiodophenoxy)-3,5-diiodophenyl]propanoate, calculated with reference to the dried substance. It contains a variable amount of water.

CHARACTERS

An almost white or slightly brownish-yellow powder, or a fine, crystalline powder, very slightly soluble in water, slightly soluble in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *levothyroxine sodium CRS*.

C. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution. Dissolve 5 mg of the substance to be examined in a mixture of 5 volumes of *concentrated ammonia R* and 70 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (a). Dissolve 5 mg of *levothyroxine sodium CRS* in a mixture of 5 volumes of *concentrated ammonia R* and 70 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (b). Dissolve 5 mg of *liothyronine sodium CRS* in a mixture of 5 volumes of *concentrated ammonia R* and 70 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents. Mix 1 ml of this solution and 1 ml of the test solution.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *concentrated ammonia R*, 35 volumes of *2-propanol R* and 55 volumes of *ethyl acetate R*. Allow the plate to dry in air and spray with *ninhydrin solution R*. Heat at 100-105 °C until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

D. To about 50 mg in a porcelain dish add a few drops of *sulphuric acid R* and heat. Violet vapour is evolved.

E. To 200 mg add 2 ml of *dilute sulphuric acid R*. Heat on a water-bath and then carefully over a naked flame, increasing the temperature gradually up to about 600 ± 50 °C. Continue the ignition until most of the black particles have disappeared. Dissolve the residue in 2 ml of *water R*. The solution gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 0.500 g in 23 ml of a gently boiling mixture of 1 volume of *1 M hydrochloric acid* and 4 volumes of *ethanol (96 per cent) R*. Cool and dilute to 25.0 ml with the same mixture of solvents.

Appearance of solution. Freshly prepared solution S is not more intensely coloured than reference solution BY_3 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*): + 16 to + 20, determined on solution S and calculated with reference to the dried substance.

Liothyronine and other related substances. Examine the chromatograms obtained in the assay. In the chromatogram obtained with test solution (a), the area of any peak due to liothyronine is not greater than that of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all the peaks apart from the principal peak and any peak due to liothyronine is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Disregard any peak with an area less than that of the peak in the chromatogram obtained with reference solution (d).

Loss on drying (*2.2.32*): 6.0 per cent to 12.0 per cent, determined on 0.100 g by drying in an oven at 105 °C.

ASSAY

Examine by liquid chromatography (*2.2.29*). *Protect the solutions from light throughout the assay.*

Test solution (a). Dissolve 20.0 mg of the substance to be examined in *methanolic sodium hydroxide solution R* and dilute to 100.0 ml with the same solvent.

Test solution (b). Dilute 2.0 ml of test solution (a) to 200 ml with *methanolic sodium hydroxide solution R*.

Reference solution (a). Dissolve 20.0 mg of *levothyroxine sodium CRS* in *methanolic sodium hydroxide solution R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of this solution to 200 ml with *methanolic sodium hydroxide solution R*.

Reference solution (b). Dissolve 5 mg of *liothyronine sodium CRS* in *methanolic sodium hydroxide solution R* and dilute to 50.0 ml with the same solvent. Dilute 10.0 ml of the solution to 50 ml with *methanolic sodium hydroxide solution R*. Dilute 10.0 ml of this solution to 100 ml with *methanolic sodium hydroxide solution R*.

Reference solution (c). Mix equal volumes of reference solution (a) and reference solution (b).

Reference solution (d). Dilute 1 ml of reference solution (a) to 10 ml with *methanolic sodium hydroxide solution R*.

The chromatographic procedure may be carried out using:

– a column 0.25 m long and 4 mm in internal diameter packed with *nitrile silica gel for chromatography R* (5-10 µm);

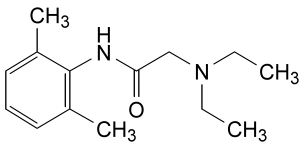
– as mobile phase at a flow rate of 1 ml/min a mixture of 1 volume of *phosphoric acid R*, 300 volumes of *acetonitrile R* and 700 volumes of *water R*;

– as detector a spectrophotometer set at 225 nm;

– a loop injector.

Inject separately 50 µl of each solution. Continue the chromatography for 3.5 times the retention time of the principal peak. The assay is not valid unless the resolution between the peaks due to levothyroxine and liothyronine in the chromatogram obtained with reference solution (c) is at least 4 and the principal peak in the chromatogram obtained with reference solution (d) has a signal-to-noise ratio of at least 5.

Calculate the percentage content of $C_{15}H_{10}I_4NNaO_4$ from the declared content of *levothyroxine sodium CRS*.



STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

01/2008:0727

LIDOCAINE

Lidocainum

$C_{14}H_{22}N_2O$ M_r 234.3
[137-58-6]

DEFINITION

2-(Diethylamino)-*N*-(2,6-dimethylphenyl)acetamide.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, very soluble in ethanol (96 per cent) and in methylene chloride.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D, E.

A. Melting point (*2.2.14*): 66 °C to 70 °C, determined without previous drying.

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *lidocaine CRS*.

C. Dissolve 0.20 g in a mixture of 0.5 ml of *dilute hydrochloric acid R* and 10 ml of *water R* with warming and add 10 ml of *picric acid solution R*. The precipitate, washed with *water R* and dried, melts (*2.2.14*) at about 230 °C, with decomposition.

D. To about 5 mg add 0.5 ml of *fuming nitric acid R*. Evaporate to dryness on a water-bath, cool and dissolve the residue in 5 ml of *acetone R*. Add 0.2 ml of *alcoholic potassium hydroxide solution R*. A green colour is produced.

E. Dissolve about 0.1 g in 1 ml of *ethanol (96 per cent) R* and add 0.5 ml of a 100 g/l solution of *cobalt nitrate R*. A bluish-green precipitate is formed.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 1.0 g in 3 ml of *dilute hydrochloric acid R* and dilute to 10 ml with *water R*.

2,6-Dimethylaniline: maximum 100 ppm.

Dissolve 0.25 g in *methanol R* and dilute to 10 ml with the same solvent. To 2 ml of the solution add 1 ml of a freshly prepared 10 g/l solution of *dimethylaminobenzaldehyde R* in *methanol R* and 2 ml of *glacial acetic acid R* and allow to stand for 10 min. Any yellow colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 2 ml of a 2.5 mg/l solution of *2,6-dimethylaniline R* in *methanol R*.

Chlorides (*2.4.4*): maximum 35 ppm.

Dissolve 1.4 g in a mixture of 3 ml of *dilute nitric acid R* and 12 ml of *water R*.

Sulphates (*2.4.13*): maximum 0.1 per cent.

Dissolve 0.2 g in 5 ml of *ethanol (96 per cent) R* and dilute to 20 ml with *distilled water R*.

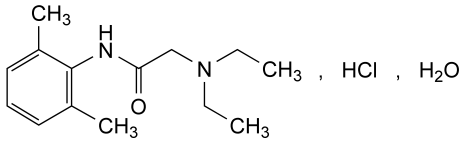
Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.000 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



To 0.200 g add 50 ml of *anhydrous acetic acid R* and stir until dissolution is complete. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 23.43 mg of $C_{14}H_{22}N_2O$.

01/2008:0227

LIDOCAINE HYDROCHLORIDE

Lidocaini hydrochloridum

$C_{14}H_{23}ClN_2O,H_2O$ M_r 288.8
[6108-05-0]

DEFINITION

2-(Diethylamino)-*N*-(2,6-dimethylphenyl)acetamide hydrochloride monohydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very soluble in water, freely soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 74 °C to 79 °C, determined without previous drying.

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *lidocaine hydrochloride CRS*.

C. To about 5 mg add 0.5 ml of *fuming nitric acid R*. Evaporate to dryness on a water-bath, cool and dissolve the residue in 5 ml of *acetone R*. Add 0.2 ml of *alcoholic potassium hydroxide solution R*. A green colour is produced.

D. It gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 4.0 to 5.5.
Dilute 1 ml of solution S to 10 ml with *carbon dioxide-free water R*.

Related substances. Liquid chromatography (*2.2.29*).
Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.
Reference solution (a). Dissolve 50.0 mg of *2,6-dimethylaniline R* (impurity A) in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml of this solution to 100.0 ml with the mobile phase.
Reference solution (b). Dissolve 5 mg of *2-chloro-N-(2,6-dimethylphenyl)acetamide R* (impurity H) in the mobile phase and dilute to 10 ml with the mobile phase.
Reference solution (c). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase.
Reference solution (d). Mix 1.0 ml of reference solution (a), 1.0 ml of reference solution (b) and 1.0 ml of reference solution (c) and dilute to 100.0 ml with the mobile phase.
Column:
– *size*: *l* = 0.15 m, Ø = 3.9 mm;
– *stationary phase*: *end-capped polar-embedded octadecylsilyl amorphous organosilica polymer R* (5 µm);
– *temperature*: 30 °C.
Mobile phase: mix 30 volumes of *acetonitrile for chromatography R* and 70 volumes of a 4.85 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 8.0 with *strong sodium hydroxide solution R*.
Flow rate: 1.0 ml/min.
Detection: spectrophotometer at 230 nm.
Injection: 20 µl.
Run time: 3.5 times the retention time of lidocaine.
Relative retention with reference to lidocaine (retention time = about 17 min): impurity H = about 0.37; impurity A = about 0.40.
System suitability: reference solution (d):
– *resolution*: minimum 1.5 between the peaks due to impurities H and A.
Limits:
– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.01 per cent);
– *unspecified impurities*: for each impurity, not more than the area of the peak due to lidocaine in the chromatogram obtained with reference solution (d) (0.10 per cent);
– *total*: not more than 5 times the area of the peak due to lidocaine in the chromatogram obtained with reference solution (d) (0.5 per cent);
– *disregard limit*: 0.5 times the area of the peak due to lidocaine in the chromatogram obtained with reference solution (d) (0.05 per cent).

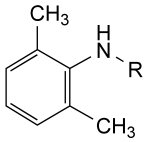
Heavy metals (*2.4.8*): maximum 5 ppm.
Dissolve 1.0 g in *water R* and dilute to 25 ml with the same solvent. Carry out the prefiltration. 10 ml of the prefiltrate complies with test E. Prepare the reference solution using 2 ml of *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): 5.5 per cent to 7.0 per cent, determined on 0.25 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.220 g in 50 ml of *ethanol (96 per cent) R* and add 5.0 ml of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.
1 ml of *0.1 M sodium hydroxide* is equivalent to 27.08 mg of $C_{14}H_{23}ClN_2O$.



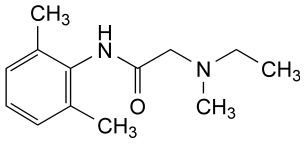
STORAGE

Protected from light.

IMPURITIES

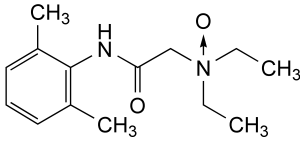
Specified impurities: *A*.
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these

impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *B, C, D, E, F, G, H, I, J, K.*



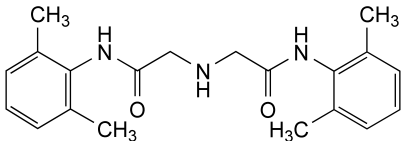
A. R = H: 2,6-dimethylaniline,

C. R = CO-CH_3: *N*-(2,6-dimethylphenyl)acetamide,

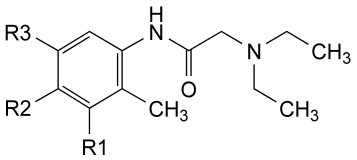


D. R = CO-CH_2-NH-C_2H_5: *N*-(2,6-dimethylphenyl)-2-(ethylamino)acetamide,

G. R = CO-CH_2-NH-$CH(CH_3)_2$: *N*-(2,6-dimethylphenyl)-2-[(1-methylethyl)amino]acetamide,



H. R = CO-CH_2-Cl: 2-chloro-*N*-(2,6-dimethylphenyl)acetamide,



K. R=CO-CH_2-N(CH_3)C_2H_5: *N*-(2,6-dimethylphenyl)-2-(ethylmethylamino)acetamide,

B. 2-(diethylazinoyl)-*N*-(2,6-dimethylphenyl)acetamide (lidocaine N^2-oxide),

E. 2-2′-(azanediyl)bis[*N*-(2,6-dimethylphenyl)acetamide],

F. R1 = CH_3, R2 = R3 = H: 2-(diethylamino)-*N*-(2,3-dimethylphenyl)acetamide,

I. R1 = R3 = H, R2 = CH_3: 2-(diethylamino)-*N*-(2,4-dimethylphenyl)acetamide,

J. R1 = R2 = H, R3 = CH_3: 2-(diethylamino)-*N*-(2,5-dimethylphenyl)acetamide.

corrected 6.0

LIME FLOWER

Tiliae flos

DEFINITION

Whole, dried inflorescence of *Tilia cordata* Miller, of *Tilia platyphyllos* Scop., of *Tilia* × *vulgaris* Heyne or a mixture of these.

CHARACTERS

Faint aromatic odour.

Faint, sweet and mucilaginous taste.

IDENTIFICATION

A. The inflorescence is yellowish-green. The main axis of the inflorescence bears a linguiform bract, membranous, yellowish-green, practically glabrous, the central vein of which is joined for up to about half of its length with the peduncle. The inflorescence usually consists of 2-7 flowers, occasionally up to 16. The sepals are detached easily from the perianth; they are up to 6 mm long, their abaxial surface is usually glabrous, their adaxial surface and their borders are strongly pubescent. The 5 spatulate, thin petals are yellowish-white, up to 8 mm long. They show fine venation and their borders only are sometimes covered with isolated trichomes. The numerous stamens are free and usually constitute 5 groups. The superior ovary has a pistil with a somewhat 5-lobate stigma.

B. Separate the inflorescence into its different parts. Examine under a microscope using *chloral hydrate solution R*. The adaxial epidermis of the bract shows cells with straight or slightly sinuous anticlinal walls; the abaxial epidermis shows cells with wavy-sinuous anticlinal walls and anomocytic stomata (*2.8.3*). Isolated cells in the mesophyll contain small calcium oxalate cluster crystals. The parenchyma of the sepals shows, particularly near the veins, numerous mucilaginous cells and cells containing small calcium oxalate clusters. The adaxial epidermis of sepals bears bent, thick-walled covering trichomes, unicellular or stellate with up to 5 cells. The epidermal cells of the petals show straight anticlinal walls with a striated cuticle without stomata. The parenchyma of the petals shows small calcium oxalate clusters and especially in its acuminate part mucilaginous cells. The pollen grains have a diameter of about 30-40 µm and are oval or slightly triangular with 3 germinal pores and a finely granulated exine. The ovary is glabrous or densely covered with trichomes, often very twisted, unicellular or stellate with 2-4 branches.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Shake 1.0 g of the powdered drug (355) (*2.9.12*) with 10 ml of *methanol R* in a water-bath at 65 °C for 5 min. Allow to cool and filter.

Reference solution. Dissolve 2.0 mg of *caffeic acid R*, 5 mg of *hyperoside R* and 5 mg of *rutin R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R* (10:10:30:50 *V/V/V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: at 100-105 °C.

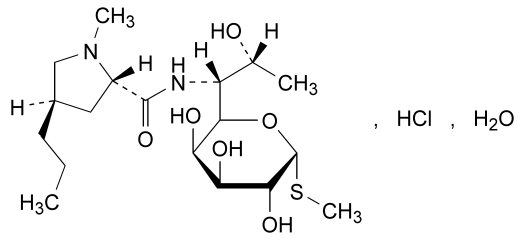
Detection: spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Then spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow to dry for about 30 min and examine in ultraviolet light at 365 nm.

Results: the chromatogram obtained with the reference solution shows in order of increasing R_F value yellowish-orange or brownish-orange fluorescent zones due to rutin and hyperoside and a greenish-blue fluorescent zone due to caffeic acid. In the chromatogram obtained with the test solution, the main zone shows brownish-yellow or orange fluorescence. This zone is situated just above the zone due to hyperoside in the chromatogram obtained with the reference solution. In daylight, this zone stands out from the other zones as the main zone. At the R_F level of rutin there is also

a brownish-yellow fluorescent zone. Below this zone, 2 yellow fluorescent zones may be present. Between the zones due to rutin and hyperoside, orange and yellow fluorescent zones are visible. Between the zones due to hyperoside and caffeic acid, up to 5 yellow or orange fluorescent zones are present. Immediately below the zone due to caffeic acid is a a blue fluorescent zone.

TESTS

Foreign matter (*2.8.2*): maximum 2 per cent, determined on 30 g. There are no inflorescences with a bract bearing at the abaxial face stellate, five- to eight-rayed trichomes and flowers having an apparent double corolla by transformation of five stamens into petal-like staminoids and having a pistil which is not lobular nor indented. Hexamerous flowers occur only occasionally (*Tilia americana* L., *Tilia tomentosa* Moench).



Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 8.0 per cent.

01/2008:0583

LINCOMYCIN HYDROCHLORIDE

Lincomycini hydrochloridum

, HCl , H_2O

$C_{18}H_{35}ClN_2O_6S,H_2O$ M_r 461.0
[7179-49-9]

DEFINITION

Lincomycin hydrochloride consists mainly of the methyl 6,8-dideoxy-6-[[[(2*S*,4*R*)-1-methyl-4-propylpyrrolidin-2-yl]carbonyl]amino]-1-thio-D-*erythro*-α-D-*galacto*-octopyranoside hydrochloride, an antimicrobial substance produced by *Streptomyces lincolnensis* var. *lincolnensis* or by any other means. It contains not less than 89.5 per cent and not more than 102.0 per cent of lincomycin hydrochloride ($C_{18}H_{35}ClN_2O_6S$), calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, very soluble in water, slightly soluble in ethanol (96 per cent), very slightly soluble in acetone.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *lincomycin hydrochloride CRS*.

B. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *lincomycin hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *lincomycin hydrochloride CRS* and 10 mg of *clindamycin hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using the upper layer from a mixture of 20 volumes of *2-propanol R*, 40 volumes of a 150 g/l solution of *ammonium acetate R* previously adjusted to pH 9.6 with *ammonia R* and 45 volumes of *ethyl acetate R*. Allow the plate to dry in air and spray with a 1 g/l solution of *potassium permanganate R*. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. Dissolve about 10 mg in 2 ml of *dilute hydrochloric acid R* and heat in a water-bath for 3 min. Add 3 ml of *sodium carbonate solution R* and 1 ml of a 20 g/l solution of *sodium nitroprusside R*. A violet-red colour develops.

D. Dissolve 0.1 g in *water R* and dilute to 10 ml with the same solvent. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

pH (*2.2.3*). The pH of solution S is 3.5 to 5.5.

Specific optical rotation (*2.2.7*). Dissolve 1.000 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 135 to + 150, calculated with reference to the anhydrous substance.

Lincomycin B. Examine the chromatogram obtained in the assay with test solution (a). The area of the peak due to lincomycin B, which is eluted just before lincomycin, is not more than 5 per cent of the area of the peak due to lincomycin.

Heavy metals (*2.4.8*). 2.0 g complies with test C for heavy metals (5 ppm). Prepare the reference solution using 1.0 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*). 3.1 per cent to 4.6 per cent, determined on 0.500 g by the semi-micro determination of water.

Sulphated ash (*2.4.14*). Not more than 0.5 per cent, determined on 1.0 g.

Bacterial endotoxins (*2.6.14*): less than 0.50 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Examine by gas chromatography (*2.2.28*), using *dotriacontane R* as the internal standard.

Internal standard solution. Dissolve 0.200 g of *dotriacontane R* in *chloroform R* and dilute to 25.0 ml with the same solvent.

Test solution (a). Dissolve 0.100 g of the substance to be examined in a 20 g/l solution of *imidazole R* in *chloroform R* and dilute to 100.0 ml with the same solution. Shake until

dissolution is complete. Place 4.0 ml of the solution in a ground-glass-stoppered 15 ml centrifuge tube. Add 1.0 ml of a mixture of 1 volume of *chlorotrimethylsilane R* and 99 volumes of *N,O-bis(trimethylsilyl)acetamide R* and swirl gently. Position the glass stopper loosely in the tube and heat at 65 °C for 30 min.

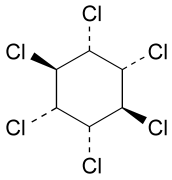
Test solution (b). Prepare as described for test solution (a) but add 10.0 ml of the internal standard solution before dissolution of the substance to be examined.

Reference solution. Prepare as described for test solution (a) using 0.100 g of *lincomycin hydrochloride CRS* instead of the substance to be examined and adding 10.0 ml of the internal standard solution before dissolution of the reference substance.

The chromatographic procedure may be carried out using:

– a glass column 1.5 m long and 3 mm in internal diameter packed with *silanised diatomaceous earth for gas chromatography R* impregnated with 3 per cent *m/m* of *poly(methylphenylsiloxane) R*,
– *helium for chromatography R* as the carrier gas at a flow rate of about 45 ml/min,
– a flame-ionisation detector,

maintaining the temperature of the column at 260 °C and that of the injection port and of the detector between 260 °C and 290 °C. Inject the chosen volume of the test solutions and the reference solution.



STORAGE

Store in an airtight container at a temperature not exceeding 30 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

01/2008:0772

LINDANE

Lindanum

$C_6H_6Cl_6$ M_r 290.8
[58-89-9]

DEFINITION

Lindane contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of *r*-1,*c*-2,*t*-3,*c*-4,*c*-5,*t*-6-hexachlorocyclohexane.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone, soluble in ethanol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (*2.2.14*): 112 °C to 115 °C.

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *lindane CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 5 mg in 4 ml of *alcohol R*. Add 1 ml of *0.5 M potassium hydroxide alcoholic*. Allow to stand for 10 min. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Appearance of solution. Dissolve 0.50 g in *acetone R* and dilute to 10 ml with the same solvent. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution B_7 (*2.2.2, Method II*).

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 1.0 g of the substance to be examined in *chloroform R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *chloroform R*.

Reference solution (a). Dissolve 0.1 g of *lindane CRS* in *chloroform R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 10 ml with *chloroform R*.

Reference solution (c). Dissolve 10 mg of *α-hexachlorocyclohexane CRS* in test solution (a) and dilute to 5 ml with the same solvent.

Apply separately to the plate 1 µl of each solution. Develop over a path of 12 cm using a mixture of 10 volumes of *chloroform R* and 90 volumes of *cyclohexane R*. Dry the plate in a current of air, irradiate with ultraviolet light at 254 nm for 15 min and spray with a 6 g/l solution of *dicarboxidine hydrochloride R* in *alcohol (90 per cent V/V) R*. Examine in daylight. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (*2.4.4*). To 0.75 g, finely powdered, add 15 ml of *water R*. Boil for 1 min. Allow to cool, shaking frequently, and filter. To 10 ml of the filtrate add 3 ml of *water R* and 2 ml of *alcohol R*. The solution complies with the limit test for chlorides (100 ppm).

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

To 0.200 g add 10 ml of *alcohol R* and warm on a water-bath until dissolved. Cool, add 20 ml of *0.5 M alcoholic potassium hydroxide* and allow to stand for 10 min, swirling frequently. Add 50 ml of *water R*, 20 ml of *dilute nitric acid R*, 25.0 ml of *0.1 M silver nitrate* and 5 ml of *ferric ammonium sulphate solution R2*. Titrate with *0.1 M ammonium thiocyanate* until a reddish-yellow colour is obtained. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 9.694 mg of $C_6H_6Cl_6$.

STORAGE

Store protected from light.

01/2008:1232

LINOLEOYL MACROGOLGLYCERIDES

Macrogolglyceridorum linoleates

DEFINITION

Mixtures of monoesters, diesters and triesters of glycerol and monoesters and diesters of macrogols.

They are obtained by partial alcoholysis of an unsaturated oil mainly containing triglycerides of linoleic (*cis,cis*-9,12-octadecadienoic) acid, using macrogol with a mean relative molecular mass between 300 and 400, or by esterification of glycerol and macrogol with unsaturated fatty acids, or by mixing glycerol esters and condensates of ethylene oxide with the fatty acids of this unsaturated oil.

CHARACTERS

Appearance: amber, oily liquid which may give rise to a deposit after prolonged periods at 20 °C.

Solubility: practically insoluble but dispersible in water, freely soluble in methylene chloride.

Viscosity: about 35 mPa·s at 40 °C.

Relative density: about 0.95 at 20 °C.

Refractive index: about 1.47 at 20 °C.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 20 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *hexane R, ether R* (30:70 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 0.1 g/l solution of *rhodamine B R* in *ethanol (96 per cent) R* and examine in ultraviolet light at 365 nm.

Results: the chromatogram shows a spot due to triglycerides with an R_F value of about 0.9 (R_{st} 1) and spots due to 1,3-diglycerides (R_{st} 0.7), to 1,2-diglycerides (R_{st} 0.6), to monoglycerides (R_{st} 0.1) and to esters of macrogol (R_{st} 0).

B. Hydroxyl value (see Tests).

C. Saponification value (see Tests).

D. Fatty acid composition (see Tests).

TESTS

Acid value (*2.5.1*): maximum 2.0, determined on 2.0 g.

Hydroxyl value (*2.5.3, Method A*): 45 to 65, determined on 1.0 g.

Iodine value (*2.5.4, Method A*): 90 to 110.

Peroxide value (*2.5.5, Method A*): maximum 12.0, determined on 2.0 g.

Saponification value (*2.5.6*): 150 to 170, determined on 2.0 g.

Alkaline impurities. Into a test tube introduce 5.0 g and carefully add a mixture, neutralised if necessary with *0.01 M hydrochloric acid* or with *0.01 M sodium hydroxide*, of 0.05 ml of a 0.4 g/l solution of *bromophenol blue R* in *ethanol (96 per cent) R*, 0.3 ml of *water R* and 10 ml of *ethanol (96 per cent) R*. Shake and allow to stand. Not more than 1.0 ml of *0.01 M hydrochloric acid* is required to change the colour of the upper layer to yellow.

Free glycerol: maximum 3.0 per cent.

Dissolve 1.20 g in 25.0 ml of *methylene chloride R*. Heat if necessary. After cooling, add 100 ml of *water R*. Shake and add 25.0 ml of *periodic acetic acid solution R*. Shake and allow to stand for 30 min. Add 40 ml of a 75 g/l solution of *potassium iodide R*. Allow to stand for 1 min. Add 1 ml of *starch solution R*. Titrate the iodine with *0.1 M sodium thiosulphate*. Carry out a blank titration.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 2.3 mg of glycerol.

Composition of fatty acids (*2.4.22, Method A*).

Composition of the fatty-acid fraction of the substance:

- *palmitic acid*: 4.0 per cent to 20.0 per cent;
- *stearic acid*: maximum 6.0 per cent;
- *oleic acid*: 20.0 per cent to 35.0 per cent;
- *linoleic acid*: 50.0 per cent to 65.0 per cent;
- *linolenic acid*: maximum 2.0 per cent;
- *arachidic acid*: maximum 1.0 per cent;
- *eicosenoic acid*: maximum 1.0 per cent.

Ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.0 g. Use a mixture of 30 volumes of *anhydrous methanol R* and 70 volumes of *methylene chloride R* as solvent.

Total ash (*2.4.16*): maximum 0.1 per cent.

STORAGE

Protected from light.

LABELLING

The label states the type of macrogol used (mean relative molecular mass) or the number of units of ethylene oxide per molecule (nominal value).

01/2008:0095
corrected 6.0

LINSEED

Lini semen

DEFINITION

Dried, ripe seeds of *Linum usitatissimum* L.

IDENTIFICATION

A. The linseed has a flattened, elongated ovoid shape. The testa is dark reddish-brown or yellow, smooth and shiny. The seeds are 4-6 mm long, 2-3 mm wide and 1.5-2 mm thick; one end is rounded and the other end forms an oblique point near which the hilum appears as a slight depression. When viewed with a lens, the surface of the seed-coat is seen to be minutely pitted. Inside the testa a narrow, whitish endosperm and an embryo composed of 2 large, flattened, yellowish and oily cotyledons are present; the radicle points towards the hilum.

B. Reduce to a powder (355) (*2.9.12*). The powder is greasy to the touch. Examine under a microscope using *chloral hydrate solution R*. The powder consists

of fragments of the outer epidermal cells of the testa filled with mucillage; collenchymatously thickened sub-epidermal layer seen in surface view as rounded cells with distinct triangular intercellular spaces often attached to the sclerenchymatous layer composed of elongated cells, some with strongly thickened and pitted walls; thin-walled pitted cells of the hyaline layer often remaining attached to the elongated sclereids and crossing them at approximately right angles; pigmented cells of the inner epidermis of the testa composed of moderately thickened polygonal cells filled with orange-brown pigment; parenchyma of the endosperm and cotyledons containing aleurone grains and fatty oil.

TESTS

Foreign matter (*2.8.2*): maximum 10 per cent of seeds with a dull coat and maximum 1.5 per cent of other foreign matter.

Swelling index (*2.8.4*): minimum 4.

Cadmium (*2.4.27*): maximum 0.5 ppm.

Loss on drying (*2.2.32*): maximum 8.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 5.0 per cent.

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*). Use the calibration mixture in Table 2.4.22.-3.

Composition of the fatty-acid fraction of the oil:

- *fatty acids with a chain length less than C_{16}*: maximum 1.0 per cent,
- *palmitic acid*: 3.0 per cent to 8.0 per cent,
- *palmitoleic acid* (equivalent chain length on polyethyleneglycol adipate 16.3): maximum 1.0 per cent,
- *stearic acid*: 2.0 per cent to 8.0 per cent,
- *oleic acid* (equivalent chain length on polyethyleneglycol adipate 18.3): 11.0 per cent to 35.0 per cent,
- *linoleic acid* (equivalent chain length on polyethyleneglycol adipate 18.9): 11.0 per cent to 24.0 per cent,
- *linolenic acid* (equivalent chain length on polyethyleneglycol adipate 19.7): 35.0 per cent to 65.0 per cent,
- *arachidic acid*: maximum 1.0 per cent.

Cadmium (*2.4.27*): maximum 0.5 ppm.

Water (*2.5.32*): maximum 0.1 per cent, determined on 5.00 g.

STORAGE

In an airtight container, protected from light.

01/2008:1908

LINSEED OIL, VIRGIN

Lini oleum virginale

DEFINITION

Virgin oil obtained by cold expression from ripe seeds of *Linum usitatissimum* L. A suitable antioxidant may be added.

CHARACTERS

Appearance: clear, yellow or brownish-yellow liquid, on exposure to air turning dark and gradually thickening. When cooled, it becomes a soft mass at about – 20 °C.

Solubility: very slightly soluble in alcohol, miscible with light petroleum.

Relative density: about 0.931.

Refractive index: about 1.480.

IDENTIFICATION

First identification: B, C.

Second identification: A, B.

A. Identification of fatty oils by thin-layer chromatography (*2.3.2*). The chromatogram obtained is similar to the type chromatogram for linseed oil.

B. It complies with the test for iodine value (see Tests).

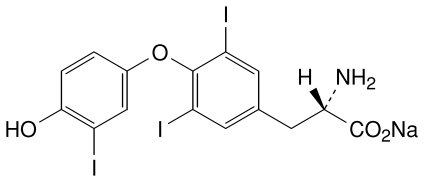
C. It complies with the test for composition of fatty acids (see Tests).

TESTS

Acid value (*2.5.1*): maximum 4.5.

Iodine value (*2.5.4*): 160 to 200.

Peroxide value (*2.5.5*): maximum 15.0.



Saponification value (*2.5.6*): 188 to 195. Carry out the saponification for 1 h.

Unsaponifiable matter (*2.5.7*): maximum 1.5 per cent, determined on 5.0 g.

LIOTHYRONINE SODIUM

Liothyroninum natricum

$C_{15}H_{11}I_3NNaO_4$ M_r 673

[55-06-1]

DEFINITION

Liothyronine sodium contains not less than 95.0 per cent and not more than the equivalent of 102.0 per cent of sodium (2*S*)-2-amino-3-[4-(4-hydroxy-3-iodophenoxy)-3,5-diiodophenyl]propanoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white or slightly coloured powder, practically insoluble in water, slightly soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, C, E.

Second identification: A, B, D, E.

A. It complies with the test for specific optical rotation (see Tests).

B. Dissolve 10.0 mg in *0.1 M sodium hydroxide* and dilute to 100.0 ml with the same solvent. Examined between 230 nm and 350 nm (*2.2.25*), the solution shows an absorption maximum at 319 nm. The specific absorbance at the maximum is 63 to 69, calculated with reference to the dried substance.

C. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *liothyronine sodium CRS*.

D. To about 50 mg in a porcelain dish add a few drops of *sulphuric acid R* and heat. Violet vapour is evolved.

E. Dissolve the residue obtained in the test for sulphated ash in 2 ml of *water R*. The solution gives reaction (a) of sodium (*2.3.1*).

TESTS

Solution S. Dissolve 0.250 g in a mixture of 1 volume of *1 M hydrochloric acid* and 4 volumes of *alcohol R* and dilute to 25.0 ml with the same mixture of solvents.

Appearance of solution. Freshly prepared solution S is not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*). + 18.0 to + 22.0, determined on solution S and calculated with reference to the dried substance.

Levothyroxine and other related substances. Examine the chromatograms obtained in the assay. In the chromatogram obtained with test solution (a), the area of any peak corresponding to levothyroxine is not greater than that of the principal peak in the chromatogram obtained with reference solution (c) (5.0 per cent) and the sum of the areas of all the peaks apart from the principal peak and any peak corresponding to levothyroxine is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (c) (2.5 per cent). Disregard any peak with an area less than that of the peak in the chromatogram obtained with reference solution (e).

Chlorides. Not more than 2.0 per cent, expressed as NaCl and calculated with reference to the dried substance. Dissolve 0.500 g in a 2 g/l solution of *sodium hydroxide R* and dilute to 100 ml with the same solvent. Add 15 ml of *dilute nitric acid R* and titrate with *0.05 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.05 M silver nitrate* is equivalent to 2.93 mg of NaCl.

Loss on drying (*2.2.32*). Not more than 4.0 per cent, determined on 0.500 g by drying in an oven at 105 °C for 2 h.

Sulphated ash (*2.4.14*). 9.0 per cent to 12.2 per cent, determined on 0.200 g and calculated with reference to the dried substance.

ASSAY

Examine by liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 20.0 mg in *methanolic sodium hydroxide solution R* and dilute to 100.0 ml with the same solvent.

Test solution (b). Dilute 5.0 ml of test solution (a) to 200 ml with *methanolic sodium hydroxide solution R*.

Reference solution (a). Dissolve 20.0 mg of *liothyronine sodium CRS* in *methanolic sodium hydroxide solution R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 200 ml with *methanolic sodium hydroxide solution R*.

Reference solution (c). Dissolve 5 mg of *levothyroxine sodium CRS* in *methanolic sodium hydroxide solution R* and dilute to 50.0 ml with same solvent. Dilute 10.0 ml of this solution to 100.0 ml with *methanolic sodium hydroxide solution R*.

Reference solution (d). Mix equal volumes of reference solution (b) and reference solution (c).

Reference solution (e). Dilute 1.0 ml of reference solution (b) to 25.0 ml with *methanolic sodium hydroxide solution R*.

The chromatographic procedure may be carried out using:

– a column 0.25 m long and 4 mm in internal diameter packed with *nitrile silica gel for chromatography R* (5-10 µm),

– as mobile phase at a flow rate of 1 ml/min a mixture of 5 volumes of *phosphoric acid R*, 300 volumes of *acetonitrile R* and 700 volumes of *water R*,

– as detector a spectrophotometer set at 225 nm,

– a loop injector.

Inject separately 50 µl of each solution. Record the chromatogram obtained with test solution (a) for 5 times the retention time of the principal peak. The test is not valid unless the resolution between the peaks corresponding to liothyronine and levothyroxine in the chromatogram obtained with reference solution (d) is at least 4 and the principal peak in the chromatogram obtained with reference solution (e) has a signal-to-noise ratio of at least 5. Calculate the content of $C_{15}H_{11}I_3NNaO_4$ from the peak areas in the chromatograms obtained with test solution (b) and reference solution (b) and the declared content of $C_{15}H_{11}I_3NNaO_4$ in *liothyronine sodium CRS*.

STORAGE

Store in an airtight container, protected from light, at a temperature between 2 °C and 8 °C.

01/2008:1536

LIQUORICE ETHANOLIC LIQUID EXTRACT, STANDARDISED

Liquiritiae extractum fluidum ethanolicum normatum

DEFINITION

Standardised liquorice ethanolic liquid extract is produced from *Liquorice root (0277)*. It contains not less than 3.0 per cent and not more than 5.0 per cent of glycyrrhizic acid ($C_{42}H_{62}O_{16}$; M_r 823).

PRODUCTION

The extract is produced from the drug and ethanol (70 per cent *V/V*), with an appropriate procedure for liquid extracts.

CHARACTERS

A dark brown, clear liquid with a faint characteristic odour and a sweet taste.

IDENTIFICATION

Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel F_{254} plate R*.

Test solution. Place 1.0 g of the extract to be examined in a 50 ml round-bottomed flask, add 16.0 ml of *water R* and 4.0 ml of *hydrochloric acid R1* and heat on a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Dry the filter and the round-bottomed flask at 105 °C for 60 min. Transfer the filter to the round-bottomed flask, add 20 ml of *ether R* and heat in a water-bath at 40 °C under a reflux condenser for 5 min. Allow to cool and filter. Evaporate the filtrate to dryness and dissolve the residue in 5.0 ml of *ether R*.

Reference solution. Dissolve 5.0 mg of *glycyrrhetic acid R* and 5.0 mg of *thymol R* in 5 ml of *ether R*.

Apply to the plate, as bands, 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 9 volumes of *water R*, 25 volumes of *ethanol (96 per cent) R* and 65 volumes of *ethyl acetate R*. Allow the plate to dry in air for 5 min and examine in ultraviolet light at 254 nm. The chromatograms obtained with the test solution and the reference solution show in the lower half a quenching zone due to glycyrrhetic acid. Spray the plate with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min and examine in daylight. The chromatogram obtained with the reference solution shows in the lower half, a violet zone (glycyrrhetic acid) and, in the upper third, a red zone (thymol). The chromatogram obtained with the test solution shows, in the lower half, a violet zone corresponding to glycyrrhetic acid in the chromatogram obtained with the reference solution and, in the upper third, below the zone of thymol in the chromatogram obtained with the reference solution, a yellow zone due to isoliquiritigenin. Further zones are present.

TESTS

Ethanol (*2.9.10*): 52 per cent *V/V* to 65 per cent *V/V*.

Methanol and 2-propanol (*2.9.11*): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

ASSAY

Examine by liquid chromatography (*2.2.29*).

Test solution. Dilute 1.000 g of the liquid extract to 100 ml with a mixture of 8 volumes of *dilute ammonia R1* and 92 volumes of *water R*. Centrifuge. Dilute 2.0 ml of the supernatant to 10.0 ml with a mixture of 8 volumes of *dilute ammonia R1* and 92 volumes of *water R*.

Stock solution. Dissolve 0.130 g of *monoammonium glycyrrhizate CRS* in a mixture of 8 volumes of *dilute ammonia R1* and 92 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 5.0 ml of the stock solution to 100.0 ml with a mixture of 8 volumes of *dilute ammonia R1* and 92 volumes of *water R*.

Reference solution (b). Dilute 10.0 ml of the stock solution to 100.0 ml with a mixture of 8 volumes of *dilute ammonia R1* and 92 volumes of *water R*.

Reference solution (c). Dilute 15.0 ml of the stock solution to 100.0 ml with a mixture of 8 volumes of *dilute ammonia R1* and 92 volumes of *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.10 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 6 volumes of *glacial acetic acid R*, 30 volumes of *acetonitrile R* and 64 volumes of *water R*,
- as detector a spectrophotometer set at 254 nm.

Inject 10 µl of reference solution (c). Adjust the sensitivity of the system so that the heights of the peaks are at least 50 per cent of the full scale of the recorder. Inject each reference solution and determine the peak areas.

Establish a calibration curve with the concentrations of the reference solutions (g/100 ml) as the abscissa and the corresponding peak areas as the ordinate.

Inject 10 µl of the test solution. Using the retention times and the peak areas determined from the chromatograms obtained with the reference solutions, locate and integrate the peak due to glycyrrhizic acid in the chromatogram obtained with the test solution.

Calculate the percentage content of glycyrrhizic acid from the expression:

$$A \times \frac{5}{m} \times B \times \frac{822}{840}$$

A = concentration of monoammonium glycyrrhizate in the test solution, determined from the calibration curve, in g/100 ml,

B = declared percentage content of *monoammonium glycyrrhizate CRS*,

m = mass of the liquid extract in grams,

822 = molecular mass of glycyrrhizic acid,

840 = molecular mass of monoammonium glycyrrhizate (without any water of crystallisation).

01/2008:0277
corrected 6.0

LIQUORICE ROOT

Liquiritiae radix

DEFINITION

Dried unpeeled or peeled, whole or cut root and stolons of *Glycyrrhiza glabra* L. and/or of *Glycyrrhiza inflata* Bat. and/or *Glycyrrhiza uralensis* Fisch.

Content: minimum 4.0 per cent of glycyrrhizic acid ($C_{42}H_{62}O_{16}$; M_r 823) (dried drug).

IDENTIFICATION

A. The root has few branches. Its bark is brownish-grey or brown with longitudinal striations and bears traces of lateral roots. The cylindrical stolons are 1-2 cm in diameter; their external appearance is similar to that of the root but there are occasional small buds. The fracture of the root and the stolon is granular and fibrous. The cork layer is thin; the secondary phloem region is thick and light yellow with radial striations. The yellow xylem cylinder is compact, with a radiate structure. The stolon has a central pith, which is absent from the root. The external part of the bark is absent from the peeled root.

B. Reduce to a powder (355) (*2.9.12*). The powder is light yellow or faintly greyish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of yellow thick-walled fibres, 700-1200 µm long and 10-20 µm wide with a punctiform lumen, often accompanied by crystal sheaths containing prisms of calcium oxalate 10-35 µm long and 2-5 µm wide. The walls of the large vessels are yellow, 5-10 µm thick, lignified and have numerous bordered pits with a slit-shaped aperture; fragments of cork consisting of thin-walled cells and isolated prisms of calcium oxalate occur as well as fragments of parenchymatous tissue. Fragments of cork are absent from the peeled root. Examine under a microscope using a mixture of equal volumes of *glycerol R* and *water R*. The powder shows the following diagnostic characters: simple, round or oval starch granules, 2-20 µm in diameter.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 0.50 g of the powdered drug (180) (*2.9.12*) in a 50 ml round-bottomed flask add 16.0 ml of *water R* and 4.0 ml of *hydrochloric acid R1* and heat on a water-bath under a reflux condenser for 30 min. Cool and filter. Dry the filter and the round-bottomed flask at 105 °C for 60 min. Place the filter in the round-bottomed flask, add 20.0 ml of *ether R* and heat in a water-bath at

40 °C under a reflux condenser for 5 min. Cool and filter. Evaporate the filtrate to dryness. Dissolve the residue in 5.0 ml of *ether R*.

Reference solution. Dissolve 5.0 mg of *glycyrrhetic acid R* and 5.0 mg of *thymol R* in 5.0 ml of *ether R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *concentrated ammonia R, water R, ethanol (96 per cent) R, ethyl acetate R* (1:9:25:65 *V/V/V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air for 5 min.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the chromatograms obtained with the test solution and with the reference solution show in the lower half a quenching zone due to glycyrrhetic acid.

Detection B: spray with *anisaldehyde solution R*, and heat at 100-105 °C for 5-10 min; examine in daylight.

Results B: the chromatogram obtained with the reference solution shows in the lower half a violet zone due to glycyrrhetic acid and in the upper third a red zone due to thymol. The chromatogram obtained with the test solution shows in the lower half a violet zone corresponding to the zone of glycyrrhetic acid in the chromatogram obtained with the reference solution and a yellow zone (isoliquiridigenine) in the upper third under the zone of thymol in the chromatogram obtained with the reference solution. Further zones may be present.

TESTS

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 10.0 per cent for the unpeeled drug and maximum 6.0 per cent for the peeled drug.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 2.0 per cent for the unpeeled drug and maximum 0.5 per cent for the peeled drug.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Place 1.000 g of the powdered drug (180) (*2.9.12*) in a 150 ml ground glass conical flask. Add 100.0 ml of an 8 g/l solution of *ammonia R* and treat in a ultrasonic bath for 30 min. Centrifuge a part of the solution and dilute 1.0 ml of the supernatant layer to 5.0 ml with an 8 g/l solution of *ammonia R*. Filter the solution through a filter (0.45 µm) and use the filtrate as the test solution.

Solution A. Dissolve 0.130 g of *monoammonium glycyrrhizate CRS* in an 8 g/l solution of *ammonia R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dilute 5.0 ml of solution A to 100.0 ml with an 8 g/l solution of *ammonia R*.

Reference solution (b). Dilute 10.0 ml of solution A to 100.0 ml with an 8 g/l solution of *ammonia R*.

Reference solution (c). Dilute 15.0 ml of solution A to 100.0 ml with an 8 g/l solution of *ammonia R*.

Column:

- *size*: *l* = 0.10 m, Ø = 4 mm;
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: *glacial acetic acid R, acetonitrile R, water R* (6:30:64 *V/V/V*).

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 10 µl.

Establish a calibration curve with the concentration of the reference solutions (g/100 ml) as the abscissa and the corresponding areas as the ordinate.

Using the retention time and the peak area determined from the chromatograms obtained with the reference solutions, locate and integrate the peak due to glycyrrhizic acid in the chromatogram obtained with the test solution.

Calculate the percentage content of glycyrrhizic acid from the following expression:

$$A \times \frac{5}{m} \times B \times \frac{822}{840}$$

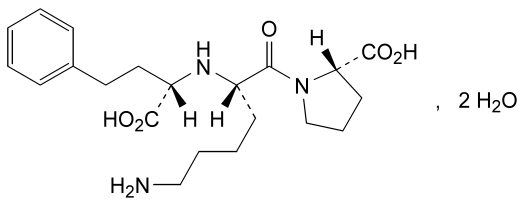
A = concentration of monoammonium glycyrrhizate in the test solution determined from the calibration curve, in g/100 ml;

B = declared percentage content of *monoammonium glycyrrhizate CRS*;

m = mass of the drug, in grams;

822 = molecular weight of glycyrrhizic acid;

840 = molecular weight of the monoammonium glycyrrhizate (without any water of crystallisation).



LABELLING

The label states whether the drug is peeled or unpeeled.

corrected 6.0

LISINOPRIL DIHYDRATE

Lisinoprilum dihydricum

$C_{21}H_{31}N_3O_5,2H_2O$ M_r 441.5
[83915-83-7]

DEFINITION

(2*S*)-1-[(2*S*)-6-Amino-2-[[(1*S*)-1-carboxy-3-phenylpropyl]-amino]hexanoyl]pyrrolidine-2-carboxylic acid dihydrate.

Content: 98.5 per cent to 101.5 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water, sparingly soluble in methanol, practically insoluble in acetone and in anhydrous ethanol.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *lisinopril dihydrate CRS*.

TESTS

Specific optical rotation (*2.2.7*): – 43 to – 47 (anhydrous substance).

Dissolve 0.5 g in *zinc acetate solution R* and dilute to 50.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 20.0 mg of the substance to be examined in mobile phase A and dilute to 10.0 ml with mobile phase A.

Reference solution (a). Dissolve the contents of 1 vial of *lisinopril dihydrate for performance test CRS* with 1.0 ml of mobile phase A.

Reference solution (b). Dilute 0.5 ml of the test solution to 50.0 ml with mobile phase A.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: *octylsilyl silica gel for chromatography R*;
- *temperature*: 50 °C.

Mobile phase:

- *mobile phase A*: mix 30 volumes of *acetonitrile R* and 970 volumes of a 3.12 g/l *sodium dihydrogen phosphate R* solution adjusted to pH 5.0 with a 50 g/l solution of *sodium hydroxide R*;
- *mobile phase B*: mix 200 volumes of *acetonitrile R* and 800 volumes of a 3.12 g/l *sodium dihydrogen phosphate R* solution adjusted to pH 5.0 with a 50 g/l solution of *sodium hydroxide R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 35	100 → 70	0 → 30
35 - 45	70	30
45 - 50	70 → 100	30 → 0

Flow rate: 1.8 ml/min.

Detection: spectrophotometer at 210 nm.

Equilibration: with mobile phase A for at least 30 min.

Injection: 20 µl.

System suitability: reference solution (a):

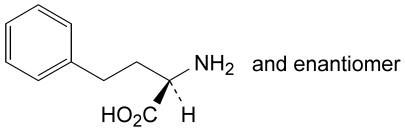
- the chromatogram obtained is similar to the chromatogram supplied with *lisinopril dihydrate for performance test CRS* in that the peaks due to impurity A and impurity E fall on either side of the peak due to lisinopril;
- *peak-to-valley ratio*: minimum 9, where H_p = height above the baseline of the peak due to impurity A and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to lisinopril, and minimum 9 where H_p = height above the baseline of the peak due to impurity E and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to lisinopril; if necessary, adjust the pH of the mobile phase to 4.5 with *phosphoric acid R*; a further adjustment to pH 4.0 may be necessary with some columns before satisfactory separation of impurity A, lisinopril and impurity E is obtained; if, after adjustment, the retention time of the peak due to impurities C and D becomes extended to the point where integration becomes difficult, increase the content of mobile phase B from 30 per cent to 40 per cent over the interval from 35-45 min from the start of the chromatogram; maintain this concentration for a further 10 min and return the concentration of mobile phase A to 100 per cent over the next 10 min prior to the next injection.

Limits:

- *impurities A, B, C, D, E, F*: for each impurity, not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *sum of impurities other than E*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard any peak occurring in the first 3 min.

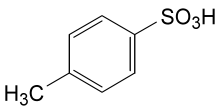
Water (*2.5.12*): 8.0 per cent to 9.5 per cent, determined on 0.200 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.



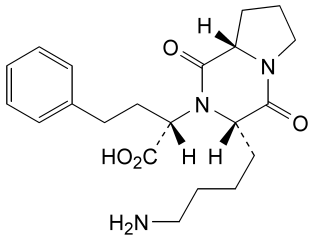
ASSAY

Dissolve 0.350 g in 50 ml of *distilled water R*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (*2.2.20*).

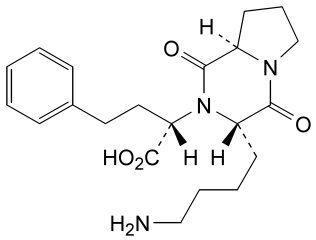


1 ml of *0.1 M sodium hydroxide* is equivalent to 40.55 mg of $C_{21}H_{31}N_3O_5$.

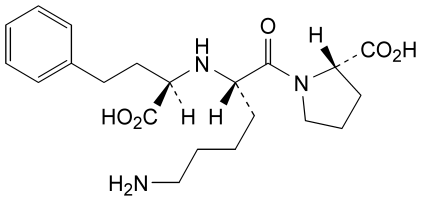
IMPURITIES



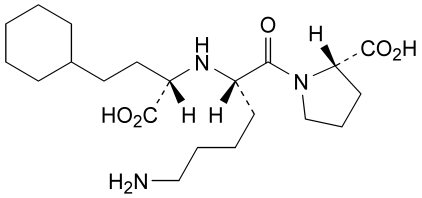
Specified impurities: A, B, C, D, E, F.



A. (2*RS*)-2-amino-4-phenylbutanoic acid,



B. 4-methylbenzenesulphonic acid,



C. (2*S*)-2-[(3*S*,8a*S*)-3-(4-aminobutyl)-1,4-dioxohexahydropyrrolo[1,2-*a*]pyrazin-2(1*H*)-yl]-4-phenylbutanoic acid (*S*,*S*,*S*-diketopiperazine),

D. (2*S*)-2-[(3*S*,8a*R*)-3-(4-aminobutyl)-1,4-dioxohexahydropyrrolo[1,2-*a*]pyrazin-2(1*H*)-yl]-4-phenylbutanoic acid (*R*,*S*,*S*-diketopiperazine),

E. (2*S*)-1-[(2*S*)-6-amino-2-[[(1*R*)-1-carboxy-3-phenylpropyl]amino]hexanoyl]pyrrolidine-2-carboxylic acid (lisinopril *R,S,S*-isomer),

F. (2*S*)-1-[(2*S*)-6-amino-2-[[(1*S*)-1-carboxy-3-cyclohexylpropyl]amino]hexanoyl]pyrrolidine-2-carboxylic acid (cyclohexyl analogue).

01/2008:0228
corrected 6.0

LITHIUM CARBONATE

Lithii carbonas

Li_2CO_3 M_r 73.9
[554-13-2]

DEFINITION

Content: 98.5 per cent to 100.5 per cent.

CHARACTERS

Appearance: white or almost white powder.

Solubility: slightly soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. When moistened with *hydrochloric acid R*, it gives a red colour to a non-luminous flame.

B. Dissolve 0.2 g in 1 ml of *hydrochloric acid R*. Evaporate to dryness on a water-bath. The residue dissolves in 3 ml of *ethanol (96 per cent) R*.

C. It gives the reaction of carbonates (*2.3.1*).

TESTS

Solution S. Suspend 10.0 g in 30 ml of *distilled water R* and dissolve by the addition of 22 ml of *nitric acid R*. Add *dilute sodium hydroxide solution R* until the solution is neutral and dilute to 100 ml with *distilled water R*.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Chlorides (*2.4.4*): maximum 200 ppm.

Dilute 2.5 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 200 ppm.

Disperse 1.25 g in 5 ml of *distilled water R* and dissolve by adding 5 ml of *hydrochloric acid R1*. Boil for 2 min. Cool and add *dilute sodium hydroxide solution R* until neutral. Dilute to 25 ml with *distilled water R*.

Arsenic (*2.4.2, Method A*): maximum 2 ppm, determined on 0.5 g.

Calcium (*2.4.3*): maximum 200 ppm.

Dilute 5 ml of solution S to 15 ml with *distilled water R*.

Iron (*2.4.9*): maximum 20 ppm.

Dilute 5 ml of solution S to 10 ml with *water R*.

Magnesium (*2.4.6*): maximum 150 ppm.

Dilute 1 ml of solution S to 10 ml with *water R*. Dilute 6.7 ml of this solution to 10 ml with *water R*.

Potassium: maximum 3.00×10^2 ppm.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution. Dissolve 1.0 g in 10 ml of *hydrochloric acid R1* and dilute to 50.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using a solution of *potassium chloride R* containing 500 µg of K per millilitre, diluted as necessary with *water R*.

Wavelength: 766.5 nm.

Sodium: maximum 3.00×10^2 ppm.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution. Dissolve 1.0 g in 10 ml of *hydrochloric acid R1* and dilute to 50.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using a solution of *sodium chloride R* containing 500 µg of Na per millilitre, diluted as necessary with *water R*.

Wavelength: 589 nm.

Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

ASSAY

Dissolve 0.500 g in 25.0 ml of *1 M hydrochloric acid*. Titrate with *1 M sodium hydroxide*, using *methyl orange solution R* as indicator.

1 ml of *1 M hydrochloric acid* is equivalent to 36.95 mg of Li_2CO_3.

01/2008:0621

LITHIUM CITRATE

Lithii citras

$C_6H_5Li_3O_7,4H_2O$ M_r 282.0

DEFINITION

Trilithium 2-hydroxypropane-1,2,3-tricarboxylate tetrahydrate.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, fine crystalline powder.

Solubility: freely soluble in water, slightly soluble in ethanol (96 per cent).

IDENTIFICATION

A. When moistened with *hydrochloric acid R*, it gives a red colour to a non-luminous flame.

B. Dilute 3 ml of solution S (see Tests) to 10 ml with *water R*. Add 3 ml of *potassium ferriperiodate solution R*. A white or yellowish-white precipitate is formed.

C. To 1 ml of solution S add 4 ml of *water R*. The solution gives the reaction of citrates (*2.3.1*).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. Not more than 0.2 ml of *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Readily carbonisable substances. To 0.20 g of the powdered substance to be examined add 10 ml of *sulphuric acid R* and heat in a water-bath at 90 ± 1 °C for 60 min. Cool rapidly. The solution is not more intensely coloured than reference solution Y_2 or GY_2 (*2.2.2, Method II*).

Chlorides (*2.4.4*): maximum 100 ppm.

Dilute 5 ml of solution S to 15 ml with *water R*.

Oxalates: maximum 300 ppm, calculated as anhydrous oxalate ion.

Dissolve 0.50 g in 4 ml of *water R*, add 3 ml of *hydrochloric acid R* and 1 g of *zinc R* in granules and heat on a water-bath for 1 min. Allow to stand for 2 min, decant the liquid into a test-tube containing 0.25 ml of a 10 g/l solution of *phenylhydrazine hydrochloride R* and heat to boiling. Cool rapidly, transfer to a graduated cylinder and add an equal volume of *hydrochloric acid R* and 0.25 ml of *potassium ferricyanide solution R*. Shake and allow to stand for 30 min. Any pink colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 4 ml of a 0.05 g/l solution of *oxalic acid R*.

Sulphates (*2.4.13*): maximum 500 ppm.

To 3 ml of solution S add 2 ml of *hydrochloric acid R1* and dilute to 17 ml with *distilled water R*. Prepare the reference solution using 15 ml of a mixture of 2 ml of *hydrochloric acid R1* and 15 ml of *sulphate standard solution (10 ppm SO_4) R* and compare the opalescence after 15 min.

Heavy metals (*2.4.8*): maximum 10 ppm.

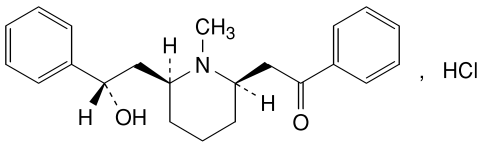
12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): 24.0 per cent to 27.0 per cent, determined on 0.100 g. After adding the substance to be examined, stir for 15 min before titrating. Carry out a blank titration.

ASSAY

Dissolve 80.0 mg in 50 ml of *anhydrous acetic acid R*, heating to about 50 °C. Allow to cool. Titrate with *0.1 M perchloric acid*, using 0.25 ml of *naphtholbenzein solution R* as indicator, until the colour changes from yellow to green.

1 ml of *0.1 M perchloric acid* is equivalent to 7.00 mg of $C_6H_5Li_3O_7$.



STORAGE

In an airtight container.

01/2008:1988

LOBELINE HYDROCHLORIDE

Lobelini hydrochloridum

$C_{22}H_{28}ClNO_2$ M_r 373.9
[134-63-4]

DEFINITION

2-[(2*R*,6*S*)-6-[(2*S*)-2-Hydroxy-2-phenylethyl]-1-methylpiperidin-2-yl]-1-phenylethanone hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, microcrystalline powder.

Solubility: sparingly soluble in water, freely soluble in alcohol, soluble in methylene chloride.

IDENTIFICATION

First identification: A, B.

Second identification: B, C.

A. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *lobeline hydrochloride CRS*.

B. Solution S (see Tests) gives reaction (a) of chlorides (*2.3.1*).

C. Examine the chromatograms obtained in the test for foreign alkaloids.
Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (b).

TESTS

Solution S. Dissolve 0.250 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*): 4.6 to 6.4 for solution S.

Specific optical rotation (*2.2.7*): – 55 to – 59 (dried substance), determined on solution S.

Foreign alkaloids. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 5.0 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dilute 0.1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (b). Dissolve 10 mg of *lobeline hydrochloride CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Plate: *TLC silica gel GF_{254} plate R*.

Mobile phase: *diethylamine R, cyclohexane R* (10:90 *V/V*).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: at 120 °C.

Detection: examine in ultraviolet light at 254 nm.

Limits: in the chromatogram obtained with test solution (a):

– *any impurity*: any spot, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *phenytoin CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. To 1 ml of the solution add 0.1 ml of the test solution and dilute to 25 ml with the mobile phase.

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm,

– *stationary phase*: spherical *end-capped octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dissolve 1.0 g of *sodium methanesulphonate R* and 2.50 g of *disodium hydrogen phosphate dihydrate R* in a mixture of 3 volumes of a 6.7 per cent *V/V* solution of *phosphoric acid R*, 29 volumes of *acetonitrile R* and 70 volumes of *water R* and dilute to 1000 ml with the same mixture of solvents.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 µl.

Run time: 2 times the retention time of lobeline which is about 17 min.

System suitability: reference solution (b):

– *resolution*: minimum 4.0 between the peaks due to phenytoin and to lobeline.

Limits:

– *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *total*: maximum of 2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),

– *disregard level*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

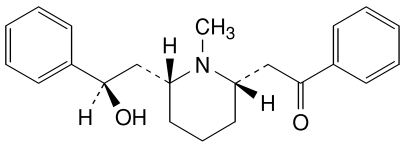
Sulphates (*2.4.13*): maximum 0.1 per cent.

15 ml of solution S complies with the limit test for sulphates.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g *in vacuo*.

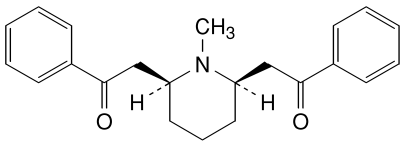
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on the residue obtained in the test for loss on drying.

ASSAY



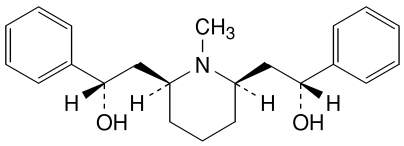
Dissolve 0.300 g in 50 ml of *alcohol R*. Add 5 ml of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 37.39 mg of $C_{22}H_{28}ClNO_2$.

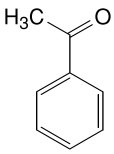


STORAGE

Protected from light.



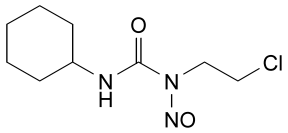
IMPURITIES



A. 2-[(2*S*,6*R*)-6-[(2*R*)-2-hydroxy-2-phenylethyl]-1-methylpiperidin-2-yl]-1-phenylethanone ((+)-lobeline),

B. 2,2′-[(2*R*,6*S*)-1-methylpiperidine-2,6-diyl]bis(1-phenylethanone) (lobelanine),

C. *meso*-(1*R*,1′*S*)-2,2′-[(2*R*,6*S*)-1-methylpiperidine-2,6-diyl]bis(1-phenylethanol) (lobelanidine),



D. acetophenone.

01/2008:0928

LOMUSTINE

Lomustinum

$C_9H_{16}ClN_3O_2$ M_r 233.7

[13010-47-4]

DEFINITION

1-(2-Chloroethyl)-3-cyclohexyl-1-nitrosourea.

Content: 98.5 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: yellow, crystalline powder.

Solubility: practically insoluble in water, freely soluble in acetone and in methylene chloride, soluble in ethanol (96 per cent).

Carry out the tests protected from light and prepare all the solutions immediately before use.

IDENTIFICATION

First identification: C.

Second identification: A, B, D, E.

A. Melting point (*2.2.14*): 89 °C to 91 °C.

B. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 50.0 mg in *ethanol (96 per cent) R* and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *ethanol (96 per cent) R*.

Spectral range: 220-350 nm.

Absorption maximum: at 230 nm.

Specific absorbance at the absorption maximum: 250 to 270.

C. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *lomustine CRS*.

D. Examine the chromatograms obtained in the test for related substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

E. Dissolve about 25 mg in 1 ml of *methanol R*, add 0.1 ml of *dilute sodium hydroxide solution R* and 2 ml of *water R*. Acidify by adding dropwise *dilute nitric acid R*. Filter. The filtrate gives reaction (a) of chlorides (*2.3.1*).

TESTS

Related substances

A. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 0.25 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 25 ml with *methanol R*.

Reference solution (a). Dissolve 10 mg of *lomustine CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 10 ml with *methanol R*.

Reference solution (c). Dilute 1 ml of test solution (b) to 20 ml with *methanol R*.

Reference solution (d). Dissolve 10 mg of *lomustine CRS* and 10 mg of *dicyclohexylurea R* (impurity C) in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R*.

Mobile phase: *glacial acetic acid R, toluene R* (20:80 *V/V*).

Application: 5 µl.

Development: over a path of 15 cm.

Drying: at 110 °C for 1 h.

Chlorine treatment: place at the bottom of a chromatography tank an evaporating dish containing a mixture of 1 volume of *hydrochloric acid R1*, 1 volume of *water R* and 2 volumes of a 15 g/l solution of *potassium permanganate R*; close the tank and allow to stand for 15 min; place the dried plate in the tank and close the tank; leave the plate in contact with the chlorine vapour for 5 min; withdraw the plate and place it in a current of cold air until the excess of chlorine is removed and an area of coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution R*.

Detection: spray with *potassium iodide and starch solution R*.

System suitability: reference solution (d):

– the chromatogram shows 2 clearly separated principal spots.

Limit: test solution (a):

– *impurities A, B, C*: any spot, apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.4 per cent) and at most one such spot is more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

B. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.25 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4 mm;

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5-10 µm).

Mobile phase: *methanol R, water R* (50:50 *V/V*).

Flow rate: 2 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl.

Limits:

– *total*: not more than the area of the principal peak in the chromatogram obtained with the reference solution (1 per cent);

– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

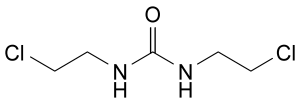
Chlorides (*2.4.4*): maximum 500 ppm.

Dissolve 0.24 g in 4 ml of *methanol R* and add 20 ml of *water R*. Allow to stand for 20 min and filter. To 10 ml of the filtrate, add 5 ml of *methanol R*. When preparing the standard, replace the 5 ml of *water R* with 5 ml of *methanol R*.

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in a desiccator over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa for 24 h.

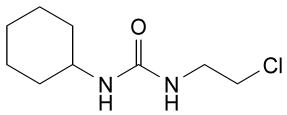
ASSAY

Dissolve 0.200 g in about 3 ml of *ethanol (96 per cent) R* and add 20 ml of a 200 g/l solution of *potassium hydroxide R* and boil under a reflux condenser for 2 h. Add 75 ml of *water R* and 4 ml of *nitric acid R*. Cool and titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.



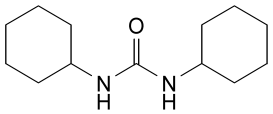
1 ml of *0.1 M silver nitrate* is equivalent to 23.37 mg of $C_9H_{16}ClN_3O_2$.

STORAGE



Protected from light.

IMPURITIES



Specified impurities: A, B, C.

A. 1,3-bis(2-chloroethyl)urea,

B. 1-(2-chloroethyl)-3-cyclohexylurea,

C. 1,3-dicyclohexylurea.

01/2008:1537
corrected 6.0

LOOSESTRIFE

Lythri herba

DEFINITION

Dried flowering tops, whole or cut, of *Lythrum salicaria* L.

Content: minimum 5.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

IDENTIFICATION

A. The stems are rigid, four-angled, branching at the top, brownish-green, longitudinally wrinkled and pubescent. The leaves are opposite, decussate, rarely verticillate in threes and sometimes alternate at the inflorescence which forms a long terminal spike. The leaves are sessile, lanceolate and cordate at the base, 5-15 cm long and 1-2.5 cm wide, pubescent on the lower surface; the subsidiary veins form arcs that anastomose near the leaf margin. The flowers have a pubescent, tubular, persistent gamosepalous calyx, 4-8 mm long, consisting of 6 sepals bearing 6 small, triangular teeth alternating with 6 large acute teeth at least half as long as the tube; a polypetalous corolla consisting of 6 violet-pink petals, each expanded at the top with a wavy outline and narrowing at the base. The androecium consists of 2 verticils of 6 stamens (one verticil with short, barely emerging stamens, the other with long stamens extending well out of the corolla). The fruit, if formed, is a small capsule included in the persistent calyx.

B. Reduce to a powder (355) (*2.9.12*). The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: unicellular or bicellular, uniseriate, thick-walled, finely pitted covering trichomes from the lower epidermis of the stem and leaf; numerous uniseriate, unicellular or bicellular, thin-walled, finely pitted covering trichomes from the calyx; transparent violet-pink fragments from the petals; numerous cluster crystals of calcium oxalate; pollen grains with 3 pores and a thin and slightly granular exine; fragments of the upper epidermis with large polygonal cells and sinuous walls; fragments of the lower epidermis with smaller polygonal cells and anomocytic stomata (*2.8.3*).

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methanol R* and heat in a water-bath at 65 °C for 5 min with frequent shaking. Cool and filter. Dilute the filtrate to 10 ml with *methanol R*.

Reference solution. Dissolve 0.5 mg of *chlorogenic acid R*, 1 mg of *hyperoside R*, 1 mg of *rutin R* and 1 mg of *vitexin R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous acetic acid R, anhydrous formic acid R, water R, ethyl acetate R* (7.5:7.5:18:67 *V/V/V/V*).

Application: 10 µl as bands.

Development: over a path of 15 cm.

Drying: at 100-105 °C.

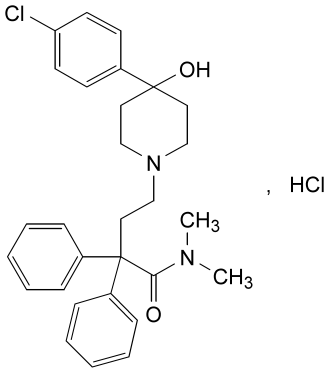
Detection: spray the plate while still warm with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results: the chromatogram obtained with the reference solution shows in the lower third a yellowish-brown fluorescent zone due to rutin and in the middle third a light blue fluorescent zone due to chlorogenic acid, above it a yellowish-brown fluorescent zone due to hyperoside and a green fluorescent zone due to vitexin. The chromatogram obtained with the test solution shows a bright green fluorescent zone slightly above the zone due to rutin in the chromatogram obtained with the reference solution, a yellow fluorescent zone similar in position to the zone due to chlorogenic acid in the chromatogram obtained with the reference solution, a yellow fluorescent zone similar in position to the zone due to hyperoside in the chromatogram obtained with the reference solution and a bright green fluorescent zone corresponding to the zone due to vitexin in the chromatogram obtained with the reference solution.

TESTS

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C.

Total ash (*2.4.16*): maximum 7.0 per cent.



ASSAY

Carry out the determination of tannins in herbal drugs (*2.8.14*). Use 0.750 g of the powdered drug (180) (*2.9.12*).

01/2008:0929
corrected 6.0

LOPERAMIDE HYDROCHLORIDE

Loperamidi hydrochloridum

$C_{29}H_{34}Cl_2N_2O_2$ M_r 513.5
[34552-83-5]

DEFINITION

4-[4-(4-Chlorophenyl)-4-hydroxypiperidin-1-yl]-*N*,*N*-dimethyl-2,2-diphenylbutanamide hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: slightly soluble in water, freely soluble in alcohol and in methanol.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *loperamide hydrochloride CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *methylene chloride R*, evaporate to dryness and record new spectra using the residues.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of *loperamide hydrochloride for system suitability CRS* in *methanol R* and dilute to 1.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 25.0 ml with *methanol R*.

Column:

- *size*: *l* = 0.10 m, Ø = 4.6 mm,
- *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm),
- *temperature*: 35 °C.

Mobile phase:

- *mobile phase A*: 17.0 g/l solution of *tetrabutylammonium hydrogen sulphate R1*,
- *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	90 → 30	10 → 70
15 - 17	30	70
17 - 19	30 → 90	70 → 10
19 - 24	90	10

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 10 µl.

System suitability: reference solution (a):

- *peak-to-valley ratio*: minimum 1.5, where H_p = height above the baseline of the peak due to impurity G and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity H;
- *peak-to-valley ratio*: minimum 1.5, where H_p = height above the baseline of the peak due to impurity E and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity A;
- the chromatogram obtained is concordant with the chromatogram supplied with *loperamide hydrochloride for system suitability CRS*.

Limits:

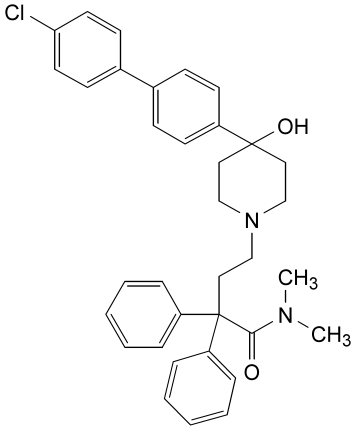
- *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 1.3; impurity D = 1.7;
- *impurities A, B, C, D, E, F, G, H*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *any other impurity*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);
- *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

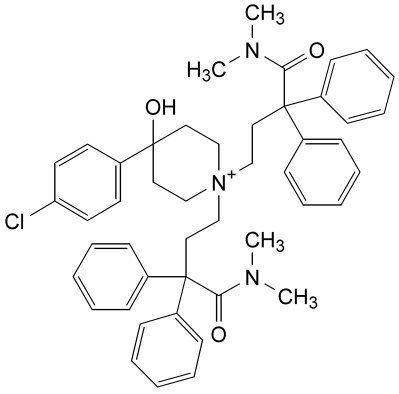
ASSAY

Dissolve 0.400 g in 50 ml of *alcohol R* and add 5.0 ml of *0.01 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.



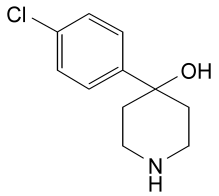
1 ml of *0.1 M sodium hydroxide* is equivalent to 51.35 mg of $C_{29}H_{34}Cl_2N_2O_2$.

STORAGE

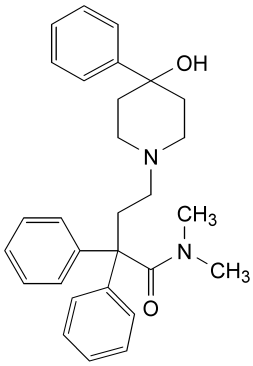


Protected from light.

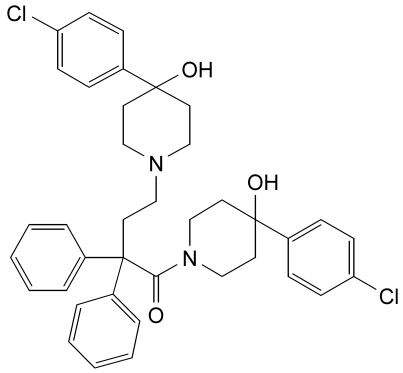
IMPURITIES



Specified impurities: A, B, C, D, E, F, G, H.

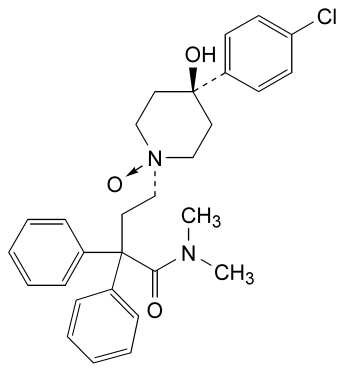


A. 4-[4-(4′-chlorobiphenyl-4-yl)-4-hydroxypiperidin-1-yl]-*N*,*N*-dimethyl-2,2-diphenylbutanamide,

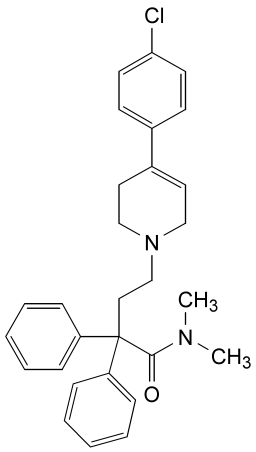


B. 4-(4-chlorophenyl)-1,1-bis[4-(dimethylamino)-4-oxo-3,3-diphenylbutyl]-4-hydroxypiperidinium,

C. 4-(4-chlorophenyl)piperidin-4-ol,



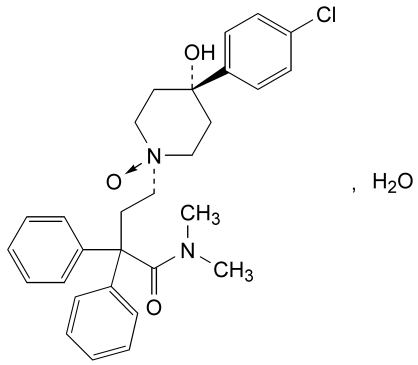
D. 4-(4-hydroxy-4-phenylpiperidin-1-yl)-*N*,*N*-dimethyl-2,2-diphenylbutanamide,



E. 4-(4-chlorophenyl)-1-[4-[4-(4-chlorophenyl)-4-hydroxypiperidin-1-yl]-2,2-diphenylbutanoyl]piperidin-4-ol,

F. loperamide oxide,

G. 4-[*cis*-4-(4-chlorophenyl)-4-hydroxy-1-oxidopiperidin-1-yl]-*N*,*N*-dimethyl-2,2-diphenylbutanamide,



H. 4-[4-(4-chlorophenyl)-3,6-dihydropyridin-1(2*H*)-yl]-*N*,*N*-dimethyl-2,2-diphenylbutanamide.

01/2008:1729

LOPERAMIDE OXIDE MONOHYDRATE

Loperamidi oxidum monohydricum

$C_{29}H_{33}ClN_2O_3,H_2O$ M_r 511.1

DEFINITION

4-[*trans*-4-(4-Chlorophenyl)-4-hydroxy-1-oxidopiperidin-1-yl]-*N*,*N*-dimethyl-2,2-diphenylbutanamide monohydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder, slightly hygroscopic.

Solubility: practically insoluble in water, freely soluble in alcohol and in methylene chloride.

mp: about 152 °C, with decomposition.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *loperamide oxide monohydrate CRS*.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *loperamide hydrochloride CRS* in *methanol R*, add 0.5 ml of the test solution and dilute to 100.0 ml with *methanol R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 25.0 ml with *methanol R*.

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm,
– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm),
– *temperature*: 35 °C.

Mobile phase:

– *mobile phase A*: 17.0 g/l solution of *tetrabutylammonium hydrogen sulphate R1*,
– *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	90 → 30	10 → 70
15 - 17	30	70
17 - 19	30 → 90	70 → 10
19 - 24	90	10

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 10 µl.

Relative retention with reference to loperamide oxide (retention time = about 7 min): impurity A = about 0.9; impurity B = about 1.11; impurity C = about 1.13.

System suitability: reference solution (a):

– *resolution*: minimum 3.8 between the peaks due to loperamide oxide and impurity A.

Limits:

– *impurities A, B, C*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
– *any other impurity*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
– *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
– *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

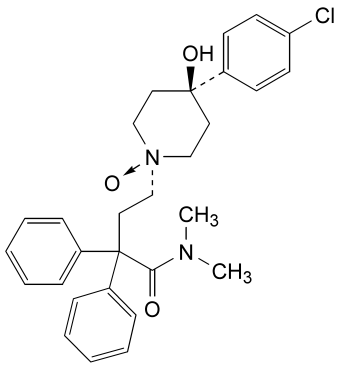
Water (*2.5.12*): 3.4 per cent to 4.2 per cent, determined on 0.500 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

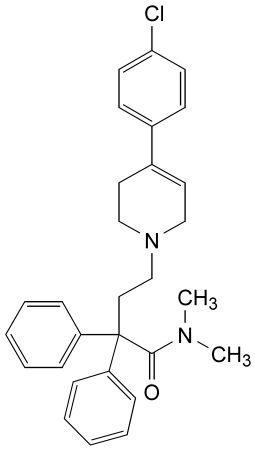
Dissolve 0.350 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with *0.1 M perchloric acid* using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of *0.1 M perchloric acid* is equivalent to 49.30 mg of $C_{29}H_{33}ClN_2O_3$.



STORAGE

In an airtight container, protected from light.

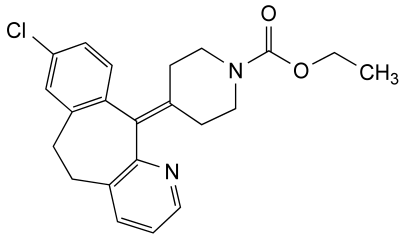


IMPURITIES

Specified impurities: A, B, C.

A. loperamide,

B. 4-[*cis*-4-(4-chlorophenyl)-4-hydroxy-1-oxidopiperidin-1-yl]-*N*,*N*-dimethyl-2,2-diphenylbutanamide,



C. 4-[4-(4-chlorophenyl)-3,6-dihydropyridin-1(2*H*)-yl]-*N*,*N*-dimethyl-2,2-diphenylbutanamide.

01/2008:2124

LORATADINE

Loratadinum

$C_{22}H_{23}ClN_2O_2$ M_r 382.9

[79794-75-5]

DEFINITION

Ethyl 4-(8-chloro-5,6-dihydro-11*H*-benzo[5,6]cyclohepta-[1,2-*b*]pyridin-11-ylidene)piperidine-1-carboxylate.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in acetone and in methanol.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *loratadine CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

Dissolve 1.0 g in *methanol R* and dilute to 20.0 ml with the same solvent.

Impurity H. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 25 mg of *isoamyl benzoate R* in *methylene chloride R* and dilute to 100 ml with the same solvent. Dilute 5.0 ml of this solution to 50 ml with *methylene chloride R*.

Test solution. Dissolve 25.0 mg of the substance to be examined in *methylene chloride R*, add 1.0 ml of reference solution (a) and 1.0 ml of the internal standard solution and dilute to 5.0 ml with *methylene chloride R*.

Reference solution (a). Dissolve 25.0 mg of *loratadine impurity H CRS* in *methylene chloride R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of this solution to 50.0 ml with *methylene chloride R*.

Reference solution (b). To 1.0 ml of reference solution (a) add 1.0 ml of the internal standard solution and dilute to 5.0 ml with *methylene chloride R*.

Column:

- *material*: fused silica;
- *size*: *l* = 25 m, Ø = 0.32 mm;
- *stationary phase*: *poly(dimethyl)siloxane R* (film thickness 0.52 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.0 ml/min.

Split ratio: 1:30.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	80
	1 - 23	80 → 300
	23 - 33	300
Injection port		260
Detector		300

Detection: flame ionisation.

Injection: 1 µl of the test solution and reference solution (b).

Relative retention with reference to loratadine (retention time = about 32 min): impurity H = about 0.33; isoamyl benzoate = about 0.37.

System suitability: reference solution (b):

- *resolution*: minimum 2.0 between the peaks due to impurity H and isoamyl benzoate;
- *signal-to-noise ratio*: minimum 10 for the peak due to impurity H.

Limit:

- *impurity H*: calculate the ratio (*R*) of the area of the peak due to impurity H to the area of the peak due to isoamyl benzoate from the chromatogram obtained with reference solution (b); from the chromatogram obtained with the test solution, calculate the ratio of the area of the peak due to impurity H to the area of the peak due to isoamyl benzoate: this ratio is not greater than twice *R* (0.1 per cent).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *loratadine impurity F CRS* in the mobile phase and dilute to 25 ml with the mobile phase. Dilute 1 ml of this solution to 10 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *loratadine for system suitability CRS* (containing impurities A and E) in the mobile phase, add 0.5 ml of reference solution (a) and dilute to 5 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with very low silanol activity;
- *temperature*: 40 °C.

Mobile phase: mix 30 volumes of *methanol R*, 35 volumes of a 6.8 g/l solution of *potassium dihydrogen phosphate R* previously adjusted to pH 2.80 ± 0.05 with *phosphoric acid R* and 40 volumes of *acetonitrile R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl of the test solution and reference solutions (b) and (c).

Run time: 5 times the retention time of loratadine.

Identification of impurities: use the chromatogram supplied with *loratadine for system suitability CRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to impurities A and E.

Relative retention with reference to loratadine (retention time = about 12 min): impurity D = about 0.2; impurity B = about 0.4; impurity F = about 0.9; impurity E = about 1.1; impurity A = about 2.4; impurity C = about 2.7.

System suitability: reference solution (b):

- *peak-to-valley ratio*: minimum 2.5, where H_p = height above the baseline of the peak due to impurity E and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to loratadine.

Limits:

- *correction factors*: for the calculation of content, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 1.7; impurity E = 3.4; impurity F = 1.6;
- *impurity F*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent);
- *impurities A, B, C, D, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.10 per cent);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent);

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

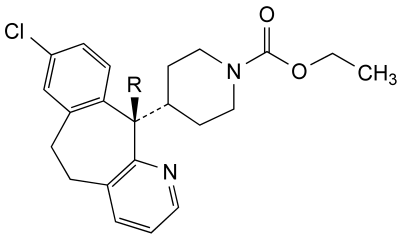
Sulphates (*2.4.13*): maximum 150 ppm.

Ignite 1.33 g at 800 ± 25 °C and take up the residue with 20 ml of *distilled water R*. Filter, if necessary, through paper free from sulphates. Repeat the filtration with new paper filters until the filtrate is no longer turbid.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

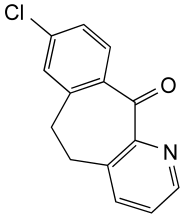


Dissolve 0.300 g in 50 ml of *glacial acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

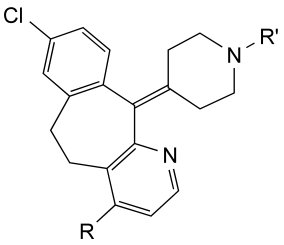
1 ml of *0.1 M perchloric acid* is equivalent to 38.29 mg of $C_{22}H_{23}ClN_2O_2$.

IMPURITIES

Specified impurities: A, B, C, D, E, F, H.



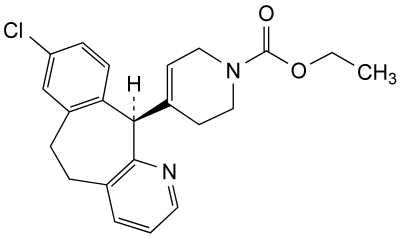
Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *G*.



and enantiomer

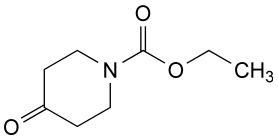
A. R = OH: ethyl 4-[(11*RS*)-8-chloro-11-hydroxy-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl]piperidine-1-carboxylate,

F. R = F: ethyl 4-[(11*RS*)-8-chloro-11-fluoro-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-yl]piperidine-1-carboxylate,



B. 8-chloro-5,6-dihydro-11*H*-benzo[5,6]cyclohepta-[1,2-*b*]pyridin-11-one,

C. R = Cl, R′ = CO-OC_2H_5: ethyl 4-(4,8-dichloro-5,6-dihydro-11*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridin-11-ylidene)piperidine-1-carboxylate,

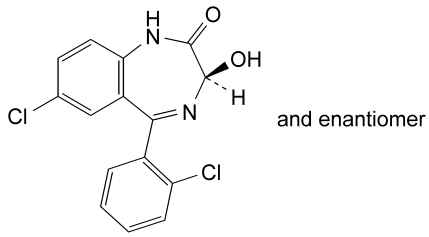


D. R = R′ = H: 8-chloro-11-(piperidin-4-ylidene)-6,11-dihydro-5*H*-benzo[5,6]cycloheptа[1,2-*b*]pyridine,

G. R = H, R′ = CH_3: 8-chloro-11-(1-methylpiperidin-4-ylidene)-6,11-dihydro-5*H*-benzo[5,6]cyclohepta[1,2-*b*]pyridine,

and enantiomer

E. ethyl 4-[(11*RS*)-8-chloro-6,11-dihydro-5*H*-benzo-[5,6]cyclohepta[1,2-*b*]pyridin-11-yl]-3,6-dihydropyridine-1(2*H*)-carboxylate,



H. ethyl 4-oxopiperidine-1-carboxylate.

LORAZEPAM

Lorazepamum

and enantiomer

$C_{15}H_{10}Cl_2N_2O_2$ M_r 321.2
[846-49-1]

DEFINITION

(3*RS*)-7-Chloro-5-(2-chlorophenyl)-3-hydroxy-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one.

Content: 98.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, sparingly soluble in ethanol (96 per cent), sparingly soluble or slightly soluble in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Spectral range: 600-2000 cm^{-1}.

Comparison: *lorazepam CRS*.

TESTS

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 40.0 mg of the substance to be examined in 25 ml of *acetonitrile R1* and dilute to 50.0 ml with *water R*.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of equal volumes of *acetonitrile R1* and *water R*. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of equal volumes of *acetonitrile R1* and *water R*.

Reference solution (b). Dissolve the contents of a vial of *lorazepam for system suitability CRS* (containing impurities B and D) in 1.0 ml of a mixture of equal volumes of *acetonitrile R1* and *water R*.

Reference solution (c). Dissolve 4.0 mg of *lorazepam impurity D CRS* in 25 ml of *acetonitrile R1* and dilute to 50.0 ml with *water R*. Dilute 1.0 ml of this solution to 100.0 ml with a mixture of equal volumes of *acetonitrile R1* and *water R*.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm;
- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) resistant to bases up to pH 11.5.

Mobile phase:

- *mobile phase A*: dissolve 3.48 g of *dipotassium hydrogen phosphate R* in a mixture of 50 ml of *acetonitrile R1* and 850 ml of *water R*; adjust the apparent pH to 10.5 with a 40 g/l solution of *sodium hydroxide R* and dilute to 1000 ml with *water R*;
- *mobile phase B*: *acetonitrile R1*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	80	20
5 - 35	80 → 30	20 → 70
35 - 50	30	70
50 - 60	30 → 80	70 → 20

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 235 nm.

Injection: 20 µl.

Relative retention with reference to lorazepam (retention time = about 17 min): impurity D = about 0.9; impurity B = about 1.1.

System suitability: reference solution (b):

- *resolution*: minimum 4.5 between the peaks due to impurity D and lorazepam;
- *peak-to-valley ratio*: minimum 5.0, where H_p = height above the baseline of the peak due to impurity B and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to lorazepam.

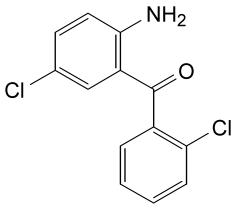
Limits:

- *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *impurity D*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent);
- *unspecified impurities*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g under high vacuum at 105 °C.

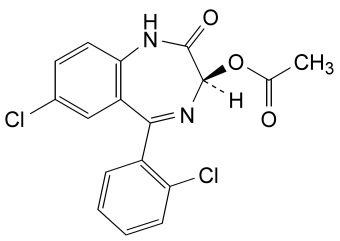
Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY



Dissolve 0.250 g in 30 ml of *dimethylformamide R*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (*2.2.20*). Protect the solution from atmospheric carbon dioxide throughout the titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 32.12 mg of $C_{15}H_{10}Cl_2N_2O_2$.



IMPURITIES

Specified impurities: B, D.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. corrected 6.0

LOVAGE ROOT

Levistici radix

DEFINITION

Whole or cut, dried rhizome and root of *Levisticum officinale* Koch.

Content: minimum 4.0 ml/kg of essential oil for the whole drug and minimum 3.0 ml/kg of essential oil for the cut drug (dried drug).

IDENTIFICATION

A. The rhizome and the large roots are often split longitudinally. The rhizome is short, up to 5 cm in diameter, light greyish-brown or yellowish-brown, simple or with several protuberances; the roots, showing little ramification, are the same colour as the rhizome; they are usually up to 1.5 cm thick and up to about 25 cm long; the fracture is usually smooth and shows a very wide yellowish-white bark and a narrow brownish-yellow wood.

B. Reduce to a powder (355) (*2.9.12*). The powder is brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: cork cells, polygonal or rounded in surface view, with brown contents; abundant parenchyma, mostly thin-walled and rounded but some with thicker walls; groups of small, reticulately thickened vessels embedded in small-celled, unlignified parenchyma; fragments of larger vessels with reticulate thickening, up to 125 µm in diameter; fragments of secretory canals up to 180 µm wide. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows starch granules, simple, rounded or ovoid, up to about 12 µm, and numerous larger, compound granules, many with several components.

C. Examine the chromatograms obtained in the test for angelica root.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
———	———
Eugenol (marked at 254 nm)	
	An intense pale blue or white fluorescent zone
	An intense pale blue or white fluorescent zone
Coumarin (marked at 254 nm)	
———	———
	1 or 2 less intense pale blue or white fluorescent zones
Reference solution	**Test solution**

TESTS

Angelica root. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g of the freshly powdered drug (355) (*2.9.12*) add 5 ml of *methanol R* and boil for 30 s. Cool and filter.

Reference solution. Dissolve 5 mg of *coumarin R* and 25 µl of *eugenol R* in 10 ml of *methanol R*.

Plate: *TLC silica gel F_{254} plate R*.

Mobile phase: *methylene chloride R, toluene R* (50:50 *V/V*).

Application: 20 µl, as bands.

Development: twice over a path of 10 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm. Mark the quenching zones due to coumarin and eugenol on the chromatogram obtained with the reference solution. Examine in ultraviolet light at 365 nm.

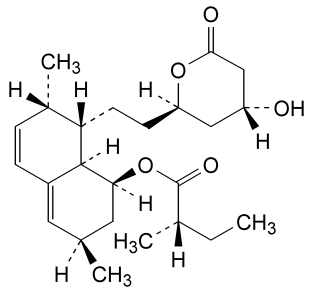
Results: the chromatogram obtained with the test solution shows no blue or yellow fluorescent zones in the lower third.

Foreign matter (*2.8.2*): maximum 3 per cent, determined on 50 g.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 8.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 2.0 per cent.



ASSAY

Carry out the determination of essential oils in herbal drugs (*2.8.12*). Use a 2 litre flask, 10 drops of *liquid paraffin R*, 500 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Reduce the drug to a powder (500) (*2.9.12*) and immediately use 40.0 g for the determination. Distil at a rate of 2-3 ml/min for 4 h.

01/2008:1538

LOVASTATIN

Lovastatinum

$C_{24}H_{36}O_5$ M_r 404.5
[75330-75-5]

DEFINITION

(1*S*,3*R*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-Hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl (2*S*)-2-methylbutanoate.

Content: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white crystalline powder.

Solubility: practically insoluble in water, soluble in acetone, sparingly soluble in anhydrous ethanol.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *lovastatin CRS*.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution B_6 or BY_6 (*2.2.2, Method II*).

Dissolve 0.200 g in *acetonitrile R* and dilute to 20.0 ml with the same solvent.

Specific optical rotation (*2.2.7*): + 325 to + 340 (dried substance).

Dissolve 0.125 g in *acetonitrile R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Test solution (a). Dissolve 20.0 mg of the substance to be examined in *acetonitrile R* and dilute to 50.0 ml with the same solvent.

Test solution (b). Dilute 10.0 ml of test solution (a) to 20.0 ml with *acetonitrile R*.

Reference solution (a). Dissolve 10.0 mg of *lovastatin CRS* in *acetonitrile R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100.0 ml with *acetonitrile R*.

Reference solution (c). To 5.0 ml of reference solution (a) add 1 mg of *simvastatin CRS* and dilute to 50.0 ml with *acetonitrile R*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: *acetonitrile R*;

– *mobile phase B*: 0.1 per cent *V/V* solution of *phosphoric acid R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	60	40
5 - 7	60 → 65	40 → 35
7 - 13	65 → 90	35 → 10
13 - 15	90	10
15 - 17	90 → 60	10 → 40
17 - 20	60	40

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 238 nm.

Injection: 10 µl of test solution (a) and reference solutions (b) and (c).

Relative retention with reference to lovastatin (retention time = about 7 min): impurity B = about 0.6; impurity A = about 0.8; simvastatin = about 1.1; impurity C = about 1.2; impurity D = about 2.3.

System suitability: reference solution (c):

– *resolution*: minimum 5.0 between the peaks due to lovastatin and simvastatin.

Limits:

– *impurities A, B, C, D*: for each impurity, not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent);

– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

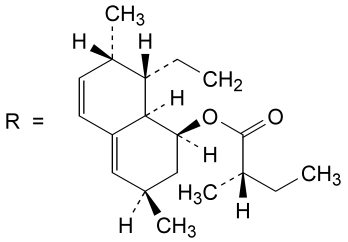
Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in a desiccator under high vacuum at 60 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

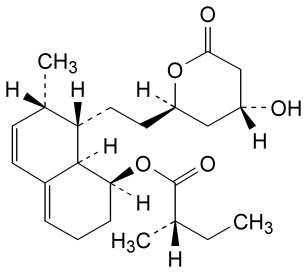
ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution (b) and reference solution (a).

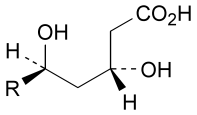


Calculate the content of $C_{24}H_{36}O_5$ from the declared content of *lovastatin CRS*.



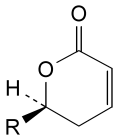
STORAGE

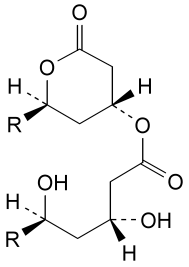
Under nitrogen at a temperature of 2 °C to 8 °C.



IMPURITIES

Specified impurities: *A, B, C, D.*

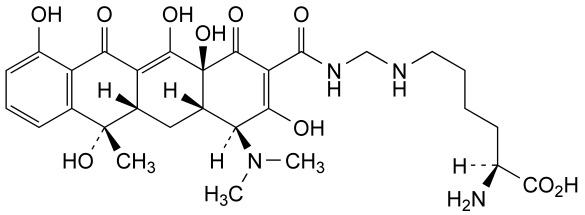




A. (1*S*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-7-methyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl (2*S*)-2-methylbutanoate (mevastatin),

B. (3*R*,5*R*)-7-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-2,6-dimethyl-8-[[(2*S*)-2-methylbutanoyl]oxy]-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]-3,5-dihydroxyheptanoic acid (hydroxyacid lovastatin),

C. (1*S*,3*R*,7*S*,8*S*,8a*R*)-3,7-dimethyl-8-[2-[(2*R*)-6-oxo-3,6-dihydro-2*H*-pyran-2-yl]ethyl]-1,2,3,7,8,8a-hexahydronaphthalen-1-yl (2*S*)-2-methylbutanoate (dehydrolovastatin),



D. (2*R*,4*R*)-2-[2-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-2,6-dimethyl-8-[[(2*S*)-2-methylbutanoyl]oxy]-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]ethyl]-6-oxotetrahydro-2*H*-pyran-4-yl (3*R*,5*R*)-7-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-2,6-dimethyl-8-[[(2*S*)-2-methylbutanoyl]oxy]-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]-3,5-dihydroxyheptanoate (lovastatin dimer).

01/2008:1654

LYMECYCLINE

Lymecyclinum

$C_{29}H_{38}N_4O_{10}$ M_r 603

[302-17-0]

DEFINITION

(2*S*)-2-Amino-6-[[[[[(4*S*,4a*S*,5a*S*,6*S*,12a*S*)-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracen-2-yl]carbonyl]amino]methyl]amino]hexanoic acid (reaction product of formaldehyde, lysine and tetracycline), semi-synthetic product derived from a fermentation product.

Content: 81.0 per cent to 102.0 per cent (equivalent to 60.0 per cent to 75.0 per cent of tetracycline) (anhydrous substance).

CHARACTERS

Appearance: yellow powder, hygroscopic.

Solubility: very soluble in water, slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 5 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *tetracycline hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *tetracycline hydrochloride CRS*, 5 mg of *demeclocycline hydrochloride R* and 5 mg of *oxytetracycline hydrochloride R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC octadecylsilyl silica gel F_{254} plate R* (2-10 µm).

Mobile phase: mix 20 volumes of *acetonitrile R*, 20 volumes of *methanol R* and 60 volumes of a 63 g/l solution of *oxalic acid R* previously adjusted to pH 2.0 with *concentrated ammonia R*.

Application: 2 µl.

Development: over a path of 5 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 3 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 50 mg of the substance to be examined in 50 ml *water R*.

Reference solution (a). Dissolve 10 mg of *lysine hydrochloride CRS* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *arginine CRS* and 10 mg of *lysine hydrochloride CRS* in *water R* and dilute to 25 ml with the same solvent.

Plate: *TLC silica gel plate R.*

Mobile phase: *concentrated ammonia R, 2-propanol R* (30:70 *V/V*).

Application: 5 µl.

Development: over 3/4 of the plate.

Drying: at 100-105 °C until the ammonia disappears completely.

Detection: spray with *ninhydrin solution R* and heat at 100-105 °C for 15 min.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.2 g in 5 ml of *water R*, add 0.3 ml of *orthophosphoric acid R* and distil. To 1 ml of the distillate add 10 ml of *chromotropic acid-sulphuric acid solution R*. A violet colour is produced.

D. Specific optical rotation (see Tests).

TESTS

pH (*2.2.3*): 7.8 to 8.2.

Dissolve 0.1 g in 10 ml of *carbon dioxide-free water R*.

Specific optical rotation (*2.2.7*): – 180 to – 210 (anhydrous substance).

Dissolve 0.250 g in *water R* and dilute to 50.0 ml with the same solvent.

Free tetracycline: maximum 2.5 per cent (anhydrous and methanol-free substance).

To 0.5 g add 50 ml of *butyl acetate R* and allow to stand at 25 °C for 1 h. Filter and extract the filtrate with 2 quantities each of 25 ml of *0.1 M hydrochloric acid*. Combine the extracts and complete to 50.0 ml with *0.1 M hydrochloric acid*. Dilute 10.0 ml of this solution to 100.0 ml with *0.1 M hydrochloric acid*. The absorbance (*2.2.25*) measured at 355 nm is not greater than 0.64.

Light absorbing impurities: the absorbance (*2.2.25*) is not greater than 0.50 at 430 nm (anhydrous and methanol-free substance).

Dissolve 25.0 mg in *0.01 M hydrochloric acid* and dilute to 100.0 ml with the same acid.

Related substances. Liquid chromatography (*2.2.29*). *Prepare the solutions immediately before use.*

Test solution. Dissolve 0.125 g of the substance to be examined in 5.0 ml of *water R*. Add 1.0 ml of a 40 g/l solution of *sodium metabisulphite R* and allow to stand without stirring at 20-25 °C for 16-24 h in the dark. Add 50 ml of *0.05 M hydrochloric acid*, shake to dissolve the precipitate and dilute to 100.0 ml with *water R*.

Reference solution (a). Dissolve 25.0 mg of *tetracycline hydrochloride CRS* in *0.01 M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (b). Dissolve 12.5 mg of *4-epitetracycline hydrochloride CRS* in *0.01 M hydrochloric acid* and dilute to 50.0 ml with the same acid.

Reference solution (c). Dissolve 10.0 mg of *anhydrotetracycline hydrochloride CRS* in *0.01 M hydrochloric acid* and dilute to 100.0 ml with the same acid.

Reference solution (d). Dissolve 10.0 mg of *4-epianhydrotetracycline hydrochloride CRS* in *0.01 M hydrochloric acid* and dilute to 50.0 ml with the same acid.

Reference solution (e). Mix 1.0 ml of reference solution (a), 2.0 ml of reference solution (b) and 5.0 ml of reference solution (d) and dilute to 25.0 ml with *0.01 M hydrochloric acid*.

Reference solution (f). Mix 40.0 ml of reference solution (b), 20.0 ml of reference solution (c) and 5.0 ml of reference solution (d) and dilute to 200.0 ml with *0.01 M hydrochloric acid*.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *styrene-divinylbenzene copolymer R* (8 µm) with a pore size of 10 nm,

– *temperature*: 60 °C.

Mobile phase: weigh 80.0 g of *2-methyl-2-propanol R* and transfer to a 1000 ml volumetric flask with the aid of 200 ml of *water R*. Add 100 ml of a 35 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 8.0 with *dilute phosphoric acid R*, 200 ml of a 10 g/l solution of *tetrabutylammonium hydrogen sulphate R* adjusted to pH 8.0 with *dilute sodium hydroxide solution R* and 10 ml of a 40 g/l solution of *sodium edetate R* adjusted to pH 8.0 with *dilute sodium hydroxide solution R*; dilute to 1000.0 ml with *water R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl of the test solution and reference solutions (e) and (f).

Run time: 5 times the retention time of the principal peak in the chromatogram obtained with the test solution.

Relative retention with reference to tetracycline (retention time = about 8 min): impurity E = about 0.50; impurity F = about 0.68; impurity A = about 0.75; impurity B (eluting on the tail of the principal peak) = about 1.2; impurity D = about 1.45; impurity G = about 1.45; impurity C = about 2.95.

System suitability: reference solution (e):

– *resolution*: minimum 3.0 between the 1st peak (impurity A) and the 2nd peak (tetracycline) and minimum 5.0 between the 2nd peak and the 3rd peak (impurity D); adjust the concentration of 2-methyl-2-propanol in the mobile phase if necessary;

– *symmetry factor*: maximum 1.25 for the peak due to tetracycline.

Limits:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (5.0 per cent),

– *impurity B*: not more than 0.1 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (f) (0.5 per cent),

– *impurity C*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (1.0 per cent),

– *sum of impurities D and G*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.5 per cent),

– *impurities E, F*: for each impurity, not more than 0.1 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (f) (0.5 per cent),
– *any other impurity*: for each impurity, not more than 0.04 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (f) (0.2 per cent),
– *total*: not more than 1.6 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (f) (8.0 per cent),
– *disregard limit*: 0.02 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (f) (0.1 per cent).

Methanol (*2.4.24, System A*): maximum 1.5 per cent.

Water (*2.5.12*): maximum 5.0 per cent, determined on 0.200 g.

Sulphated ash (*2.4.14*): maximum 0.5 per cent, determined on 1.0 g.

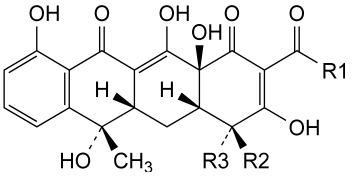
ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Injection: test solution and reference solution (a).

System suitability:

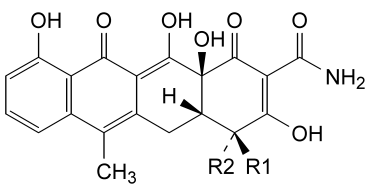
– *repeatability*: maximum relative standard deviation of 1.0 per cent after 6 injections of reference solution (a).



Calculate the percentage content of tetracycline and multiply it by 1.3560 to obtain the percentage content of lymecycline.

STORAGE

In an airtight container, protected from light.



IMPURITIES

Specified impurities: A, B, C, D, E, F.

A. R1 = NH_2, R2 = H, R3 = $N(CH_3)_2$: (4*R*,4a*S*,5a*S*,6*S*,12a*S*)-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide (4-epitetracycline),

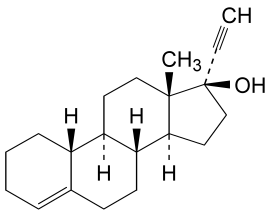
B. R1 = CH_3, R2 = $N(CH_3)_2$, R3 = H: (4*S*,4a*S*,5a*S*,6*S*,12a*S*)-2-acetyl-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-4a,5a,6,12a-tetrahydrotetracene-1,11(4*H*,5*H*)-dione (2-acetyl-2-decarbamoyltetracycline),

C. R1 = $N(CH_3)_2$, R2 = H: (4*S*,4a*S*,12a*S*)-4-(dimethylamino)-3,10,11,12a-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,12,12a-hexahydrotetracene-2-carboxamide (anhydrotetracycline),

D. R1 = H, R2 = $N(CH_3)_2$: (4*R*,4a*S*,12a*S*)-4-(dimethylamino)-3,10,11,12a-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,12,12a-hexahydrotetracene-2-carboxamide (4-epianhydrotetracycline),

E. unknown structure,

F. unknown structure,



G. chlortetracycline,

H. tetracycline.

corrected 6.0

LYNESTRENOL

Lynestrenolum

$C_{20}H_{28}O$ M_r 284.4
[52-76-6]

DEFINITION

Lynestrenol contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 19-nor-17α-pregn-4-en-20-yn-17-ol, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, soluble in acetone and in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Melting point (*2.2.14*): 161 °C to 165 °C.
B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *lynestrenol CRS*.
C. Examine the chromatograms obtained in the test for related substances in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position, fluorescence and size to the principal spot in the chromatogram obtained with reference solution (b).

TESTS

Appearance of solution. Dissolve 0.2 g in *alcohol R* and dilute to 10 ml with the same solvent. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*). Dissolve 0.900 g in *alcohol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is – 9.5 to – 11, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.125 g of the substance to be examined in *chloroform R* and dilute to 25 ml with the same solvent.

Test solution (b). Dilute 5 ml of test solution (a) to 10 ml with *chloroform R*.

Reference solution (a). Dilute 1 ml of test solution (a) to 100 ml with *chloroform R*. Dilute 5 ml of the solution to 10 ml with *chloroform R*.

Reference solution (b). Dissolve 25 mg of *lynestrenol CRS* in *chloroform R* and dilute to 10 ml with the same solvent.

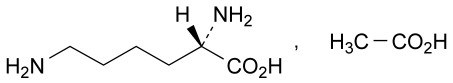
Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *acetone R* and 80 volumes of *heptane R*. Allow the plate to dry in air, spray with *0.25 M alcoholic sulphuric acid R* and heat at 105 °C for 10 min. Examine in ultraviolet light at 365 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 0.500 g by drying in an oven at 105 °C.

ASSAY

Dissolve 0.150 g in 40 ml of *tetrahydrofuran R* and add 5.0 ml of a 100 g/l solution of *silver nitrate R*. Titrate with *0.1 M sodium hydroxide*. Determine the end-point potentiometrically (*2.2.20*), using a glass indicator electrode and as comparison electrode a silver-silver chloride double-junction electrode with a saturated solution of *potassium nitrate R* as junction liquid. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 28.44 mg of $C_{20}H_{28}O$.



STORAGE

Store protected from light.

LYSINE ACETATE

Lysini acetas

$C_8H_{18}N_2O_4$ M_r 206.2
[57282-49-2]

DEFINITION

(2*S*)-2,6-Diaminohexanoic acid acetate.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: freely soluble in water, very slightly soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

A. It complies with the test for specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *lysine acetate CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *water R*, evaporate to dryness at 60 °C and record new spectra using the residues.

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To 0.1 ml of solution S (see Tests) add 2 ml of *water R* and 1 ml of a 50 g/l solution of *phosphomolybdic acid R*. A yellowish-white precipitate is formed.

E. It gives reaction (a) of acetates (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*): + 8.5 to + 10.0 (dried substance), determined on solution S.

Ninhydrin-positive substances. Thin-layer chromatography (*2.2.27*).

Test solution (a). Dissolve 0.10 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *lysine acetate CRS* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *lysine acetate CRS* and 10 mg of *arginine CRS* in *water R* and dilute to 25 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *concentrated ammonia R, 2-propanol R* (30:70 *V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: at 100-105 °C until the ammonia has evaporated.

Detection: spray with *ninhydrin solution R* and heat at 100-105 °C for 15 min.

System suitability: reference solution (c):

– the chromatogram shows 2 clearly separated spots.

Limits: test solution (a):

– *any impurity*: any spot, apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Chlorides (*2.4.4*): maximum 200 ppm.

Dilute 2.5 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 300 ppm.

Dilute 5 ml of solution S to 15 ml with *distilled water R*.

Ammonium (*2.4.1, Method B*): maximum 200 ppm, determined on 50 mg.

Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (*2.4.9*): maximum 30 ppm.

In a separating funnel, dissolve 0.33 g in 10 ml of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the test.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 60 °C for 3 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

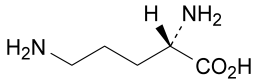
Dissolve 80.0 mg in 3 ml of *anhydrous formic acid R*. Add 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 10.31 mg of $C_8H_{18}N_2O_4$.

STORAGE

Protected from light.

IMPURITIES



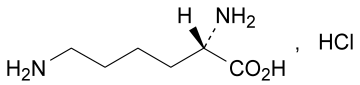
Specified impurities: A, B, C, D, E, F.

A. aspartic acid,

B. glutamic acid,

C. alanine,

D. valine,



E. (2*S*)-2,5-diaminopentanoic acid (ornithine),

F. arginine.

corrected 6.0

LYSINE HYDROCHLORIDE

Lysini hydrochloridum

$C_6H_{15}ClN_2O_2$ M_r 182.7
[657-27-2]

DEFINITION

Lysine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*S*)-2,6-diaminohexanoic acid hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (*2.2.24*), comparing with the spectrum obtained with *lysine hydrochloride CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *water R*, evaporate to dryness at 60 °C, and record new spectra using the residues.

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To 0.1 ml of solution S (see Tests) add 2 ml of *water R* and 1 ml of a 50 g/l solution of *phosphomolybdic acid R*. A yellowish-white precipitate is formed.

E. To 0.1 ml of solution S add 2 ml of *water R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution B_7 or GY_7 (*2.2.2, Method II*).

Specific optical rotation (*2.2.7*). Dissolve 2.00 g in *hydrochloric acid R1* and dilute to 25.0 ml with the same acid. The specific optical rotation is + 21.0 to + 22.5, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *lysine hydrochloride CRS* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *lysine hydrochloride CRS* and 10 mg of *arginine CRS* in *water R* and dilute to 25 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *concentrated ammonia R* and 70 volumes of *2-propanol R*. Dry the plate at 100 °C to 105 °C until the ammonia disappears completely. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Sulphates (*2.4.13*). Dilute 5 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (*2.4.1*). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (*2.4.9*). In a separating funnel, dissolve 0.33 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (30 ppm).

Heavy metals (*2.4.8*). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 5 ml of *anhydrous formic acid R*. Add 50 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 ml of *0.1 M perchloric acid* is equivalent to 18.27 mg of $C_6H_{15}ClN_2O_2$.

STORAGE

Store protected from light.

MACROGOL CETOSTEARYL ETHER

Macrogoli aether cetostearylicus

DEFINITION

Mixture of ethers of mixed macrogols with linear fatty alcohols, mainly cetostearyl alcohol. It may contain some free macrogols and it contains various amounts of free cetostearyl alcohol. The number of moles of ethylene oxide reacted per mole of cetostearyl alcohol is 2 to 33 (nominal value).

CHARACTERS

Appearance: white or yellowish-white, waxy, unctuous mass, pellets, microbeads or flakes.

Solubility:

- macrogol cetostearyl ether with low numbers of moles of ethylene oxide reacted per mole: practically insoluble in water, soluble in ethanol (96 per cent) and in methylene chloride;
- macrogol cetostearyl ether with higher numbers of moles of ethylene oxide reacted per mole: dispersible or soluble in water, soluble in ethanol (96 per cent) and in methylene chloride.

It solidifies at 32 °C to 52 °C.

IDENTIFICATION

A. Hydroxyl value (see Tests).

B. Iodine value (see Tests).

C. Saponification value (see Tests).

D. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve the prescribed amount of substance to be examined (see table below) in a mixture of 1 volume of *water R* and 9 volumes of *methanol R* and dilute to 75 ml with the same mixture of solvents.

Number of moles of ethylene oxide reacted per mole	Amount to be dissolved (g)
2 - 6	5.0
10 - 22	10.0
25 - 33	15.0

Add 60 ml of *hexane R* and shake for 3 min. The formation of foam can be reduced by the addition of some drops of *ethanol (96 per cent) R*. Filter the upper layer through *anhydrous sodium sulphate R*, wash the filter with 3 quantities, each of 10 ml, of *hexane R* and evaporate the combined filtrates to dryness. Dissolve 0.05 g of the residue in 10 ml of *methanol R* (the solution may be opalescent).

Reference solution. Dissolve 25 mg of *stearyl alcohol CRS* in *methanol R* and dilute to 25 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R*.

Application: 20 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with vanillin-sulphuric acid reagent prepared as follows: dissolve 0.5 g of *vanillin R* in 50 ml of *ethanol (96 per cent) R* and dilute to 100 ml with *sulphuric acid R*; allow to dry in air; heat at about 130 °C for 15 min and allow to cool in air.

Results: the chromatogram obtained with the test solution shows several spots; one of these spots corresponds to the principal spot in the chromatogram obtained with the reference solution.

E. Dissolve or disperse 0.1 g in 5 ml of *ethanol (96 per cent) R*, add 2 ml of *water R*, 10 ml of *dilute hydrochloric acid R*, 10 ml of *barium chloride solution R1* and 10 ml of a 100 g/l solution of *phosphomolybdic acid R*. A precipitate is formed.

TESTS

Appearance of solution. The solution is not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

Dissolve 5.0 g in *ethanol (96 per cent) R* and dilute to 50 ml with the same solvent.

Alkalinity. Dissolve 2.0 g in a hot mixture of 10 ml of *ethanol (96 per cent) R* and 10 ml of *water R*. Add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator to yellow.

Acid value (*2.5.1*): maximum 1.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*).

Number of moles of ethylene oxide reacted per mole (nominal value)	Hydroxyl value
2	150 - 180
3	135 - 155
5 - 6	100 - 134
10	75 - 90
12	67 - 77
15	58 - 67
20 - 22	40 - 55
25	36 - 46
30 - 33	32 - 40

Iodine value (*2.5.4, Method A*): maximum 2.0.

Saponification value (*2.5.6*): maximum 3.0, determined on 10.0 g.

Ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Water (*2.5.12*): maximum 3.0 per cent, determined on 2.00 g.

Total ash (*2.4.16*): maximum 0.2 per cent, determined on 2.0 g.

STORAGE

In an airtight container.

LABELLING

The label states the number of moles of ethylene oxide reacted per mole of cetostearyl alcohol (nominal value).

01/2008:1443
corrected 6.0

MACROGOL 6 GLYCEROL CAPRYLOCAPRATE

Macrogol 6 glyceroli caprylocapras

DEFINITION

Mixture of mainly mono- and diesters of polyoxyethylene glycerol ethers mainly with caprylic (octanoic) and capric (decanoic) acids. The average number of moles of ethylene oxide reacted per mole of substance is 6.

Macrogol 6 glycerol caprylocaprate may be obtained by ethoxylation of glycerol and esterification with distilled coconut or palm kernel fatty acids, or by ethoxylation of mono- and diglycerides of caprylic and capric acids.

CHARACTERS

Appearance: pale yellow liquid.

Solubility: partly soluble in water, freely soluble in castor oil, in glycerol, in isopropanol and in propylene glycol.

Viscosity: about 145 mPa·s.

IDENTIFICATION

A. Dissolve 1.0 g in 99 g of a mixture of 10 volumes of *2-propanol R* and 90 volumes of *water R*. Heat the solution obtained to about 40 °C. A turbidity is produced. Allow to cool until the turbidity disappears. The cloud point is between 15 °C and 35 °C.

B. Saponification value (see Tests).

C. Composition of fatty acids (see Tests).

TESTS

Appearance. The substance to be examined is clear (*2.2.1*) and not more intensely coloured than reference solution Y_2 (*2.2.2, Method I*).

Alkalinity. Dissolve 2.0 g in a hot mixture of 10 ml of *ethanol (96 per cent) R* and 10 ml of *water R*. Add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator to yellow.

Acid value (*2.5.1*): maximum 5.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*): 165 to 225.

Saponification value (*2.5.6*): 85 to 105, determined on 2.0 g.

Composition of fatty acids. Gas chromatography (*2.4.22, Method A*).

Composition of the fatty-acid fraction of the substance:

– *caproic acid*: maximum 2.0 per cent;

– *caprylic acid*: 50.0 per cent to 80.0 per cent;

– *capric acid*: 20.0 per cent to 50.0 per cent;

– *lauric acid*: maximum 3.0 per cent;

– *myristic acid*: maximum 1.0 per cent.

Ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g.

Total ash (*2.4.16*): maximum 0.3 per cent.

01/2008:1122
corrected 6.0

MACROGOLGLYCEROL COCOATES

Macrogolglyceroli cocoates

DEFINITION

Mixtures of mono-, di- and triesters of ethoxylated glycerol with fatty acids of vegetable origin having a composition corresponding to the fatty acid composition of the oil extracted from the hard, dried fraction of the endosperm of *Cocos nucifera* L. The average number of moles of ethylene oxide reacted per mole of substance (nominal value) is either 7 (macrogol 7 glycerol cocoate) or 23 (macrogol 23 glycerol cocoate).

CHARACTERS

Appearance: clear, yellowish, oily liquid.

Solubility: soluble in water and in ethanol (96 per cent) and practically insoluble in light petroleum (50-70 °C) for macrogol 7 glycerol cocoate and macrogol 23 glycerol cocoate.

Relative density: about 1.05 for macrogol 7 glycerol cocoate; about 1.09 for macrogol 23 glycerol cocoate.

IDENTIFICATION

A. Dissolve 1.0 g of macrogol 7 glycerol cocoate in 99 g of a mixture of 10 volumes of *2-propanol R* and 90 volumes of *water R*. Heat the solution to about 65 °C. A turbidity is produced. Allow to cool until the turbidity disappears. The cloud point is between 35 °C and 54 °C.

Heat a 10 g/l solution of macrogol 23 glycerol cocoate in a 100 g/l solution of *sodium chloride R* to about 90 °C. A turbidity is produced. Allow to cool until the turbidity disappears. The cloud point is between 65 °C and 85 °C.

B. Iodine value (see Tests).

C. Saponification value (see Tests).

TESTS

Appearance. The substance to be examined is clear (*2.2.1*) and not more intensely coloured than reference solution Y_2 (*2.2.2, Method I*).

Alkalinity. Dissolve 2.0 g in a hot mixture of 10 ml of *ethanol (96 per cent) R* and 10 ml of *water R*. Add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator to yellow.

Acid value (*2.5.1*): maximum 5.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*): see Table 1122.-1.

Saponification value (*2.5.6*): see Table 1122.-1.

Table 1122.-1

Number of moles of ethylene oxide reacted per mole (nominal value)	Hydroxyl value	Saponification value (determined on 2.0 g)
7	170 - 210	85 - 105
23	80 - 100	40 - 50

Iodine value (*2.5.4, Method A*): maximum 5.0.

Composition of fatty acids. Gas chromatography (*2.4.22, Method A*).

Composition of the fatty-acid fraction of the substance:

– *caproic acid*: maximum 1.0 per cent;

– *caprylic acid*: 5.0 per cent to 10.0 per cent;

– *capric acid*: 4.0 per cent to 10.0 per cent;
– *lauric acid*: 40.0 per cent to 55.0 per cent;
– *myristic acid*: 14.0 per cent to 23.0 per cent;
– *palmitic acid*: 8.0 per cent to 12.0 per cent;
– *stearic acid*: 1.0 per cent to 5.0 per cent;
– *oleic acid*: 5.0 per cent to 10.0 per cent;
– *linoleic acid*: maximum 3.0 per cent.

Ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.0 g.

Total ash (*2.4.16*): maximum 0.3 per cent.

LABELLING

The label states the number of moles of ethylene oxide reacted per mole of substance (nominal value).

01/2008:1083

MACROGOLGLYCEROL HYDROXYSTEARATE

Macrogolglyceroli hydroxystearas

DEFINITION

Contains mainly trihydroxystearyl glycerol ethoxylated with 7 to 60 molecules of ethylene oxide (nominal value), with small amounts of macrogol hydroxystearate and of the corresponding free glycols. It results from the reaction of hydrogenated castor oil with ethylene oxide.

CHARACTERS

Appearance:
– if less than 10 units of ethylene oxide per molecule: yellowish, turbid, viscous liquid;
– if more than 20 units of ethylene oxide per molecule: white or yellowish semi-liquid or pasty mass.

Solubility:
– if less than 10 units of ethylene oxide per molecule: practically insoluble in water, soluble in acetone, dispersible in ethanol (96 per cent);
– if more than 20 units of ethylene oxide per molecule: freely soluble in water, in acetone and in ethanol (96 per cent), practically insoluble in light petroleum.

IDENTIFICATION

A. It complies with the test for iodine value (see Tests).
B. It complies with the test for saponification value (see Tests).
C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1 g of the substance to be examined, add 100 ml of a 100 g/l solution of *potassium hydroxide R* and boil under a reflux condenser for 30 min. Allow to cool. Acidify the solution with 20 ml of *hydrochloric acid R*. Shake the mixture with 50 ml of *ether R* and allow to stand until separation of the layers is obtained. Transfer the clear upper layer to a suitable tube, add 5 g of *anhydrous sodium sulphate R*, close the tube and allow to stand for 30 min. Filter and evaporate the filtrate to dryness on a water-bath. Dissolve 50 mg of the residue in 25 ml of *ether R*.

Reference solution. Dissolve 50 mg of *12-hydroxystearic acid R* in *methylene chloride R* and dilute to 25 ml with the same solvent.

Plate: *TLC octadecylsilyl silica gel plate R*.

Mobile phase: *methylene chloride R, glacial acetic acid R, acetone R* (10:40:50 *V/V/V*).

Application: 2 µl.

Development: over a path of 8 cm.

Drying: in a current of cold air.

Detection: spray with a 80 g/l solution of *phosphomolybdic acid R* in *2-propanol R* and heat at 120 °C for about 1-2 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and colour to the principal spot in the chromatogram obtained with the reference solution.

D. Place about 2 g in a test-tube and add 0.2 ml of *sulphuric acid R*. Close the tube using a stopper fitted with a glass tube bent twice at right angles. Heat the tube until white fumes appear. Collect the fumes in 1 ml of *mercuric chloride solution R*. A white precipitate is formed and the fumes turn a filter paper impregnated with *alkaline potassium tetraiodomercurate solution R* black.

TESTS

Solution S. Dissolve 5.0 g of macrogolglycerol hydroxystearate with less than 40 units of ethylene oxide per molecule in a mixture of 50 volumes of *acetone R* and 50 volumes of *anhydrous ethanol R* and dilute to 50 ml with the same mixture of solvents.

Dissolve 5.0 g of macrogolglycerol hydroxystearate with 40 units or more of ethylene oxide per molecule in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension III (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Alkalinity. To 2 ml of solution S add 0.5 ml of *bromothymol blue solution R1*. The solution is not blue.

Acid value (*2.5.1*): maximum 2.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*). See Table 1083.-1.

Iodine value (*2.5.4*): maximum 5.0.

Saponification value (*2.5.6*). See Table 1083.-1.

Table 1083.-1

Ethylene oxide units per molecule (nominal value)	Hydroxyl value	Saponification value
7	115 - 135	125 - 140
25	70 - 90	70 - 90
40	60 - 80	45 - 69
60	45 - 67	40 - 51

Residual ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of residual ethylene oxide and 10 ppm of residual dioxan.

Heavy metals (*2.4.8*).

Substances soluble in acetone/anhydrous ethanol: maximum 10 ppm.

12 ml of solution S complies with limit test B. Prepare the reference solution using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of equal volumes of *acetone R* and *anhydrous ethanol R*.

Substances soluble in water: maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): maximum 3.0 per cent, determined on 2.000 g.

Total ash (*2.4.16*): maximum 0.3 per cent, determined on 2.0 g.

LABELLING

The label states the number of ethylene oxide units per molecule (nominal value).

01/2008:2044

MACROGOL 20 GLYCEROL MONOSTEARATE

Macrogol 20 glyceroli monostearas

DEFINITION

Macrogol 20 glycerol monostearate is obtained by ethoxylation with ethylene oxide of different types of glycerol stearates, mainly *Glycerol monostearate 40-55 (0495)*. The number of moles of ethylene oxide reacted per mole of glycerol stearate is 20 (nominal value).

CHARACTERS

Appearance: pale yellow, oily liquid or gel.

Solubility: soluble in water at 40 °C and above and in ethanol (96 per cent), practically insoluble in light liquid paraffin and in fatty oils.

Relative density: about 1.07.

IDENTIFICATION

A. Hydroxyl value (see Tests).

B. Saponification value (see Tests).

C. Composition of fatty acids (see Tests).

D. Place 1 g in a test tube and add 0.1 ml of *sulphuric acid R*. Heat the tube until white fumes appear. The fumes turn filter paper impregnated with *alkaline potassium tetraiodomercurate solution R* black.

TESTS

Acid value (*2.5.1*): maximum 2.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*): 65 to 85, determined on 0.350 g.

Iodine value (*2.5.4, Method A*): maximum 2.0.

Peroxide value (*2.5.5, Method A*): maximum 6.0.

Saponification value (*2.5.6*): 40 to 60.

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*).

Composition of the fatty-acid fraction of the substance:

Type of macrogol 20 glycerol monostearate	Type of glycerol stearate used	Composition of fatty acids
Type I	Type I (obtained using stearic acid 50)	*Stearic acid*: 40.0 per cent to 60.0 per cent, *Sum of the contents of palmitic and stearic acids*: minimum 90.0 per cent.
Type II	Type II (obtained using stearic acid 70)	*Stearic acid*: 60.0 per cent to 80.0 per cent, *Sum of the contents of palmitic and stearic acids*: minimum 90.0 per cent.
Type III	Type III (obtained using stearic acid 95)	*Stearic acid*: 90.0 per cent to 99.0 per cent, *Sum of the contents of palmitic and stearic acids*: minimum 96.0 per cent.

Ethylene oxide and dioxan (*2.4.25, Method A)*: maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 3.0 per cent, determined on 1.00 g.

Total ash (*2.4.16*): maximum 0.2 per cent.

STORAGE

Protected from light.

LABELLING

The label states the type of macrogol 20 glycerol monostearate.

01/2008:1082

MACROGOLGLYCEROL RICINOLEATE

Macrogolglyceroli ricinoleas

DEFINITION

Contains mainly ricinoleyl glycerol ethoxylated with 30-50 molecules of ethylene oxide (nominal value), with small amounts of macrogol ricinoleate and of the corresponding free glycols. It results from the reaction of castor oil with ethylene oxide.

CHARACTERS

Appearance: clear, yellow viscous liquid or semi-solid.

Solubility: freely soluble in water, very soluble in methylene chloride, freely soluble in ethanol (96 per cent).

Relative density: about 1.05.

Viscosity: 500 mPa·s to 800 mPa·s at 25 °C.

IDENTIFICATION

A. Iodine value (see Tests).

B. Saponification value (see Tests).

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1 g of the substance to be examined add 100 ml of a 100 g/l solution of *potassium hydroxide R* and boil under a reflux condenser for 30 min. Allow to cool. Acidify the solution with 20 ml of *hydrochloric acid R*. Shake the mixture with 50 ml of *ether R* and

allow to stand until separation of the layers is obtained. Transfer the clear upper layer to a suitable tube, add 5 g of *anhydrous sodium sulphate R*, close the tube and allow to stand for 30 min. Filter and evaporate the filtrate to dryness on a water-bath. Dissolve 50 mg of the residue in 25 ml of *ether R*.

Reference solution. Dissolve 50 mg of *ricinoleic acid R* in *methylene chloride R* and dilute to 25 ml with the same solvent.

Plate: *TLC octadecylsilyl silica gel plate R*.

Mobile phase: *methylene chloride R, glacial acetic acid R, acetone R* (10:40:50 *V/V/V*).

Application: 2 µl.

Development: over a path of 8 cm.

Drying: in a current of cold air.

Detection: spray with an 80 g/l solution of *phosphomolybdic acid R* in *2-propanol R* and heat at 120 °C for 1-2 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and colour to the principal spot in the chromatogram obtained with the reference solution.

D. Place about 2 g of the substance to be examined in a test-tube and add 0.2 ml of *sulphuric acid R*. Close the tube using a stopper fitted with a glass tube bent twice at right angles. Heat the tube until white fumes appear. Collect the fumes in 1 ml of *mercuric chloride solution R*. A white precipitate is formed and the fumes turn a filter paper impregnated with *alkaline potassium tetraiodomercurate solution R* black.

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension III (*2.2.1*) and not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*). If intended for use in the manufacture of parenteral dosage forms, solution S is not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Alkalinity. Dissolve 2.0 g in a hot mixture of 10 ml of *water R* and 10 ml of *ethanol (96 per cent) R*. Add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator to yellow.

Acid value (*2.5.1*): maximum 2.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*). See Table 1082.-1.

Iodine value (*2.5.4*): 25 to 35.

Saponification value (*2.5.6*). See Table 1082.-1.

Table 1082.-1

Ethylene oxide units per molecule (nominal value)	Hydroxyl value	Saponification value
30 - 35	65 - 82	60 - 75
50	48 - 68	38 - 52

Residual ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of residual ethylene oxide and 10 ppm of residual dioxan.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S, filtered if necessary, complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): maximum 3.0 per cent, determined on 2.000 g.

Total ash (*2.4.16*): maximum 0.3 per cent, determined on 2.0 g.

STORAGE

Protected from light.

LABELLING

The label states:

– the amount of ethylene oxide reacted with castor oil (nominal value),

– where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

01/2008:2052

MACROGOL 15 HYDROXYSTEARATE

Macrogoli 15 hydroxystearas

DEFINITION

Mixture of mainly monoesters and diesters of 12-hydroxystearic (12-hydroxyoctadecanoic) acid and macrogols obtained by ethoxylation of 12-hydroxystearic acid. The number of moles of ethylene oxide reacted per mole of 12-hydroxystearic acid is 15 (nominal value). It contains free macrogols.

CHARACTERS

Appearance: yellowish, waxy mass.

Solubility: very soluble in water, soluble in ethanol (96 per cent), insoluble in liquid paraffin.

It solidifies at about 25 °C.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. To 1.0 g add 100 ml of a 100 g/l solution of *potassium hydroxide R* and boil under a reflux condenser for 30 min. Acidify the warm solution with 20 ml of *hydrochloric acid R* and cool to room temperature. Shake the mixture with 50 ml of *ether R* and allow to stand until a separation of the layers is visible. Separate the clear upper layer, add 5 g of *anhydrous sodium sulphate R*, wait for 30 min, filter and evaporate to dryness on a water-bath. Dissolve 50 mg of the residue in 25 ml of *ether R*.

Reference solution. Dissolve 50 mg of *12-hydroxystearic acid R* in 25 ml of *methylene chloride R*.

Plate: *TLC octadecylsilyl silica gel plate R*.

Mobile phase: *methylene chloride R, glacial acetic acid R, acetone R* (10:40:50 *V/V/V*).

Application: 2 µl.

Development: over 2/3 of the plate.

Drying: in a current of cold air.

Detection: spray with a 80 g/l solution of *phosphomolybdic acid R* in *2-propanol R* and heat at 120 °C for 1-2 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and colour to the principal spot in the chromatogram obtained with the reference solution.

B. Dissolve 15.0 g in 50 ml of *water R*. The viscosity (*2.2.9*) has a maximum of 20 mPa·s.

C. Free macrogols (see Tests).

TESTS

Appearance of solution. The solution is not more opalescent than reference suspension III (*2.2.1*) and not more intensely coloured than reference solution B_6 or BY_6 (*2.2.2, Method II*).

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent.

Acid value (*2.5.1*): maximum 1.0, determined on 2.0 g.

Hydroxyl value (*2.5.3, Method A*): 90 to 110.

Iodine value (*2.5.4, Method A*): maximum 2.0.

Peroxide value (*2.5.5, Method A*): maximum 5.0.

Saponification value (*2.5.6*): 53 to 63.

Free macrogols. Size-exclusion chromatography (*2.2.30*).

Test solution. Dissolve 1.20 g of the substance to be examined in the mobile phase and dilute to 250.0 ml with the mobile phase.

Reference solution (a). Dissolve about 0.4 g of *macrogol 1000 R* in the mobile phase and dilute to 250.0 ml with the mobile phase.

Reference solution (b). Dilute 50.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Precolumns (2):

- *size*: *l* = 0.125 m, Ø = 4 mm;
- *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 10 nm.

Column:

- *size*: *l* = 0.30 m, Ø = 7.8 mm;
- *stationary phase*: *hydroxylated polymethacrylate gel R* (6 µm) with a pore size of 12 nm.

Connect both precolumns to the column using a 3-way valve and switch the mobile phase flow according to the following programme:

- 0-114 s: precolumn 1 and column;
- 115 s to the end: precolumn 2 and column;
- 115 s to 7 min: flow back of precolumn 1.

Mobile phase: *water R, methanol R* (2:8 *V/V*).

Flow rate: 1.1 ml/min.

Detection: refractometer.

Injection: 50 µl.

Calculate the percentage content of free macrogols using the following expression:

$$\frac{A_1 \times m_2 \times 200}{m_1 \times (A_2 + 2A_3)}$$

m_1 = mass of the substance to be examined in the test solution, in grams;

m_2 = mass of *macrogol 1000 R* in reference solution (a), in grams;

A_1 = area of the peak due to free macrogols in the substance to be examined in the chromatogram obtained with the test solution;

A_2 = area of the peak due to macrogol 1000 in the chromatogram obtained with reference solution (a);

A_3 = area of the peak due to macrogol 1000 in the chromatogram obtained with reference solution (b).

Limit:

- *free macrogols*: 27.0 per cent to 39.0 per cent.

Ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of ethylene oxide and maximum 50 ppm of dioxan.

Nickel (*2.4.31*): maximum 1 ppm.

Water (*2.5.12*): maximum 1.0 per cent, determined on 2.00 g.

Total ash (*2.4.16*): maximum 0.3 per cent, determined on 1.0 g.

STORAGE

In an airtight container.

01/2008:1124
corrected 6.0

MACROGOL LAURYL ETHER

Macrogoli aether laurilicus

DEFINITION

Mixture of ethers of mixed macrogols with fatty alcohols, mainly $C_{12}H_{26}O$. It contains a variable amount of free $C_{12}H_{26}O$ and it may contain free macrogols. The number of moles of ethylene oxide reacted per mole of $C_{12}H_{26}O$ is 3 to 23 (nominal value).

CHARACTERS

- Macrogol lauryl ether with 3 to 5 units of ethylene oxide per molecule.

  Appearance: colourless liquid.

  Solubility: practically insoluble in water, soluble or dispersible in alcohol, practically insoluble in light petroleum.

- Macrogol lauryl ether with 9 to 23 units of ethylene oxide per molecule.

  Appearance: white or almost white, waxy mass.

  Solubility: soluble or dispersible in water, soluble in alcohol, practically insoluble in light petroleum.

IDENTIFICATION

A. It complies with the test for hydroxyl value (see Tests).

B. It complies with the test for iodine value (see Tests).

C. It complies with the test for saponification value (see Tests).

D. Dissolve or disperse 0.1 g in 5 ml of *alcohol R*, add 10 ml of *dilute hydrochloric acid R*, 10 ml of *barium chloride solution R1* and 10 ml of a 100 g/l solution of *phosphomolybdic acid R*. A precipitate is formed.

TESTS

Appearance of solution. The solution is not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

Dissolve 5.0 g in *alcohol R* and dilute to 50 ml with the same solvent.

Alkalinity. Dissolve 2.0 g in a hot mixture of 10 ml of *water R* and 10 ml of *alcohol R*. Add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator to yellow.

Acid value (*2.5.1*): maximum 1.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*).

Ethylene oxide units per molecule (nominal value)	Hydroxyl value
3	165 - 180
4	145 - 165
5	130 - 140
9	90 - 100
10	85 - 95
12	73 - 83
15	64 - 74
20 - 23	40 - 60

Iodine value (*2.5.4*): maximum 2.0.

Saponification value (*2.5.6*): maximum 3.0, determined on 10.0 g.

Ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Water (*2.5.12*): maximum 3.0 per cent, determined on 2.00 g.

Total ash (*2.4.16*): maximum 0.2 per cent, determined on 2.0 g.

STORAGE

In an airtight container.

LABELLING

The label states the number of moles of ethylene oxide reacted per mole of $C_{12}H_{26}O$ (nominal value).

01/2008:1618

MACROGOL OLEATE

Macrogoli oleas

DEFINITION

A mixture of monoesters and diesters of mainly oleic (*cis*-9-octadecenoic) acid and macrogols. It may be obtained by ethoxylation of *Oleic acid (0799)* or by esterification of macrogols with oleic acid of animal or vegetable origin. It may contain free macrogols. The average polymer length is equivalent to 5-6 or 10 moles of ethylene oxide per mole (nominal value). A suitable antioxidant may be added.

CHARACTERS

Appearance: slightly yellowish, viscous liquid.

Solubility: dispersible in water, soluble in ethanol (96 per cent) and in 2-propanol, dispersible in oils, miscible with fatty oils and with waxes.

Refractive index: about 1.466.

IDENTIFICATION

First identification: A, C.

Second identification: A, B.

A. Saponification value (see Tests).

B. Thin-layer chromatography (*2.2.27*).

Test solution. To 20 mg add 10 ml of *methylene chloride R* and mix.

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: 25 per cent *V/V* solution of *concentrated ammonia R, 2-propanol R* (20:80 *V/V*).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *potassium iodobismuthate solution R4*; examine the plate about 10 min later.

Results: the chromatogram obtained shows 3 principal spots, corresponding, in order of increasing R_F value, to free macrogol, macrogol mono-oleate and macrogol dioleate.

C. Composition of fatty acids (see Tests).

TESTS

Alkalinity. Dissolve 2.0 g in *ethanol (96 per cent) R* and dilute to 20 ml with the same solvent. To 2 ml of this solution add 0.05 ml of *phenol red solution R*. The solution is not red.

Acid value (*2.5.1*): maximum 2.0.

Hydroxyl value (*2.5.3, Method A*): see Table 1618.-1.

Iodine value (*2.5.4, Method A*): see Table 1618.-1.

Peroxide value (*2.5.5, Method A*): maximum 12.0.

Saponification value (*2.5.6*): see Table 1618.-1.

Table 1618.-1

	5-6 moles of ethylene oxide	10 moles of ethylene oxide
Hydroxyl value	50 - 70	65 - 90
Iodine value	50 - 60	27 - 34
Saponification value	105 - 120	68 - 85

Composition of fatty acids. Gas chromatography (*2.4.22, Method A*).

Composition of the fatty-acid fraction of the substance:

- *myristic acid*: maximum 5.0 per cent;
- *stearic acid*: maximum 6.0 per cent;
- *palmitic acid*: maximum 16.0 per cent;
- *palmitoleic acid*: maximum 8.0 per cent;
- *oleic acid*: 65.0 per cent to 88.0 per cent;
- *linoleic acid*: maximum 18.0 per cent;
- *linolenic acid*: maximum 4.0 per cent;
- *fatty acids with a chain length greater than C_{18}*: maximum 4.0 per cent.

Residual ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of residual ethylene oxide and 10 ppm of residual dioxan.

Water (*2.5.12*): maximum 2.0 per cent, determined on 1.00 g using *anhydrous methanol R* as the solvent.

Total ash (*2.4.16*): maximum 0.3 per cent, determined on 1.0 g.

STORAGE

In an airtight container.

LABELLING

The label states the number of moles of ethylene oxide per mole (nominal value).

Monographs M

01/2008:1125

MACROGOL OLEYL ETHER

Macrogoli aether oleicus

DEFINITION

Mixture of ethers of mixed macrogols with linear fatty alcohols, mainly oleyl alcohol. It contains a variable amount of free oleyl alcohol and it may contain free macrogols. The number of moles of ethylene oxide reacted per mole of oleyl alcohol is 2 to 20 (nominal value). A suitable antioxidant may be added.

CHARACTERS

– Macrogol oleyl ether with 2 to 5 units of ethylene oxide per molecule.

  Appearance: yellow liquid.

  Solubility: practically insoluble in water, soluble in alcohol, practically insoluble in light petroleum.

– Macrogol oleyl ether with 10 to 20 units of ethylene oxide per molecule.

  Appearance: yellowish-white waxy mass.

  Solubility: dispersible or soluble in water, soluble in alcohol, practically insoluble in light petroleum.

IDENTIFICATION

A. It complies with the test for hydroxyl value (see Tests).

B. It complies with the test for iodine value (see Tests).

C. It complies with the test for saponification value (see Tests).

D. Dissolve or disperse 0.1 g in 5 ml of *alcohol R*, add 2 ml of *water R*, 10 ml of *dilute hydrochloric acid R*, 10 ml of *barium chloride solution R1* and 10 ml of a 100 g/l solution of *phosphomolybdic acid R*. A precipitate is formed.

TESTS

Appearance of solution. The solution is not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

Dissolve 5.0 g in *alcohol R* and dilute to 50 ml with the same solvent.

Alkalinity. Dissolve 2.0 g in a hot mixture of 10 ml of *water R* and 10 ml of *alcohol R*. Add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator to yellow.

Acid value (*2.5.1*): maximum 1.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*). See Table 1125.-1.

Iodine value (*2.5.4*). See Table 1125.-1.

Table 1125.-1

Ethylene oxide units per molecule (nominal value)	Hydroxyl value	Iodine value
2	158 - 178	48 - 74*
5	110 - 125	48 - 56
10	75 - 95	24 - 38
20	40 - 65	14 - 24

* This broad range is needed since 2 different grades of oleyl alcohol may be used for the synthesis. The iodine value does not differ by more than 5 units from the nominal iodine value and is within the limits stated in the table.

Peroxide value (*2.5.5*): maximum 10.0.

Saponification value (*2.5.6*): maximum 3.0.

Ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of ethylene oxide and 10 ppm of dioxan.

Water (*2.5.12*): maximum 3.0 per cent, determined on 2.00 g.

Total ash (*2.4.16*): maximum 0.2 per cent, determined on 2.0 g.

STORAGE

In an airtight container, protected from light.

LABELLING

The label states:

– the number of moles of ethylene oxide reacted per mole of oleyl alcohol (nominal value),

– the nominal iodine value for the type with 2 units of ethylene oxide per molecule.

01/2008:1444

MACROGOLS

Macrogola

DEFINITION

Mixtures of polymers with the general formula $H-(OCH_2-CH_2)_n-OH$ where n represents the average number of oxyethylene groups. The type of macrogol is defined by a number that indicates the average relative molecular mass. A suitable stabiliser may be added.

CHARACTERS

Type of macrogol	Appearance	Solubility
300 400 600	clear, viscous, colourless or almost colourless hygroscopic liquid	miscible with water, very soluble in acetone, in alcohol, and in methylene chloride, practically insoluble in fatty oils and in mineral oils
1000	white or almost white, hygroscopic solid with a waxy or paraffin-like appearance	very soluble in water, freely soluble in alcohol and in methylene chloride, practically insoluble in fatty oils and in mineral oils
1500	white or almost white solid with a waxy or paraffin-like appearance	very soluble in water and in methylene chloride, freely soluble in alcohol, practically insoluble in fatty oils and in mineral oils
3000 3350	white or almost white solid with a waxy or paraffin-like appearance	very soluble in water and in methylene chloride, very slightly soluble in alcohol, practically insoluble in fatty oils and in mineral oils
4000 6000 8000	white or almost white solid with a waxy or paraffin-like appearance	very soluble in water and in methylene chloride, practically insoluble in alcohol and in fatty oils and in mineral oils
20 000 35 000	white or almost white solid with a waxy or paraffin-like appearance	very soluble in water, soluble in methylene chloride, practically insoluble in alcohol and in fatty oils and in mineral oils

IDENTIFICATION

A. It complies with the test for viscosity (see Tests).

B. To 1 g in a test-tube add 0.5 ml of *sulphuric acid R*, close the test-tube with a stopper fitted with a bent delivery tube and heat until white fumes are evolved. Collect the fumes via the delivery tube into 1 ml of *mercuric chloride solution R*. An abundant white, crystalline precipitate is formed.

C. To 0.1 g add 0.1 g of *potassium thiocyanate R* and 0.1 g of *cobalt nitrate R* and mix thoroughly with a glass rod. Add 5 ml of *methylene chloride R* and shake. The liquid phase becomes blue.

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Dissolve 12.5 g in *water R* and dilute to 50 ml with the same solvent.

Acidity or alkalinity. Dissolve 5.0 g in 50 ml of *carbon dioxide-free water R* and add 0.15 ml of *bromothymol blue solution R1*. The solution is yellow or green. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to blue.

Viscosity (*2.2.9*). The viscosity is calculated using a density given in Table 1444.-1.

Table 1444.-1

Type of macrogol	Kinematic viscosity ($mm^2 \cdot s^{-1}$)	Dynamic viscosity (mPa·s)	Density* (g/ml)
300	71 - 94	80 - 105	1.120
400	94 - 116	105 - 130	1.120
600	13.9 - 18.5	15 - 20	1.080
1000	20.4 - 27.7	22 - 30	1.080
1500	31 - 46	34 - 50	1.080
3000	69 - 93	75 - 100	1.080
3350	76 - 110	83 - 120	1.080
4000	102 - 158	110 - 170	1.080
6000	185 - 250	200 - 270	1.080
8000	240 - 472	260 - 510	1.080
20 000	2500 - 3200	2700 - 3500	1.080
35 000	10 000 - 13 000	11 000 - 14 000	1.080

*Density of the substance for macrogols 300 and 400. Density of the 50 per cent *m/m* solution for the other macrogols.

For macrogols having a relative molecular mass greater than 400, determine the viscosity on a 50 per cent *m/m* solution of the substance to be examined.

Freezing point (*2.2.18*). See Table 1444.-2.

Table 1444.-2

Type of macrogol	Freezing point (°C)
600	15 - 25
1000	35 - 40
1500	42 - 48
3000	50 - 56
3350	53 - 57
4000	53 - 59
6000	55 - 61
8000	55 - 62
20 000	minimum 57
35 000	minimum 57

Hydroxyl value. Introduce *m* g (see Table 1444.-3) into a dry conical flask fitted with a reflux condenser. Add 25.0 ml of *phthalic anhydride solution R*, swirl to dissolve and boil under a reflux condenser on a hot plate for 60 min. Allow to cool. Rinse the condenser first with 25 ml of *pyridine R* and then with 25 ml of *water R*, add 1.5 ml of *phenolphthalein solution R* and titrate with *1 M sodium hydroxide* until a faint pink colour is obtained (n_1 ml). Carry out a blank test (n_2 ml). Calculate the hydroxyl value using the expression:

$$\frac{56.1 \times (n_2 - n_1)}{m}$$

Table 1444.-3

Type of macrogol	Hydroxyl value	*m* (g)
300	340 - 394	1.5
400	264 - 300	1.9
600	178 - 197	3.5
1000	107 - 118	5.0
1500	70 - 80	7.0
3000	34 - 42	12.0
3350	30 - 38	12.0
4000	25 - 32	14.0
6000	16 - 22	18.0
8000	12 - 16	24.0
20 000	-	-
35 000	-	-

For macrogols having a relative molecular mass greater than 1000, if the water content is more than 0.5 per cent, dry a sample of suitable mass at 100-105 °C for 2 h and carry out the determination of the hydroxyl value on the dried sample.

Reducing substances. Dissolve 1 g in 1 ml of a 10 g/l solution of *resorcinol R* and warm gently if necessary. Add 2 ml of *hydrochloric acid R*. After 5 min the solution is not more intensely coloured than reference solution R_3 (*2.2.2, Method I*).

Formaldehyde: maximum 30 ppm.

Test solution. To 1.00 g add 0.25 ml of *chromotropic acid, sodium salt solution R*, cool in iced water and add 5.0 ml of *sulphuric acid R*. Allow to stand for 15 min and complete slowly to 10 ml with *water R*.

Reference solution. Dilute 0.860 g of *formaldehyde solution R* to 100 ml with *water R*. Dilute 1.0 ml of this solution to 100 ml with *water R*. In a 10 ml flask, mix 1.00 ml of this solution with 0.25 ml of *chromotropic acid, sodium salt solution R*, cool in iced water and add 5.0 ml of *sulphuric acid R*. Allow to stand for 15 min and complete slowly to 10 ml with *water R*.

Blank solution. In a 10 ml flask mix 1.00 ml of *water R* with 0.25 ml of *chromotropic acid, sodium salt solution R*, cool in iced water and add 5.0 ml of *sulphuric acid R*. Complete slowly to 10 ml with *water R*.

Determine the absorbance (*2.2.25*) of the test solution at 567 nm, against the blank solution. It is not higher than that of the reference solution.

If the use of macrogols with a higher content of formaldehyde may have adverse effects, the competent authority may impose a limit of not more than 15 ppm.

Monographs M

Ethylene glycol and diethylene glycol: *carry out this test only if the macrogol has a relative molecular mass below 1000.*

Gas chromatography (*2.2.28*).

Test solution. Dissolve 5.00 g of the substance to be examined in *acetone R* and dilute to 100.0 ml with the same solvent.

Reference solution. Dissolve 0.10 g of *ethylene glycol R* and 0.50 g of *diethylene glycol R* in *acetone R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 10.0 ml with *acetone R.*

Column:

– *material*: glass,

– *size*: *l* = 1.8 m, Ø = 2 mm,

– *stationary phase*: *silanised diatomaceous earth for gas chromatography R,* impregnated with 5 per cent *m/m* of *macrogol 20 000 R,*

Carrier gas: *nitrogen for chromatography R.*

Flow rate: 30 ml/min.

Temperature:

– *column*: if necessary, precondition the column by heating at 200 °C for about 15 h; adjust the initial temperature of the column to obtain a retention time of 14-16 min for diethylene glycol; raise the temperature of the column by about 30 °C at a rate of 2 °C/min but without exceeding 170 °C;

– *injection port and detector*: 250 °C.

Detection: flame ionisation.

Injection: 2 µl.

Carry out 5 replicate injections to check the repeatability of the response.

Limit: maximum 0.4 per cent, calculated as the sum of the contents of ethylene glycol and diethylene glycol.

Ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of ethylene oxide and 10 ppm of dioxan.

Heavy metals (*2.4.8*): maximum 20 ppm.

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R.*

Water (*2.5.12*): maximum 2.0 per cent for macrogol with a relative molecular mass not greater than 1000 and maximum 1.0 per cent for macrogol with a relative molecular mass greater than 1000, determined on 2.00 g.

Sulphated ash (*2.4.14*): maximum 0.2 per cent, determined on 1.0 g.

STORAGE

In an airtight container.

LABELLING

The label states:

– the type of macrogol,

– the content of formaldehyde.

01/2008:2396

MACROGOL 40 SORBITOL HEPTAOLEATE

Macrogol 40 sorbitoli heptaoleas

DEFINITION

Mixture of esters of fatty acids, mainly *Oleic acid (0799),* and sorbitol ethoxylated with approximately 40 moles of ethylene oxide for each mole of sorbitol. 7 moles of oleic acid are used for each mole of sorbitol. It also contains macrogol fatty acid esters.

CHARACTERS

Appearance: clear or slightly opalescent, yellowish, viscous, hygroscopic liquid.

Solubility: dispersible in water, soluble in isopropyl myristate, in isopropyl palmitate, in mineral oils and in vegetable fatty oils.

Relative density: about 1.0.

Viscosity (*2.2.9*): about 175 mPa·s at 25 °C.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *macrogol 40 sorbitol heptaoleate CRS.*

B. Hydroxyl value (see Tests).

C. Saponification value (see Tests).

D. Composition of fatty acids (see Tests).

TESTS

Acid value (*2.5.1*): maximum 12.0, determined on 3.0 g.

Hydroxyl value (*2.5.3, Method A*): 22 to 55.

Peroxide value: maximum 10.0.

Introduce 10.0 g into a 100 ml beaker, dissolve with *glacial acetic acid R* and dilute to 20 ml with the same acid. Add 1 ml of *saturated potassium iodide solution R* and allow to stand for 1 min. Add 50 ml of *carbon dioxide-free water R* and a magnetic stirring bar. Titrate with *0.01 M sodium thiosulphate,* determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

Determine the peroxide value using the following expression:

$$\frac{(n_1 - n_2) \times M \times 1000}{m}$$

n_1 = volume of *0.01 M sodium thiosulphate* required for the titration of the substance to be examined, in millilitres;

n_2 = volume of *0.01 M sodium thiosulphate* required for the blank titration, in millilitres;

M = molarity of the sodium thiosulphate solution;

m = mass of the substance to be examined, in grams.

Saponification value (*2.5.6*): 90 to 110, determined on 4.0 g.

Use 30.0 ml of *0.5 M alcoholic potassium hydroxide,* heat under reflux for 60 min and add 50 ml of *anhydrous ethanol R* before carrying out the titration.

Composition of fatty acids (*2.4.22, Method C*). Use the mixture of calibrating substances in Table 2.4.22.-3.

Composition of the fatty-acid fraction of the substance:

– *myristic acid*: maximum 5.0 per cent;
– *palmitic acid*: maximum 16.0 per cent;
– *palmitoleic acid*: maximum 8.0 per cent;
– *stearic acid*: maximum 6.0 per cent;
– *oleic acid*: minimum 58.0 per cent;
– *linoleic acid*: maximum 18.0 per cent;
– *linolenic acid*: maximum 4.0 per cent.

Ethylene oxide and dioxan (*2.4.25, Method A*): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Water (*2.5.12*): maximum 0.5 per cent, determined on 0.50 g.

Sulphated ash: maximum 0.25 per cent.

Heat a silica crucible to redness for 30 min, allow to cool in a desiccator and weigh. Evenly distribute 1.0 g of the substance to be examined in the crucible and weigh. Dry at 100-105 °C for 1 h and ignite in a muffle furnace at 600 ± 25 °C, until the substance is thoroughly charred. Carry out the test for sulphated ash (*2.4.14*) on the residue obtained, starting from “Moisten the substance to be examined...”.

STORAGE

In an airtight container, protected from light.

01/2008:1234

MACROGOL STEARATE

Macrogoli stearas

DEFINITION

Mixture of monoesters and diesters of mainly stearic (octadecanoic) acid and/or palmitic (hexadecanoic) acid and macrogols. It may be obtained by ethoxylation or by esterification of macrogols with stearic acid 50 (type I) or stearic acid 95 (type II) (see *Stearic acid (1474)*). It may contain free macrogols. The average polymer length is equivalent to 6 to 100 ethylene oxide units per molecule (nominal value).

CHARACTERS

Appearance: white or slightly yellowish waxy mass.

Solubility: soluble in alcohol and in 2-propanol. Macrogol stearate corresponding to a product with 6 to 9 units of ethylene oxide per molecule is practically insoluble, but freely dispersible in water and miscible with fatty oils and with waxes. Macrogol stearate corresponding to a product with 20 to 100 units of ethylene oxide per molecule is soluble in water and practically insoluble in fatty oils and in waxes.

IDENTIFICATION

A. It complies with the test for saponification value (see Tests).
B. It complies with the test for composition of fatty acids (see Tests).

TESTS

Alkalinity. Dissolve 2.0 g in *alcohol R* and dilute to 20 ml with the same solvent. To 2 ml of this solution add 0.05 ml of *phenol red solution R*. The solution is not red.

Melting point (*2.2.15*). See Table 1234.-1.

Melt about 10 g at 80-90 °C. Introduce into the tube by capillary action, a sufficient amount of the substance, to form in the tube a column of the prescribed height. Allow to stand at 0 °C for 2 h.

Acid value (*2.5.1*): maximum 2.0, determined on 2.0 g.

Hydroxyl value (*2.5.3, Method A*). See Table 1234.-1.

Iodine value (*2.5.4*): maximum 2.0.

Saponification value (*2.5.6*). See Table 1234.-1.

Table 1234.-1

Ethylene oxide units per molecule (nominal value)	Melting point (°C)	Hydroxyl value	Saponification value
6		90 - 110	85 - 105
8 - 9	26 - 35	80 - 105	88 - 100
20	33 - 40	50 - 62	46 - 56
40 - 50	38 - 52	23 - 40	20 - 35
100	48 - 60	15 - 30	5 - 20

Reducing substances. Dissolve or disperse 2.0 g in *water R* and dilute to 20 ml with the same solvent. Mix 1.0 ml of the solution with 9 ml of *0.1 M sodium hydroxide* and 0.5 ml of *triphenyltetrazolium chloride solution R*. Heat in a water-bath at 70 °C. After 5 min, the solution is not more intensely coloured than a mixture of 0.15 ml of yellow primary solution, 0.9 ml of red primary solution and 8.95 ml of a 10 g/l solution of *hydrochloric acid R* (*2.2.2, Method II*).

Composition of fatty acids. Gas chromatography (*2.4.22, Method C*).

Composition of the fatty acid fraction of the substance:

	Type of fatty acid used	Composition of fatty acids
Macrogol stearate type I	Stearic acid 50	*Stearic acid*: 40.0 per cent to 60.0 per cent, *Sum of the contents of palmitic and stearic acids*: not less than 90.0 per cent.
Macrogol stearate type II	Stearic acid 95	*Stearic acid*: 90.0 per cent to 99.0 per cent, *Sum of the contents of palmitic and stearic acids*: not less than 96.0 per cent.

Ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of ethylene oxide and 10 ppm of dioxan.

Heavy metals (*2.4.8*): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 3.0 per cent, determined on 0.50 g. Use as the solvent a mixture of equal volumes of *anhydrous methanol R* and *methylene chloride R*.

Total ash (*2.4.16*): maximum 0.3 per cent, determined on 1.0 g.

STORAGE

In an airtight container.

LABELLING

The label states:

– the number of ethylene oxide units per molecule (nominal value),
– the type of macrogol stearate.

01/2008:1340

MACROGOL STEARYL ETHER

Macrogoli aether stearylicus

DEFINITION

Mixture of ethers obtained by ethoxylation of stearyl alcohol. It may contain some free macrogols and various amounts of free stearyl alcohol. The number of moles of ethylene oxide reacted per mole of stearyl alcohol is 2 to 20 (nominal value).

CHARACTERS

Appearance: white or yellowish-white, waxy, unctuous mass, pellets, microbeads or flakes.

Solubility:

- macrogol stearyl ether with 2 moles of ethylene oxide reacted per mole: practically insoluble in water, soluble in ethanol (96 per cent) with heating and in methylene chloride;
- macrogol stearyl ether with 10 moles of ethylene oxide reacted per mole: soluble in water and in ethanol (96 per cent);
- macrogol stearyl ether with 20 moles of ethylene oxide reacted per mole: soluble in water, in ethanol (96 per cent) and in methylene chloride.

After melting, it solidifies at about 45 °C.

IDENTIFICATION

A. Hydroxyl value (see Tests).

B. Iodine value (see Tests).

C. Saponification value (see Tests).

D. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10.0 g in a mixture of 1 volume of *water R* and 9 volumes of *methanol R* and dilute to 75 ml with the same mixture of solvents. Add 60 ml of *heptane R* and shake for 3 min. The formation of foam can be reduced by the addition of a few drops of *ethanol (96 per cent) R*. Filter the upper layer through *anhydrous sodium sulphate R*, wash the filter with 3 quantities, each of 10 ml, of *heptane R* and evaporate the combined filtrates to dryness. Dissolve 50 mg of the residue in 10 ml of *methanol R* (the solution may be opalescent).

Reference solution. Dissolve 25 mg of *stearyl alcohol CRS* in *methanol R* and dilute to 25 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R*.

Application: 20 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with vanillin-sulphuric acid reagent prepared as follows: dissolve 0.5 g of *vanillin R* in 50 ml of *ethanol (96 per cent) R* and dilute to 100 ml with *sulphuric acid R*; allow to dry in air; heat at about 130 °C for 15 min and allow to cool in air.

Results: the chromatogram obtained with the test solution shows several spots; one of these spots corresponds to the principal spot in the chromatogram obtained with the reference solution.

E. Dissolve or disperse 0.1 g in 5 ml of *ethanol 96 per cent R*, add 2 ml of *water R*, 10 ml of *dilute hydrochloric acid R*, 10 ml of *barium chloride solution R1* and 10 ml of a 100 g/l solution of *phosphomolybdic acid R*. A precipitate is formed.

TESTS

Appearance of solution. The solution is not more intensely coloured than reference solution BY_5 (*2.2.2, Method II*).

Dissolve 5.0 g in *ethanol (96 per cent) R* and dilute to 50 ml with the same solvent.

Alkalinity. Dissolve 2.0 g in a hot mixture of 10 ml of *ethanol (96 per cent) R* and 10 ml of *water R*. Add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator to yellow.

Acid value (*2.5.1*): maximum 1.0, determined on 5.0 g.

Hydroxyl value (*2.5.3, Method A*).

Number of moles of ethylene oxide reacted per mole (nominal value)	Hydroxyl value
2	150 - 180
10	75 - 90
20	40 - 60

Iodine value (*2.5.4, Method A*): maximum 2.0.

Saponification value (*2.5.6*): maximum 3.0, determined on 10.0 g.

Ethylene oxide and dioxan (*2.4.25*): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Water (*2.5.12*): maximum 3.0 per cent, determined on 1.00 g.

STORAGE

In an airtight container.

LABELLING

The label states the number of moles of ethylene oxide reacted per mole of stearyl alcohol (nominal value).

01/2008:1539

MAGALDRATE

Magaldratum

$Al_5Mg_{10}(OH)_{31}(SO_4)_2,xH_2O$ M_r 1097 (anhydrous substance)

DEFINITION

Magaldrate is composed of aluminium and magnesium hydroxides and sulphates. Its composition corresponds approximately to the formula $Al_5Mg_{10}(OH)_{31}(SO_4)_2,xH_2O$.

Content: 90.0 per cent to 105.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water and in ethanol (96 per cent). It is soluble in dilute mineral acids.

IDENTIFICATION

A. Dissolve 0.6 g in 20 ml of *3 M hydrochloric acid R*, add about 30 ml of *water R* and heat to boiling. Adjust to pH 6.2 with *dilute ammonia R1*, continue boiling for a further 2 min, filter and retain the precipitate and the filtrate. To 2 ml of the filtrate add 2 ml of *ammonium chloride solution R* and neutralise with a solution

prepared by dissolving 2 g of *ammonium carbonate R* and 2 ml of *dilute ammonia R1* in 20 ml of *water R*; no precipitate is produced. Add *disodium hydrogen phosphate solution R*; a white, crystalline precipitate is produced which does not dissolve in *dilute ammonia R1*.

B. The precipitate retained in identification test A gives the reaction of aluminium (*2.3.1*).

C. The filtrate retained in identification test A gives reaction (a) of sulphates (*2.3.1*).

TESTS

Soluble chlorides: maximum 3.5 per cent.

Disperse 1 g in 50 ml of *water R*, boil for 5 min, cool, dilute again to 50.0 ml, mix and filter. To 25.0 ml of the filtrate add 0.2 ml of *potassium chromate solution R* and titrate with *0.1 M silver nitrate* until a persistent violet-red colour is obtained. Not more than 5.0 ml of *0.1 M silver nitrate* is required.

Soluble sulphates: maximum 1.9 per cent.

To 2.5 ml of the filtrate obtained in the test for soluble chlorides, add 30 ml of *water R*, neutralise to *blue litmus paper R* with *hydrochloric acid R*, add 3 ml of *1 M hydrochloric acid*, 3 ml of a 120 g/l solution of *barium chloride R* and dilute to 50 ml with *water R*. Mix and allow to stand for 10 min. Any opalescence in the test solution is not more intense than that of a standard prepared at the same time in the same manner using 1 ml of *0.01 M sulphuric acid* instead of 2.5 ml of filtrate.

Sulphates: 16.0 per cent to 21.0 per cent (dried substance).

Dissolve 0.875 g in a mixture of 5 ml of *glacial acetic acid R* and 10 ml of *water R* and dilute to 25 ml with *water R*. Prepare a chromatographic column of 1 cm in internal diameter containing 15 ml of *cation exchange resin R* (150-300 µm), previously washed with 30 ml of *water R*. Transfer 5.0 ml of the solution to be examined to the column and elute with 15 ml of *water R*. To the eluate add 5 ml of a 53.6 g/l solution of *magnesium acetate R*, 32 ml of *methanol R* and 0.2 ml of *alizarin S solution R*. Add from a burette about 4.0 ml of *0.05 M barium chloride*, add a further 0.2 ml of *alizarin S solution R* and slowly complete the titration until the yellow colour disappears and a violet-red tinge is visible.

1 ml of *0.05 M barium chloride* is equivalent to 4.803 mg of SO_4.

Aluminium hydroxide: 32.1 per cent to 45.9 per cent (dried substance).

Dissolve 0.800 g in 10 ml of *dilute hydrochloric acid R1*, heating on a water-bath. Cool and dilute to 50.0 ml with *water R*. To 10.0 ml of this solution, add *dilute ammonia R1* until a precipitate begins to appear. Add the smallest quantity of *dilute hydrochloric acid R* needed to dissolve the precipitate and dilute to 20 ml with *water R*. Carry out the complexometric titration of aluminium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 7.80 mg of $Al(OH)_3$.

Magnesium hydroxide: 49.2 per cent to 66.6 per cent (dried substance).

Dissolve 0.100 g in 2 ml of *dilute hydrochloric acid R* and carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 5.832 mg of $Mg(OH)_2$.

Sodium: maximum 0.10 per cent.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution. Weigh 2.00 g into a 100 ml volumetric flask, place in an ice-bath, add 5 ml of *nitric acid R* and swirl to mix. Allow to warm to room temperature and dilute to 100 ml with *water R*. Filter, if necessary, to obtain a clear solution. Dilute 10.0 ml of the filtrate to 100.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*, diluted as necessary with *dilute nitric acid R*.

Source: sodium hollow-cathode lamp.

Wavelength: 589 nm.

Atomisation device: air-acetylene flame.

Heavy metals (*2.4.8*): maximum 30 ppm.

Dissolve 2.0 g in 30 ml of *hydrochloric acid R1* and shake with 50 ml of *methyl isobutyl ketone R* for 2 min. Allow to stand, then separate and evaporate the aqueous layer to dryness. Dissolve the residue in 30 ml of *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Loss on drying (*2.2.32*): 10.0 per cent to 20.0 per cent, determined on 1.000 g by drying in an oven at 200 °C for 4 h.

ASSAY

To 1.500 g add 50.0 ml of *1 M hydrochloric acid*. Titrate the excess hydrochloric acid with *1 M sodium hydroxide* to pH 3.0, determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 ml of *1 M hydrochloric acid* is equivalent to 35.40 mg of $Al_5Mg_{10}(OH)_{31}(SO_4)_2$.

01/2008:2035
corrected 6.0

MAGNESIUM ACETATE TETRAHYDRATE

Magnesii acetas tetrahydricus

$Mg(CH_3COO)_2,4H_2O$ M_r 214.5
[16674-78-5]

DEFINITION

Content: 98.0 per cent to 101.0 per cent of magnesium acetate (anhydrous substance).

CHARACTERS

Appearance: colourless crystals or white or almost white, crystalline powder.

Solubility: freely soluble in water and in alcohol.

IDENTIFICATION

A. Dissolve about 100 mg in 2 ml of *water R*. Add 1 ml of *dilute ammonia R1* and heat. A white precipitate is formed that dissolves slowly on addition of 5 ml of *ammonium chloride solution R*. Add 1 ml of *disodium hydrogen phosphate solution R*. A white crystalline precipitate is formed.

B. It gives reaction (b) of acetates (*2.3.1*).

TESTS

pH (*2.2.3*): 7.5 to 8.5.

Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Chlorides (*2.4.4*): maximum 330 ppm.

Dissolve 1.0 g in *water R* and dilute to 100 ml with the same solvent. 15 ml of the solution complies with the limit test for chlorides.

Nitrates: maximum 3 ppm.

Dissolve 1.0 g in *distilled water R* and dilute to 10 ml with the same solvent, add 5 mg of *sodium chloride R*, 0.05 ml of *indigo carmine solution R* and while stirring, 10 ml of *nitrogen-free sulphuric acid R*. A blue colour is produced which persists for at least 10 min.

Sulphates (*2.4.13*): maximum 600 ppm.

Dissolve 0.25 g in *distilled water R* and dilute to 15 ml with the same solvent.

Aluminium (*2.4.17*): maximum 1 ppm.

Prescribed solution. Dissolve 4.0 g in *water R* and dilute to 100 ml with the same solvent. Add 10 ml of *acetate buffer solution pH 6.0 R*.

Reference solution. Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Calcium (*2.4.3*): maximum 100 ppm.

Dissolve 1.0 g in *distilled water R* and dilute to 15 ml with the same solvent.

Potassium: maximum 0.10 per cent.

Atomic emission spectrometry (*2.2.22, Method II*).

Test solution. Dissolve 0.5 g in *water R* and dilute to 100 ml with the same solvent.

Reference solutions. Prepare the reference solutions using *potassium standard solution (600 ppm K) R*, diluted as necessary with *water R*.

Wavelength: 766.5 nm.

Sodium: maximum 0.50 per cent.

Atomic emission spectrometry (*2.2.22, Method II*).

Test solution. Dissolve 1.0 g in *water R* and dilute to 100 ml with the same solvent.

Reference solutions. Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*, diluted as necessary with *water R*.

Wavelength: 589.0 nm.

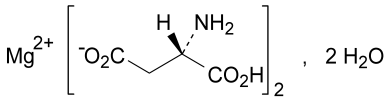
Heavy metals (*2.4.8*): maximum 40 ppm.

Dissolve 1.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Readily oxidisable substances. Dissolve 2.0 g in 100 ml of boiling *water R*, add 6 ml of a 150 g/l solution of *sulphuric acid R* and 0.3 ml of *0.02 M potassium permanganate*. Mix and boil gently for 5 min. The pink colour is not completely discharged.

Water (*2.5.12*): 33.0 per cent to 35.0 per cent, determined on 0.100 g.

ASSAY



Dissolve 0.150 g in 300 ml of *water R*. Carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 14.24 mg of $C_4H_6MgO_4$.

01/2008:1445
corrected 6.0

MAGNESIUM ASPARTATE DIHYDRATE

Magnesii aspartas dihydricus

$C_8H_{12}MgN_2O_8,2H_2O$ M_r 324.5

DEFINITION

Magnesium aspartate dihydrate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of magnesium di[(*S*)-2-aminohydrogenobutane-1,4-dioate], calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, freely soluble in water.

IDENTIFICATION

A. It complies with the test for specific optical rotation (see Tests).

B. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Ignite about 15 mg until a white residue is obtained. Dissolve the residue in 1 ml of *dilute hydrochloric acid R*, neutralise to *red litmus paper R* by the addition of *dilute sodium hydroxide solution R* and filter if necessary. The solution gives the reaction of magnesium (*2.3.1*).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

pH (*2.2.3*). The pH of solution S is 6.0 to 8.0.

Specific optical rotation (*2.2.7*). Dissolve 0.50 g in a 515 g/l solution of *hydrochloric acid R* and dilute to 25.0 ml with the same acid. The specific optical rotation is + 20.5 to + 23.0, calculated with reference to the anhydrous substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *water R* and dilute to 10 ml withthe same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *magnesium aspartate dihydrate CRS* in *water R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *magnesium aspartate dihydrate CRS* and 10 mg of *glutamic acid CRS* in 2 ml of *water R* and dilute to 25 ml with the same solvent.

Apply to the plate 5 µl of each solution. Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air and spray with *ninhydrin solution R*. Heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Chlorides (*2.4.4*). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (*2.4.13*). Dilute 12 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (500 ppm). Carry out the evaluation of the test after 30 min.

Ammonium (*2.4.1*). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (*2.4.9*). In a separating funnel, dissolve 0.20 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (50 ppm).

Heavy metals (*2.4.8*). Dissolve 2.0 g with gentle heating in 20 ml of *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*). 10.0 per cent to 14.0 per cent, determined on 0.100 g by the semi-micro determination of water. Dissolve the substance in 10 ml of *formamide R1* at 50 °C protected from moisture, add 10 ml of *anhydrous methanol R* and allow to cool. Carry out a blank determination.

ASSAY

Dissolve 0.260 g in 10 ml of *water R* and carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 28.85 mg of $C_8H_{12}MgN_2O_8$.

IMPURITIES

A. aspartic acid.

01/2008:0043
corrected 6.0

MAGNESIUM CARBONATE, HEAVY

Magnesii subcarbonas ponderosus

[546-93-0]

DEFINITION

Hydrated basic magnesium carbonate.

Content: 40.0 per cent to 45.0 per cent, calculated as MgO (M_r 40.30).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water. It dissolves in dilute acids with effervescence.

IDENTIFICATION

A. 15 g has an apparent volume (*2.9.15*) before settling of not more than 60 ml.

B. It gives the reaction of carbonates (*2.3.1*).

C. Dissolve about 15 mg in 2 ml of *dilute nitric acid R* and neutralise with *dilute sodium hydroxide solution R*. The solution gives the reaction of magnesium (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in 100 ml of *dilute acetic acid R*. When the effervescence has ceased, boil for 2 min, allow to cool and dilute to 100 ml with *dilute acetic acid R*. Filter, if necessary, through a previously ignited and tared porcelain or silica filter crucible of suitable porosity to give a clear filtrate.

Appearance of solution. Solution S is not more intensely coloured than reference solution B_4 (*2.2.2, Method II*).

Soluble substances: maximum 1.0 per cent.

Mix 2.00 g with 100 ml of *water R* and boil for 5 min. Filter whilst hot through a sintered-glass filter (40) (*2.1.2*), allow to cool and dilute to 100 ml with *water R*. Evaporate 50 ml of the filtrate to dryness and dry at 100-105 °C. The residue weighs not more than 10 mg.

Substances insoluble in acetic acid: maximum 0.05 per cent.

Any residue obtained during the preparation of solution S, washed, dried, and ignited at 600 ± 50 °C, weighs not more than 2.5 mg.

Chlorides (*2.4.4*): maximum 700 ppm.

Dilute 1.5 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 0.6 per cent.

Dilute 0.5 ml of solution S to 15 ml with *distilled water R*.

Arsenic (*2.4.2, Method A*): maximum 2 ppm, determined on 10 ml of solution S.

Calcium (*2.4.3*): maximum 0.75 per cent.

Dilute 2.6 ml of solution S to 150 ml with *distilled water R*. 15 ml of the solution complies with the test.

Iron (*2.4.9*): maximum 400 ppm.

Dissolve 0.1 g in 3 ml of *dilute hydrochloric acid R* and dilute to 10 ml with *water R*. Dilute 2.5 ml of the solution to 10 ml with *water R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

To 20 ml of solution S add 15 ml of *hydrochloric acid R1* and shake with 25 ml of *methyl isobutyl ketone R* for 2 min. Allow to stand, separate the aqueous lower layer and evaporate to dryness. Dissolve the residue in 1 ml of *acetic acid R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 0.150 g in a mixture of 2 ml of *dilute hydrochloric acid R* and 20 ml of *water R*. Carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 4.030 mg of MgO.

01/2008:0042 corrected 6.0

MAGNESIUM CARBONATE, LIGHT

Magnesii subcarbonas levis

[546-93-0]

DEFINITION

Hydrated basic magnesium carbonate.

Content: 40.0 per cent to 45.0 per cent, calculated as MgO (M_r 40.30).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water. It dissolves in dilute acids with effervescence.

IDENTIFICATION

A. 15 g has an apparent volume (*2.9.15*) before settling of at least 100 ml.

B. It gives the reaction of carbonates (*2.3.1*).

C. Dissolve about 15 mg in 2 ml of *dilute nitric acid R* and neutralise with *dilute sodium hydroxide solution R*. The solution gives the reaction of magnesium (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in 100 ml of *dilute acetic acid R*. When the effervescence has ceased, boil for 2 min, allow to cool and dilute to 100 ml with *dilute acetic acid R*. Filter, if necessary, through a previously ignited and tared porcelain or silica filter crucible of suitable porosity to give a clear filtrate.

Appearance of solution. Solution S is not more intensely coloured than reference solution B_4 (*2.2.2, Method II*).

Soluble substances: maximum 1.0 per cent.

Mix 2.00 g with 100 ml of *water R* and boil for 5 min. Filter whilst hot through a sintered-glass filter (40) (*2.1.2*), allow to cool and dilute to 100 ml with *water R*. Evaporate 50 ml of the filtrate to dryness and dry at 100-105 °C. The residue weighs a maximum of 10 mg.

Substances insoluble in acetic acid: maximum 0.05 per cent.

Any residue obtained during the preparation of solution S, washed, dried and ignited at 600 ± 50 °C, weighs a maximum of 2.5 mg.

Chlorides (*2.4.4*): maximum 700 ppm.

Dilute 1.5 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 0.3 per cent.

Dilute 1 ml of solution S to 15 ml with *distilled water R*.

Arsenic (*2.4.2, Method A*): maximum 2 ppm, determined on 10 ml of solution S.

Calcium (*2.4.3*): maximum 0.75 per cent.

Dilute 2.6 ml of solution S to 150 ml with *distilled water R*. 15 ml of the solution complies with the test.

Iron (*2.4.9*): maximum 400 ppm.

Dissolve 0.1 g in 3 ml of *dilute hydrochloric acid R* and dilute to 10 ml with *water R*. Dilute 2.5 ml of the solution to 10 ml with *water R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

To 20 ml of solution S add 15 ml of *hydrochloric acid R1* and shake with 25 ml of *methyl isobutyl ketone R* for 2 min. Allow to stand, separate the aqueous lower layer and evaporate to dryness. Dissolve the residue in 1 ml of *acetic acid R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 0.150 g in a mixture of 2 ml of *dilute hydrochloric acid R* and 20 ml of *water R*. Carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 4.030 mg of MgO.

01/2008:0402 corrected 6.0

MAGNESIUM CHLORIDE HEXAHYDRATE

Magnesii chloridum hexahydricum

$MgCl_2,6H_2O$ M_r 203.3

[7791-18-6]

DEFINITION

Content: 98.0 per cent to 101.0 per cent of $MgCl_2,6H_2O$.

CHARACTERS

Appearance: colourless crystals, hygroscopic.

Solubility: very soluble in water, freely soluble in ethanol (96 per cent).

IDENTIFICATION

A. Water (see Tests).

B. It gives reaction (a) of chlorides (*2.3.1*).

C. It gives the reaction of magnesium (*2.3.1*).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 5 ml of solution S add 0.05 ml of *phenol red solution R*. Not more than 0.3 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Bromides: maximum 500 ppm.

Dilute 2.0 ml of solution S to 10.0 ml with *water R*. To 1.0 ml of this solution add 4.0 ml of *water R*, 2.0 ml of *phenol red solution R3* and 1.0 ml of *chloramine solution R2* and mix immediately. After exactly 2 min, add 0.30 ml of *0.1 M sodium thiosulphate*, mix and dilute to 10.0 ml with *water R*. The absorbance (*2.2.25*) of the solution measured at 590 nm, using *water R* as the compensation liquid, is not greater than that of a standard prepared at the same time and in the same manner using 5.0 ml of a 3 mg/l solution of *potassium bromide R*.

Sulphates (*2.4.13*): maximum 100 ppm, determined on solution S.

Aluminium (*2.4.17*): maximum 1 ppm, if intended for use in the manufacture of peritoneal dialysis solutions, haemodialysis solutions, or haemofiltration solutions.

Prescribed solution. Dissolve 4 g in 100 ml of *water R* and add 10 ml of *acetate buffer solution pH 6.0 R*.

Reference solution. Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Arsenic (*2.4.2, Method A*): maximum 2 ppm, determined on 0.5 g.

Calcium (*2.4.3*): maximum 0,1 per cent.

Dilute 1 ml of solution S to 15 ml with *distilled water R*.

Iron (*2.4.9*): maximum 10 ppm, determined on solution S.

Potassium: maximum 5.0×10^2 ppm, if intended for use in the manufacture of parenteral dosage forms.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution. Dissolve 1.00 g in *water R* and dilute to 100.0 ml with the same solvent.

Reference solutions. Prepare the reference solutions using the following solution, diluted as necessary with *water R*: dissolve 1.144 g of *potassium chloride R*, previously dried at 100-105 °C for 3 h in *water R* and dilute to 1000.0 ml with the same solvent (600 µg of K per millilitre).

Wavelength: 766,5 nm.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): 51.0 per cent to 55.0 per cent, determined on 50.0 mg.

ASSAY

Dissolve 0.300 g in 50 ml of *water R*. Carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 20.33 mg of $MgCl_2,6H_2O$.

STORAGE

In an airtight container.

LABELLING

The label states:

– where applicable, that the substance is suitable for use in the manufacture of peritoneal dialysis solutions, haemodialysis solutions or haemofiltration solutions,

– where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

MAGNESIUM CHLORIDE 4.5-HYDRATE

Magnesii chloridum 4.5-hydricum

$MgCl_2,xH_2O$ with $x \simeq 4.5$ M_r 95.21 (anhydrous substance)

DEFINITION

Content: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, granular powder, hygroscopic.

Solubility: very soluble in water, freely soluble in ethanol (96 per cent).

IDENTIFICATION

A. Water (see Tests).

B. It gives reaction (a) of chlorides (*2.3.1*).

C. It gives the reaction of magnesium (*2.3.1*).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 5 ml of solution S add 0.05 ml of *phenol red solution R*. Not more than 0.3 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Bromides: maximum 500 ppm.

Dilute 2.0 ml of solution S to 10.0 ml with *water R*. To 1.0 ml of the solution add 4.0 ml of *water R*, 2.0 ml of *phenol red solution R3* and 1.0 ml of *chloramine solution R2* and mix immediately. After exactly 2 min, add 0.30 ml of *0.1 M sodium thiosulphate*, mix and dilute to 10.0 ml with *water R*. The absorbance (*2.2.25*) of the solution measured at 590 nm, using *water R* as the compensation liquid, is not greater than that of a standard prepared at the same time and in the same manner using 5.0 ml of a 3 mg/l solution of *potassium bromide R*.

Sulphates (*2.4.13*): maximum 100 ppm, determined on solution S.

Aluminium (*2.4.17*): maximum 1 ppm, if intended for use in the manufacture of peritoneal dialysis solutions, haemodialysis solutions, or haemofiltration solutions.

Prescribed solution. Dissolve 4 g in 100 ml of *water R* and add 10 ml of *acetate buffer solution pH 6.0 R*.

Reference solution. Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Arsenic (*2.4.2, Method A*): maximum 2 ppm, determined on 0.5 g.

Calcium (*2.4.3*): maximum 0.1 per cent.

Dilute 1 ml of solution S to 15 ml with *distilled water R*.

Iron (*2.4.9*): maximum 10 ppm, determined on solution S.

Potassium: maximum 5.00×10^2 ppm, if intended for use in the manufacture of parenteral dosage forms.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution. Dissolve 1.00 g in *water R* and dilute to 100.0 ml with the same solvent.

Reference solutions. Prepare the reference solutions using the following solution, diluted as necessary with *water R*: dissolve 1.144 g of *potassium chloride R*, previously dried at 100-105 °C for 3 h, in *water R* and dilute to 1000.0 ml with the same solvent (600 µg of K per millilitre).

Wavelength: 766.5 nm.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (*2.5.12*): 44.0 per cent to 48.0 per cent, determined on 50.0 mg.

ASSAY

Dissolve 0.250 g in 50 ml of *water R*. Carry out the complexometric titration of magnesium (*2.5.11*).

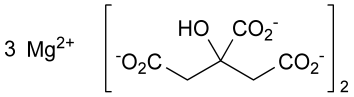
1 ml of *0.1 M sodium edetate* is equivalent to 9.521 mg of $MgCl_2$.

STORAGE

In an airtight container.

LABELLING

The label states:



– where applicable, that the substance is suitable for use in the manufacture of peritoneal dialysis solutions, haemodialysis solutions or haemofiltration solutions,

– where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

01/2008:2339

MAGNESIUM CITRATE, ANHYDROUS

Magnesii citras anhydricus

$Mg_3(C_6H_5O_7)_2$ M_r 451.1

[3344-18-1]

DEFINITION

Trimagnesium bis(2-hydroxypropane-1,2,3-tricarboxylate).

Content: 15.0 per cent to 16.5 per cent of Mg (dried substance).

CHARACTERS

Appearance: white or almost white, fine, slightly hygroscopic powder.

Solubility: soluble in water, practically insoluble in ethanol (96 per cent). It dissolves in dilute hydrochloric acid.

IDENTIFICATION

A. It gives the reaction of citrates (*2.3.1*).

B. It gives the reaction of magnesium (*2.3.1*).

C. pH (see Tests).

D. Loss on drying (see Tests).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R*, heating at 60 °C, cool and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solutions Y_7 or BY_6 (*2.2.2, Method II*).

pH (*2.2.3*): 6.0 to 8.5 for solution S.

Oxalates: maximum 280 ppm.

Dissolve 0.50 g in 4 ml of *water R*. Add 3 ml of *hydrochloric acid R* and 1 g of *activated zinc R*. Allow to stand for 5 min. Transfer the liquid to a tube containing 0.25 ml of a 10 g/l solution of *phenylhydrazine hydrochloride R*. Heat to boiling. Cool rapidly, transfer to a graduated cylinder and add an equal volume of *hydrochloric acid R* and 0.25 ml of *potassium ferricyanide solution R*. Shake and allow to stand for 30 min. Any pink colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 4 ml of a 50 mg/l solution of *oxalic acid R*.

Sulphates (*2.4.13*): maximum 0.2 per cent.

Dilute 1.5 ml of solution S to 15 ml with *distilled water R*.

Calcium (*2.4.3*): maximum 0.2 per cent.

Dilute 1.0 ml of solution S to 15 ml with *distilled water R*.

Iron (*2.4.9*): maximum 100 ppm.

Dilute 2.0 ml of solution S to 10 ml with *distilled water R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

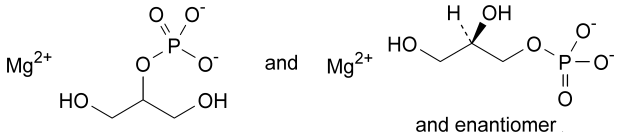
Dissolve 5.0 g in 15 ml of *dilute hydrochloric acid R* with heating. Adjust to pH 3.5 with *ammonia R* and dilute to 50 ml with *distilled water R*. 12 ml of this solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 3.5 per cent, determined on 1.000 g by drying in an oven at 180 ± 10 °C for 5 h.

ASSAY

Dissolve 0.150 g in 50 ml of *water R*. Carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 2.431 mg of Mg.



STORAGE

In a non-metallic, airtight container.

01/2008:1446
corrected 6.0

MAGNESIUM GLYCEROPHOSPHATE

Magnesii glycerophosphas

$C_3H_7MgO_6P$ M_r 194.4

DEFINITION

Mixture, in variable proportions, of magnesium salts of (*RS*)-2,3-dihydroxypropyl phosphate and 2-hydroxy-1-(hydroxymethyl)ethyl phosphate, which may be hydrated.

Content: 11.0 per cent to 12.5 per cent of Mg (dried substance).

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: practically insoluble in ethanol (96 per cent). It dissolves in dilute solutions of acids.

IDENTIFICATION

A. Mix 1 g with 1 g of *potassium hydrogen sulphate R* in a test tube fitted with a glass tube. Heat strongly and direct the white vapour towards a piece of filter paper impregnated with a freshly prepared 10 g/l solution of *sodium nitroprusside R*. The filter paper develops a blue colour in contact with *piperidine R*.

B. Ignite 0.1 g in a crucible. Take up the residue with 5 ml of *nitric acid R* and heat on a water-bath for 1 min. Filter. The filtrate gives reaction (b) of phosphates (*2.3.1*).

C. It gives the reaction of magnesium (*2.3.1*).

Monographs M

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension III (*2.2.1*).

Acidity. Dissolve 1.0 g in 100 ml of *carbon dioxide-free water R*. Add 0.1 ml of *phenolphthalein solution R*. Not more than 1.5 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Glycerol and ethanol (96 per cent)-soluble substances: maximum 1.5 per cent.

Shake 1.0 g with 25 ml of *ethanol (96 per cent) R* for 2 min. Filter and wash the residue with 5 ml of *ethanol (96 per cent) R*. Combine the filtrate and the washings, evaporate to dryness on a water-bath and dry the residue at 70 °C for 1 h. The residue weighs a maximum of 15 mg.

Chlorides (*2.4.4*): maximum 0.15 per cent.

Dissolve 1.0 g in *water R* and dilute to 100 ml with the same solvent. Dilute 3.5 ml of this solution to 15 ml with *water R*.

Phosphates (*2.4.11*): maximum 0.5 per cent.

Dilute 4 ml of solution S to 100 ml with *water R*. Dilute 1 ml of this solution to 100 ml with *water R*.

Sulphates (*2.4.13*): maximum 0.1 per cent.

Dilute 3 ml of solution S to 15 ml with *distilled water R*.

Iron (*2.4.9*): maximum 150 ppm.

Dissolve 67 mg in *water R* and dilute to 10 ml with the same solvent.

Heavy metals (*2.4.8*): maximum 20 ppm.

To 20 ml of solution S add 15 ml of *hydrochloric acid R* and shake with 25 ml of *methyl isobutyl ketone R* for 2 min. Allow to stand, then separate and evaporate the aqueous layer to dryness. Dissolve the residue in 2.5 ml of *acetic acid R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g by drying in an oven at 150 °C for 4 h.

ASSAY

Dissolve 0.200 g in 40 ml of *water R*. Carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 2.431 mg of Mg.

STORAGE

In an airtight container.

01/2008:0039
corrected 6.0

MAGNESIUM HYDROXIDE

Magnesii hydroxidum

$Mg(OH)_2$ M_r 58.32
[1309-42-8]

DEFINITION

Content: 95.0 per cent to 100.5 per cent of $Mg(OH)_2$.

CHARACTERS

Appearance: white or almost white, fine, amorphous powder.

Solubility: practically insoluble in water. It dissolves in dilute acids.

IDENTIFICATION

A. Dissolve about 15 mg in 2 ml of *dilute nitric acid R* and neutralise with *dilute sodium hydroxide solution R*. The solution gives the reaction of magnesium (*2.3.1*).

B. It complies with the test for loss on ignition (see Tests).

TESTS

Solution S. Dissolve 5.0 g in a mixture of 50 ml of *acetic acid R* and 50 ml of *distilled water R*. Not more than slight effervescence is produced. Boil for 2 min, cool and dilute to 100 ml with *dilute acetic acid R*. Filter, if necessary, through a previously ignited and tared porcelain or silica filter crucible of suitable porosity to give a clear filtrate.

Appearance of solution. Solution S is not more intensely coloured than reference solution B_3 (*2.2.2, Method II*).

Soluble substances: maximum 2.0 per cent.

Mix 2.00 g with 100 ml of *water R* and boil for 5 min. Filter whilst hot through a sintered-glass filter (40) (*2.1.2*), allow to cool and dilute to 100 ml with *water R*. Evaporate 50 ml of the filtrate to dryness and dry at 100-105 °C. The residue weighs not more than 20 mg.

Substances insoluble in acetic acid: maximum 0.1 per cent.

Any residue obtained during the preparation of solution S, washed, dried, and ignited at 600 ± 50 °C, weighs not more than 5 mg.

Chlorides (*2.4.4*): maximum 0.1 per cent.

1 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides.

Sulphates (*2.4.13*): maximum 0.5 per cent.

0.6 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates.

Arsenic (*2.4.2*): maximum 4 ppm.

5 ml of solution S complies with limit test A.

Calcium (*2.4.3*): maximum 1.5 per cent.

Dilute 1.3 ml of solution S to 150 ml with *distilled water R*. 15 ml of the solution complies with the limit test for calcium.

Iron (*2.4.9*): maximum 0.07 per cent.

Dissolve 0.15 g in 5 ml of *dilute hydrochloric acid R* and dilute to 10 ml with *water R*. 1 ml of this solution diluted to 10 ml with *water R* complies with the limit test for iron.

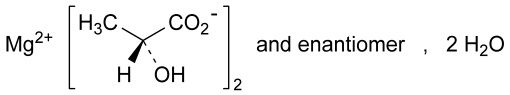
Heavy metals (*2.4.8*): maximum 30 ppm.

Dissolve 2.0 g in 20 ml of *hydrochloric acid R1* and shake with 25 ml of *methyl isobutyl ketone R* for 2 min. Allow to stand, separate the aqueous layer and evaporate to dryness. Dissolve the residue in 30 ml of *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Loss on ignition: 29.0 per cent to 32.5 per cent.

Heat 0.5 g gradually to 900 ± 50 °C and ignite to constant mass.

ASSAY



Dissolve 0.100 g in a mixture of 20 ml of *water R* and 2 ml of *dilute hydrochloric acid R* and carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 5.832 mg of $Mg(OH)_2$.

01/2008:2160

MAGNESIUM LACTATE DIHYDRATE

Magnesii lactas dihydricus

$C_6H_{10}MgO_6,2H_2O$ M_r 238.5

DEFINITION

Magnesium bis(2-hydroxypropanoate) or mixture of magnesium (2*R*)-, (2*S*)- and (2*RS*)-2-hydroxypropanoate dihydrate.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline or granular powder.

Solubility: slightly soluble in water, soluble in boiling water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. It gives the reaction of lactates (*2.3.1*).

B. It gives the reaction of magnesium (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g with heating in *carbon dioxide-free water R* prepared from *distilled water R*, allow to cool and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

pH (*2.2.3*): 6.5 to 8.5 for solution S.

Chlorides (*2.4.4*): maximum 200 ppm.

Dilute 5 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 400 ppm.

Dilute 7.5 ml of solution S to 15 ml with *distilled water R*.

Iron (*2.4.9*): maximum 50 ppm.

Dilute 4 ml of solution S to 10 ml with *water R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): 14.0 per cent to 17.0 per cent, determined on 0.500 g by drying in an oven at 125 °C.

ASSAY

Dissolve 0.180 g in *water R* and dilute to 300 ml with the same solvent. Carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 20.25 mg of $C_6H_{10}MgO_6$.

01/2008:0041
corrected 6.0

MAGNESIUM OXIDE, HEAVY

Magnesii oxidum ponderosum

MgO M_r 40.30
[1309-48-4]

DEFINITION

Content: 98.0 per cent to 100.5 per cent of MgO (ignited substance).

CHARACTERS

Appearance: fine, white or almost white powder.

Solubility: practically insoluble in water. It dissolves in dilute acids with at most slight effervescence.

IDENTIFICATION

A. 15 g has an apparent volume (*2.9.15*) before settling of not more than 60 ml.

B. Dissolve about 15 mg in 2 ml of *dilute nitric acid R* and neutralise with *dilute sodium hydroxide solution R*. The solution gives the reaction of magnesium (*2.3.1*).

C. Loss on ignition (see Tests).

TESTS

Solution S. Dissolve 5.0 g in a mixture of 30 ml of *distilled water R* and 70 ml of *acetic acid R*, boil for 2 min, cool and dilute to 100 ml with *dilute acetic acid R*. Filter, if necessary, through a previously ignited and tared porcelain or silica filter crucible of suitable porosity to give a clear filtrate.

Appearance of solution. Solution S is not more intensely coloured than reference solution B_3 (*2.2.2, Method II*).

Soluble substances: maximum 2.0 per cent.

To 2.00 g add 100 ml of *water R* and boil for 5 min. Filter whilst hot through a sintered-glass filter (40) (*2.1.2*), allow to cool and dilute to 100 ml with *water R*. Evaporate 50 ml of the filtrate to dryness and dry at 100-105 °C. The residue weighs a maximum of 20 mg.

Substances insoluble in acetic acid: maximum 0.1 per cent.

Any residue obtained during the preparation of solution S, washed, dried, and ignited at 600 ± 50 °C, weighs a maximum of 5 mg.

Chlorides (*2.4.4*): maximum 0.1 per cent.

Dilute 1 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 1.0 per cent.

Dilute 0.3 ml of solution S to 15 ml with *distilled water R*.

Arsenic (*2.4.2, Method A*): maximum 4 ppm, determined on 5 ml of solution S.

Calcium (*2.4.3*): maximum 1.5 per cent.

Dilute 1.3 ml of solution S to 150 ml with *distilled water R*. 15 ml of the solution complies with the test.

Iron (*2.4.9*): maximum 0.07 per cent.

Dissolve 0.15 g in 5 ml of *dilute hydrochloric acid R* and dilute to 10 ml with *water R*. Dilute 1 ml of the solution to 10 ml with *water R*.

Heavy metals (*2.4.8*): maximum 30 ppm.

To 20 ml of solution S add 15 ml of *hydrochloric acid R1* and shake with 25 ml of *methyl isobutyl ketone R* for 2 min. Allow to stand, then separate and evaporate the aqueous layer to dryness. Dissolve the residue in 1 ml of *acetic acid R* and dilute to 30 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on ignition: maximum 8.0 per cent, determined on 1.00 g at 900 ± 25 °C.

ASSAY

Dissolve 0.320 g in 20 ml of *dilute hydrochloric acid R* and dilute to 100.0 ml with *water R*. Using 20.0 ml of the solution, carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 4.030 mg of MgO.

01/2008:0040
corrected 6.0

MAGNESIUM OXIDE, LIGHT

Magnesii oxidum leve

MgO M_r 40.30
[1309-48-4]

DEFINITION

Content: 98.0 per cent to 100.5 per cent of MgO (ignited substance).

CHARACTERS

Appearance: fine, white or almost white, amorphous powder.

Solubility: practically insoluble in water. It dissolves in dilute acids with at most slight effervescence.

IDENTIFICATION

A. 15 g has an apparent volume (*2.9.15*) before settling of at least 100 ml.

B. Dissolve about 15 mg in 2 ml of *dilute nitric acid R* and neutralise with *dilute sodium hydroxide solution R*. The solution gives the reaction of magnesium (*2.3.1*).

C. Loss on ignition (see Tests).

TESTS

Solution S. Dissolve 5.0 g in a mixture of 30 ml of *distilled water R* and 70 ml of *acetic acid R*, boil for 2 min, cool and dilute to 100 ml with *dilute acetic acid R*. Filter, if necessary, through a previously ignited and tared porcelain or silica filter crucible of a suitable porosity to give a clear filtrate.

Appearance of solution. Solution S is not more intensely coloured than reference solution B_2 (*2.2.2, Method II*).

Soluble substances: maximum 2.0 per cent.

To 2.00 g add 100 ml of *water R* and boil for 5 min. Filter whilst hot through a sintered-glass filter (40) (*2.1.2*), allow to cool and dilute to 100 ml with *water R*. Evaporate 50 ml of the filtrate to dryness and dry at 100-105 °C. The residue weighs a maximum of 20 mg.

Substances insoluble in acetic acid: maximum 0.1 per cent.

Any residue obtained during the preparation of solution S, washed, dried, and ignited at 600 ± 50 °C, weighs a maximum of 5 mg.

Chlorides (*2.4.4*): maximum 0.15 per cent.

Dilute 0.7 ml of solution S to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 1.0 per cent.

Dilute 0.3 ml of solution S to 15 ml with *distilled water R*.

Arsenic (*2.4.2, Method A*): maximum 4 ppm, determined on 5 ml of solution S.

Calcium (*2.4.3*): maximum 1.5 per cent.

Dilute 1.3 ml of solution S to 150 ml with *distilled water R*. 15 ml of the solution complies with the test.

Iron (*2.4.9*): maximum 0.1 per cent.

Dissolve 50 mg in 5 ml of *dilute hydrochloric acid R* and dilute to 10 ml with *water R*. Dilute 2 ml of t his solution to 10 ml with *water R*.

Heavy metals (*2.4.8*): maximum 30 ppm.

To 20 ml of solution S add 15 ml of *hydrochloric acid R1* and shake with 25 ml of *methyl isobutyl ketone R* for 2 min. Allow to stand, then separate and evaporate the aqueous layer to dryness. Dissolve the residue in 1.5 ml of *acetic acid R* and dilute to 30 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on ignition: maximum 8.0 per cent, determined on 1.00 g at 900 ± 25 °C.

ASSAY

Dissolve 0.320 g in 20 ml of *dilute hydrochloric acid R* and dilute to 100.0 ml with *water R*. Using 20.0 ml of the solution, carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 4.030 mg of MgO.

01/2008:1540
corrected 6.0

MAGNESIUM PEROXIDE

Magnesii peroxidum

DEFINITION

Mixture of magnesium peroxide and magnesium oxide.

Content: 22.0 per cent to 28.0 per cent of MgO_2 (M_r 56.30).

CHARACTERS

Appearance: white or slightly yellow, amorphous, light powder.

Solubility: practically insoluble in water and in ethanol (96 per cent). It dissolves in dilute mineral acids.

IDENTIFICATION

A. Dissolve about 15 mg in 2 ml of *dilute nitric acid R* and neutralise with *dilute sodium hydroxide solution R*. The solution gives the reaction of magnesium (*2.3.1*).

B. Dissolve 0.1 g in 2 ml of *dilute sulphuric acid R* and dilute to 10 ml with *water R*. Shake 1 ml of this solution with 5 ml of *ether R* and 0.5 ml of *potassium dichromate solution R1*. The ether layer is blue.

TESTS

Solution S1. Dissolve cautiously 5.0 g in 40 ml of *hydrochloric acid R1*. Cautiously evaporate the solution to 10 ml and dilute to 100 ml with a mixture of equal volumes of *acetic acid R* and *distilled water R*. Filter, if necessary, through a previously ignited and tared porcelain or silica filter crucible of suitable porosity to give a clear filtrate. Keep the residue for the test for acid insoluble substances.

Solution S2. Dilute 5 ml of solution S1 to 25 ml with *distilled water R*.

Appearance of solution. Solution S1 is not more intensely coloured than reference solution B_4 (*2.2.2, Method II*).

Acidity or alkalinity. To 2.0 g add 100 ml of *carbon dioxide-free water R* and heat to boiling for 5 min. Filter whilst hot through a sintered-glass filter (40) (*2.1.2*), allow to cool and dilute to 100 ml with *carbon dioxide-free water R*. To 15 ml of the filtrate, add 0.1 ml of *phenolphthalein solution R*. The solution is red. Not more than 0.2 ml of *0.1 M hydrochloric acid* is necessary to change the colour of the indicator. Keep the filtrate for the test for soluble substances.

Acid insoluble substances: maximum 0.1 per cent.

Any residue obtained during the preparation of solution S1, washed, dried and ignited at 600 ± 50 °C, weighs a maximum of 5 mg.

Soluble substances: maximum 1.5 per cent.

Take 50 ml of the filtrate obtained in the test for acidity or alkalinity, evaporate to dryness and dry at 100-105 °C. The residue weighs a maximum of 15 mg.

Chlorides (*2.4.4*): maximum 0.1 per cent.

Dissolve 50 mg in 5 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*.

Sulphates (*2.4.13*): maximum 0.5 per cent.

Dilute 3 ml of solution S2 to 15 ml with *distilled water R*.

Arsenic (*2.4.2, Method A*): maximum 4 ppm, determined on 5 ml of solution S1.

Calcium (*2.4.3*): maximum 1.0 per cent.

Dilute 1 ml of solution S2 to 15 ml with *distilled water R*.

Iron (*2.4.9*): maximum 500 ppm.

Dilute 2 ml of solution S2 to 10 ml with *water R*.

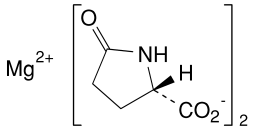
Heavy metals (*2.4.8*): maximum 30 ppm.

To 20 ml of solution S1 add 15 ml of *hydrochloric acid R1* and shake with 25 ml of *methyl isobutyl ketone R* for 2 min. Allow to stand, then separate and evaporate the aqueous layer to dryness. Dissolve the residue in 1.5 ml of *acetic acid R* and dilute to 30 ml with *water R*. 12 ml of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 80.0 mg, shaking cautiously, in a mixture, previously cooled to 20 °C, of 10 ml of *sulphuric acid R* and 90 ml of *water R*. Titrate with *0.02 M potassium permanganate* until a pink colour is obtained.

1 ml of *0.02 M potassium permanganate* is equivalent to 2.815 mg of MgO_2.



STORAGE

Protected from light.

01/2008:1619

MAGNESIUM PIDOLATE

Magnesii pidolas

$C_{10}H_{12}N_2O_6Mg$ M_r 280.5
[62003-27-4]

DEFINITION

Magnesium bis[(2*S*)-5-oxopyrrolidine-2-carboxylate].

Content: 8.49 per cent to 8.84 per cent of Mg (A_r = 24.31) (anhydrous substance).

CHARACTERS

Appearance: amorphous, white or almost white powder, hygroscopic.

Solubility: very soluble in water, soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 60 mg in 2 ml of *water R* and dilute to 10 ml with *methanol R*.

Reference solution. Dissolve 55 mg of *pidolic acid CRS* in 2 ml of *water R* and dilute to 10 ml with *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *methanol R, glacial acetic acid R, methylene chloride R* (15:20:65 *V/V/V*).

Application: 1 µl.

Development: over 2/3 of the plate.

Drying: at 100-105 °C for 15 min.

Detection: spray with *concentrated sodium hypochlorite solution R*. Allow to stand for 10 min and spray abundantly with *glacial acetic acid R*. Allow to stand again for 10 min and dry the plate at 100-105 °C for 2 min. Spray with *potassium iodide and starch solution R* until spots appear.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution. The chromatogram obtained with the test solution may show 2 faint secondary spots.

B. To 0.15 ml of solution S (see Tests) add 1.8 ml of *water R*. The solution gives the reaction of magnesium (*2.3.1*).

TESTS

Solution S. Dissolve 5.00 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution B_8 (*2.2.2, Method I*).

pH (*2.2.3*): 5.5 to 7.0 for solution S.

Specific optical rotation (*2.2.7*): – 23.3 to – 26.5 (anhydrous substance), determined on solution S.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.500 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 50.0 mg *pidolate impurity B CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (c). Dilute 10.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of *nitrate standard solution (100 ppm NO_3) R* to 100.0 ml with the mobile phase.

Reference solution (e). Dilute 6.0 ml of reference solution (a) to 10.0 ml with reference solution (b).

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm,

– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: dissolve 1.56 g of *sodium dihydrogen phosphate R* in 1000 ml of *water R* and adjust to pH 2.5 with a 10 per cent *V/V* solution of *phosphoric acid R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 µl loop injector; inject the test solution and reference solutions (b), (c), (d) and (e).

Run time: 4 times the retention time of pidolic acid.

Retention times: pidolic acid = about 4.5 min; impurity B = about 7.5 min.

System suitability: reference solution (e):

– *resolution*: minimum 10 between the peaks due to pidolic acid and to impurity B.

Limits:

– *impurity B*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),

– *total of other impurities*: not more than half of the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

– *disregard limit*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent); disregard any peak corresponding to the nitrate ion (NO_3^-).

Impurity A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 0.250 g of the substance to be examined in 4 ml of *water R* and dilute to 50.0 ml with *methanol R*.

Reference solution (a). Dissolve 60.0 mg of *glutamic acid R* in 50 ml of *water R* and dilute to 100.0 ml with *methanol R*. Dilute 1.0 ml of the solution to 20.0 ml with *methanol R*.

Reference solution (b). Dissolve 10 mg of *glutamic acid R* and 10 mg of *aspartic acid R* in *water R* and dilute to 25 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *water R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *glacial acetic acid R, water R, butanol R* (20:20:60 *V/V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with *ninhydrin solution R* and heat at 100-105 °C for 15 min.

System suitability: the test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Limit:

– *impurity A*: any spot corresponding to impurity A in the chromatogram obtained with the test solution is not more intense that the spot in the chromatogram obtained with reference solution (a) (0.6 per cent).

Chlorides (*2.4.4*): maximum 500 ppm.

Dilute 1.0 ml of solution S to 15.0 ml of *water R*. The solution complies with the limit test for chlorides.

Nitrates. Examine the chromatogram obtained with the test solution in the test for related substances.

Limit:

– *nitrates*: not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (200 ppm).

Sulphates (*2.4.13*): maximum 0.1 per cent.

Dilute 1.5 ml of solution S to 15.0 ml with *distilled water R*. The solution complies with the limit test for sulphates.

Arsenic (*2.4.2*): maximum 2 ppm.

5.0 ml of solution S complies with limit test A.

Iron (*2.4.9*): maximum 200 ppm.

Dilute 0.5 ml of solution S to 10 ml of *water R*. The solution complies with the limit test for iron.

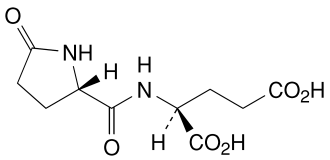
Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Water (*2.5.12*): maximum 8.0 per cent, determined on 0.200 g.

ASSAY

Dissolve 0.300 g in 50 ml of *water R*. Carry out the complexometric titration of magnesium (*2.5.11*).



1 ml of *0.1 M sodium edetate* is equivalent to 2.431 mg of Mg.

STORAGE

In an airtight container.

IMPURITIES

A. glutamic acid,

B. (2*S*)-2-[[[(2*S*)-5-oxopyrrolidin-2-yl]carbonyl]amino]pentanedioic acid.

01/2008:0229
corrected 6.0

MAGNESIUM STEARATE

Magnesii stearas

DEFINITION

Magnesium stearate is a mixture of magnesium salts of different fatty acids consisting mainly of stearic (octadecanoic) acid [$(C_{17}H_{35}COO)_2Mg$; M_r 591.3] and palmitic (hexadecanoic) acid [$(C_{15}H_{31}COO)_2$ Mg; M_r 535.1] with minor proportions of other fatty acids. It contains not less than 4.0 per cent and not more than 5.0 per cent of Mg (A_r 24.30), calculated with reference to the dried substance. The fatty acid fraction contains not less than 40.0 per cent of stearic acid and the sum of stearic acid and palmitic acid is not less than 90.0 per cent.

CHARACTERS

A white or almost white, very fine, light powder, greasy to the touch, practically insoluble in water and in ethanol.

IDENTIFICATION

First identification: C, D.

Second identification: A, B, D.

A. The residue obtained in the preparation of solution S (see Tests) has a freezing point (*2.2.18*) not lower than 53 °C.

B. The acid value of the fatty acids (*2.5.1*) is 195 to 210, determined on 0.200 g of the residue obtained in the preparation of solution S dissolved in 25 ml of the prescribed mixture of solvents.

C. Examine the chromatograms obtained in the test for fatty acid composition. The retention times of the principal peaks in the chromatogram obtained with the test solution are approximately the same as those of the principal peaks in the chromatogram obtained with the reference solution.

D. 1 ml of solution S gives the reaction of magnesium (*2.3.1*).

TESTS

Solution S. To 5.0 g add 50 ml of *peroxide-free ether R*, 20 ml of *dilute nitric acid R* and 20 ml of *distilled water R* and heat under a reflux condenser until dissolution is complete. Allow to cool. In a separating funnel, separate the aqueous layer and shake the ether layer with 2 quantities, each of 4 ml, of *distilled water R*. Combine the aqueous layers, wash with 15 ml of *peroxide-free ether R* and dilute to 50 ml with *distilled water R* (solution S). Evaporate the organic layer to dryness and dry the residue at 100-105 °C. Keep the residue for identification tests A and B.

Acidity or alkalinity. To 1.0 g add 20 ml of *carbon dioxide-free water R* and boil for 1 min with continuous stirring. Cool and filter. To 10 ml of the filtrate add 0.05 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Chlorides (*2.4.4*). 0.5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (0.1 per cent).

Sulphates (*2.4.13*). 0.3 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (0.5 per cent).

Cadmium. Not more than 3.0 ppm of Cd, determined by atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Place 50.0 mg of the substance to be examined in a polytetrafluoroethylene digestion bomb and add 0.5 ml of a mixture of 1 volume of *hydrochloric acid R* and 5 volumes of *cadmium- and lead-free nitric acid R*. Allow to digest at 170 °C for 5 h. Allow to cool. Dissolve the residue in *water R* and dilute to 5.0 ml with the same solvent.

Reference solutions. Prepare the reference solutions using *cadmium standard solution (10 ppm Cd) R*, diluted as necessary with a 1 per cent *V/V* solution of *hydrochloric acid R*.

Measure the absorbance at 228.8 nm, using a cadmium hollow-cathode lamp as a source of radiation and a graphite furnace as atomic generator.

Lead. Not more than 10.0 ppm of Pb, determined by atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Use the solution described in the test for cadmium.

Reference solutions. Prepare the reference solutions using *lead standard solution (10 ppm Pb) R*, diluted as necessary with *water R*.

Measure the absorbance at 283.3 nm, using a lead hollow-cathode lamp as a source of radiation and a graphite furnace as atomic generator, depending on the apparatus the line at 217.0 nm may be used.

Nickel. Not more than 5.0 ppm of Ni, determined by atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. Use the solution described in the test for cadmium.

Reference solutions. Prepare the reference solutions using *nickel standard solution (10 ppm Ni) R*, diluted as necessary with *water R*.

Measure the absorbance at 232.0 nm, using a nickel hollow-cathode lamp as a source of radiation and a graphite furnace as atomic generator.

Loss on drying (*2.2.32*). Not more than 6.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 micro-organisms per gram, determined by plate count. It complies with the test for *Escherichia coli* (*2.6.13*).

ASSAY

Magnesium. To 0.500 g in a 250 ml conical flask add 50 ml of a mixture of equal volumes of *butanol R* and *ethanol R*, 5 ml of *concentrated ammonia R*, 3 ml of *ammonium chloride buffer solution pH 10.0 R*, 30.0 ml of *0.1 M sodium edetate* and 15 mg of *mordant black 11 triturate R*. Heat to 45-50 °C until the solution is clear and titrate with *0.1 M zinc sulphate* until the colour changes from blue to violet. Carry out a blank titration.

1 ml of *0.1 M sodium edetate* is equivalent to 2.431 mg of Mg.

Fatty acid composition. Examine by gas chromatography (*2.2.28*).

Test solution. In a conical flask fitted with a reflux condenser, dissolve 0.10 g of the substance to be examined in 5 ml of *boron trifluoride-methanol solution R*. Boil under a reflux condenser for 10 min. Add 4 ml of *heptane R* through the condenser and boil again under a reflux condenser for 10 min. Allow to cool. Add 20 ml of a *saturated sodium chloride solution R*. Shake and allow the layers to separate. Remove about 2 ml of the organic layer and dry over 0.2 g of *anhydrous sodium sulphate R*. Dilute 1.0 ml of the solution to 10.0 ml with *heptane R*.

Reference solution. Prepare the reference solution in the same manner as the test solution using 50.0 mg of *palmitic acid CRS* and 50.0 mg of *stearic acid CRS* instead of magnesium stearate.

The chromatographic procedure may be carried out using:

– a fused-silica column 30 m long and 0.32 mm in internal diameter coated with *macrogol 20 000 R* (film thickness 0.5 µm),

– *helium for chromatography R* as the carrier gas at a flow rate of 2.4 ml/min,

– a flame-ionisation detector,

with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 2	70	–	isothermal
	2 - 36	70 → 240	5	linear gradient
	36 - 41	240	–	isothermal
Injection port		220		
Detector		260		

Inject 1 µl of the reference solution. When the chromatogram is recorded in the prescribed conditions, the relative retention of methyl palmitate to that of methyl stearate is about 0.88. The test is not valid unless, in the chromatogram obtained

with the reference solution, the resolution between the peaks corresponding to methyl stearate and methyl palmitate is at least 5.0.

Inject 1 µl of the test solution. Calculate the percentage content of stearic acid and palmitic acid from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure, disregarding the peak due to the solvent.

FUNCTIONALITY-RELATED CHARACTERISTICS

This section provides information on characteristics that are recognised as being relevant control parameters for one or more functions of the substance when used as an excipient. This section is a non-mandatory part of the monograph and it is not necessary to verify the characteristics to demonstrate compliance. Control of these characteristics can however contribute to the quality of a medicinal product by improving the consistency of the manufacturing process and the performance of the medicinal product during use. Where control methods are cited, they are recognised as being suitable for the purpose, but other methods can also be used. Wherever results for a particular characteristic are reported, the control method must be indicated.

The following characteristic may be relevant for magnesium stearate used as a lubricant in solid dosage forms (compressed and powder).

Specific surface area (*2.9.26, Method I*). Determine the specific surface area in the P/P_0 range of 0.05 to 0.15.

Sample outgassing: 2 h at 40 °C.

01/2008:0044
corrected 6.0

MAGNESIUM SULPHATE HEPTAHYDRATE

Magnesii sulfas heptahydricus

$MgSO_4,7H_2O$ M_r 246.5
[10034-99-8]

DEFINITION

Content: 99.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or brilliant, colourless crystals.

Solubility: freely soluble in water, very soluble in boiling water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. It gives the reactions of sulphates (*2.3.1*).

B. It gives the reaction of magnesium (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in *water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of *phenol red solution R*. Not more than 0.2 ml of *0.01 M hydrochloric acid* or *0.01 M sodium hydroxide* is required to change the colour of the indicator.

Chlorides (*2.4.4*): maximum 300 ppm.

Dilute 1.7 ml of solution S to 15 ml with *water R*.

Arsenic (*2.4.2, Method A*): maximum 2 ppm, determined on 0.5 g.

Iron (*2.4.9*): maximum 20 ppm.

Dilute 5 ml of solution S to 10 ml with *water R*.

Heavy metals (*2.4.8*): maximum 10 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): 48.0 per cent to 52.0 per cent, determined on 0.500 g by drying in an oven at 110-120 °C for 1 h and then at 400 °C to constant mass.

ASSAY

Dissolve 0.450 g in 100 ml of *water R* and carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 12.04 mg of $MgSO_4$.

01/2008:0403
corrected 6.0

MAGNESIUM TRISILICATE

Magnesii trisilicas

DEFINITION

It has a variable composition corresponding approximately to $Mg_2Si_3O_8,xH_2O$.

Content:

– *magnesium oxide* (MgO; M_r 40.30): minimum 29.0 per cent (ignited substance),

– *silicon dioxide* (SiO_2; M_r 60.1): minimum 65.0 per cent (ignited substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water and in ethanol (96 per cent).

IDENTIFICATION

A. 0.25 g gives the reaction of silicates (*2.3.1*).

B. 1 ml of solution S (see Tests) neutralised with *dilute sodium hydroxide solution R* gives the reaction of magnesium (*2.3.1*).

TESTS

Solution S. To 2.0 g add a mixture of 4 ml of *nitric acid R* and 4 ml of *distilled water R*. Heat to boiling with frequent shaking. Add 12 ml of *distilled water R* and allow to cool. Filter or centrifuge to obtain a clear solution and dilute to 20 ml with *distilled water R*.

Alkalinity. To 10.0 g in a 200 ml conical flask, add 100.0 g of *water R* and heat on a water-bath for 30 min. Allow to cool and make up to the initial mass with *water R*. Allow to stand and filter or centrifuge until a clear liquid is obtained. To 10 ml of this liquid add 0.1 ml of *phenolphthalein solution R*. Not more than 1.0 ml of *0.1 M hydrochloric acid* is required to change the colour of the indicator.

Water-soluble salts: maximum 1.5 per cent.

In a platinum dish, evaporate to dryness on a water-bath 20.0 ml of the liquid obtained in the test for alkalinity. The residue, ignited to constant mass at 900 ± 50 °C, weighs a maximum of 30 mg.

Chlorides (*2.4.4*): maximum 500 ppm.

Dilute 0.5 ml of solution S to 15 ml with *water R*. Prepare the standard using a mixture of 5 ml of *chloride standard solution (5 ppm Cl) R* and 10 ml of *water R*.

Sulphates (*2.4.13*): maximum 0.5 per cent.

Dilute 0.3 ml of solution S to 15 ml with *distilled water R*.

Arsenic (*2.4.2, method A*): maximum 4 ppm, determined on 2.5 ml of solution S.

Heavy metals (*2.4.8*): maximum 40 ppm.

Neutralise 10 ml of solution S with *dilute ammonia R1*, using *metanil yellow solution R* as an external indicator. Dilute to 20 ml with *water R* and filter if necessary. 12 ml of this solution complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Loss on ignition: 17 per cent to 34 per cent, determined on 0.5 g by ignition to constant mass at 900 ± 50 °C in a platinum crucible.

Acid-absorbing capacity. Suspend 0.25 g in *0.1 M hydrochloric acid*, dilute to 100.0 ml with the same acid and allow to stand for 2 h in a water-bath at 37 ± 0.5 °C, with frequent shaking. Allow to cool. To 20.0 ml of the supernatant solution add 0.1 ml of *bromophenol blue solution R* and titrate with *0.1 M sodium hydroxide* until a blue colour is obtained. The acid-absorbing capacity is not less than 100.0 ml of *0.1 M hydrochloric acid* per gram.

ASSAY

Magnesium oxide. To 1.000 g in a 200 ml conical flask, add 35 ml of *hydrochloric acid R* and 60 ml of *water R* and heat in a water-bath for 15 min. Allow to cool, filter, wash the conical flask and the residue with *water R* and dilute the combined filtrate and washings to 250.0 ml with *water R*. Neutralise 50.0 ml of the solution with *strong sodium hydroxide solution R* (about 8 ml). Carry out the complexometric titration of magnesium (*2.5.11*).

1 ml of *0.1 M sodium edetate* is equivalent to 4.030 mg of MgO.

Silicon dioxide. To 0.700 g add 10 ml of *dilute sulphuric acid R* and 10 ml of *water R*. Heat for 90 min on a water-bath with frequent shaking, replacing the evaporated water. Allow to cool and decant onto an ashless filter paper (diameter 7 cm). Wash the precipitate by decantation with 3 quantities, each of 5 ml, of hot *water R*, transfer it to the filter and wash it with hot *water R* until 1 ml of the filtrate remains clear after the addition of 0.05 ml of *dilute hydrochloric acid R* and 2 ml of *barium chloride solution R1*. Incinerate the filter and its contents in a platinum crucible, then ignite the residue (SiO_2) at 900 ± 50 °C to constant mass.

01/2008:1342

MAIZE OIL, REFINED

Maydis oleum raffinatum

DEFINITION

Refined maize oil is the fatty oil obtained from the seeds of *Zea mays* L. by expression or by extraction, then refined.

CHARACTERS

A clear, light yellow or yellow oil, practically insoluble in water and in alcohol, miscible with light petroleum (bp: 40 °C to 60 °C) and with methylene chloride.

It has a relative density of about 0.920 and a refractive index of about 1.474.

IDENTIFICATION

A. Carry out the identification of fatty oils by thin-layer chromatography (*2.3.2*). The chromatogram obtained with the test solution is similar to that obtained with the reference solution.

B. It complies with the test for composition of fatty acids (see Tests).

TESTS

Acid value (*2.5.1*). Not more than 0.5, determined on 10.0 g. If intended for use in the manufacture of parenteral dosage forms, not more than 0.3.

Peroxide value (*2.5.5*). Not more than 10.0. If intended for use in the manufacture of parenteral dosage forms, not more than 5.0.

Unsaponifiable matter (*2.5.7*). Not more than 2.8 per cent, determined on 5.0 g.

Alkaline impurities (*2.4.19*). It complies with the test for alkaline impurities in fatty oils.

Composition of fatty acids (*2.4.22, Method A*). The fatty-acid fraction of the oil has the following composition:

- *fatty acids of chain length less than C_{16}*: not more than 0.6 per cent,
- *palmitic acid*: 8.6 per cent to 16.5 per cent,
- *stearic acid*: not more than 3.3 per cent,
- *oleic acid*: 20.0 per cent to 42.2 per cent (equivalent chain length on polyethyleneglycol adipate 18.3),
- *linoleic acid*: 39.4 per cent to 65.6 per cent (equivalent chain length on polyethyleneglycol adipate 18.9),
- *linolenic acid*: 0.5 per cent to 1.5 per cent (equivalent chain length on polyethyleneglycol adipate 19.7),
- *arachidic acid*: not more than 0.8 per cent,
- *eicosenoic acid*: not more than 0.5 per cent (equivalent chain length on polyethyleneglycol adipate 20.3),
- *behenic acid*: not more than 0.5 per cent,
- *other fatty acids*: not more than 0.5 per cent.

Sterols. Determined by gas chromatography (*2.4.23*), the sterol fraction of the oil contains not more than 0.3 per cent of brassicasterol.

Water (*2.5.32*). If intended for use in the manufacture of parenteral dosage forms, not more than 0.1 per cent, determined on 5.00 g by the micro-determination of water. Use a mixture of equal volumes of *decanol R* and *anhydrous methanol R* as the solvent.

STORAGE

Store protected from light, at a temperature not exceeding 25 °C.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- whether the oil is obtained by mechanical expression or by extraction.

01/2008:0344

MAIZE STARCH

Maydis amylum

DEFINITION

Maize starch is obtained from the caryopsis of *Zea mays* L.

CHARACTERS

Appearance: matt, white to slightly yellowish, very fine powder which creaks when pressed between the fingers.

Solubility: practically insoluble in cold water and in ethanol (96 per cent).

The presence of granules with cracks or irregularities on the edge is exceptional.

IDENTIFICATION

A. Examined under a microscope, using not less than 20 × magnification and using equal volumes of *glycerol R* and *water R*, it appears as either angular polyhedral granules of irregular sizes with diameters ranging from about 2 µm to about 23 µm or as rounded or spheroidal granules of irregular sizes with diameters ranging from about 25 µm to about 35 µm. The central hilum consists of a distinct cavity or two-to five-rayed cleft and there are no concentric striations. Between crossed nicol prisms, the starch granules show a distinct black cross intersecting at the hilum.

B. Suspend 1 g in 50 ml of *water R*, boil for 1 min and cool. A thin, cloudy mucilage is formed.

C. To 1 ml of the mucilage obtained in identification test B add 0.05 ml of *iodine solution R1*. An orange-red to dark blue colour is produced which disappears on heating.

TESTS

pH (*2.2.3*): 4.0 to 7.0.

Shake 5.0 g with 25.0 ml of *carbon dioxide-free water R* for 60 s. Allow to stand for 15 min.

Foreign matter. Examined under a microscope using a mixture of equal volumes of *glycerol R* and *water R*, not more than traces of matter other than starch granules are present. No starch grains of any other origin are present.

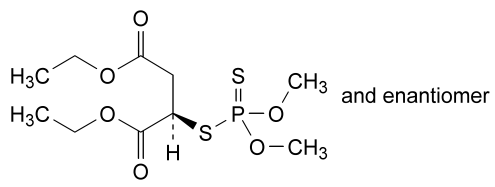
Oxidising substances (*2.5.30*): maximum 20 ppm, calculated as H_2O_2.

Sulphur dioxide (*2.5.29*): maximum 50 ppm.

Iron (*2.4.9*): maximum 10 ppm.

Shake 1.5 g with 15 ml of *dilute hydrochloric acid R*. Filter. The filtrate complies with the limit test for iron.

Loss on drying (*2.2.32*): maximum 15.0 per cent, determined on 1.000 g by drying in an oven at 130 °C for 90 min.



Sulphated ash (*2.4.14*): maximum 0.6 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 bacteria and 10^2 fungi per gram, determined by plate count. It complies with the test for *Escherichia coli* (*2.6.13*).

01/2008:1343

MALATHION

Malathionum

$C_{10}H_{19}O_6PS_2$ M_r 330.4
[121-75-5]

DEFINITION

Diethyl (2*RS*)-2-(dimethoxyphosphinodithioyl)butanedioate.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: clear, colourless or slightly yellowish liquid.

Solubility: slightly soluble in water, miscible with acetone, with cyclohexane, with ethanol (96 per cent) and with vegetable oils.

It solidifies at about 3 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *malathion CRS*.

TESTS

Relative density (*2.2.5*): 1.220 to 1.240.

Optical rotation (*2.2.7*): – 0.1° to + 0.1°.

Dissolve 2.50 g in *ethanol (96 per cent) R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (*2.2.29*).

Solvent mixture: *water R, acetonitrile R* (1:3 *V/V*).

Test solution (a). Dissolve 0.10 g of the substance to be examined in the solvent mixture and dilute to 5.0 ml with the solvent mixture.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the solvent mixture.

Reference solution (a). Dissolve 0.100 g of *malathion CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 5.0 mg of *malathion impurity A CRS* and 5.0 mg of *malathion impurity B CRS* in the solvent mixture, then dilute 50.0 ml with the solvent mixture.

Reference solution (d). Dilute 2.0 ml of reference solution (c) to 10.0 ml with the solvent mixture.

Column:

– *size*: *l* = 0.15 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (10 µm);
– *temperature*: 35 °C.

Mobile phase: *acetonitrile R, water R* (45:55 *V/V*).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl of test solution (a) and reference solutions (b), (c) and (d).

Retention time: impurity B = about 3.5 min; impurity A = about 5 min; malathion = about 16 min.

System suitability: reference solution (c):

– *resolution*: minimum 2.0 between the peaks due to impurities B and A.

Limits:

– *impurity A*: not more than 3 times the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.3 per cent);
– *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.1 per cent);

– *sum of impurities other than A and B*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (*2.5.12*): maximum 0.1 per cent, determined on 2.000 g.

ASSAY

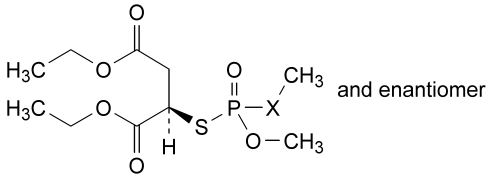
Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modifications.

Injection: test solution (b) and reference solution (a).

System suitability: reference solution (a):

– *repeatability*: maximum relative standard deviation of 1.0 per cent after 6 injections.

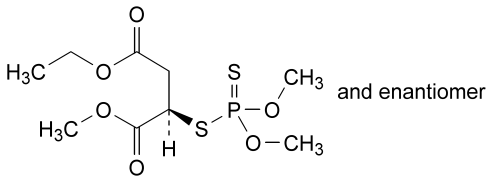
Calculate the percentage content of $C_{10}H_{19}O_6PS_2$ from the declared content of *malathion CRS*.



STORAGE

In an airtight container, protected from light.

IMPURITIES

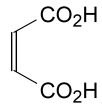


Specified impurities: A, B.

Other detectable impurities (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities and/or by the general monograph *Substances for pharmaceutical use (2034)*. It is therefore not necessary to identify these impurities for demonstration of compliance. See also *5.10. Control of impurities in substances for pharmaceutical use*): *C.*

A. X = S: diethyl (2*RS*)-2-[(methoxy)(methylsulphanyl)-*S*-phosphinothioyl]butanedioate (isomalathion),

B. X = O: diethyl (2*RS*)-2-(dimethoxy-*S*-phosphinothioyl)-butanedioate (maloxon),



C. ethyl and methyl (2*RS*)-2-(dimethoxyphosphino-dithioyl)butanedioate (methyl analogue).

corrected 6.0

MALEIC ACID

Acidum maleicum

$C_4H_4O_4$ M_r 116.1
[110-16-7]

DEFINITION

Maleic acid contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (*Z*)-butenedioic acid, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water and in alcohol.

IDENTIFICATION

A. Dilute 5 ml of solution S (see Tests) to 10 ml with *water R*. The pH of the dilution is less than 2.

B. Examine the chromatograms obtained in the test for fumaric acid. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in 10 ml of *water R* (solution a). To 0.3 ml of solution (a) add a solution of 10 mg of *resorcinol R* in 3 ml of *sulphuric acid R*. Heat on a water-bath for 15 min; no colour develops. To 3 ml of solution (a) add 1 ml of *bromine water R*. Heat on a water-bath to remove the bromine (15 min), heat to boiling and cool. To 0.2 ml of this solution add a solution of 10 mg of *resorcinol R* in 3 ml of *sulphuric acid R*. Heat on a water-bath for 15 min. A violet-pink colour develops.

TESTS

Solution S. Dissolve 5.0 g in *water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution Y_7 (*2.2.2, Method II*).

Fumaric acid. Examine by thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance.

Test solution (a). Dissolve 0.5 g of the substance to be examined in *acetone R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *acetone R*.

Reference solution (a). Dissolve 20 mg of *maleic acid CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 15 mg of *fumaric acid CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (c). Mix 5 ml of reference solution (a) and 5 ml of reference solution (b).

Apply separately to the plate 5 µl of test solutions (a) and (b), 5 µl of reference solutions (a) and (b) and 10 µl of reference solution (c). Develop in a non-saturated tank over a path of 10 cm using a mixture of 12 volumes of *anhydrous formic acid R*, 16 volumes of *chloroform R*, 32 volumes of *butanol R* and 44 volumes of *heptane R*. Dry the plate at 100 °C for 15 min and examine in ultraviolet light at 254 nm. Any spot

corresponding to fumaric acid in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Iron. To 10 ml of solution S add 2 ml of *dilute hydrochloric acid R* and 0.05 ml of *bromine water R*. After 5 min, remove the excess of bromine by passing a current of air and add 3 ml of *potassium thiocyanate solution R*. Shake. Prepare a standard at the same time and in the same manner, using a mixture of 5 ml of *iron standard solution (1 ppm Fe) R*, 1 ml of *dilute hydrochloric acid R*, 6 ml of *water R* and 0.05 ml of *bromine water R*. Allow both solutions to stand for 5 min. Any red colour in the test solution is not more intense than that in the standard (5 ppm).

Heavy metals (*2.4.8*). 1.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

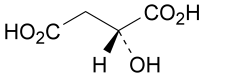
Water (*2.5.12*). Not more than 2.0 per cent, determined on 1.00 g by the semi-micro determination of water.

Sulphated ash (*2.4.14*). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.500 g in 50 ml of *water R*. Titrate with *1 M sodium hydroxide* using 0.5 ml of *phenolphthalein solution R* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 58.04 mg of $C_4H_4O_4$.



STORAGE

Store in a glass container, protected from light.

01/2008:2080
corrected 6.0

MALIC ACID

Acidum malicum

and enantiomer

$C_4H_6O_5$ M_r 134.1
[6915-15-7]

DEFINITION

(2*RS*)-2-Hydroxybutanedioic acid.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water and in alcohol, sparingly soluble in acetone.

IDENTIFICATION

A. Melting point (*2.2.14*): 128 °C to 132 °C.

B. Infrared absorption spectrophotometry (*2.2.24*).
Comparison: *Ph. Eur. reference spectrum of malic acid.*

TESTS

Solution S. Dissolve 5.00 g in *water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Optical rotation (*2.2.7*): – 0.10° to + 0.10°, determined on solution S.

Water-insoluble substances: maximum 0.1 per cent.

Dissolve 25.0 g in 100 ml of *water R*, filter the solution through a tared sintered-glass filter (16) (*2.1.2*), wash the filter with hot *water R* and dry at 100-105 °C to constant weight. The residue weighs a maximum of 25 mg.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 100.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *fumaric acid R* and 4.0 mg of *maleic acid R* in 25 ml of the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 2.5 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 20.0 mg of the substance to be examined in the mobile phase, add 1.0 ml of reference solution (a) and dilute to 20.0 ml with the mobile phase.

Column:
- *size*: *l* = 0.30 m, Ø = 7.8 mm,
- *stationary phase*: *ion-exclusion resin for chromatography R* (9 µm),
- *temperature*: 37 °C.

Mobile phase: *0.005 M sulphuric acid.*

Flow rate: 0.6 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Run time: twice the retention time of the principal peak in the chromatogram obtained with the test solution.

Relative retention with reference to malic acid (retention time = about 10 min): impurity B = about 0.8; impurity A = about 1.5.

System suitability: reference solution (c):
- *resolution*: minimum 2.5 between the peaks due to impurity B and malic acid.

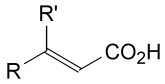
Limits:
- *impurity A*: not more than twice the area of the corresponding peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *impurity B*: not more than 0.25 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.05 per cent),
- *any other impurity*: for each impurity, not more than 0.5 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total of other impurities*: not more than 2.5 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.5 per cent),
- *disregard limit*: 0.1 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.02 per cent).

Heavy metals (*2.4.8*): maximum 20 ppm.

1.0 g complies with limit test F. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (*2.5.12*): maximum 2.0 per cent, determined on 1.00 g.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.



ASSAY

Dissolve 0.500 g in 50 ml of *carbon dioxide-free water R*. Titrate with *1 M sodium hydroxide* determining the end-point potentiometrically (*2.2.20*).

1 ml of *1 M sodium hydroxide* is equivalent to 67.05 mg of $C_4H_6O_5$.

IMPURITIES

Specified impurities: A, B.

A. R = CO_2H, R′ = H: (*E*)-butenedioic acid (fumaric acid),

B. R = H, R′ = CO_2H: (*Z*)-butenedioic acid (maleic acid).

01/2008:1541
corrected 6.0

MALLOW FLOWER

Malvae sylvestris flos

DEFINITION

Whole or fragmented dried flower of *Malva sylvestris* L. or its cultivated varieties.

IDENTIFICATION

A. The flower consists of an epicalyx with 3 oblong or elliptical-lanceolate parts that are shorter than those of the calyx and situated immediately below it; a calyx with 5 pubescent triangular lobes, gamosepalous at the base; a corolla 3-4 times longer than the calyx with 5 wedge-shaped, notched petals fused to the staminal tube at their base; numerous stamens, the filaments of which fuse into a staminal tube covered by small star-shaped trichomes and occasional simple trichomes visible using a lens; numerous wrinkled carpels, glabrous or sometimes pubescent, enclosed in the staminal tube and arranged into a circle around a central style ending with numerous filiform stigmas. In cultivated varieties, the epicalyx is 3-7 partite, the calyx 5-8 partite and the corolla 5-10 partite.

B. Reduce to a powder (355) (*2.9.12*). The powder is bluish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: unicellular, thick-walled, stiff trichomes, up to 2 mm in length; small unicellular covering trichomes, somewhat curved, either isolated or in small star-shaped groups of 2-6; capitate glandular trichomes with multicellular heads; mesophyll fragments with vessels accompanied by cluster crystals of calcium oxalate; spherical pollen grains, about 150 µm in diameter, with a roughly spiny exine.

When mounted with *ethanol (96 per cent) R*, numerous elongated cells containing mucilage are seen in the petal fragments.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1 g of the powdered drug (355) (*2.9.12*) add 10 ml of *ethanol (60 per cent V/V) R*. Stir for 15 min and filter.

Reference solution. A 0.5 g/l solution of *quinaldine red R* in *ethanol (96 per cent) R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *acetic acid R, water R, butanol R* (15:30:60 *V/V/V*).

Application: 10 µl of the test solution and 5 µl of the reference solution, as bands.

Development: over a path of 10 cm.

Drying: in air.

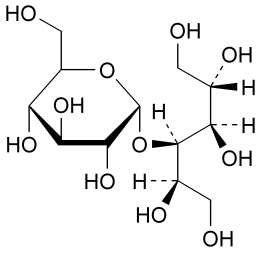
Detection: examine in daylight.

Results: the chromatogram obtained with the reference solution shows an orange-red zone in the upper part of the middle third. The chromatogram obtained with the test solution shows, below the zone in the chromatogram obtained with the reference solution, 2 violet zones in the middle third; the principal zone (6″-malonyl malvin) is situated just below the other violet zone (malvin).

TESTS

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug by drying in an oven at 105 °C.

Total ash (*2.4.16*): maximum 14.0 per cent.



Ash insoluble in hydrochloric acid (*2.8.1*): maximum 2.0 per cent.

Swelling index (*2.8.4*): minimum 15, determined on 0.2 g of the powdered drug (710) (*2.9.12*) humidified with 0.5 ml of *anhydrous ethanol R*.

01/2008:1235
corrected 6.0

MALTITOL

Maltitolum

$C_{12}H_{24}O_{11}$ M_r 344.3
[585-88-6]

DEFINITION

4-*O*-α-D-Glucopyranosyl-D-glucitol (D-maltitol).

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white crystalline powder.

Solubility: very soluble in water, practically insoluble in anhydrous ethanol.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *maltitol CRS*.

B. Melting point (*2.2.14*): 148 °C to 151 °C.

C. Specific optical rotation (*2.2.7*): + 105.5 to + 108.5 (anhydrous substance).

Dissolve 5.00 g in *water R* and dilute to 100.0 ml with the same solvent.

D. Thin-layer chromatography (*2.2.27*) .

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *maltitol CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 25 mg of *maltitol CRS* and 25 mg of *sorbitol CRS* in *water R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R.*

Mobile phase: *water R, ethyl acetate R, propanol R* (10:20:70 *V/V/V*).

Application: 2 µl.

Development: over a path of 17 cm.

Drying: in air.

Detection: spray with *4-aminobenzoic acid solution R.* Dry in a current of cold air until the acetone is removed. Heat at 100-105 °C for 15 min. Allow to cool and spray with a 2 g/l solution of *sodium periodate R.* Dry in a current of cold air. Heat at 100 °C for 15 min.

System suitability: test solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 5.0 g in *water R* and dilute to 50 ml with the same solvent.

Conductivity (*2.2.38*): maximum 20 $\mu S \cdot cm^{-1}$.

Dissolve 20.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent. Measure the conductivity of the solution, while gently stirring with a magnetic stirrer.

Reducing sugars: maximum 0.2 per cent, expressed as glucose equivalent.

Dissolve 5.0 g in 6 ml of *water R* with the aid of gentle heat. Cool and add 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of *0.025 M iodine.* With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R* and, when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 5.0 g of the substance to be examined in 20 ml of *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 0.50 g of *maltitol CRS* in 2.0 ml of *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *water R.*

Reference solution (c). Dilute 10.0 ml of reference solution (b) to 100.0 ml with *water R.*

Reference solution (d). Dissolve 0.5 g of *maltitol R* and 0.5 g of *sorbitol R* in 5 ml of *water R* and dilute to 10.0 ml with the same solvent.

Column:

– *size*: *l* = 0.3 m, Ø = 7.8 mm;
– *stationary phase*: *strong cation exchange resin (calcium form) R* (9 µm);
– *temperature*: 85 ± 1 °C.

Mobile phase: degassed *water R.*

Flow rate: 0.5 ml/min.

Detection: refractometer maintained at a constant temperature.

Injection: 20 µl of the test solution and reference solutions (b), (c) and (d).

Run time: 3 times the retention time of maltitol.

Relative retention with reference to maltitol (retention time = about 16 min): impurity B = about 0.8; impurity A = about 1.8.

System suitability: reference solution (d):

– *resolution*: minimum 2 between the peaks due to maltitol and impurity A.

Limits:

– *any impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent);
– *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent);
– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Lead (*2.4.10*): maximum 0.5 ppm.

Nickel (*2.4.15*): maximum 1 ppm.

Water (*2.5.12*): maximum 1.0 per cent, determined on 1.00 g.

Microbial contamination. If intended for use in the manufacture of parenteral dosage forms, the total viable aerobic count (*2.6.12*) is not more than 10^2 bacteria and 10^2 fungi per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (*2.6.13*).

Bacterial endotoxins (*2.6.14*). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins:

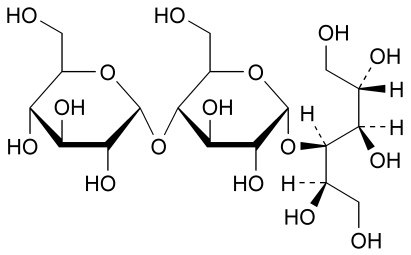
– less than 4 IU/g for parenteral dosage forms having a concentration of less than 100 g/l of maltitol,
– less than 2.5 IU/g for parenteral dosage forms having a concentration of 100 g/l or more of maltitol.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of D-maltitol from the declared content of *maltitol CRS.*



LABELLING

The label states:

– where applicable, the maximum concentration of bacterial endotoxins,
– where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

IMPURITIES

A. sorbitol,

B. *O*-α-D-glucopyranosyl-(1→4)-*O*-α-D-glucopyranosyl-(1→4)-D-glucitol (maltotriitol).

01/2008:1236

MALTITOL, LIQUID

Maltitolum liquidum

DEFINITION

Aqueous solution of a hydrogenated, partly hydrolysed starch, composed of a mixture of mainly 4-*O*-α-D-glucopyranosyl-D-glucitol (D-maltitol) with D-glucitol (D-sorbitol) and hydrogenated oligo- and polysaccharides.

Content:

– *D-maltitol* ($C_{12}H_{24}O_{11}$): minimum 50.0 per cent *m/m* (anhydrous substance) and 95.0 per cent to 105.0 per cent of the content stated on the label;
– *D-sorbitol* ($C_6H_{14}O_6$): maximum 8.0 per cent *m/m* (anhydrous substance);
– *anhydrous substance*: 68.0 per cent *m/m* to 85.0 per cent *m/m*.

CHARACTERS

Appearance: clear, colourless, syrupy liquid.

Solubility: miscible with water and with glycerol.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dilute 0.35 g of the substance to be examined to 100 ml with *water R*.

Reference solution (a). Dissolve 20 mg of *maltitol CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *maltitol CRS* and 20 mg of *sorbitol CRS* in *water R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R*.

Mobile phase: *water R, ethyl acetate R, propanol R* (10:20:70 *V/V/V*)

Application: 2 µl.

Development: over a path of 17 cm.

Drying: in air.

Detection: spray with *4-aminobenzoic acid solution R*. Dry in a current of cold air until the acetone is removed. Heat at 100-105 °C for 15 min. Allow to cool and spray with a 2 g/l solution of *sodium periodate R*. Dry in a current of cold air. Heat at 100 °C for 15 min.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and colour to the principal spot in the chromatogram obtained with reference solution (a).

C. To 3 ml of a freshly prepared 100 g/l solution of *pyrocatechol R*, add 6 ml of *sulphuric acid R* while cooling in iced water. To 3 ml of the cooled mixture, add 0.3 ml of solution S (see Tests). Heat gently over a naked-flame for about 30 s. A pink colour develops.

TESTS

Solution S. Dilute 7.0 g to 50 ml with *water R*.

Appearance of solution. Solution S is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Conductivity (*2.2.38*): maximum 10 µS·cm^{-1}, measured on undiluted liquid maltitol while gently stirring with a magnetic stirrer.

Reducing sugars: maximum 0.2 per cent, calculated as glucose equivalent.

To 5.0 g add 6 ml of *water R*, 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R* and, when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Lead (*2.4.10*): maximum 0.5 ppm.

Nickel (*2.4.15*): maximum 1 ppm.

Water (*2.5.12*): 15.0 per cent *m/m* to 32.0 per cent *m/m*, determined on 0.100 g. Use as solvent a mixture of equal volumes of *anhydrous methanol R* and *formamide R*. Carry out the titration at about 50 °C.

ASSAY

Liquid chromatography (*2.2.29*).

Test solution. Mix 1.00 g of the solution to be examined with 20 ml of *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 50.0 mg of *maltitol CRS* in 2 ml of *water R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dissolve 8.0 mg of *sorbitol CRS* in 2 ml of *water R* and dilute to 5.0 ml with the same solvent.

Reference solution (c). Dissolve 50 mg of *maltitol R* and 50 mg of *sorbitol R* in 2 ml of *water R* and dilute to 5.0 ml with the same solvent.

Column:

– *size*: *l* = 0.3 m, Ø = 7.8 mm;
– *stationary phase*: *strong cation exchange resin (calcium form) R* (9 µm);
– *temperature*: 85 ± 2 °C.

Mobile phase: degassed *water R*.

Flow rate: 0.5 ml/min.

Detection: refractometer maintained at a constant temperature.

Injection: 20 µl.

Run time: 3 times the retention time of maltitol.

Relative retention with reference to maltitol (retention time = about 16 min): sorbitol = about 1.8.

System suitability: reference solution (c):

– *resolution*: minimum 2 between the peaks due to sorbitol and maltitol.

Calculate the percentage contents of D-maltitol and D-sorbitol from the declared contents of *maltitol CRS* and *sorbitol CRS*.

LABELLING

The label states the content of D-maltitol.

01/2008:1542
corrected 6.0

MALTODEXTRIN

Maltodextrinum

DEFINITION

Mixture of glucose, disaccharides and polysaccharides, obtained by the partial hydrolysis of starch.

The degree of hydrolysis, expressed as dextrose equivalent (DE), is not greater than 20 (nominal value).

CHARACTERS

Appearance: white or almost white, slightly hygroscopic powder or granules.

Solubility: freely soluble in water.

IDENTIFICATION

A. Dissolve 0.1 g in 2.5 ml of *water R* and heat with 2.5 ml of *cupri-tartaric solution R*. A red precipitate is formed.

B. Dip, for 1 s, a suitable stick with a reactive pad containing glucose-oxidase, peroxidase and a hydrogen-donating substance, such as tetramethylbenzidine, in a 100 g/l solution of the substance to be examined. Observe the colour of the reactive pad; within 60 s the colour changes from yellow to green or blue.

C. It is a powder or granules.

D. Dextrose equivalent (see Tests).

TESTS

Solution S. Dissolve 12.5 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

pH (*2.2.3*): 4.0 to 7.0.

Mix 1 ml of a 223.6 g/l solution of *potassium chloride R* and 30 ml of solution S.

Sulphur dioxide (*2.5.29*): maximum 20 ppm.

Heavy metals (*2.4.8*): maximum 10 ppm.

Dilute 4 ml of solution S to 30 ml with *water R*. The solution complies with test E. Prepare the reference solution using 10 ml of *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 6.0 per cent, determined on 10.00 g by drying in an oven at 105 °C.

Sulphated ash (*2.4.14*): maximum 0.5 per cent, determined on 1.0 g.

Dextrose equivalent (DE): within 2 DE units of the nominal value.

Weigh an amount of the substance to be examined equivalent to 2.85-3.15 g of reducing carbohydrates, calculated as dextrose equivalent, into a 500 ml volumetric flask. Dissolve in *water R* and dilute to 500.0 ml with the same solvent. Transfer the solution to a 50 ml burette.

Pipette 25.0 ml of *cupri-tartaric solution R* into a 250 ml flask and add 18.5 ml of the test solution from the burette, mix and add a few glass beads. Place the flask on a hot plate, previously adjusted so that the solution begins to boil within 2 min ± 15 s. Allow to boil for exactly 120 s, add 1 ml of a 1 g/l solution of *methylene blue R* and titrate with the test solution (V_1) until the blue colour disappears. Maintain the solution at boiling throughout the titration.

Standardise the cupri-tartaric solution using a 6.00 g/l solution of *glucose R* (V_0).

Calculate the dextrose equivalent using the following expression:

$$\frac{300 \times V_0 \times 100}{V_1 \times M \times D}$$

V_0 = total volume of glucose standard solution, in millilitres,

V_1 = total volume of test solution, in millilitres,

M = sample mass, in grams,

D = percentage content of dry matter in the substance.

Microbial contamination. Total viable aerobic count (*2.6.12*) not more than 10^3 bacteria and 10^2 fungi per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (*2.6.13*).

LABELLING

The label states the dextrose equivalent (DE) (= nominal value).

01/2008:2355

MANDARIN OIL

Citri reticulatae aetheroleum

DEFINITION

Essential oil obtained without heating, by suitable mechanical treatment, from the peel of the fresh fruit of *Citrus reticulata* Blanco.

CHARACTERS

Appearance: greenish, or yellow to reddish orange liquid showing blue fluorescence.

It has a characteristic odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dilute 0.1 ml of the substance to be examined to 1 ml with *toluene R*.

Reference solution. Dissolve 2 µl of *methyl N-methylanthranilate R*, 4 mg of *guaiazulene R* and 10 mg of *α-terpineol R* in 10 ml of *toluene R*.

Plate: *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

Mobile phase: *ethyl acetate R, toluene R* (15:85 *V/V*).

Application: 10 µl [or 2 µl] as bands.

Development: over a path of 15 cm [or 6 cm].

Drying: in air.

Detection A: examine in ultraviolet light at 365 nm.

Results A: the intense blue fluorescent zone in the chromatogram obtained with the test solution is similar in position and fluorescence to the zone due to methyl *N*-methylanthranilate in the chromatogram obtained with the reference solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Detection B: spray with a 200 g/l solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R* and heat at 100 °C for 10 min; examine in daylight.

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A blue zone
Guaiazulene: a blue zone	A blue zone
	A blue zone
———	———
	A blue zone
———	———
α-Terpineol: a blue zone	A blue zone (α-terpineol)
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (*2.2.5*): 0.848 to 0.855.

Refractive index (*2.2.6*): 1.474 to 1.478.

Optical rotation (*2.2.7*): + 64° to + 75°.

Fatty oils and resinified essential oils (*2.8.7*). It complies with the test.

Chromatographic profile. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Dilute 0.20 g of the substance to be examined to 10.0 ml with *heptane R*.

Reference solution (a). Dilute 5 µl of *α-pinene R*, 5 µl of *sabinene R*, 5 µl of *β-pinene R*, 5 µl of *β-myrcene R*, 5 µl of *p-cymene R*, 70 µl of *limonene R*, 20 µl of *γ-terpinene R* and 5 µl of *methyl N-methylanthranilate R* to 5.0 ml with *heptane R*.

Reference solution (b). Dissolve 5 µl of *limonene R* in 50 ml of *heptane R*. Dilute 0.5 ml of this solution to 5.0 ml with *heptane R*.

Column:

– *material*: fused silica;
– *size*: *l* = 60 m, Ø = 0.25 mm;
– *stationary phase*: *poly(dimethyl)(diphenyl)siloxane R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.4 ml/min.

Split ratio: 1:70.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 90	50 → 230
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 1 µl.

Elution order: order indicated in the composition of reference solution (a); record the retention times of these substances.

System suitability: reference solution (a):

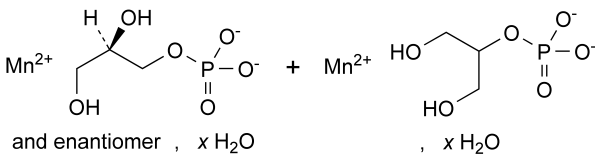
– *resolution*: minimum 1.5 between the peaks due to sabinene and β-pinene and minimum 1.5 between the peaks due to *p*-cymene and limonene.

Identification of components: using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution. Disregard the peak due to heptane.

Determine the percentage content of each of these components. The limits are within the following ranges:

– *α-pinene*: 1.6 per cent to 3.0 per cent;
– *sabinene*: less than 0.3 per cent;
– *β-pinene*: 1.2 per cent to 2.0 per cent;
– *β-myrcene*: 1.5 per cent to 2.0 per cent;
– *p-cymene*: less than 1.0 per cent;
– *limonene*: 65.0 per cent to 75.0 per cent;
– *γ-terpinene*: 16.0 per cent to 22.0 per cent;
– *methyl N-methylanthranilate*: 0.30 per cent to 0.60 per cent;
– *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (b).

Residue on evaporation (*2.8.9*): 1.6 per cent to 4.0 per cent, determined after heating on a water-bath for 4 h.



STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

01/2008:2163

MANGANESE GLYCEROPHOSPHATE, HYDRATED

Mangani glycerophosphas hydricus

$C_3H_7MnO_6P,xH_2O$ M_r 225.0 (anhydrous substance)

DEFINITION

Mixture of variable proportions of hydrated manganese (II) (2*RS*)-2,3-dihydroxypropyl phosphate and hydrated manganese (II) 2-hydroxy-1-(hydroxymethyl)ethyl phosphate.

Content: 97.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or pale pink, hygroscopic powder.

Solubility: practically insoluble in water and in ethanol (96 per cent). It is freely soluble in dilute mineral acids.

IDENTIFICATION

A. Mix 1 g with 1 g of *potassium hydrogen sulphate R* in a test tube fitted with a delivery tube. Heat strongly and direct the white vapour towards a piece of filter paper impregnated with a freshly prepared 10 g/l solution of *sodium nitroprusside R*. The filter paper develops a blue colour in contact with *piperidine R*.

B. Disperse 50 mg in 5 ml of *water R*. Add 0.5 ml of *ammonium sulphide solution R*. A pale pink precipitate is formed that dissolves on the addition of 1 ml of *acetic acid R*.

C. Ignite 0.1 g in a crucible. Take up the residue with 5 ml of *nitric acid R* and heat on a water-bath for 1 min. Filter. The filtrate gives reaction (b) of phosphates (*2.3.1*).

TESTS

Solution S. Dissolve 5.0 g in 20 ml of *dilute hydrochloric acid R*. Filter if necessary. Add *dilute ammonia R1* until a precipitate is formed. Dissolve the precipitate by adding the minimum quantity needed of *dilute hydrochloric acid R* and dilute to 100 ml with *distilled water R*.

Glycerol and ethanol (96 per cent)-soluble substances: maximum 1.0 per cent.

Shake 1.00 g with 25 ml of *ethanol (96 per cent) R* for 1 min. Filter. Evaporate the filtrate to dryness on a water-bath and dry the residue at 70 °C for 1 h. The residue weighs a maximum of 10 mg.

Chlorides (*2.4.4*): maximum 0.15 per cent.

Dissolve 0.22 g in a mixture of 1 ml of *nitric acid R* and 10 ml of *water R* and dilute to 100 ml with *water R*.

Phosphates (*2.4.11*): maximum 0.3 per cent.

Dilute 1.0 ml of solution S to 100.0 ml with *water R*. To 10 ml of this solution add 140 ml of *water R*.

Sulphates (*2.4.13*): maximum 0.2 per cent.

Dilute 5 ml of solution S to 50 ml with *distilled water R*.

Iron (*2.4.9*): maximum 50 ppm.

Dilute 4 ml of solution S to 10 ml with *water R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

ASSAY

To 0.200 g add 50 ml of *water R* and stir until dissolution. Add 10 mg of *ascorbic acid R*, 20 ml of *ammonium chloride buffer solution pH 10.0 R* and 0.3 ml of a 2 g/l solution of *mordant black 11 R* in *triethanolamine R*. Titrate with *0.1 M sodium edetate* until the colour changes from violet to pure blue.

1 ml of *0.1 M sodium edetate* is equivalent to 22.50 mg of $C_3H_7MnO_6P$.

STORAGE

In an airtight container.

01/2008:1543
corrected 6.0

MANGANESE SULPHATE MONOHYDRATE

Mangani sulfas monohydricus

$MnSO_4,H_2O$ M_r 169.0
[10034-96-5]

DEFINITION

Content: 99.0 per cent to 101.0 per cent (ignited substance).

CHARACTERS

Appearance: pale pink crystalline powder, slightly hygroscopic.

Solubility: freely soluble in water, practically insoluble in ethanol (96 per cent).

IDENTIFICATION

A. Solution S (see Tests) gives reaction (a) of sulphates (*2.3.1*).

B. Dissolve 50 mg in 5 ml of *water R*. Add 0.5 ml of *ammonium sulphide solution R*. A pale pink precipitate is formed which dissolves on the addition of 1 ml of *anhydrous acetic acid R*.

C. Loss on ignition (see Tests).

TESTS

Solution S. Dissolve 10.0 g in *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (*2.2.1*).

Chlorides (*2.4.4*): maximum 100 ppm.

Dilute 5 ml of solution S to 15 ml with *water R*.

Iron (*2.4.9*): maximum 10 ppm, determined on solution S.

Zinc: maximum 50 ppm.

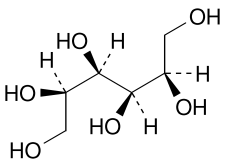
To 10 ml of solution S add 1 ml of *sulphuric acid R* and 0.1 ml of *potassium ferrocyanide solution R*. After 30 s, any opalescence in the solution is not more intense than that in a mixture of 5 ml of *zinc standard solution (10 ppm Zn) R*, 5 ml of *water R*, 1 ml of *sulphuric acid R* and 0.1 ml of *potassium ferrocyanide solution R*.

Heavy metals (*2.4.8*): maximum 20 ppm.

12 ml of solution S complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Loss on ignition: 10.0 per cent to 12.0 per cent, determined on 1.00 g at 500 ± 50 °C.

ASSAY



Dissolve 0.150 g in 50 ml of *water R*. Add 10 mg of *ascorbic acid R*, 20 ml of *ammonium chloride buffer solution pH 10.0 R* and 0.2 ml of a 2 g/l solution of *mordant black 11 R* in *triethanolamine R*. Titrate with *0.1 M sodium edetate* until the colour changes from violet to pure blue.

1 ml of *0.1 M sodium edetate* is equivalent to 15.10 mg of $MnSO_4$.

01/2008:0559

MANNITOL

Mannitolum

$C_6H_{14}O_6$ M_r 182.2
[69-65-8]

DEFINITION

D-Mannitol.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or free-flowing granules.

Solubility: freely soluble in water, very slightly soluble in ethanol (96 per cent).

It shows polymorphism (*5.9*).

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Specific optical rotation (*2.2.7*): + 23 to + 25 (anhydrous substance).

Dissolve 2.00 g of the substance to be examined and 2.6 g of *disodium tetraborate R* in about 20 ml of *water R* at 30 °C; shake continuously for 15-30 min without further heating. Dilute the resulting clear solution to 25.0 ml with *water R*.

B. Melting point (*2.2.14*): 165 °C to 170 °C.

C. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *mannitol CRS*.

If the spectra obtained in the solid state show differences, dissolve separately in 2 glass vials 25 mg of the substance to be examined and 25 mg of the reference substance in 0.25 ml of *distilled water R* without heating. The solutions obtained are clear. Evaporate to dryness by heating in a microwave oven with a power range of 1000-1300 W for 15-30 min or by heating in an oven *in vacuo* at 100 °C. Non-sticky, white or slightly yellowish powders are obtained. Record new spectra using the residues.

D. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *mannitol CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 25 mg of *mannitol R* and 25 mg of *sorbitol R* in *water R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel G plate R*.

Mobile phase: *water R, ethyl acetate R, propanol R* (10:20:70 *V/V/V*).

Application: 2 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with *4-aminobenzoic acid solution R*. Dry in a current of cold air until the acetone is removed. Heat at 100 °C for 15 min. Allow to cool and spray with a 2 g/l solution of *sodium periodate R*. Dry in a current of cold air. Heat at 100 °C for 15 min.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. The solution is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Dissolve 5.0 g in *water R* and dilute to 50 ml with the same solvent.

Conductivity (*2.2.38*): maximum 20 µS·cm^{-1}.

Dissolve 20.0 g in *carbon dioxide-free water R* prepared from *distilled water R* by heating at 40-50 °C and dilute to 100.0 ml with the same solvent. After cooling, measure the conductivity of the solution while gently stirring with a magnetic stirrer.

Reducing sugars: maximum 0.2 per cent (calculated as glucose equivalent).

Dissolve 5.0 g in 25 ml of *water R* with the aid of gentle heating. Cool and add 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of *0.025 M iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R* and, when the precipitate has dissolved, titrate the excess of iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 5.0 g of the substance to be examined in 25 ml of *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 0.50 g of *mannitol CRS* in 2.5 ml of *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with *water R*.

Reference solution (c). Dilute 0.5 ml of reference solution (b) to 20.0 ml with *water R*.

Reference solution (d). Dissolve 0.5 g of *mannitol R* and 0.5 g of *sorbitol R* (impurity A) in 5 ml of *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (e). Dissolve 0.1 g of *maltitol R* (impurity B) and 0.1 g of *isomalt R* (impurity C) in 5 ml of *water R* and dilute to 100 ml with the same solvent.

Column:

– *size*: *l* = 0.3 m, Ø = 7.8 mm;

– *stationary phase*: *strong cation-exchange resin (calcium form) R* (9 µm);

– *temperature*: 85 ± 1 °C.

Mobile phase: degassed *water R*.

Flow rate: 0.5 ml/min.

Detection: refractometer maintained at a constant temperature.

Injection: 20 µl of the test solution and reference solutions (b), (c), (d) and (e).

Run time: twice the retention time of mannitol.

Relative retention with reference to mannitol (retention time = about 22 min): impurity C (eluted in 2 peaks) = about 0.7; impurity B = about 0.8; impurity A = about 1.2.

System suitability: reference solution (d):

– *resolution*: minimum 2 between the peaks due to mannitol and impurity A.

Limits:

– *impurities A, B*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent);

– *impurity C*: for the sum of the areas of the 2 peaks, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent);

– *unspecified impurities*: for each impurity, not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.10 per cent);

– *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent);

– *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Lead (*2.4.10*): maximum 0.5 ppm.

Dissolve the substance to be examined in 150.0 ml of the prescribed mixture of solvents.

Nickel (*2.4.15*): maximum 1 ppm.

Dissolve the substance to be examined in 150.0 ml of the prescribed mixture of solvents.

Water (*2.5.12*): maximum 0.5 per cent, determined on 1.00 g. Use as solvent 40 ml of a mixture of equal volumes of *anhydrous methanol R* and *formamide R* at about 50 °C.

Microbial contamination: if intended for use in the manufacture of parenteral dosage forms: the total viable aerobic count (*2.6.12*) is not more than 10^2 bacteria and 10^2 fungi per gram, determined by plate count; it complies with the tests for *Escherichia coli* and *Salmonella* (*2.6.13*).

Bacterial endotoxins (*2.6.14*): if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins: less than 4 IU/g for parenteral dosage forms having a concentration of 100 g/l or less of mannitol, and less than 2.5 IU/g for parenteral dosage forms having a concentration of more than 100 g/l of mannitol.

ASSAY

Liquid chromatography (*2.2.29*) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of D-mannitol from the areas of the peaks and the declared content of *mannitol CRS*.

LABELLING

The label states:

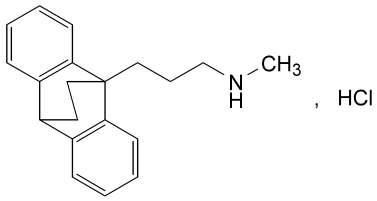
– where applicable, the maximum concentration of bacterial endotoxins;

– where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

IMPURITIES

Specified impurities: A, B, C.

A. sorbitol,



B. maltitol,

C. isomalt.

01/2008:1237

MAPROTILINE HYDROCHLORIDE

Maprotilini hydrochloridum

$C_{20}H_{24}ClN$ M_r 313.9

[10347-81-6]

DEFINITION

3-(9,10-Ethanoanthracen-9(10*H*)-yl)-*N*-methylpropan-1-amine hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: slightly soluble in water, freely soluble in methanol, soluble in ethanol (96 per cent), sparingly soluble in methylene chloride, very slightly soluble in acetone.

It shows polymorphism (*5.9*).

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Ultraviolet and visible absorption spectrophotometry (*2.2.25*).

Test solution. Dissolve 10 mg in *1 M hydrochloric acid* and dilute to 100 ml with the same acid.

Spectral range: 250-300 nm.

Absorption maxima: at 265 nm and 272 nm.

Absorption minimum: at 268 nm.

Absorbance ratio: A_{272}/A_{265} = 1.1 to 1.3.

B. Infrared absorption spectrophotometry (*2.2.24*).

Preparation: discs.

Comparison: *maprotiline hydrochloride CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *maprotiline hydrochloride CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *maprotiline impurity D CRS* in reference solution (a) and dilute to 2 ml with reference solution (a).

Plate: *TLC silica gel F_{254} plate R.*

Mobile phase: *ethyl acetate R, dilute ammonia R1, 2-butanol R* (4:5:14 *V/V/V*).

Application: 5 µl.

Development: over a path of 10 cm.

Drying: in a current of warm air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

– the chromatogram shows 2 clearly separated principal spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dilute 0.5 ml of solution S (see Tests) to 2 ml with *methanol R*. The solution gives reaction (a) of chlorides (*2.3.1*).

TESTS

Solution S. Dissolve 1.0 g in *methanol R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (*2.2.1*) and not more intensely coloured than reference solution BY_6 (*2.2.2, Method II*).

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 0.10 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 1.0 mg of *maprotiline impurity D CRS* in the test solution and dilute to 10.0 ml with the test solution.

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;

– *stationary phase*: *silica gel for chromatography R* (5 µm).

Mobile phase: dissolve about 0.580 g of *ammonium acetate R* in 200 ml of *water R* and add 2 ml of a 70 g/l solution of *concentrated ammonia R*; add 150 ml of *2-propanol R* and 650 ml of *methanol R*; the resulting apparent pH value is between 8.2 and 8.4.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 272 nm.

Injection: 20 µl.

Run time: 1.5 times the retention time of maprotiline.

Relative retention with reference to maprotiline (retention time = about 10.3 min): impurity A = about 0.3; impurity B = about 0.47; impurity C = about 0.74; impurity D = about 0.81; impurity E = about 1.26.

System suitability: reference solution (b):

– *resolution*: 1.8 to 3.2 between the peaks due to impurity D and maprotiline; if necessary, adjust the pH of the mobile phase, in steps of 0.1 pH unit, by adding a 50 per cent *V/V* solution of *acetic acid R* if the resolution is less than 1.8, or by adding a 70 g/l solution of *concentrated ammonia R* if the resolution is greater than 3.2.

Limits:

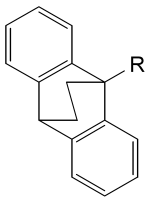
– *impurities A, B, C, D, E*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent);

– *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Loss on drying (*2.2.32*): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 80 °C at a pressure not exceeding 2.5 kPa for 6 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.



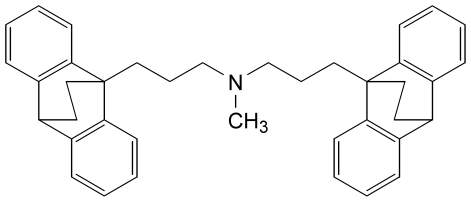
ASSAY

Dissolve 0.250 g in a mixture of 5 ml of *0.1 M hydrochloric acid* and 50 ml of *ethanol (96 per cent) R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 31.39 mg of $C_{20}H_{24}ClN$.

IMPURITIES

Specified impurities: *A, B, C, D, E.*



A. R = CH=CH-CH=O: 3-(9,10-ethanoanthracen-9(10*H*)-yl)prop-2-enal,

C. R = CH_2-CH_2-CH_2-NH_2: 3-(9,10-ethanoanthracen-9(10*H*)-yl)propan-1-amine,

D. R = CH=CH-CH_2-NH-CH_3: 3-(9,10-ethanoanthracen-9(10*H*)-yl)-*N*-methylprop-2-en-1-amine (dehydromaprotiline),

E. R = CH_2-CH_2-CH_2-$N(CH_3)_2$: 3-(9,10-ethanoanthracen-9(10*H*)-yl)-*N*,*N*-dimethylpropan-1-amine,

B. 3-(9,10-ethanoanthracen-9(10*H*)-yl)-*N*-[3-(9,10-ethanoanthracen-9(10*H*)-yl)propyl]-*N*-methylpropan-1-amine.

corrected 6.0

MARSHMALLOW LEAF

Althaeae folium

DEFINITION

Whole or cut dried leaf of *Althaea officinalis* L.

IDENTIFICATION

A. The leaves have long petioles and are about 7-10 cm long; the lamina is cordate or ovate with 3-5 shallow lobes and crenate or dentate margins; the venation is palmate. The petioles and both surfaces of the lamina are greyish-green and densely pubescent. Rarely, fragments of the inflorescence or immature fruits may be present.

B. Reduce to a powder (355) (*2.9.12*). The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous long, rigid, unicellular covering trichomes with thick walls, pointed at the apex, angular and pitted at the base where they are sometimes still united to form stellate structures with up to 8 components; few secretory trichomes with unicellular stalks and globular, multicellular heads; fragments of the leaf epidermis with anomocytic or paracytic stomata (*2.8.3*); cluster crystals of calcium oxalate, isolated or in the parenchyma of the mesophyll; fragments of veins with small, spiral or annular vessels. Examine under a microscope using *ruthenium red solution R*. The powder shows groups of parenchyma containing mucilage which stains orange-red.

C. Thin-layer chromatography (*2.2.27*).

Test solution. To 1 g of the powdered drug (355) (*2.9.12*) add 10 ml of *methanol R*. Heat in a water-bath under a reflux condenser for 5 min. Cool and filter. Distil the filtrate under reduced pressure until the total volume is about 2 ml.

Reference solution. Dissolve 2.5 mg of *quercitrin R* and 2.5 mg of *chlorogenic acid R* in 10 ml of *methanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R* (11:11:27:100 *V/V/V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: at 100–105 °C.

Detection: spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow to dry in air for 30 min. Examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate

Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 4 per cent of leaves infected by *Puccinia malvacearum*, showing red spots and maximum 2 per cent of other foreign matter.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 18.0 per cent.

Ash insoluble in hydrochloric acid (*2.8.1*): maximum 2.0 per cent.

Swelling index (*2.8.4*): minimum 12, determined on 0.2 g of the powdered drug (355) (*2.9.12*).

01/2008:1126
corrected 6.0

MARSHMALLOW ROOT

Althaeae radix

DEFINITION

Peeled or unpeeled, whole or cut, dried root of *Althaea officinalis* L.

IDENTIFICATION

A. The unpeeled, non-fragmented drug consists of cylindrical, slightly twisted roots, up to 2 cm thick, with deep longitudinal furrows. The outer surface is greyish-brown and bears numerous rootlet scars. The fracture is fibrous externally, rugged and granular internally. The section shows a more or less thick, whitish bark with brownish periderm, separated by the well-marked, brownish cambium from a white xylem. The stratified structure of the bark and the radiate structure of xylem become more distinct when moistened.

The peeled drug has a greyish-white, finely fibrous outer surface. Cork and external cortical parenchyma are absent.

B. Reduce to a powder (355) (*2.9.12*). The powder is brownish-grey (unpeeled root) or whitish (peeled root). Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of colourless, mainly unlignified, thick-walled fibres with pointed or split ends; fragments of bordered, pitted or scalariformly thickened vessels; cluster crystals of calcium oxalate about 20-35 µm, mostly 25-30 µm in size; parenchymatous cells containing mucilage; fragments of cork with thin-walled, tabular cells in the unpeeled root. Examine under a microscope using *water R*. The powder shows numerous starch granules about 3-25 µm in size occasionally with a longitudinal hilum. The starch grains are mostly simple, a few being 2-4 compound.

TESTS

Foreign matter (*2.8.2*): maximum 2 per cent of brown deteriorated drug.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of powdered drug (710) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 6.0 per cent for the peeled root and maximum 8.0 per cent for the unpeeled root.

Swelling index (*2.8.4*): minimum 10, determined on the powdered drug (710) (*2.9.12*).

Monographs M

01/2008:1876

MASTIC

Mastix

DEFINITION

Dried resinous exudate obtained from stems and branches of *Pistacia lentiscus* L. var. *latifolius* Coss.

Content: minimum 10 ml/kg of essential oil (anhydrous drug).

IDENTIFICATION

A. Small light yellow to greenish-yellow, non-uniform, spherical or pyriform, clear or opaque, hard glassy fragments.

B. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 1 g of the substance to be examined in 10 ml of *methylene chloride R* and filter after 1-2 min.

Reference solution. Dissolve 25 mg of *eugenol R* and 25 mg of *borneol R* in 3 ml of *methylene chloride R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *light petroleum R, toluene R* (5:95 *V/V*).

Application: 1 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with *vanillin reagent R* and heat at 100-105 °C for 5 min.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones of various colours may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A violet zone
———	———
	A pale violet zone
	A very pale violet zone
———	———
Eugenol: a brown zone	A blue zone
Borneol: a greenish-blue zone	A bluish-violet zone
	A dark violet zone
Reference solution	**Test solution**

TESTS

Acid value (*2.5.1*): 50 to 70, determined on 1.0 g.

Water (*2.2.13*): maximum 10 ml/kg, determined on 25.0 g of the drug reduced to a coarse powder (1400) (*2.9.12*).

Total ash (*2.4.16*): maximum 0.5 per cent.

ASSAY

Essential oil (*2.8.12*). Use a 500 ml round-bottomed flask and 200 ml of *water R* as the distillation liquid. Reduce the drug to a coarse powder (1400) (*2.9.12*) and immediately use 20.0 g for the determination. Introduce 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

STORAGE

Do not powder.

01/2008:0404

MATRICARIA FLOWER

Matricariae flos

DEFINITION

Dried capitula of *Matricaria recutita* L. (*Chamomilla recutita* (L.) Rauschert).

Content:

– *blue essential oil*: minimum 4 ml/kg (dried drug);

– *total apigenin 7-glucoside* ($C_{21}H_{20}O_{10}$): minimum 0.25 per cent (dried drug).

IDENTIFICATION

A. Capitula, when spread out, consisting of an involucre made up of many bracts arranged in 1-3 rows; an elongated-conical receptacle, occasionally hemispherical (young capitula); 12-20 marginal ligulate florets with a white ligule; several dozen yellow central tubular florets. The involucre bracts are ovate or lanceolate, with a brownish-grey scarious margin. The receptacle is hollow, without paleae. The corolla of the ligulate florets has a brownish-yellow tube at the base extending to form a white, elongated-oval ligule. The inferior ovary is dark brown, ovoid or spherical, and has a long style and bifid stigma. The tubular florets are yellow and have a five-toothed corolla tube, 5 syngenesious, epipetalous stamens and a gynoecium similar to that of the ligulate florets.

B. Separate the capitulum into its different parts. Examine under a microscope using *chloral hydrate solution R*. The bracts have a margin composed of thin-walled cells and a central region composed of elongated sclereids with occasional stomata (*2.8.3*). The inner epidermis of the corolla of the ligulate florets, in surface view, consisting of thin-walled, polygonal cells, slightly papillose, those of the outer epidermis markedly sinuous and strongly striated; corolla of the tubular florets with longitudinally elongated epidermal cells, and with small groups of papillae near the apex of the lobes. Glandular trichomes each consisting of a short stalk and a head of 2-3 tiers of 2 cells each occur on the outer surfaces of the bracts and on the corollas of both types of florets. The ovaries have a sclerous ring at the base and the wall is composed of vertical bands of thin-walled, longitudinally elongated cells with numerous glandular trichomes, alternating with fusiform groups of small, radially elongated cells containing mucilage. The cells at the apex of the stigmas are extended to form rounded papillae. Numerous small, cluster crystals of calcium oxalate occur in the inner tissues of the ovaries and the anther lobes. Pollen grains spherical to triangular, about 30 µm in diameter with 3 pores and a spiny exine.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Dilute 50 µl of essential oil obtained in the assay of essential oil in 1 ml of *xylene R*.

Reference solution. Dissolve 2 µl of *chamazulene R*, 5 µl of *(–)-α-bisabolol R* and 10 mg of *bornyl acetate R* in 5 ml of *toluene R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min. Examine immediately in daylight.

Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
	1 or 2 blue or bluish-violet zones
Chamazulene: a red or reddish-violet zone	A red or reddish-violet zone (chamazulene)
———	———
Bornyl acetate: a yellowish-brown zone	
	A brown zone (en-yne-dicycloether)
———	———
(–)-α-Bisabolol: a reddish-violet or bluish-violet zone	A reddish-violet or bluish-violet zone ((–)-α-bisabolol)
Reference solution	**Test solution**

TESTS

Broken drug: maximum 25 per cent, determined on 20.0 g, passes through a sieve (710) (*2.9.12*).

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 13.0 per cent.

ASSAY

Essential oil (*2.8.12*). Use 30 g of whole drug, a 1000 ml flask, 300 ml of *water R* as distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 3-4 ml/min for 4 h. Towards the end of this period, stop the flow of water to the condenser assembly but continue distilling until the blue, steam-volatile components have reached the lower end of the condenser. Immediately re-start the flow of water to the condenser assembly to avoid warming the separation space. Stop the distillation after a further 10 min.

Total apigenin 7-glucoside. Liquid chromatography (*2.2.29*).

Test solution. Reduce 40 g of the drug to a powder (500) (*2.9.12*). Place 2.00 g of the powdered drug in a 500 ml round-bottomed flask. Add 200 ml of *ethanol (96 per cent) R*. Heat the mixture under a reflux condenser on a water-bath for 15 min. Cool and filter. Rinse the filter and the residue with a few millilitres of *ethanol (96 per cent) R*. To the filtrate add 10 ml of freshly prepared *dilute sodium hydroxide solution R* and heat the mixture under a reflux condenser on a water-bath for about 1 h. Cool. Dilute to 250.0 ml with *ethanol (96 per cent) R*. To 50.0 ml of the solution add 0.5 g of *citric acid R*. Shake for 5 min and filter. Dilute 5.0 ml of this solution to 10.0 ml with the mobile phase (initial mixture).

Reference solution (a). Dissolve 10.0 mg of *apigenin 7-glucoside R* in 100.0 ml of *methanol R*. Dilute 25.0 ml of this solution to 200.0 ml with the mobile phase (initial mixture).

Reference solution (b). Dissolve 10.0 mg of *5,7-dihydroxy-4-methylcoumarin R* in 100.0 ml of *methanol R*. Dilute 25.0 ml of this solution to 100.0 ml of the mobile phase (initial mixture). To 4.0 ml of this solution add 4.0 ml of reference solution (a) and dilute to 10.0 ml with the mobile phase (initial mixture).

Precolumn:

– *size*: *l* = 8 mm, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Column:

– *size*: *l* = 0.25 m, Ø = 4.6 mm;
– *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

– *mobile phase A*: *phosphoric acid R, water R* (0.5:99.5 *V/V*);
– *mobile phase B*: *phosphoric acid R, acetonitrile R* (0.5:99.5 *V/V*);

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 9	75	25
9 - 19	75 → 25	25 → 75
19 - 24	25	75

Flow rate: 1 ml/min.

Detection: spectrophotometer at 340 nm.

Injection: 20 µl.

System suitability: reference solution (b):

– *resolution*: minimum 1.8 between the peaks due to apigenin 7-glucoside and 5,7-dihydroxy-4-methylcoumarin.

Calculate the percentage content of total apigenin 7-glucoside using the following expression:

$$\frac{A_1 \times m_2}{A_2 \times m_1} \times P \times 0.625$$

A_1 = area of the peak due to apigenin 7-glucoside in the chromatogram obtained with the test solution;

A_2 = area of the peak due to apigenin 7-glucoside in the chromatogram obtained with the reference solution;

m_1 = mass of the drug in the test solution, in grams;

m_2 = mass of *apigenin 7-glucoside R* in reference solution (a), in grams;

P = percentage content of apigenin 7-glucoside in the reagent.

01/2008:1544

MATRICARIA LIQUID EXTRACT

Matricariae extractum fluidum

DEFINITION

Matricaria liquid extract is produced from *Matricaria flower (0404)*. It contains not less than 0.30 per cent of blue residual oil.

PRODUCTION

The extract is produced from the drug and a mixture of 2.5 parts of a 10 per cent *m/m* solution of ammonia (NH_3), 47.5 parts of water and 50 parts of ethanol (96 per cent) with an appropriate procedure for liquid extracts.

CHARACTERS

A brownish, clear liquid with an intense characteristic odour and characteristic bitter taste; miscible with water and with ethanol (96 per cent) with development of turbidity, soluble in ethanol (50 per cent *V/V*).

IDENTIFICATION

A. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel F_{254} plate R*.

Test solution. Place 10 ml of the extract in a separating funnel and shake with 2 quantities, each of 10 ml, of *pentane R*. Combine the pentane layers, dry over 2 g of *anhydrous sodium sulphate R* and filter. Evaporate the filtrate to dryness on a water-bath and dissolve the residue in 0.5 ml of *toluene R*.

Reference solution. Dissolve 4 mg of *guaiazulene R*, 20 mg of *(-)-α-bisabolol R* and 20 mg of *bornyl acetate R* in 10 ml of *toluene R*.

Apply to the plate as bands 10 µl of each solution. Develop over a path of 10 cm using a mixture of 5 volumes of *ethyl acetate R* and 95 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram obtained with the test solution shows several quenching zones, of which 2 main zones are in the middle third (en-yne-dicycloether). Examine in ultraviolet light at 365 nm. The chromatogram obtained with the test solution shows in the middle part an intense blue fluorescent zone (herniarin). Spray the plate with *anisaldehyde solution R*. Examine in daylight while heating at 100-105 °C for 5-10 min. The chromatogram obtained with the reference solution shows in the lower third a reddish-violet to bluish-violet zone ((-)-α-bisabolol), in the middle third a yellowish-brown to greyish-green zone (bornyl acetate) and in the upper third a red to reddish-violet zone (guaiazulene). The chromatogram obtained with the test solution shows in the lower third yellowish-brown to greenish-yellow and violet zones and a reddish-violet to bluish-violet zone due to (-)-α-bisabolol in the chromatogram obtained with the reference solution; a brownish zone (en-yne-dicycloether) similar in position to bornyl acetate in the chromatogram obtained with the reference solution; a red or reddish-violet zone (chamazulene) corresponding to guaiazulene in the chromatogram obtained with the reference solution and immediately above it 1 or 2 blue to bluish-violet zones; further weak zones may be present in the chromatogram obtained with the test solution.

B. Examine by thin-layer chromatography (*2.2.27*), using a *TLC silica gel plate R*.

Test solution. Use the extract.

Reference solution. Dissolve 1.0 mg of *chlorogenic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutin R* in 10 ml of *methanol R*.

Apply to the plate as bands 10 µl of each solution. Develop over a path of 15 cm using a mixture of 7.5 volumes of *anhydrous formic acid R*, 7.5 volumes of *glacial acetic acid R*, 18 volumes of *water R*, and 67 volumes of *ethyl acetate R*. Dry the plate at 100-105 °C and spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray the plate with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for about 30 min and examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in the middle part a light blue fluorescent zone (chlorogenic acid), below it a yellowish-brown fluorescent zone (rutin) and above it a yellowish-brown fluorescent zone (hyperoside). The chromatogram obtained with the test solution shows a yellowish-brown fluorescent zone corresponding to the zone of rutin in the chromatogram obtained with the reference solution, a light blue fluorescent zone corresponding to the zone of chlorogenic acid in the chromatogram obtained with the reference solution, a yellowish-brown fluorescent zone similar in position to the zone of hyperoside in the chromatogram obtained with the reference solution; it also shows above the yellowish-brown fluorescent zone a green fluorescent zone, then several bluish or greenish fluorescent zones and near the solvent front a yellowish fluorescent zone.

TESTS

Ethanol (*2.9.10*): 38 per cent *V/V* to 53 per cent *V/V*.

Dry residue (*2.8.16*): minimum 12.0 per cent.

ASSAY

Place 20.0 g in a 1000 ml round-bottomed flask, add 300 ml of *water R* and distil until 200 ml has been collected in a flask. Transfer the distillate into a separating funnel. Dissolve 65 g of *sodium chloride R* in the distillate and shake with 3 quantities, each of 30 ml, of *pentane R* previously used to rinse the reflux condenser and the flask. Combine the pentane layers, dry over 2 g of *anhydrous sodium sulphate R* and filter into a tared 100 ml round-bottomed flask which has been dried in a desiccator for 3 h. Rinse the anhydrous sodium sulphate and the filter with 2 quantities, each of 20 ml, of *pentane R*. Evaporate the pentane in a water-bath at 45 °C. The residue of pentane is eliminated in a current of air for 3 min. Dry the flask in a desiccator for 3 h and weigh. The residual oil is blue (chamazulene).

MATRICARIA OIL

Matricariae aetheroleum

DEFINITION

Blue essential oil obtained by steam distillation from the fresh or dried flower-heads or flowering tops of *Matricaria recutita* L. (*Chamomilla recutita* L. Rauschert). There are 2 types of matricaria oil which are characterised as rich in bisabolol oxides, or rich in (–)-α-bisabolol.

CHARACTERS

Appearance: clear, intensely blue, viscous liquid.

It has an intense characteristic odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 20 µl of the substance to be examined in 1.0 ml of *toluene R*.

Reference solution. Dissolve 2 mg of *guaiazulene R*, 5 µl of *(–)-α-bisabolol R* and 10 mg of *bornyl acetate R* in 5.0 ml of *toluene R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, toluene R* (5:95 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection A: examine in daylight.

Results A: see below for the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Guaiazulene: a blue zone	A blue zone (chamazulene)
———	———
———	———
Reference solution	**Test solution**

Detection B: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min. Examine immediately in daylight.

Results B: see below for the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, yellowish-brown to greenish-yellow zones (lower third), violet zones (lower third) and further weak zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	1 or 2 blue to bluish-violet zones
Guaiazulene: a red to reddish-violet zone	A red to reddish-violet zone (chamazulene)
———	———
Bornyl acetate: a yellowish-brown to greyish-green zone	A brown zone (en-yne-dicycloether)
———	———
(–)-α-Bisabolol: a reddish-violet to bluish-violet zone	A reddish-violet to bluish-violet zone ((–)-α-bisabolol) A brownish zone
Reference solution	**Test solution**

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks due to (–)-α-bisabolol and chamazulene in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Chromatographic profile. Gas chromatography (*2.2.28*): use the normalisation procedure.

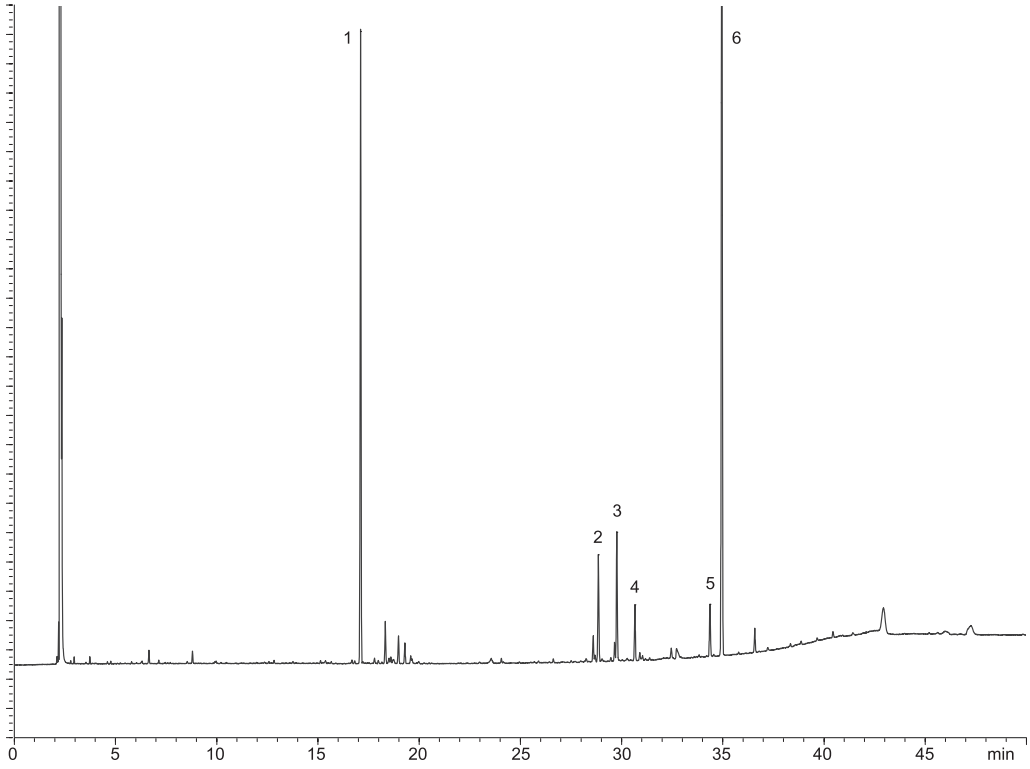
Test solution. Dissolve 20 µl of the oil to be examined in *cyclohexane R* and dilute to 5.0 ml with the same solvent.

Reference solution. Dissolve 20 µl of *(–)-α-bisabolol R*, 5 mg of *chamazulene R* and 6 mg of *guaiazulene R* in *cyclohexane R* and dilute to 5.0 ml with the same solvent.

Column:

- *material*: fused silica,
- *size*: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm, when using a column longer than 30 m, an adjustment of the temperature programme may be necessary,
- *stationary phase*: *macrogol 20 000 R*.

Carrier gas: *helium for chromatography R*.



Flow rate: 1-2 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 40	70 → 230
	40 - 50	230
Injection port		250
Detector		250

Detection: flame ionisation.

1. β-farnesene
2. bisabolol oxide B
3. bisabolone
4. (–)-α-bisabolol
5. chamazulene
6. bisabolol oxide A

Figure 1836.-1. – *Chromatogram of matricaria oil rich in bisabolol oxides*

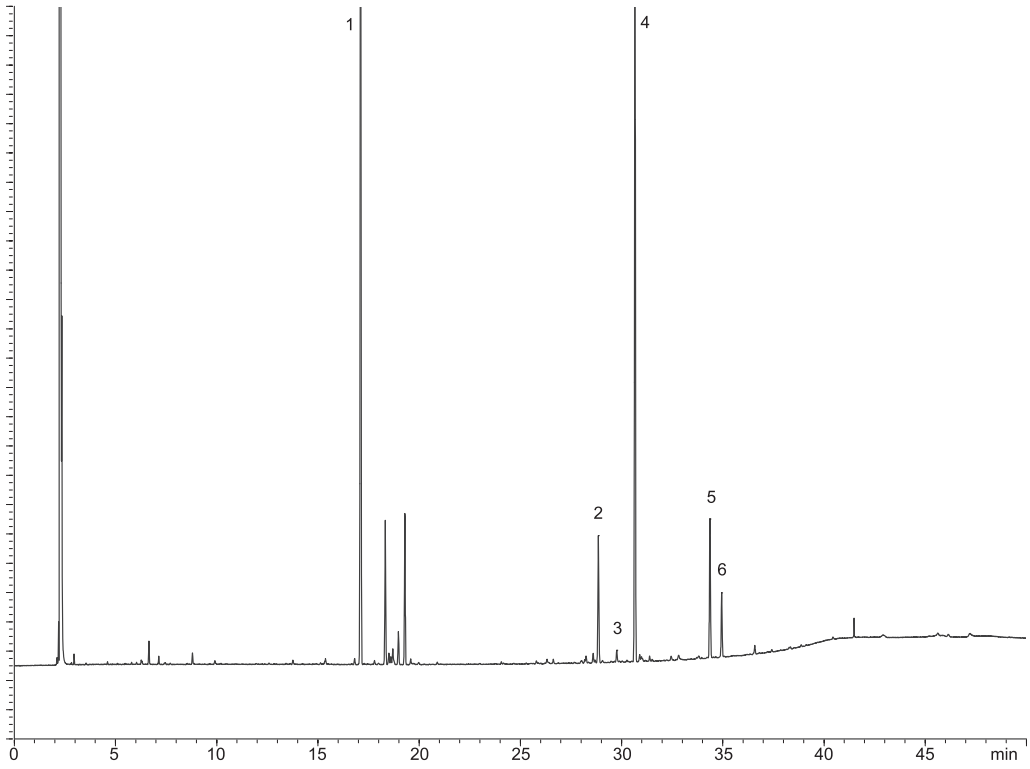


Figure 1836.-2. – *Chromatogram of matricaria oil rich in (–)-α-bisabolol*

Injection: 1.0 µl.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

Relative retention with reference to chamazulene (retention time = about 34.4 min): β-farnesene = about 0.5; bisabolol oxide B = about 0.8; bisabolone = about 0.87; (–)-α-bisabolol = about 0.9; bisabolol oxide A = about 1.02.

System suitability: reference solution:

– *resolution*: minimum 1.5 between the peaks due to chamazulene and guaiazulene.

Using the retention times determined from the chromatogram obtained with the reference solution, locate (–)-α-bisabolol and chamazulene in the chromatogram obtained with the test solution; locate bisabolol oxides (bisabolol oxide B, bisabolone and bisabolol oxide A) using Figures 1836.-1 and 1836.-2 (disregard the peak due to cyclohexane). The chromatogram obtained with the test solution does not show a peak with the retention time of guaiazulene.

Determine the percentage content of the components. The limits are within the following ranges.

	Matricaria oil rich in bisabolol oxides (per cent)	**Matricaria oil rich in (–)-α-bisabolol (per cent)**
Bisabolol oxides	29 - 81	
(–)-α-Bisabolol		10 - 65
Chamazulene	≥ 1.0	≥ 1.0
Total of bisabolol oxides and (–)-α-Bisabolol		≥ 20

STORAGE

In a well-filled, airtight container, protected from light at a temperature not exceeding 25 °C.

LABELLING

The label states the type of matricaria oil (rich in bisabolol oxides or rich in (–)-α-bisabolol.

corrected 6.0

MEADOWSWEET

Filipendulae ulmariae herba

DEFINITION

Whole or cut, dried flowering tops of *Filipendula ulmaria* (L.) Maxim. (= *Spiraea ulmaria* L.).

Content: minimum 1 ml/kg of steam-volatile substances (dried drug).

CHARACTERS

Aromatic odour of methyl salicylate, after crushing.

IDENTIFICATION

A. The stem, up to 5 mm in diameter, is greenish-brown, stiff, angular, hollow except at the apex, and has regular, straight, longitudinal furrows. The petiolate leaf, compound imparipinnate, has 2 reddish-brown angular stipules. It consists of 3 to 9 pairs of leaflets, unevenly dentate, some of which are small and fan-shaped. The leaflets are dark green and glabrous on the upper surface, tomentose and lighter, sometimes silvery on the lower surface. The terminal leaflet, the largest, is divided into 3 segments. The veins are prominent and brown on the lower surface. The inflorescence is complex and composed of very numerous flowers arranged in irregular cymose panicles. The flowers are creamish-white and about 3 mm to 6 mm in diameter; the calyx consists of 5 dark green, reflexed and hairy sepals fused at the base

to a concave receptacle; the 5 free petals, which are readily detached, are pale yellow, obovate and distinctly narrowed at the base; the stamens are numerous with rounded anthers and they extend beyond the petals; the gynoecium consists of about 4 to 6 carpels, each with a short style and a globular stigma; the carpels become twisted together spirally to form yellowish-brown fruits with a helicoidal twist. Unopened flower buds are frequently present. If the fruit is present, it has a helicoidal twist and contains brownish seeds.

B. Reduce to a powder (355) (*2.9.12*). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows unicellular covering trichomes, some thin-walled, very long and flexuous, with pointed ends, others shorter, thick-walled, conical and thickened at the base; occasional clavate glandular trichomes with a 1- to 3-celled, uniseriate stalk and a multicellular head containing dense brown contents; fragments of the leaves and sepals with sinuous to wavy epidermal cells, anomocytic stomata (*2.8.3*) on the lower surface only and cluster crystals of calcium oxalate in the mesophyll; thin-walled epidermal cells of the petals, some showing rounded papillae; numerous spherical pollen grains with 3 pores and a faintly pitted exine; fragments of the fibrous layer of the anthers with stellate thickenings; groups of small-celled parenchyma from the ovaries containing prism crystals of calcium oxalate; fragments of vascular tissue with spiral and annular vessels from the leaves and stems.

C. Thin-layer chromatography (*2.2.27*).

Test solution. Xylene solution obtained in the assay.

Reference solution. Dissolve 0.1 ml of *methyl salicylate R* and 0.1 ml of *salicylaldehyde R* in *xylene R* and dilute to 5 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *hexane R, toluene R* (50:50 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray the plate with 3 ml of *ferric chloride solution R3* and examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

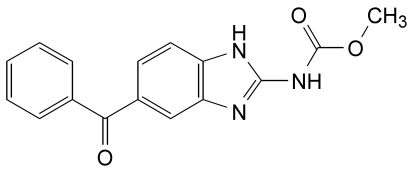
Top of the plate	
———	———
Methyl salicylate: a violet-brown zone	A violet-brown zone (methyl salicylate)
Salicylaldehyde: a violet-brown zone	A violet-brown zone (salicylaldehyde)
———	———
Reference solution	**Test solution**

TESTS

Foreign matter (*2.8.2*): maximum 5.0 per cent of stems with a diameter greater than 5 mm and maximum 2.0 per cent of foreign matter.

Loss on drying (*2.2.32*): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) (*2.9.12*) by drying in an oven at 105 °C for 2 h.

Total ash (*2.4.16*): maximum 7.0 per cent.



ASSAY

Examine according to the method described for the determination of essential oils in herbal drugs (*2.8.12*). Use 50.0 g, a 1000 ml flask and 300 ml of *dilute hydrochloric acid R* as distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

MEBENDAZOLE

Mebendazolum

$C_{16}H_{13}N_3O_3$ M_r 295.3
[31431-39-7]

DEFINITION

Methyl (5-benzoyl-1*H*-benzimidazol-2-yl)carbamate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, in alcohol and in methylene chloride.

It shows polymorphism (*5.9*).

IDENTIFICATION

Infrared absorption spectrophotometry (*2.2.24*).

Comparison: *Ph. Eur. reference spectrum of mebendazole*.

TESTS

Related substances. Liquid chromatography (*2.2.29*).

Test solution. Dissolve 25.0 mg of the substance to be examined in *dimethylformamide R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *mebendazole for system suitability CRS* in *dimethylformamide R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *dimethylformamide R*. Dilute 5.0 ml of this solution to 20.0 ml with *dimethylformamide R*.

Column:

– *size*: *l* = 0.10 m, Ø = 4.6 mm,
– *stationary phase*: *base-deactivated octadecylsilyl silica gel for chromatography R* (3 µm),
– *temperature*: 40 °C.

Mobile phase:

– *mobile phase A*: 7.5 g/l solution of *ammonium acetate R*,
– *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 15	80 → 70	20 → 30
15 - 20	70 → 10	30 → 90
20 - 25	10	90
25 - 26	10 → 80	90 → 20
26 - 30	80	20

Monographs M

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 250 nm.

Injection: 10 µl.

System suitability: reference solution (a):

– the chromatogram obtained is similar to the chromatogram supplied with *mebendazole for system suitability CRS*.

Limits:

– *correction factor*: for the calculation of content, multiply the peak area of impurity G by 1.4,

– *impurity G*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

– *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent),

– *total*: not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),

– *disregard limit*: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 105 °C for 4 h.

Sulphated ash (*2.4.14*): maximum 0.1 per cent, determined on 1.0 g.
