Branding with Type

Branding with Type

Stefan Rögener
Albert-Jan Pool
Ursula Packhäuser

Type, layout, and color make up the equilateral triangle of brand identity.

Stefan Rögener
Type consultant, Germany

A professional typesetter for many years, Stefan Rögener is naturally interested in who is using which typefaces. In the late 1980s he began to analyse thousands of ad campaigns for their typographic content. The first results were staggering: "Helvetica, Futura, Times, and Garamond were used 90 percent of the time; give me a pistol!"

Type: Walbaum Buch
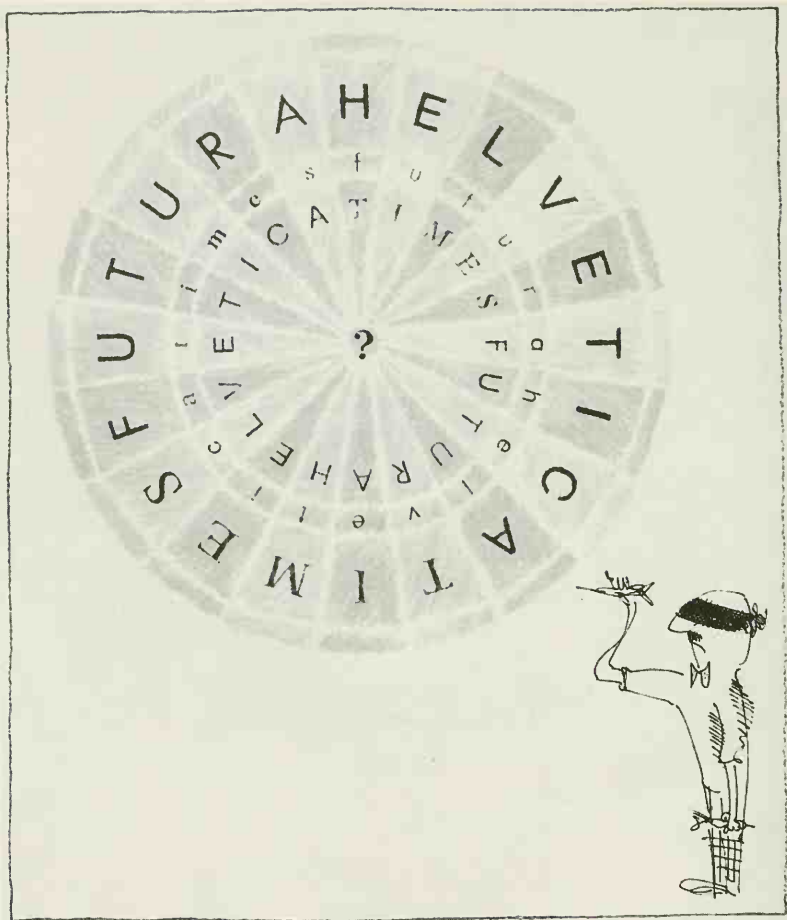

Illustration: John Miles, Banks & Miles, London.

Looking for the right type

Type is magical. It not only communicates a word's information, but it conveys a subliminal message in the letter shapes themselves. That civilizations created religious icons from letters and symbols is not without foundation. Good typography significantly increases the amount of attention a message receives: The right typeface is the basis of strong communication.

Type alone cannot sustain a brand name or a corporate identity, but a brand with the wrong typeface will flounder helplessly trying to define itself. Type, layout, and color make up the equilateral triangle of brand identity. Like everything else in life, to be successful with type you have to first choose the right one, and then use it well.

There is no foolproof recipe for selecting the right type for each and every purpose. Choosing the right type requires experience, intuition, and creativity. Which type best suits the headline, subhead, and copy of an ad, which for packaging design, which for technical products, and which for food – in-depth research is necessary before an informed decision can be made. The final arbiter is a matter of taste.

This book looks at a few ways to unravel the mysteries of type, while it sets up a series of guidelines for the intelligent choice of the right one.

Stefan Rögener

There are numerous typographic rules. The most important is: Do not ever do it the way someone else does.

Kurt Schwitters (1887 – 1948)
Painter and writer, Germany

Kurt Schwitters integrated his dadaist poetry and typography into collages he called "Merzkunst." For him, text and typography were inseparable.

Type: Berthold Block

More success with the "secret weapon" type

Branding with type

There are still art directors who use creative typography to give power to brand identities in the marketplace. Powerful type! It doesn't have to be a proprietary design, which is affordable only by large firms. For example, Mercedes has been using Corporate ase for its identity since 1990. Art director Karl Gerstner chose Berthold Bodoni for ibm's international markets fourteen years ago. And Marlboro, the world's bestselling cigarette, has been riding successfully on Neo Contact for twenty years. How do these extraordinary brand successes happen? What role does the type play, and what does an audience see when it looks at type?

Computer

Puzzle:
Look carefully at the word "computer." Something is not quite right. Do you have a strange feeling about it? Find out what is wrong.

Answer:
The word "computer" is set in the "Marlboro" typeface" Neo Contact. Your head reads "computer," but your intuition says "Marlboro." This is an example of how type influences the subconscious.

The subconscious reacts in a large variety of ways to even the most minimal stimuli. Sensory impressions are connected to symbols – that is to say, coded – and stored in the subconscious as experience. Symbols can activate experiences at any given time and bring them forward to the conscious level.

The most widely used symbols are letters. Type, in its incredible diversity of form, carries coded information that is completely independent of the content of the transmitted message. Before a single word is consciously read, the subconscious re-

4 5
A logo or text image is not only recognized on a conscious level, but is available for future reference when we recall the experience. Typography influences the subconscious so strongly that conditioning the observer with type is not only possible but definitely happens – whether we want it to or not. The designer can direct this process consciously to the advantage of the brand's identity. This is a singular opportunity to link an advertising message to a typeface that deciphers *only this* message, and so with every viewing, summons *only this* message.

Wie Sie Qualität blau auf weiß erkennen können: Aral Super reinigt und schützt vor Korrosion. Damit Ihr Motor nicht mehr verbraucht, als er braucht.

Branding with type

Mit unserem Attraktiv-Tarif* können Sie ihr ein Häuschen auf Erden versprechen.

On the other hand, setting a message in Helvetica or Times forces a brand to share its space in the audience's subconscious with thousands of other brands. There is no possibility of recognition at this level: Helvetica is already subconsciously coded as "indifferent appeal, boring, forgettable." The advertising designer is left to rely on (hoped for) unique copy or (hoped for) creative illustration to deliver the product's message. This leaves the ad copy and illustration to do what should have been the business of the typography.

IBM PS/1.

The right combination, however, of product, ad pitch, and illustration makes it possible to grab the last 10 percent of attention with the typeface. The subconscious knows if a typeface is masculine, and which script faces signal individuality, wildness, or tenderness. It knows that type with fanciful loops means luxury and that finely made letters reflect the delicate form of a woman. It knows that rough headlines slam into the consciousness and that whimsical letter designs stimulate playfulness. An experienced typographer also knows these things – he or she will design and

*Nivea is a mega brand that has

Type: Corporate A

The art of type classification

How to identify type

Designers should be able to choose and decide about type as confidently as they do color. Very few designers would like to be restricted to just using red, green, and blue. We take the time to make red into brick red, green into apple green, and blue into sky blue. It's fun and the 16 million avail-able colors offer unlimited design possibilities.

Choosing type presents the same oppor-tunities, and there are innumerable sources from which we can draw freely. Like colors, typefaces differ by rather small details: letter widths, stem widths, the shapes of curves, and the proportions of serifs.

Old Style roman

Transitional roman

Modern raman

Times
Garamond
roman types

Helvetica
Futura
sans serif types

The difficulty of choice

It's not easy. There are thousands of avail-able typefaces and it is a time-consuming task to find the ideal one for every project. And type vendors do not make it any easier. Type catalogs are usually indexed alphabetically, or by manufacturer, not by type style, which would be the logical way to do it. Alphabetical entries are helpful only to those who want to know where to get a particular typeface. Color books, for instance, have all the reds together – colors are not listed under specific names such as Bordeaux red, blue, and brown because they all happen to begin with B. Those who do not know the names of all the type-faces are in the unfortunate situation of having to spend many hours poring over type catalogs.

Textura

Fraktur

Fortunately, even if we don't know exactly what we are looking for, we do know the general direction in which to look. Roman or sans serif is the first question asked about type, and this chapter will clear up that basic issue. Take a look at Garamond, Times, Helvetica, and Futura.

The most prominent features:
Serifs and contrast

Just as colors are sorted by primary colors, typefaces can be classified by primary shapes. Typefaces are divided into two main categories: roman (seriffed) and sans serif. (The term "roman" is also used to describe letters that are upright, i.e., roman and italic.) At first glance, the difference is whether the type has serifs or not.

Removing the serifs from Garamond, however, does not give us Univers. Likewise, we don't get Garamond if we give Univers serifs, we get something that looks like Serifa.

Roman	Sans Serif?
Garamond	Garamond "without"
raman	*sans serif roman*

Roman?	Sans Serif
Univers "with" (Serifa)	Univers
slab serif linear	*sans serif linear*

This brings us to the second difference, which is contrast. In type design this is the comparative difference between thick and thin letter strokes. All classification systems refer to roman and sans serif. The example shows that we can also distinguish between typefaces with high contrast and low contrast. Linear typefaces with serifs, such as Serifa, are called slab serif. A sans serif roman is often referred to as a "modified" or "humanist" sans serif.

Different contrast varieties

If we take our "Garamond sans serif" and thicken the thin strokes, a typeface similar to Syntax or Gill Sans appears. The same procedure could result in PMN Caecilia from Garamond. If we make the horizontal strokes thinner, Univers becomes similar to Optima, and Serifa looks like Bodoni. This procedure would not turn Garamond into a Univers. Why not?

heavy serif
Modern

The two different kinds of contrast originated from the handwriting from which the latin alphabet was developed. The contrast of Old Style letterforms is derived from scripts that were written with a broad-nibbed pen, while Modern typefaces show the traces of a flexible-nibbed pen. The illustration above shows that the traditions of Old Style and Modern design have a distinct impact on sans serif and slab serif types.

Special types for exceptional legibility

In the 1930s Mergenthaler Linotype designed five typefaces specifically for newspaper settings. Each of the types in the "Legibility Group" has emphasized

serifs and generous counterforms (the white space inside letters).

These typefaces were designed to be legible under the poorest printing conditions. They are still quite useful for settings on colored, screened, or patterned backgrounds. The legibility typefaces are classified as Modern, but types with similar legibility standards have also been developed in Old Style and Transitional classes.

Type mixes and type bastardizations

The second parallel to color is that two contrast varieties can clash with each other typographically – these combinations will frequently expose typographic weaknesses. It is sometimes said that one should not mix roman and sans serif typefaces, which is not necessarily so. Combining a light Bodoni with a bold Helvetica is a safe bet because of their similar contrasts, but putting together a Bodoni and Garamond in a similar size and weight might be thought radical. The end result is what counts, and a mix of type styles can be as wrong or right as a color mixture. It works or it doesn't, depending on the context in which it is used.

How to
identify type

Helvetica
Helvetica headline contrasted with Bodoni copy.

Helvetica
The headline looks better in a bolder Helvetica. the proportions are more distinct.

Bodoni
It might be adventurous to set a Bodoni headline over Garamond copy. It is not especially eye-catching.

Bodoni
Creating a conspicuous contrast sometimes stimulates interest.

Legibility
Excelsior, designed in 1931, is a typeface from the Mergenthaler Linotype "Legibility Group" (Ionic, Excelsior, Opticon, Paragon, Corona)

Legibility
With the release of LinoLetter in 1993, Linotype ensured the next generation of legibility types.

With so many new typeface variations, type classifications have almost become obsolete. However, you can still count on Bodoni and Garamond falling into the right classification slots. But Gill Sans and Helvetica – very different from each other – are often classified the same; and so it is for PMN Caecilia and Serifa.

The Transitional roman historically represents the shift from Old Style to Modern. These Transitional faces also exist between slab serif typefaces PMN Caecilia and Serifa and the heavy serif typefaces Swift and Melior (Page 25).

Rotis Serif

Hamburg

Rotis Semi Serif

Hamburg

Rotis Semi Sans

Hamburg

Rotis Sans Serif

An interesting variation is the sans serif roman. Officially a sans serif, many of these typefaces have small, quasi-suggestive serifs that seem to bud out of the main letter strokes, creating a combination of roman and sans serif. The opposite of this is the so-called "latin" with its large, triangular serifs. The Latienne typeface has both features.

Lastly, take note of the unusual Rotis family, which has both a Semi Serif and a Semi Sans.

Geometry

Typeface design is sometimes the result of a break from historical traditions. In the

Optima

Latienne

Latin Wide

Old Style italic

Modern italic

heavy serif italic

fifteenth century, the Italians, for example, introduced their comparatively light roman types in response to the rather blackish textura and fraktur types of Western Europe. Firmin Didot and Giambattista Bodoni broke with the Old Style tradition when they introduced the Modern style.

The Bauhaus movement in the 1920s experimented with the popular sans serif faces introduced in the nineteenth century – the most famous design rendition of this "new kind of roman typeface" is Paul Renner's Futura. Next is ITC Bauhaus, a revival of Herbert Bayer's experiments with letter shapes. Today, Futura looks stiff and conservative, but the geometrics continue to evolve and now have their own, almost independent, style direction. Examples are Neville Brody's typefaces and those of his innumerable followers.

Futura

1928 Futura is released.
For the first time the clear, simple shapes of the Bauhaus are given to the roman typeface.

ITC Avant Garde

In 1970, ITC
(International Type Corporation) releases its first typeface,
ITC Avant Garde Gothic.

ITC Bauhaus

Five years later Ed Benguiat and Vic Caruso transform Herbert Bayer's letter experiments into ITC Bauhaus.

Avenir

In 1988 Linotype commissions type designer Adrian Frutiger to develop the geometric Avenir.

Industria & Insignia

Neville Brody's letterforms have become a familiar style since 1990.

Italics

An entirely new type vista opens up when we consider the italic counterparts of the typefaces we have looked at. Many sans serif and slab serif typefaces (for example, Helvetica and Serifa) have italic companions that are different only in angle. Most typefaces, however, have "true italics" – separate designs that are generally more energetic than their roman counterparts.

Recognizing faces

The type classifications discussed above give a basic understanding of how type is grouped, and where many of the thousands of typefaces fit in.

Like human siblings or twins, the differences among typefaces are often very subtle. Typefaces, too, have similar faces, but whoever loves them will recognize them!

*Before using a
beautiful word,
one has to give it the
right context.*

Joseph Joubert (1754 – 1824)
Moralist, France

Type: DTL Fleischmann

How type works

Smart type choices enhance the advertising message. This is a given, but how do typefaces look on their own?

Certain typefaces summon direct responses because we constantly see them used for specific products. We would therefore associate Times with scientific material rather than baby food, Optima with cosmetics rather than gasoline, and Corporate ASE with cars rather than beverages.

Only Type Can Make Words Beautiful

Please judge the above type on the qualities below.
Mark the degree of the mentioned quality you think the type has.

very playful	4	3	2	1	0	not playful at all
very extravagant	4	3	2	1	0	not extravagant at all

very modern	4	3	2	1	0	not modern at all

A

ITC Legacy Serif
static

e

ITC Legacy Serif
dynamic

M

Univers
masculine

S

Optima
feminine

Such correlations are not just the result of habit. Even obscure typefaces elicit moods in the observer. The type designer gives his or her creation its shape, which is the language that speaks to the senses. From a scientific standpoint we don't know much about the effects of typography, as compared to color, for example. It is certain, though, that readers have similar feelings about certain typefaces. The selection of a typeface for an advertising message, therefore, is more than a subjective exercise, and it is certainly not arbitrary or inconsequential.

At this point in time theoretical research results are not one of a designer's tools. The selection of type depends on many factors, as you will see in the chapter "How to find the right typeface."

We still must rely on intuition and instinct. A good way to develop this sixth sense for type is to set up polarity profiles. Polarity profiles are reliable tools for analyzing the effects of type. They can be used, for example, to assess several different ad designs, or for market research that quantifies and statistically evaluates the reactions of a target group to a headline set in several different typefaces.

Using selected examples, we want to find out something about the expectation of typefaces. Contrary examples are always set up opposite one another.

Static or dynamic

How and where a typeface appears determines the impression it makes. Lower case letters appear dynamic and full of life next to capitals, but seem static when compared to italics.

CAPITALS	lower case

Rugged or elegant

One might assume that serifs are the most important factors for determining a typeface's impact, but this is not necessarily so. Frequently the question is: Does a typeface appear more masculine or more feminine, more rugged or more elegant? These reactions are not determined by the serifs as much as by the degree of contrast between letter strokes.

ITC Veljovic, ITC Esprit, ITC Gamma, and Ex Ponto.

How to find the right typeface

How do you find the right type for a brand, an ad campaign, a corporate identity, a catalog, or a packaging design? To be perfectly honest, there is no "formula." Nevertheless, designers should not rely only on intuition, and they especially should not settle for established successes because of convenience or insecurity. This chapter gives ideas and pointers for a systematic, yet creative, approach to finding the right type.

The right typeface should fit the product while simultaneously visualizing the specific message, presenting the advertiser's image, and speaking directly to the target audience.

Five key questions for success

1. Did it take my breath away the first time I saw it?
2. Do I wish I had thought it up myself?
3. Is it unforgettable?
4. Does it fit seamlessly into the advertising strategy of the company?
5. Will it still be good in thirty years?

In his book Ogilvy on Advertising, *the author wants the reader to ask him/herself five questions to judge the effectiveness of an ad. Beginning a design project with these questions in mind is a good way to start.*

Market research

The basis of any well-founded decision on type is market observation and, if necessary, in-depth research. Look at the competition's ads, study design magazines and type catalogs.

The following questions should be answered:
– Which typeface(s) has been used (this country, other countries) up until now for the product?
– Which typefaces were and are used for the competitor's products?
– Which typeface is used by the market leader?
– Is there a type family specifically attached to this product group?

If you don't have the appropriate material at hand or do not have the time to do the research yourself, you can contract the services of a professional type consultant.

Do not copy the market leader

This is the bottom line: Do not be satisfied too quickly. Using the typeface of the market leader does not ensure success. This actually only increases the degree of recognition for the market leader. However, under certain circumstances it can be useful to select a type with similar characteristics.

In each case, ask yourself: Are there any new typefaces that might give the message new expression? New can also mean new to this product group.

Determine the characteristics of the typeface

The next step is to define the characteristics of your ideal typeface with a polarity profile. You might choose pairs with opposite characteristics, such as businesslike – playful or classic – avant garde and then judge if and to what extent these characteristics apply to the ideal typeface.

Polarity profiles can also help determine the most important characteristics of the product itself and of the target group(s). The criteria are usually very product specific, but some generalizations apply everywhere.

Type weights

An advertising design seldom gets along with only one typeface in one size. So you have to decide: Can everything be done with only one type weight? (Note: not every text typeface is suitable for headline use.) Can I get along with just one type family? Does it have all the styles and weights I need (for example, italics, bold, etc.)? How do they differ? Do I have to choose another typeface to get a particular weight?

*Opposing pairs
for polarity profiles*

young – old
radical – conservative
low budget – high budget
new – old, reliable
sporty – intellectual
plain – luxurious
short lived – long lasting
leisurely – businesslike
modern – old-fashioned
masculine – feminine
proven – theoretical
poetic – technical

*Characteristics of products,
brands, target groups, and typefaces.
The list is endless.*

Measures of style

Style definitions for type can also be useful
for visualizing special characteristics of
the product. See if there is agreement with
certain stylistic features of the product.
Does the product have a relationship to
a certain art historical period, to a country,
a cultural trend, or special area of life?

Contrasts

Interesting design contrasts can be evoked
by using very different typefaces (type
mixing). Decide if these contrasts suit the
product.

When working with various type weights,
widths, and styles (for example, extra black,
extended, italics) it is best to stay with one
family. Type designers have created the
different variations in many type families
so that type-mixes appear to be "from
the same mold." Stylistic *faux pas* are there-
fore impossible.

Several of these extended type families
contain some surprises: The "Stones" come
not only in Sans and Serif but also Infor-
mal, and the new FF Thesis has a separate
weight called "The Mix." Also remarkable
in this context is Bordeaux. It is not an
especially large family, but it unites the
often-difficult-to-combine longhand script
with roman in one family.

Legibility

Legibility plays an important role in de-
ciding the type size and the intended venue
for publication. Are you looking for a pure
logotype, or a headline typeface for a
poster? Is the most important issue the
readability of small type in a catalog or
copy displayed on a monitor? There are
typefaces more or less appropriate for
every case.

Even the smallest sizes of type should be
legible. Newspaper printing and photogra-
vure are the worst-case scenarios when
it comes to unpredictable printing results.

Background colors, screens, or pictures can also inhibit type clarity. Compensate for these situations with a stronger typeface or a bolder weight, lighten up the background, put an outline around the type, or drop out the background entirely.

Headlines

When it comes to setting headlines there is practically no rule without an exception. Anything that can maintain the balance between conspicuousness and legibility is acceptable. There is, however, one hard and fast rule: Don't set long headlines in all caps. They are 30 percent more difficult to read, and when faced with more than twenty words set in all caps, most readers will not even attempt to read them.

Where do I find the right type?

The actual typeface choice can be made with the help of type specimen books (see bibliography). Buy new books – an up-to-date library is a good investment.

The other possibility is the software of the type manufacturer. Type CDs, type installation and management programs are more than just technical aids. Several companies have type browsers which allow users to look at and compare typefaces, and print out samples.

There are large quality differences even among typefaces. Bad type creates a bad image! Use only licensed original typefaces and avoid pirated copies.

Styles of typesetting

After finding the right typeface, make sure that weight, contrast, letter and word spacing, and line feed are well-balanced; this also affects the overall effectiveness of the design.

Compare the work of a typographer with that of a photographer. The photographer doesn't just take a picture. He or she conceptualizes, styles, lights. After

chosen typeface to make sure the letters don't disintegrate, drown, or lose sharpness or depth.

Effects

Even the dot over an i can make a typographical difference. Less is more, so caution must be exercised. Surely the goal is missed if typographic effects push the message into the background.

The presentation

The typeface choice should be on the list of important design elements presented to the client – it should not be treated as an afterthought.

Explain how you decided to suggest this or that typeface. Make it clear that the decision was not arbitrary, and explain your reasoning and research in an understandable way.

Ways to find a typeface

The easy way

- The client determines the typeface
- I use my favorite typeface
- I use a standard typeface, that way nothing can go wrong
- I use a system typeface from the Mac or PC
- I use the typeface of a successful competitor
- I don't waste any time on extra research
- I stay with the client's current campaign
- I choose a typeface the client will immediately like
- I leave the decision to my assistant

The right way

- I'm lucky – the client has a good corporate typeface
- I look for the most fitting typeface
- I look for an unusual typeface that hasn't been used yet
- I study the latest type specimen books and font offers
- I do a product and type analysis and avoid the competitor's typeface
- I search for inspiration in domestic and foreign magazines
- I compare several ad campaigns
- I try to persuade the client to accept my type decision
- I have an exclusive typeface designed

Create type consciousness!

The client should realize that the type decision is an important part of product politics and that the success of the advertising campaign is directly influenced by the correct typeface choice.

This common-sense approach is advantageous when the decision to award a contract is imminent.

Oxen cannot convey
as much as beauty.

English proverb

*Type can express qualities that may seem
contrary at first glance. A fine example
of this is PMN Caecilia, which has sturdy
slab serifs that are carefully balanced with
elegant curves.*

Type: PMN Caecilia

International car advertising

Put the pedal to the metal

There isn't a product that requires consumer brand identification as much as cars. Special attention should be given to clearly defining the identity of the product – then informed, creative typography can be put into place. What types have been successful in car advertising? We found some answers by looking at car advertising in Germany, Great Britain, and the United States for the years 1990 to 1995.

The results: type variety

In total, 86 different typefaces were used in the examined ads. This initially looks encouraging and seems to refute the general opinion that six typefaces will work for everything that needs to be set.

But these figures are deceptive: In reality, only six or seven typefaces were used for 60 percent of the headlines, subheads, and copy in Germany. In England about twice as many typefaces are used for 60 percent of occurrences, and in the United States there are at least nine different typefaces.

The research method

Example 1: Volkswagen Ad in Germany 1990
Headline Futura, Subhead Futura, Copy Times: 3 occurrences, 2 points to Futura, 1 point to Times.

Example 2: BMW Ad in USA 1994
Headline Helvetica, no Subhead, Copy Garamond: 2 occurrences, 1 point to Helvetica, 1 point to Garamond.

Each ad was analyzed by typeface used in headlines, subheads, and copy. Each typeface received one point per use in headline, subhead, and copy. The sum of the points is the basis for the ranking.

Since not every ad contains headlines, subheads, and copy, there is no logical relationship between total points and the number of ads examined.

This is pitiful, and makes one wonder about the state of German creativity. Isn't it enough that after "streamlining," cars look more and more alike? It is more difficult to distinguish among them, and consequently more difficult for advertisers to develop ad campaigns for new models. We shouldn't, however, put on the brakes for the typography.

Put the pedal to the metal!

International brands and their typefaces

All of this can't be because of the frequently cited conservative customer who supposedly always wants to see the same typeface. Only two car manufacturers, Volkswagen and Mercedes, have used the same typeface for several years. Neither Volkswagen nor Renault use their corporate typefaces all the way into their print advertising. Volvo and Mercedes have exclusive typefaces. In Europe, Alfa-Romeo, Opel, and Saab have consistent type representation. Lexus, General Motors, Citroën, and Peugeot use a different typeface for almost every model. It's questionable whether that is an especially good idea, but it is definitely not a good idea to use the same or a similar typefaces for similar products of different brands.

Australisches Standardmodell Macropus rufus

Sieh da, es gibt noch andere Hersteller mit integrierten Kindersitzen.

▶ 1692 strandete Francesco Pelsaert an der Küste Australiens und sah zum ersten Mal ein Modell mit integriertem Kindersitz. Als er davon zu Hause erzählte, tippte man sich nur an die Stirn.
▶ Über 300 Jahre später gilt der integrierte Kindersitz als eine der sinnvollsten Innovationen im Automobilbau. Wir haben diese Idee noch ein wenig verbessert. Zum ersten Mal gibt es ein Auto mit zwei integrierten Kindersitzen. Sehr zur Freude aller, die mehr als nur die durchschnittlichen 1,2 Kinder haben. Die besagten Sitze finden Sie auf Wunsch in der C-Klasse. Dem Auto, das unter motor sport zum sichersten seiner Klasse gekürt hat Wir finden ein guter Platz, um groß zu werden.

Mercedes-Benz
Ihr guter Stern auf allen Straßen.

Many designers are afraid that it will stifle their creativity if they use a typeface that is a predetermined corporate design. These ads prove the contrary. Mercedes-Benz can afford to forego pictures of cars and use children's drawings because the typesetting and typeface have already alerted the audience to what the ad is about.

National markets and their typefaces

Nationalistic type markets still seem to
exist. In Great Britain, English-designed
typefaces such as Baskerville, Gill Sans,
and Rockwell are used more frequently
than German-designed faces; Futura is
used more often in Germany than in Great
Britain. This nationalistic tendency be-
comes even more pronounced when the
percentage of the German-designed Akzi-
denz Grotesk and Optima are calculated.
Goudy Old Style is typically used in the
United States, and new American typefaces,

No dominant typeface for cars

Unlike cosmetics, there is no dominant
typeface in the car industry. Although
Futura is used frequently, it is not used sig-
nificantly more than in other product
groups. If Futura was the "right" typeface
for this product group then similar type-
faces such as ITC Avant Garde Gothic,
would appear much more often. We should
note that the popularity of sans serif type-
faces decreases the further west you go.

Mediocrity is always
the correct weight;
except its scales are not true.

Anselm Feuerbach (1829 – 1880)
Philosopher, Germany

Avoiding mediocrity does not necessarily
lead to extravagance. Look at the type-
faces shown above, and compare the
classically proportioned Univers with the
top-heavy FF Balance: as in life, a small
change in weight can make a difference
in performance.

Type: Univers (upper lines)
and FF Balance (lower line)

Advertising monotony

Now that more typefaces than ever are being sold, fewer than ever are being used. This result of an AdFinder type analysis of *Stern* and *Spiegel* ads during the years 1992 to 1994, is, to be frank, pathetic – 551 ads from different industries were analyzed for typographic content in headlines, subheads, and copy. (*Stern* is a weekly magazine that covers popular culture and its icons in a slightly sensational way. *Spiegel* is also a weekly; it gives in-depth coverage of politics, the economy, and other more serious issues of the day.)

The disturbing result

Forty-two typefaces were used in 1215 instances. But only 7 different typefaces were used for 69 percent of them, a total of 844 instances! Unbelievably, 523 occurrences (43 percent of the total) used 3 typefaces, namely Futura, Helvetica, and Garamond. Fourth through seventh places are held by Univers, Times, Bodoni, and Franklin Gothic.

Since 1992, this is what happened to the top seven: Top-ranked Futura took the lead again in 1994 after dropping to second place behind Helvetica in 1993. Garamond fell from second place in 1992 to fourth place in 1994. Even greater losses were felt by Times: still number 3 in 1992, plummeting to number 7 in 1994. Univers moved up from seventh place in 1992 to third place in 1994. The numbers of annually used typefaces stayed fairly constant at around 45, independent of the number of ads. It appears ad designers can't handle more than that.

All the ads were professionally designed by renowned agencies, not amateur desk-

The four most popular typefaces in the United States

It seems every hemisphere has its own type preferences. While in Germany the Futura, Helvetica, Garamond, Times quartet represents a large part of the printed advertising market, in the United States the cards are shuffled differently: ITC Garamond, Palatino, ITC Berkeley Old Style, and Bernhard Modern.

The most frequently seen typeface in the United States is ITC Garamond, which is comparable in use to Times in Germany. ITC Garamond is enormously popular because it was one of the first digital Garamonds available, and because its large

Garamond Simoncini

x-height allows for high legibility. The fact that it is not a "true" Garamond has given it a bad reputation among some typographers.

Palatino is also very popular in the United States, especially for pure image advertising: computers, cosmetics, and business. The world of finance and business seems to have a special fondness for ITC Berkeley Old Style. Bernhard Modern is preferred for fashion, cosmetics, and food.

A fitting anecdote: When the new Rotis was released in 1988 in Paris, the official typeface for the Olympic Games in Barce-

There are many Garamonds. On top, three "real" ones, on the bottom three "fake" ones. The fake Garamonds apparently all originated with type specimens mistakenly attributed at the beginning of this century to the punch-cutter Claude Garamond. The error was discovered as early as 1926, but since these false Garamonds were already generating good sales, the mistake was never corrected.

67

"Who's going to make sure the trees will be here tomorrow?"

Not an easy question. But that's what my son asked the other day. He's thinking about it. Just like everybody. He wants to know if the trees will still be around when he grows up. Well, working for Georgia-Pacific like I do, I

can tell him: we're doing our part. Planting new trees by the millions. Setting aside land. Making sure the trees will always be here. For everybody. Of course, I can't speak for other companies out there. But I know we're doing what's right. Steve Dolfs, Forester. **Georgia-Pacific**

Campaign: Georgia-Pacific; Product: Finance;

Several other typefaces also ride the wave of success of the graceful Bernhard Modern. One is Lucian, from the same designer, and the French Cochins. At first glance they look very similar. Looking closer,

especially at the italics, only the large capital letters and the long ascenders are a common feature. There aren't quite as many "Cochins" as "Garamonds" but the differences are greater among them.

69

IT IS NOT THE CAPITAL
THAT CONNECTS US
BUT THE SMALL CAP.

Hans Peter Willberg
Typographer, teacher, Germany

Hans Peter Willberg is one of the leading
German typography evangelists and
is the author on several books on type
and typography.

Type: Latienne

For All Those
Waiting For The
Perfect Balance Of
Hand Craftsmanship,
Advanced Technology,
And A Look That'll
Knock The Wind
Right Out Of You...

*Fake small caps: Advanced technology?
Typeface: Goudy Old Style*

*Why you can't capitalize on unreal
small caps*

Small caps are noble, reliable, confidence
inspiring. So it's no surprise that banks
and credit institutions, purveyors of high-
yield investments and consumable prod-
ucts, and high-tech service companies
frequently display their "capital" messages
this way. This trend is especially apparent in
the United States. In principle, there is
nothing to be said against it except that
legibility suffers in longer headlines.

FOR ALL THOSE WAITING FOR THE PERFECT BALANCE OF HAND CRAFTMANSHIP, ADVANCED TECHNOLOGY, AND A LOOK THAT'LL KNOCK THE WIND RIGHT OUT OF YOU...

*The perfect balance: Real small caps
Typeface: Goudy Catalogue*

German typography professor and designer Hans Peter Willberg once said in conversation with fellow typographers: "It is not the capital that connects us but the small cap."

Capitals and small caps

That a mysterious connection between the capital and small caps does exist is neatly shown in the Schwab ad. American bankers apparently have a preference for letting the small capits work for them-

OUR BUSINESS SERVICES ARE DESIGNED TO IMPROVE YOUR STANDING NOT JUST WITH THE CEO, BUT ALSO WITH THE CFO.

Campaign: Schwab; Product: Finance; Country: United States; Typeface: Caxton
Here the small caps are not only fake, they are also condensed and spaced far too tight.

selves. But it is not as simple as it seems: Real small caps are different from computer-compressed capitals, which look like they were washed in water that was too hot. If they are also spaced too closely, as in the Schwab ad, a very negative message appears "between the lines."

The perfect balance between craftsmanship and technology is certainly not appar-

THE JAPANESE DIET TO GET FAT OVERSEAS.

Typeface: Goudy Old Style

ent in the typography in the ad on the previous page. Before long the opposite is conveyed because small caps are just as problematic in text as caps. With several lines of text, it hampers reading and makes comprehension more difficult.

If someone loses twenty pounds, then his or her figure will have different proportions. It's not any different when small caps are made out of caps – not even after a Japanese diet – even if it looks that way here.

Real small caps have been designed by type designers so that a smooth and har-

monious type picture is portrayed. This involves line weight, spacing, and several other characteristics. Today many digitized typefaces include real small caps. They can be found as Small Cap Fonts, in Expert Sets, and they are easy as pie to access.

POOR OLD MOUSE.

Typeface: Futura

Saving money by not investing in real small caps will result in messages that carry the wrong signals. Who here is the least well off? The advertiser who can't afford real small caps, the tortured type – or the audience?

With fake small caps the first letters appear blown up, clumsy, and awkward. They are also glued too closely to the second let-

ter and suffocate the rest of the type with their excess weight. Instead of rolling hills, there are big mountains in front of each word! You instantly lose interest in reading and the information is lost.

Most imitators are drawn
to the inimitable.

Marie von Ebner-Eschenbach (1830 – 1916)
Novelist, poet, Austria

Type: Apple Garamond

Campaign: Intel; Product: Microprocessors;
Type: ITC Garamond; Country: United States

How type copiers make Apple stronger

Remember the 1960s? The duck tail was a
must for every fan who wanted to imitate
Elvis. Even today teens around the world
try to grab a little glitter by copying the
clothes and mannerisms of their stars and
idols. Happily this stops after young people
mature and find their own identity. In the
long run it would be pretty boring with
thousands of Elvis clones.

All told, the only one to profit from all
the copying was Elvis. His fame grew pro-
portionally to the number of imitators –
just the way any star, brand, or identity is
strengthened, not weakened, by imitators.

Campaign: Apple; Product: Computers;
Type: ITC Garamond; Country: Germany

From this point of view, the results of
our examination of advertising in the com-
puter industry gives plenty to think about.
Over fifty computer manufacturers are
zealously strengthening Apple by copying
its typographic appearance. All use ITC
Garamond.

What happens when pears want to be
apples? The world will begin to think that
pears are second-class and that apples are
the only thing worth having. The computer
companies listed here suggest, uninten-
tionally, the same thing with their imitated
type: Apple is the only real computer.

Campaign: NEC; Product: Laserprinters;
Type: ITC Garamond; Country: Germany

One appears in the guise of the trendsetter
with the hope that Apple's image and suc-
cess will rub off on its product, implying
that their product is not strong enough to
have its own identity.

Perhaps it's because the computer indus-
try is relatively young. These copycat com-
panies shouldn't, however, give themselves
too much more time to find an identity.
Otherwise, interest in their products will
be short-lived.

Pears into apples …

Apple ***Garamond*** bold italic

ITC ***Garamond*** bold cond. italic

Even ITC Garamond is not what it used to be – at least not for those who want to imitate Apple's typographic appearance. At first glance what appears to be ITC Garamond condensed is actually something quite different.

In 1990 Apple contracted Bitstream to redesign ITC Garamond. "Apple Garamond" has existed ever since. It is very much like ITC Garamond except narrower by 80 percent and a little heavier. Distinct differences are evident in the light and bold italics.
I consider myself
a seducer
and seducing people
is sweaty work.

Optima – the optima(l) typeface?

Recent studies of several international cosmetics ads show that Optima is used almost without exception. And that worldwide! This is so phenomenal that you don't really know whether to laugh or cry about it.

You could laugh because obviously users and clients have accepted as fact that it actually does matter what type is used, and that certain typefaces fit only specific product groups. Otherwise we would find the standard mix of Helvetica, Futura, Times, or Courier in cosmetics advertising. But this is not the case.
Mask of the cosmetic industry

GUERLAIN

GATINEAU

Silvikrin

OENOBIOL

You could cry because the cosmetics industry is clinging like a drowning person to a piece of driftwood – in this case Optima – even though shiploads of other typefaces are floating around nearby.

Since the entire industry relies on this one typeface, it is very difficult for the consumer to find a brand in this product group that is different from the others. Where is the product that will make the consumer feel special? Whether it's "pure energy" or "natural radiance," "unique vitamin complex," or "beauty sense" – everything hides behind the same mask.

Headache or boredom …

In the formidable search for an original
brand personality, the consumer could get
a headache, or fall asleep from boredom.
One might even get the idea that all those
bottles and tubes contain the same thing.

Alternatives

Whoever wants to play it safe can choose
a typeface similar to Optima, for example,
Peignot. But since it is slightly formal,
Peignot should be used only for a logotype.
You could then look at typefaces with a
similar style or rhythm as Optima: There
are a few alternatives on page 87 worth
considering.

…until you fall asleep? No wonder with so much Optima!

The secret of type
is that it speaks

Paul Claudel (1868 – 1955)
Poet and statesman, France

Type: Creme

Nivea – the elite of brand typography

What is a brand? According to Hans
Domizlaff, a prominent brand and identity
expert, there is no such thing. It is a void,
a phantom existing as a live and soulful
being only in the minds of consumers. How
do you get such a phantom to inhabit
the consciousness? With type! A brand that
has done it like no other is Nivea. You can
almost smell the Nivea scent just by look-
ing at their typefaces.

   Nivea Bold was developed by Günther
Heinrich at the TBWA advertising agency in
Hamburg in 1992 from the original logo-
type, which was created in the 1930s.
Heinrich used it as the model for Nivea
Bold typeface.
*Through an international image campaign Nivea
prepared the market for widespread marketing
of the creme to all areas of the cosmetics industry.
With urgency and at the same time, subtlety, the
new type (based on the original Nivea logo) conveys*

*that something sensational has been happening
with the brand. Such a strategy was possible only
because the Nivea logo has been imprinted in
people's minds for decades, therefore, even the
smallest change is perceived as sensational.*

First of all, he had to visualize the consistent corporate presentation of a brand whose product philosophy is "pure & simple". Nivea Bold became the permanent headline typeface for worldwide advertising. Creme type, designed in the United States, was added as a complement. Heinrich: "The communication center of the Nivea umbrella brand is the creme. Its formal identity is defined by the harmonious order of opposites. For that the Creme type is necessary."

Nivea as an umbrella brand for cosmetic products has a worldwide market share of 35 percent – a success only dreamed of by other brands.

*Metroblack (left) was the design inspiration for the
1930s Nivea logo (below). In 1992 the new Nivea Bold
alphabet (right) was modeled on the original five letters
by Gisela Will of EF Fontinform in Hamburg under the
direction of Günther Heinrich of the TBWA agency.*

NIVEA

This phenomenon has occurred even
though Nivea advertising denies following
current trends and advertising techniques.
Next to Nivea, only the elite of strong
brand personalities, for example, IBM,
Marlboro, and Mercedes, can afford to be
this casual. Common characteristic of
these four top brands: they have used the
same typographic image for several
years, they take care that no exceptions
appear, and their typography is recognized
internationally.

*Campaign: De Beers; Product: Diamonds;
Country: Great Britain; Type: Augustea Nova*

Diamond campaign under the glass

Type has to relate to the product so the
subconscious can be "programmed."
Ideally, the typography mirrors the prod-
uct's qualities and steers audience attention
in the right direction before one word is
read. The English diamond campaign is an
especially well-done example of this.

This ad was well thought out from the
initial concept to the final dot. Augustea
Nova was chosen to carry it off. Its serifs,
apostrophes, and i dots have sharp, bril-
liant contours – every letter polished like a
real diamond.

Für uns war es nicht immer leicht.
Für uns war es nicht immer
Für uns war es nicht
Für uns war es
Für uns war
Für uns ist
Für Dich

*Campaign: De Beers; Product: Diamonds;
Country: Germany; Type: ITC Novarese*

There was more than the problem of
keeping the ambiguity in the copy in the
translation into German. Unfortunately,
the type selection was not as sensitive
either, even though both the English and
German typefaces were designed by Aldo
Novarese, the highly praised Italian type
designer. And the diamond was the victim!
i dots became round and boring, the t lost
its interesting facet on the cross bar, and
the feet of the t and e were worn blunt on
the road from England to Germany. Too
bad, these aren't real diamonds anymore.

TELL ME THE PAST
AND I WILL RECOGNIZE
THE FUTURE.

Peter Stuyvesant – a brand through changing times

Type is not just blue smoke – it mirrors the current culture, and can be an icon for trends, developments, and idols. This is plain as day in Peter Stuyvesant's advertising from the years 1959 to 1995. While the logotype remained unchanged, the typography shows the spirit of the times in the headlines and subheads.

In 1959 a modern, widely spaced sans serif, Gill Sans, was used to show that whoever identified with the brand was open, worldly, and widely traveled.

In the 1970s the slogan "the scent of the big, wide world" becomes a person-to-

1994   1995

Clearface	1970	Beton	1983		
Futura	1971	Beton	1984		

person connection with closely set Clearface and its comfortable, softly rounded edges.

The unchecked growth of the 1980s shows itself in the dramatically inclined narrow bold Futura (then still something special).

The ads from the 1990s mirror the change to a less complicated, more personal lifestyle with handwriting – continuing with the campaign "Come together."

What do you think would have happened if Peter Stuyvesant had set everything in Times or Helvetica?

101

There is nothing
more important
in the world
than enticing people
to think.

Writer, Germany
Type: Find out in the next chapter!

**Are you
type conscious?**

Type: Century Schoolbook
Type: Univers
Type: ITC Fenice

Type: Bodoni

Test it now!

After reading this book, have you turned
into a type with more awareness, or could
you still possibly be a type heathen? You
can find out here in three steps.
FIRST STEP: Look at the sixteen ads from
the French department store chain
"Monoprix" on pages 104 to 107. The prize-
winning campaign shows a colorful spec-
trum of different typefaces. What's the first
thing that comes to mind?

Type: Bernhard Modern

Type: Permanent Headline
Are you type conscious?

Type: Futura

Type: Times

SECOND STEP: Compare your personal
impressions with the opinions in the box
on page 106, and assess them by circling
the letters in the columns "perfectly true,"
"sort-of true," "absolutely false."
THIRD STEP: Count how many times you
circled the letters P, G or T.

Then find out on page 107 what kind of
a type type you are.

Are you type conscious?

« QUAND ON VOUS VEND DES HARICOTS VERTS, ON GARDE LES EPLUCHURES POUR NOUS.»

MONOPRIX
UNIPRIX
On pense à vous tous les jours.

Type: Goudy Old Style

"Pour séduire, essayez nos chemisiers en soie lavée. En cas de résistance, essayez notre lingerie de soie."

MONOPRIX
UNIPRIX
On pense à vous tous les jours.

Type: Balladeer

"NOUS SOMMES TRES FIERS DE NOS VESTES AUTRICHIENNES Yodledi-iïi. Yodledo-oooo...

MONOPRIX
UNIPRIX
On pense à vous tous les jours.

Type: ITC Garamond

"ON TROUVE COURAMMENT DES PAPAYES EN TANZANIE, AU ZIMBABWE, OU PLUS PRES, AU MONOPRIX.

MONOPRIX

Type: Univers

Test your type awareness ...	perfectly true	sort of true	absolutely false
• Chaotic, those French	P	P	T
• It looks like lots of specialty stores under one roof	T	G	P
• What's with the type salad?	P	G	T
• They go to a lot of trouble for their clients	T	G	P
• Looks like a graphic designer wanted to show off	P	P	T
• These people have imagination	T	G	P
• I think this is overdone	P	G	T
• It must be fun to shop there	T	G	P
• I would love to do a campaign like this some time	T	T	P

Type: ITC Garamond

Type: Bernhard Modern
Type: Baskerville

Type: ITC Novarese

Evaluation

*Count how many times you circled the letters
P, G, or T.*

Mostly P
*You have very plain type consciousness.
You'd better read the book again!*

Mostly G
*Your type consciousness still has grey areas.
Do something about it.*

Mostly T
You really are a type-conscious type. High fives!

What I see
is not what I want!

Jelle Bosma
Typographer, Netherlands

Jelle Bosma is one of the few experts
devoted to finding a reasonable balance
between type design and font technology.
He has worked for Scangraphic, and since
1991, for Monotype Typography.

Type: Futura

If you want
to get what you
see ...

**If you want
to get what you
see ...**

The phrase "What you see is what you get" (WYSIWIG) has almost become the desktop publishing mantra. Unfortunately, it doesn't always coincide with reality, and when it comes to ordering type, the exact opposite is true. You have to look very carefully in the beginning to get what you want in the end.

THE QUICK BROWN FOX JUMPS OVER THE LAZY DOG

The quick brown fox jumps over the lazy dog

1234567890

The Linotype-Hell version of Futura LH Light. The spacing is open, and it's distinctly recognizable by the stronger stroke weights, the capital J, and the lining figures. The relationship between capital height and ascenders is more harmonious.

Linotype-Hell has good guidelines for ordering type: Do not order a typeface before you've seen the entire alphabet. In a detailed type catalog you can check if the recommended font is suitable for you. Are all weights available? Does it have the necessary accents? How does the type look in a range of sizes? Caution: Different manufacturers offer the same typefaces – there are definite differences in design and quality that are apparent only after close scrutiny.

Don't let the cat out of the bag

A good example of this problem is Futura designed by Paul Renner. It is a bestseller and there are many PostScript versions available. For example, one version has been reworked for better legibility for copy set in small sizes, another specifically for setting headline type for posters. It is fre-

THE QUICK BROWN FOX JUMPS OVER THE LAZY DOG

The quick brown fox jumps over the lazy dog

1234567890

Futura Light, sold by Linotype and Adobe, is more suited for display work. Distinctly recognizable by the finer stroke weight and the stranger contrast between capital height and ascenders, this font is too light to be a text typeface.

quently recommended not to use the same type in the complete range of sizes. This is why some manufacturers offer different versions of the same font.

There are also many companies saturating the market with pirated typefaces. These typefaces usually have names similar to the original. But after a careful look, the differences quickly become evident. Not infrequently the accented characters, for instance the German umlauts (ä, ö, and ü), and other special signs are missing. Also, accents are incorrectly positioned above the letters.

**If you want
to get what you
see ...**

It is far safer to stick to quality fonts from well-known type manufacturers.

PostScript and TrueType

Digital type is offered in different data formats. The usual type formats for desktop publishers and professional users are PostScript Type1 and TrueType. Most professional studios work with PostScript because it has the best track record.

For PostScript typefaces, Adobe Type Manager, an additional piece of software, is necessary for the screen display. This automatically ensures the best possible showing

its characters and accents in perfect order.*

of the type on screen. Extra software is not necessary for the TrueType format since it is already supported by system software (Apple Macintosh as of system 7.0 and Microsoft Windows as of version 3.1). TrueType fonts are user friendly.

TrueType fonts have recently been tested with good output results on high-resolution printers. Previously there were problems with TrueType fonts in service bureaus, mostly because printer drivers were not capable of handling the new format, and because of the inferior quality of pirated fonts.

Most fonts available today, both Post-Script and TrueType, work on Macintosh computers as well as PCs with Windows.

Delivery Form

Fonts are usually delivered on diskette and include all weights in the type family. Some type sellers offer special delivery services, and will also create custom type packages for the client.

CD-ROMS are increasingly becoming the most popular form of font distribution. For a small basic fee a, CD-ROM encoded with all the typefaces in that manufactu-

Pirated type with uneven shapes. The most noticeable defects: the accented characters are missing, the G is too small on the bottom, the figures appear too bold, the spacing between the I and J is bad, and the space between words is obviously too large.

rer's library is mailed to the user. When ready to use a font, the user calls one of the unlocking centers, makes arrangements for payment, and is given the code to unlock the requested font.

Of course, there are also completely open type libraries on CD-ROM. This is a rather large investment, but for professionals who use many typefaces, and need to access them without delay, it is a good one. Delivery of fonts online is also offered, but at this time is not widely used. However, it probably won't be long before it's the pre-ferred delivery method.

Ten commandments

**Do not pirate,
do not copy,
do not imitate**

Source: FontShop

You shall use only original typefaces.

You shall respect digital typefaces
as licensed software protected by law.

You shall not think
that as the buyer of a type package
you become its owner.
You only buy the usage rights.

You are only allowed
to print on one printer
with your type package:
the purchase does not entitle you to more.

You have to acquire a multi-printer license
if you want to print
on more than one printer.

for digital type users

**Do not pirate,
do not copy,
do not imitate**

You have to buy a multi-site license
if you want to use a font
in several locations
or offices of your company.

You shall not put your type
with your jobs for the service bureau.
A single license forbids this.

You may not copy fonts
without authorization: it is illegal!
The license rules only allow
a copy for back-up purposes.

You shall not use illegal type copies.
It damages the type designers
and inhibits the development
of new typefaces.

You shall immediately destroy
any illegal copies
that might be on your company network.
This is punishable by law.

About the authors

Stefan Rögener was the first to operate a photo-typesetting studio in Hamburg, Germany. He is a type consultant, and runs Germany's largest ad library, AdFinder GmbH. He is the publisher of the award-winning typography magazine *Satzspiegel*; his co-authors, Ursula Packhäuser and Albert-Jan Pool, are a writer/editor and the designer, respectively.

Ursula Packhäuser studied music as a child, and English and education at the University of Hamburg. She worked in the classical department of RCA Records and was a product manager for Polygram Records. In 1983 she joined the Haase companies group, where she is in charge of advertising and public relations. Her piano compositions were published in 1992. She works as a freelance writer, and runs her own advertising agency in Hamburg.

Albert-Jan Pool studied graphic design at the Royal Academy of Arts, The Netherlands where Gerrit Noordzij, professor of type design, converted him to typography. The academic was followed by the practical at the type studio of Scangraphic. In 1991 he became artistic director of the type department at URW. He has designed several typefaces for URW and Font-Shop. He works at his own studio, Dutch Design, and teaches type design in Hamburg and Kiel.

Branding with Type will entertain you while reminding you of the most profound 500-year-old business lesson around: type sells.

Branding with Type reasserts a simple premise known to communication veterans throughout the world: type brands products. Be it a billboard, an Internet site, or a magazine page, the choice of typography can position a successful advertising campaign.

Originally published in a limited German edition, *Branding with Type* has been translated and edited into English with all the humor, international flavor, and authoritative scope left intact. Sometimes irreverent but always insightful, *Branding with Type* examines key ad campaigns that demonstrate the branding powers of type.

Designers, advertisers, and marketing professionals should pay heed to this slim volumn. *Branding with Type* will entertain you while reminding you of the most profound 500-year-old business lesson around: type sells.

Stefan Rögener, a type consultant with Germany's largest ad library, AdFinder GmbH, is also the publisher of the typography magazine, *Satzspiegel*. Albert-Jan Pool is a graphic designer and operates Dutch Design in Hamburg, Germany. Ursula Packhäuser is a freelance writer and copy-writer residing in Hamburg.

Stephanie Tripier grew up in Germany and has a degree from the Wiesbaden School of Art. She works for MetaDesign San Francisco, an identity design agency.

E.M. Ginger, a writer and editor residing in the San Francisco Bay Area, was the managing editor of the journal *Fine Print* for over a decade. She is the editor of several bestselling cookbooks as well as books on type and typography.
