Preface

The purpose of this reference guide is to provide the clinician with a comprehensive list of brand (trade) names and the corresponding active ingredients for prescription and non-prescription products commonly available in North America.

In addition, in order to keep the list as current, up-to-date, and useful as possible, drugs that are undergoing experimental use in North America for which brand names have been tentatively assigned are included. Likewise, selected newer drugs that are used clinically in Britain and Europe and that are likely to be marketed in North America have also been included. Since this guide is primarily concerned with products used in human therapeutics, veterinary products and diagnostic agents are omitted unless their inclusion is warranted by clinical reports of toxicity in humans. This reference guide contains complete information on both single- and multiple-ingredient products that are available for human use. Over 8,000 different brand names and over 1,600 different active ingredients are listed in this reference guide. Each entry is fully cross-referenced to facilitate retrieval of information, so that this guide contains in total over 21,000 entries.

Products are generally maintained in this listing for a minimum of five years after they have been taken off the market. This provides the clinician with information that is typically missing from most *current* references. The reason for maintaining these listings for a minimum of five years is demonstrated in clinical examples of the usefulness of such "dated" information, which includes (1) the clinician treating a patient who has not been seen for two years and who now wants a refill for a product no longer on the market; (2) a clinician treating a child who has accidentally ingested the contents of a prescription bottle of a product taken

PREFACE

off the market several years ago but which nevertheless remained in the bathroom cabinet; and (3) the clinician involved in chart review who wants to know what the active ingredient was in a prescription product the patient was receiving, but which is now no longer available.

This reference is divided into two fully cross-referenced lists. The first list contains in alphabetical order drug brand names and their corresponding active ingredient(s). For the sake of clarity and uniformity, all active ingredients are referred to by their generic United States Adopted Names. The second list contains in alphabetical order generic names of active ingredients with a corresponding alphabetized list of brand names. An asterisk after a brand name, in either list, indicates that the product contains more than one active ingredient. Inactive ingredients, such as binders, fillers, preservatives, suspending agents, and the like, are *not* included in the listings. Omission of these inactive ingredients, as well as of other data which may be related to drug products (but which are extraneous to the stated purpose of this reference guide), has been done to facilitate clarity and usability.

The first list, which presents brand names and their corresponding active ingredient(s), should be of particular assistance to:

1. Clinicians working in an emergency department when, for example, an overdose patient is brought in with a number of different prescription or nonprescription drug vials, which list brand names, but not the generic active ingredients.

2. Clinicians involved in public health, who, for example, may in their assessment of the home situation be presented with a variety of drugs identified by brand name only.

3. Clinicians involved in taking drug and other histories (e.g., medical, nursing, social, etc.), who may elicit drug names from their patients, but may not be aware of the generic names of the active ingredients.

4. Clinicians involved in providing drug information to patients or other health care providers, who, for example, may need to know what active ingredients are contained in the various proprietary preparations.

The second list, which presents the generic names of the active ingredients together with a corresponding alphabetized list of brand names, should be of particular assistance to:

1. Clinicians involved in prescribing who want to check, for example, what brand names are associated with a particular active ingredient or if perhaps the same active ingredient, but under a different brand name, is available.

2. Clinicians involved with therapeutic or toxicologic assessment who may want to know, for example, if the patient is receiving any other products which contain a specific ingredient. For example, if the patient is allergic to aspirin, the clinician can look at the second list and under aspirin find all of the various single ingredient *and* combination products which should be avoided. Likewise, if a patient is taking a drug with a relatively narrow therapeutic index, a quick check of the second list may prevent inadvertent duplication and resultant overdose. This last example is particularly relevant when a drug with a narrow therapeutic index is found in combination- as well as single-ingredient products (e.g., theophylline).

This reference guide has been carefully constructed and checked in order to ensure that it is both accurate and up-to-date. However, because manufacturers may change formulations from time to time, it is imperative that the user check the current package insert or contact the manufacturer directly whenever in doubt or whenever further information about product formulation is required. For information regarding the pharmacology of the listed ingredients, the user is referred to one of the texts listed opposite the title page of this reference guide.

We trust that this reference guide will be of practical use to both the clinician who is directly involved in patient care and to the student who is assimilating clinical knowledge and skills, and that its use will assist health care professionals in optimizing patient care.

We wish to extend special thanks to Darin Brox and Dominant Chung for their assistance.
